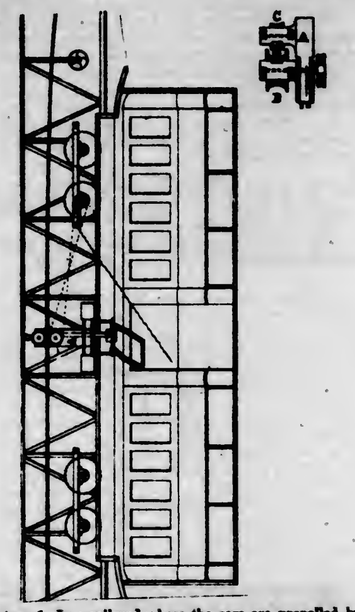
3. In a car-coupling, the combination, with the double-headed coupling-pin, of the spring-actuated catches having recesses for receiving the heads of the pin and pivoted jaws for retaining said heads, and a cross-head for supporting the catches, substantially as shown and described.

4. In a car-coupling, the combination, with a draw-head, of a cross-head having chambers on each side the draw-head, and spring-actuated sliding catches having beveled retaining-jaws, the chambers being formed with openings at the top, near the draw-head, to allow oscillation of the jaws, substantially as shown and described.

5. In a car-coupling, the combination, with the arrow-headed coupling-bar, of the vertical bar and levers for operating said bar to lift the outer end of the coupling-bar, substantially as shown and described, and for the purpose set forth.

257,120. NOZZLE FOR SHIPPING-CANS. P. CORTES WILSON and HADOCK H. BOOLS, Chicago, Ill.; said Bools assignor to said Wilson. Filed Aug. 26, 1881. (No model.)

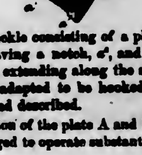


Claim.—1. The flat can-top B, in combination with the flaring nozzle F, cover E, and plate G, fitted closely around the nozzle above the cover and resting on the latter, substantially as and for the purpose set forth.

2. The flat can-top B, in combination with the flaring nozzle F, having its upper edge turned over, cover E, and plate G, fitted upon the nozzle, and having the edge around the nozzle-opening apart to rest under the turned-over edge of the nozzle, substantially as described.

257,121. CABLE RAILROAD. LEVI J. WISE, Brooklyn, N. Y. Filed Sept. 13, 1881. (No model.)

Brief.—The wheels that support the car on the track or their axles are connected with rolling compression-sheaves that grasp the cable, so that the friction of the wheels upon the track shall serve as a driving agent to set in motion the rolling sheaves, and thereby increase the speed of the car.



257,121.

Claim.—1. In a railroad where the cars are propelled by a moving cable, the method of accelerating or increasing the speed of the car or train, which consists in so combining one or more pairs of the wheels that support the car on the track with rolling sheaves that grasp the cable that the friction of the wheels upon the track shall serve as a driving agent to set in motion the rolling sheaves to increase the speed of the car, as specified.

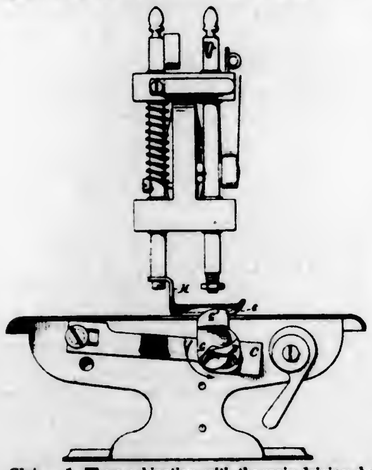
2. The combination of a moving cable, a car, a clamping device, and compression-pulleys arranged to act on the moving cable, said pulleys being operated by connection with one or more pairs of the supporting-wheels or the axle of the truck for the purpose of increasing the speed of the car or train without increasing the speed of the moving cable, substantially as set forth.

257,122. BUCKLE. JOHN H. WOOD, New Brunswick, N. J. Filed Mar. 6, 1882. (Model.)

Claim.—1. A buckle consisting of a plate, A, provided with lugs *a a*, a lug, *a'*, having a notch, *a''*, and a clasp, B, journaled between the lugs *a a*, extending along the side of the plate, bent, carried across it, and adapted to be hooked in the notch *a''*, substantially as shown and described.

2. The combination of the plate A and its lugs *a a* and *a'* with the clasp B, all arranged to operate substantially as shown and described.

257,123. TRUNK, BOX, &c. WILLIAM B. WORGER and EDWIN H. RICHFORD, London, England. Filed Feb. 17, 1882. (No model.)



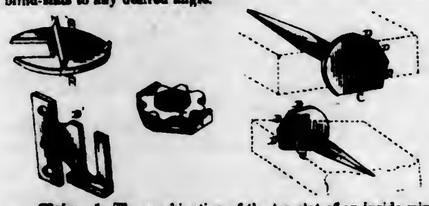
Claim.—1. The combination, with a trunk provided with recess D and groove *b*, of the lid or door A, provided with the pivots *a*, substantially as and for the purpose set forth.

2. The combination, with the lid or door A, provided with the pivots *a*, of a trunk provided with the recess D, and the grooves *b*, having their ends curved downward at right angles to their length, substantially as and for the purpose set forth.

3. The combination, with the sliding door A, of a trunk provided with the frame *c*, adapted to receive a series of drawers, and having the edges of its top and sides projecting beyond the drawers a distance equal to the thickness of the said door, substantially as and for the purpose set forth.

257,124. TRIMMING ATTACHMENT FOR SEWING-MACHINES. THOMAS R. WRIGHT and THOMAS B. HIRE, Philadelphia, Pa. Filed July 6, 1881. (No model.)

Brief.—The trimming-knife is secured to and rotates with the driving-shaft beneath the bed-plate of the machine.

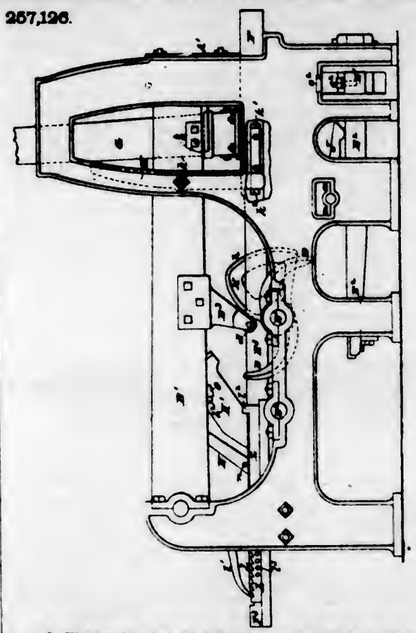


Claim.—1. The combination, with the main driving-shaft B, located beneath the bed-plate of the machine, of the cutter *c'*, secured to said shaft and adapted to project upward through a slot in said bed-plate into the grooved presser-foot, substantially as described.

2. The combination, with the driving-shaft B and cutter *c'*, of the presser-foot H, provided with the groove *e*, for the purpose specified.

257,125. SUPPORT FOR INSIDE WINDOW-BLINDS. CHARLES M. YOUNG, Lockport, N. Y. Filed Feb. 21, 1882. (No model.)

Brief.—The head of the supporting-bolt has cut-away edges, which sit on the bracket-ledge, forming resting-places to adjust the blind-slats to any desired angle.



Claim.—1. The combination of the top slat of an inside window-blind with a headed bolt or casting and a suitable support, upon which the headed bolt or casting catches, the casting or bolt being provided with a number of bearings, substantially as shown.

2. The combination of the top slat of a window-blind with a headed bolt having the cut-away edges C D and a support provided with a flange, upon which the cut-away edges are adjusted, substantially as set forth.

257,126. HAMMER BRICK-MACHINE. ERWIN F. ASSERWO, St. Louis, Mo. Filed Dec. 10, 1881. (No model.)

Claim.—1. The combination, with the hammer of a brick-machine, of a pivoted latch or lever automatically operated by tappets on the side of the charger to engage and disengage from under the hammer, substantially as described, and for the purpose set forth.

257,126.

2. The combination, in a hammer brick-machine, of the pivoted cam-block H' with the hook-bar O and disengaging mechanism, substantially as described, for the purpose set forth.

3. The combination, in a hammer brick-machine, of the ratchet-bar L, having teeth *l* and adjusting holes and bolts *l' l'*, with the pawl *l'*, bell-crank lever M, pin *m*, and hammer-helve B', as described, and for the purpose set forth.

4. The combination, in a hammer brick-machine, of the pivoted cam-block H' and operating-cam H with the hook-bar O, disengaging-lever N, and sliding ratchet-bar L, operated by the hammer-helve B', substantially as described, and for the purpose set forth.

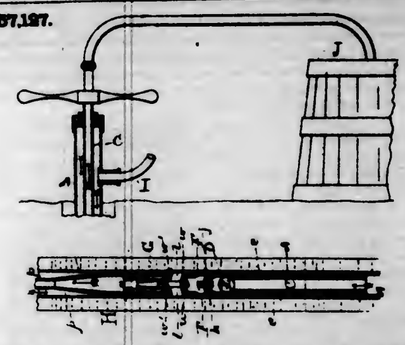
5. The combination, in a brick-machine, of a movable charger, vertically-moving mold-bottoms, lever E', and operating-cam H, having a holding-face, *h*, as described, and for the purpose set forth.

6. The combination, in a brick-machine, of a movable charger, vertically-moving mold-bottoms, with a lever, E', operated by cam H, substantially as described, and for the purpose set forth.

7. The combination, with a brick-machine, of the lever E', having a movable fulcrum that is automatically raised and lowered by the movement of the charger, substantially as described, and for the purpose set forth.

8. The combination, in a brick-machine, of a lever, E', movable fulcrum-rod *e*, incline *e'*, lever I, and tappets *i i'* with the mold-bottoms C' and charger F, as described, and for the purpose set forth.

9. The combination, in a brick-machine, of the charger F, having a removable table, F', as described, and for the purpose set forth.



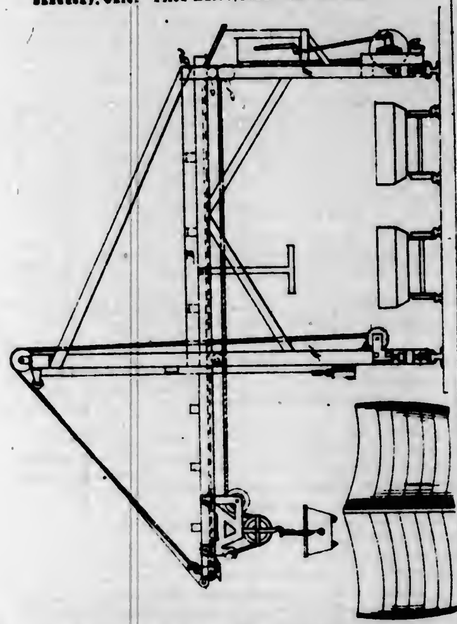
10. The charger F, formed with an open-top oil-chamber, *f'*, in combination with the capillary wicks *f''*, removable table F', and plate *f'''*, attached loosely to the charger, as described, and for the purpose set forth.

11. The bumper P, having its supporting-frame P' extending down to and resting on the anvil-block E, as described, and for the purpose set forth.

257,127. DEVICE FOR TREATING THE WALLS AND TUBING OF OIL-WELLS. BENJAMIN F. AVERILL, Dunkirk, N. Y., assignor of one-half to Thompson Pike, same place. Filed Mar. 3, 1882. (No model.)

Claim.—1. In a device for treating oil-wells by steam, and in combination with the long pipe C', the hollow connection G, with steam-ports *l l* and oil-ports *w w' w''*, and also the hollow steam-ejection pipe *k* therein, all secured to the hollow nut F, having the plug *u*, substantially as and for the purpose specified.

257,127.



2. In a device for treating oil-wells by steam, the combination of the pipe C', connection G, and nut F, having ports *j j*, and the cap D with rounded-dome top *g*, having ports *h h* therein, said top fitting into the rounded-out bottom of the nut F, all substantially as and for the purpose specified.

3. In a device for treating oil-wells by steam, the combination of the nut F, cap D, constructed as described, the ball-valve E therein, pipe C, nuts *a* and *b*, and leg B, all arranged and operating substantially as specified.

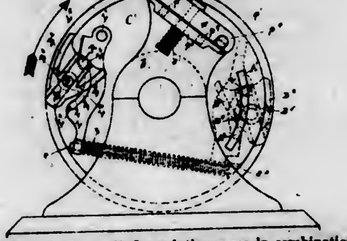
4. In a device for treating oil-wells by steam, in combination with the steam-pipe C' and tubing or working-barrel A, the steam-space *p p* between the two, and the connection G, having steam-ports *l l* therein, substantially as and for the purpose specified.

5. In a device for treating oil-wells with steam, the combination of the pipe C', connection G, nut F, cap D, pipe C, nuts *a* and *b*, packing *c c*, and leg B, all constructed, arranged, and operating substantially as and for the purpose specified.

257,128. COAL AND IRON UNLOADER. ANDREW BRICKNER, Sandusky, Ohio. Filed Mar. 6, 1882. (No model.)

Claim.—1. In an unloader, the combination, with an adjustable boom, of the frame-work having wheels mounted upon tracks, along which it can be moved, and of a shaft extending the whole length of the wharf parallel to the rails, and having a friction-roller keyed thereon to impart motion to a friction-pulley upon the frame-work, which pulley operates the bucket-lifting mechanism, all substantially as set forth, and for the purposes described.

2. In an unloader mounted upon rails, the combination, with a shaft journaled in the frame of the unloader and having a frictional roller keyed thereto, of a friction-roller held below the friction-roller on the unloader by arms and attached by a feather or key to a revolving shaft which runs parallel to the rails and has a longitudinal keyway, in which the key or feather upon the friction-roller slides when the unloader has been moved upon the rails, substantially as described, and for the purpose set forth.



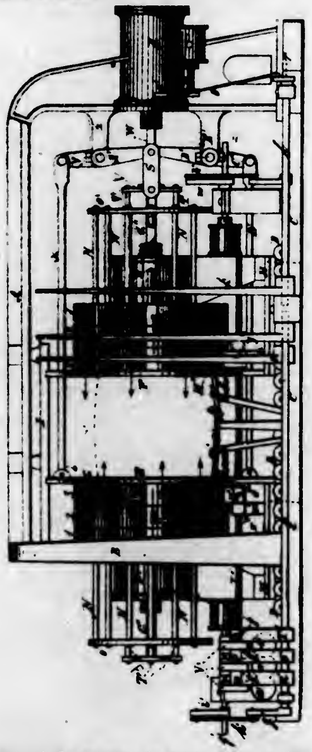
3. In an unloader adapted to be moved upon a track, the combination, with a friction-roller having eccentric bearings, of a brake-block, of a friction-pulley mounted upon a revolving shaft having a longitudinal keyway and in contact on each side with arms attached to the unloader-frame immediately below the friction-roller journaled therein, for the purpose set forth, and of a device for suspending the friction-roller between and to place it in contact either with the revolving pulley or the brake-block, substantially as described.

4. The combination, with the frame-work of an unloader having rollers and windlasses, of a boom adapted to be moved upon said rollers, and of guy-ropes passing over the top of the frame-work and attached by one end to the outer end of the boom and by the other to said windlasses, which tighten the guys when the boom has been adjusted, substantially as described, and for the purpose set forth.

5. In an unloader, an adjustable boom having a movable stop and seated upon rollers journaled in the frame-work through which the boom projects, in combination with guy-ropes attached to the outer end of the boom and to the frame-work, and provided with windlasses, whereby the guy-ropes can be tightened after the boom has been adjusted, and a traversing catch which travels upon the boom and carries a bucket provided with a trigger which strikes the movable stop and tilts the bucket, in the manner set forth.

6. In an unloader, a traversing catch consisting of a frame-work suspending from a traversing rod by means of wheels, and having a hook at one end and a sheave at the other to support a moving pulley by a lifting-cable attached to the hook and passing over the sheave, and a passage between the hook and sheave to admit the shank of a movable pulley, of a hook journaled in the frame-work above the passage and operated by a rod having a crank at one end and a spring at the other, as shown, and of a lever-latch pivoted upon the frame-work and having one end immediately over said passage and the other provided with a latch or hook which catches upon a step on the beam when the spring upon the lower end is free to play, and all combined and arranged substantially as described, and for the purpose set forth.

257,129. GRIPPER MECHANISM FOR PRINTING-PRESSES. ANDREW C. CAMPBELL, Bridgeport, Conn., assignor to the Campbell Printing Press and Manufacturing Company, of New York. Filed Apr. 26, 1881. (Model.)



Claim.—1. In a cylinder printing-press, in combination with a cylinder provided with a double-inclined cam on one end and with a gripper rock-shaft carrying a slotted tumbler-cam having inclined side surfaces, a pair of sliding studs secured to a bearing or frame of the cylinder and connected by an oscillating lever, as described, and operated thereby and by said inclined cam, and operating and operated by said tumbler-cam, whereby the slot in said cam is as directed as to automatically engage said studs at the proper times for opening and closing the grippers, and breakage due to accidental displacement of the grippers prevented, substantially as and for the purposes set forth.

2. In a gripper mechanism of a cylinder printing-press, a governing-lever, L, provided with curved surfaces L' L' and depressions L' L', and an adjusting-spring for the same, in combination with a slotted tumbler-cam, B', carrying the wings B' B', and the roller R, all mounted on or carried by the impression-cylinder, substantially as and for the purposes set forth.

3. In the gripper mechanism of a cylinder printing-press, and secured to a rigid frame-work or support, a pair of sliding or reciprocating studs, p p', in combination with an oscillating lever, p^3, provided with friction-blocks p^4 p^5, substantially as and for the purposes set forth.

257,130. HORIZONTAL HOOP-DRIVING MACHINE. MARK L. DUNNING, Cleveland, assignor to George H. Hopper, Uniontville, Ohio. Filed Nov. 21, 1881. (Model.)

Brief.—The driving-heads are driven simultaneously by a steam-cylinder whose piston is attached directly to one and to the other by a system of levers and links. Upon each driving-head is a steam cylinder, which reciprocates the driving-slides within the heads. These slides carry fingers, which are moved out radially to permit a hoop to pass by cam-faced rings surrounding the driving-heads, the ends of the fingers passing through C-shaped slots in such rings. These rings are rotated by segment-gears feathered upon rock-shafts driven by steam-cylinders, which gears engage racks on the rings. The rings are moved in pairs, one of each pair upon each head, one rock-shaft moving a pair simultaneously. The valves of the cylinders are operated at the right time by T-arms grooved on a rock-shaft.

Claim.—1. In machines for driving hoops on barrels, a pair of retaining-heads, E and F, arranged to co-operate relatively in respect to each other, as described, and consisting of a shell provided with a peripheral series of longitudinal moving slides or heads, having therein hoop-drivers adapted to move radially in relation to the axial line of the retaining-heads and at right angles to the movement of the said slides or heads, substantially as herein set forth.

2. In combination with the shell of the retaining-heads, slides and drivers arranged therein, the springs g and rotative rings the perimeters of which are a series of inclined planes, forming cams, in which are longitudinal slots, connected to each other by transverse slot adapted to receive and allow the shanks of the drivers to slide therein to permit the rings to rotate for actuating the drivers in a radial direction by the co-operation of the cams or inclined planes, springs, and collars f, substantially as and for the purpose set forth.

3. In a horizontal double-ended machine for driving hoops on barrels, the retaining-heads E F, connected to each other by rods X and B', pivoted arms y and A' and D' C', and links connecting said arms to the head V, in combination with the steam-retaining cylinder, whereby the retaining-heads are operated reciprocally and simultaneously in alignment one with the other for the purpose specified, and substantially as set forth.

4. In a machine for driving hoops on barrels, in combination with the cam-rings of the retaining-heads and racks respectively connected thereto, segment-gears arranged to engage the said racks for rotating the cam-rings, substantially as described, and for the purpose specified.

5. In combination with the shell of the retaining-heads and driver-slides, a jacket of rotative rings the perimeters of which are a series of inclined planes, forming cams, and having C-shaped openings therein for the admission of hoop-drivers, said drivers being actuated radially in the retaining-heads by the cam-rings, substantially as set forth, and for the purpose specified.

6. With the segment-gears feathered to their respective shafts, that they may slide thereon conjointly with the movements of the retaining-heads, the combination of the cylinders a', c', and e', connected to the said shafts by piston-rods, and arms 3'', 4'', and 0'', for operating the same for the purpose specified, and substantially as described.

7. In a machine for hooping barrels, the steam-cylinders a', c', and e', arms K' and T', having in the heads thereof a cam groove or slot reversely arranged in relation to each other, arms S' between the arms R' and T', and having in the head thereof a groove with a central depression, lever-arms V' and pins projecting therefrom, respectively, into the grooves of the arms R' S' T', and shafts 3', 4', and 3', with their respective segments, in combination with the rings of the retaining-heads, substantially as described.

8. In combination with the retaining-cylinder R and retaining-heads of a hoop-driving machine and connecting mechanism, the lever k and shaft l, mounted on main frame, as shown, connected by suitable mechanism to the valve of said cylinder for actuating the same, for the purpose set forth.

9. In combination with the retaining-heads herein described, the self-adjusting abutment-plate and centering-springs arranged within the cavity of the retaining-heads, substantially as described, and for the purpose specified.

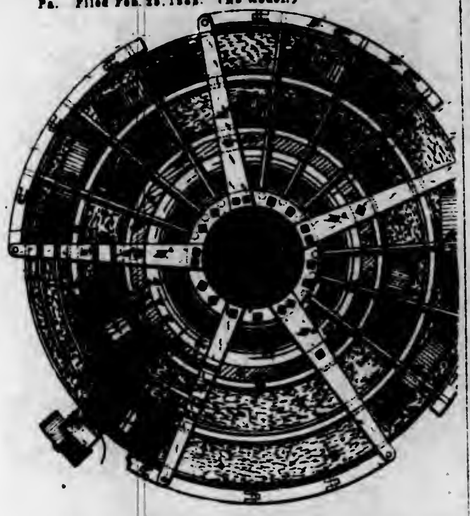
10. In a machine for driving hoops on barrels, the retaining-heads, having thereon a series of rotative cam-rings, and provided with an annular series of slides carrying the drivers K, in combination with the driving-cylinders F and U, substantially as set forth.

11. In combination with the slides K, drivers, and cam-rings of the retaining-heads, the springs g and collars f, constructed and arranged to operate and co-operate substantially as set forth.

12. In a machine for driving hoops on barrels, in combination with the retaining-heads, the frame or stand k', supporting-plate, and supplementary movable frames n' and n', connected respectively to the retaining-heads, substantially as and for the purpose set forth.

13. In a machine for driving hoops on barrels, the combination of the retaining-heads provided with annular series of slides K, carrying the hoop-drivers M, rotative cam-rings, and springs g, for operating the drivers radially, driving-cylinders, and retaining-cylinder R, arranged to operate and co-operate substantially in the manner as described, and for the purposes specified.

257,131. DROP-WIRE FOR WARPING AND BEAMING MACHINES. THOMAS C. ENTWISTLE, Lowell, Mass., assignor to the Phœnix Machine Company, same place. Filed Dec. 30, 1881. (No model.)



Brief.—The drop-wire bracket is connected to the supporting-bar in such a manner as to be capable of sliding or moving longitudinally thereon, and the drop-wire is pivoted or hinged to the bracket, so as to be capable of its own independent motion.

Claim.—1. The combination, substantially as hereinbefore set forth, of the supporting-bar, the bracket held to and movable lengthwise of said bar, and the drop-wire hinged or pivoted to the bracket.

2. The supporting-bar provided with a rib, bead, or projection, as described, in combination with the hook-like drop-wire-carrying bracket formed to fit upon the upper portion of the bar and to engage the rib or bead thereon, substantially as and for the purposes hereinbefore set forth.

257,132. MACHINE FOR REDUCING ORES. BENJAMIN HUNSBURY, Erie, Pa., assignor of three-fourths to Charles A. Hitchcock, Joseph A. Hyde, and Benjamin F. Thornton, all of Bradford, Pa. Filed Feb. 25, 1882. (No model.)

Claim.—1. The combination of a series of troughs for receiving the material to be crushed or ground, devices arranged in said troughs or vessels for grinding or crushing the material, and devices for elevating or lifting the material from one trough or vessel and discharging it into the other for the purpose of regrinding, substantially as and for the purpose described.

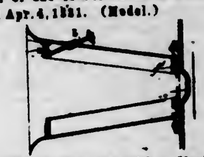
2. In an ore-crushing machine, the combination of a trough or vessel for receiving the material to be ground, a traveling roller or wheel for grinding or crushing the material, an elevating mechanism traveling in the trough or vessel and following the grinding or crushing roller or wheel for carrying the material upward, and a screen or sieve moving with the elevating mechanism, arranged to receive the material therefrom, substantially as described.

3. The combination of a series of concentrically-arranged troughs or vessels for receiving the material to be ground or crushed, a series of traveling grinding or crushing rollers or wheels arranged in said troughs or vessels, an elevating mechanism traveling in one of the troughs or vessels and following the rollers or wheels for carrying the material upward from said trough or vessel, and a screen or sieve moving with the elevating mechanism, arranged to receive the material therefrom, substantially as described.

4. The combination of a series of concentrically-arranged troughs or vessels for receiving the material to be ground or crushed, a series of traveling grinding or crushing rollers or wheels arranged in said troughs or vessels, an elevating mechanism traveling in one of the troughs or vessels and following the said rollers or wheels for carrying the material upward from said trough or vessel, a screen or sieve moving with the elevating mechanism and arranged to receive the material therefrom, and a chute or conveyor located beneath the screen and arranged to discharge the material from the inner into the outer adjacent trough, substantially as described.

5. The combination of a trough or vessel for receiving the material to be ground or crushed, a traveling roller or wheel moving in said trough or vessel, an elevating mechanism traveling in the trough or vessel and following the said roller or wheel, and a vibrating or shaking screen traveling in rear of the elevating mechanism and arranged to receive the material which is carried up by the same, substantially as described.

6. The combination, in an ore crushing or grinding machine, of a central rotary wheel, a series of radial shafts connected at their inner ends with said wheel, a series of grinding wheels or rollers supported by said shafts, troughs or vessels provided with upright rims, elevating mechanism mounted on wheels which travel on said rims, and a screen or sieve traveling in rear of the elevating mechanism and arranged to receive the material which is carried upward by the latter, substantially as described.



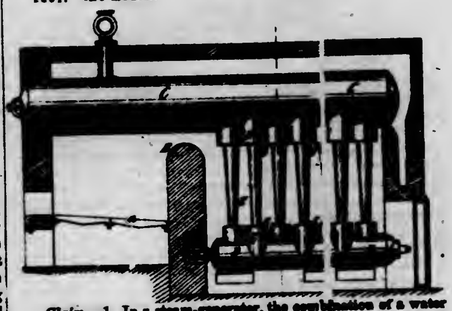
7. The combination, in an ore grinding or crushing machine, of a circular trough or vessel, provided with upright rims having upon each an inclined plane or projection, with a traveling grinding or crushing roller or wheel, a traveling elevating mechanism mounted on wheels arranged to travel on the said upright rims, and a sieve or screen traveling in rear of the said elevating mechanism, substantially as and for the purpose described.

8. The combination of a circular trough for receiving the material to be ground or crushed, a traveling grinding or crushing roller or wheel arranged therein, a traveling elevating mechanism, a screen or sieve moving in rear of the latter, an inclined chute or conveyer moving with and located beneath the screen or sieve, and a traveling receiver connected and moving with the chute or conveyer to receive the material therefrom, substantially as described.

9. The combination of a circular trough for receiving the material to be ground or crushed, a traveling grinding or crushing roller or wheel arranged therein, a traveling elevating mechanism, a screen or sieve moving in rear of the latter, an inclined chute or conveyer moving with and located beneath the screen or sieve, and a traveling receptacle connected and moving with the chute or conveyer to receive the material therefrom, and a stationary scraper arranged to clear the said receiver, substantially as and for the purpose described.

10. The combination of ring-bearings, the radial shafts having a ball-and-socket connection at their inner ends in said ring-bearings, a series of jointed links connecting the outer ends of the shafts, and grinding or crushing rollers or wheels mounted on said shafts, substantially as described, whereby the shafts are capable of rising and falling and of traveling in a circular path, as and for the purposes set forth.

257,133. TELEPHONE. A. HOWARD HIBBERSMAN, Baltimore, Md., assignor of one-fourth to A. E. Dolbear, College Hill, Mass. Filed Apr. 4, 1881. (Model.)



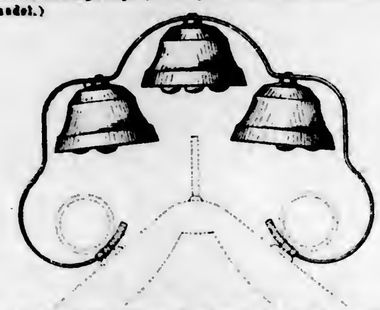
Claim.—1. The combination, with a diaphragm, of a sound-augmenter box having an opening at which the mouth or ear may be applied, and a number of resonant wires, under tension, secured within the box between the opening and diaphragm, as set forth.

2. A sound-augmenter for telephones, having a number of resonant wires, each capable of independent adjustment, and a device by means of which all the wires may be adjusted at once, as set forth.

3. The combination, with a diaphragm, of a sound-augmenter box having a sounding-board whose position is substantially that of a right angle with respect to the diaphragm, whereby the sound of the voice passes across the whole length of the board, as set forth.

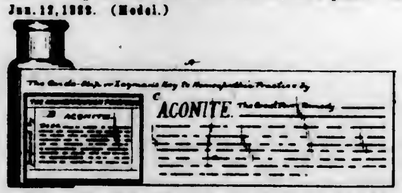
4. The combination, with a diaphragm, of a sound-augmenter box having an opening at which the mouth or ear may be applied, a number of resonant wires, under tension, secured within the box and a sounding-board, substantially as set forth.

257,134. STEAM-GENERATOR. DANIEL KELLY, Philadelphia Pa., and WILLIAM H. HOFFMAN, Passaic, N. J., assignors of one third to Walter K. Ludwig, Philadelphia, Pa. Filed Nov. 4 1881. (No model.)



Claim.—1. In a steam-generator, the combination of a water and steam drum, C, the hollow saddles or head-pieces F, provided with internal flanges, d, riveted or bolted to said drum, and tubes

E, expanded into said saddles or head-pieces, substantially as specified.



2. In a steam-generator, the combination of a water and steam drum, C, a water and sediment drum, D, hollow saddles or head and foot pieces F G, provided with internal flanges, *d e*, riveted or bolted to said drums, and tubes E, expanded into said saddles or head and foot pieces, substantially as specified.

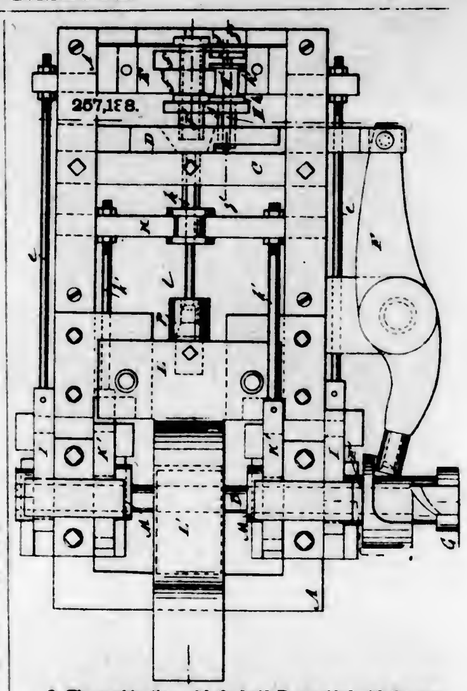
257,135. CHIME ATTACHMENT FOR HARNESS. SAMUEL KIRBY, East Hampton, Conn., assignor to the Bevin Brothers Manufactoring Company, same place. Filed Mar. 14, 1882. (No model.)

Claim.—A spring bow or bar for supporting one or more bells having slotted ends or equivalent attaching device, whereby it can be sprung upon the terrets of a harness-saddle and be retained thereon by its inherent elasticity, said spring bow or bar being thus adapted for attachment, substantially as described.

257,136. COMBINED LABEL, GUIDE-SLIP, AND WRAPPER FOR BOTTLES. JOHN LIVER, New York, N. Y., assignor, by mesne assignments, to Mahala A. Liver, same place. Filed Jan. 12, 1882. (Model.)

Claim.—In combination with a bottle, a label, guide-slip, and wrapper, the guide-slip consisting of a strip of paper or other fabric having a printed label at one end, and the remaining portion of the slip containing instructions, the label end of the guide-slip being attached to the bottle and the remaining portion of the slip left free and adapted to be wrapped around the bottle, substantially as specified.

257,137. CUSPIDOR. CHARLES F. MARKLAND, Pittsburg, Pa. Filed Nov. 8, 1881. (No model.)

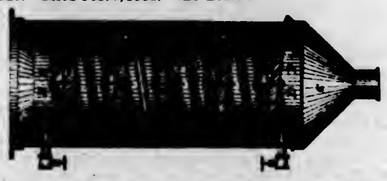


Claim.—1. A cuspidor provided with a flat rigid base-plate or platform secured to its bottom and extended laterally beyond its body, substantially as and for the purpose set forth.

2. The combination, in a cuspidor, of the body A, mat B, and one or more securing-pins *c*, as specified.

257,138. NUT-MACHINE. ALFRED MARLAND, Pittsburg, Pa., assignor to himself and Thomas Healy, same place. Filed Aug. 18, 1881. (No model.)

Claim.—1. The combination, with the stationary forming-die *c*, of the knife-bar D, punches J *l*, and hollow mandrels H *h*, arranged and operating together as described.

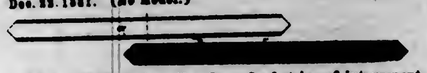


2. The combination, with the knife D, provided with the openings *c d* and cutting-edge *d'*, the lever F, and cam G, of the mandrel H, the cross-head K, rods *e e*, yokes I I, and cams E' E', as and for the purpose specified.

3. The cross-head K, provided with the opening *f*, gutters *f' f'*, and ways *f'' f''*, in combination with the collared feed-tube J' and the mandrel H, having head H' and collars *h h*, said tube and mandrel being yoked together for the purpose specified.

4. The combination, with the cross-head K, carrying hollow mandrel *h*, and the cross-head L, carrying punch *l*, of the connecting-rods *N*, yokes K' L', and cams M N, as and for the purpose specified.

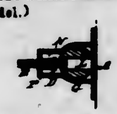
257,139. WHEAT-HEATER. DANIEL W. HARMON, Indianapolis, Ind., assignor to the Nordyke & Harmon Company, of Indiana. Filed Feb. 7, 1882. (No model.)



Claim.—1. The combination, in a wheat-heater, of the casing, the coiled heating-pipes, and conical devices secured to the latter, substantially as set forth.

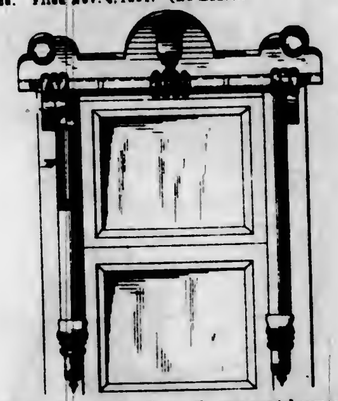
2. The combination, in a wheat-heater, with the casing and heating-pipes, (said pipes being disposed to occupy a considerable portion of the space inside said casing,) of devices secured at intervals along the pipes, transversely across the course of the grain, whereby a pulsating or irregular flow of the grain is secured, thereby mixing said grain thoroughly and heating it evenly, substantially as described, and for the purposes specified.

3. The combination, in a wheat-heater, with the coiled pipes thereof, of the device E, provided with the bearing-wings of varying heights, whereby the said device is caused to rest in horizontal position, notwithstanding the incline of the coils of pipe, substantially as set forth.



4. The combination, in a wheat-heater, of the casing, the coiled pipe, the device E, the cross-bar, and the connecting-bolt, substantially as set forth.

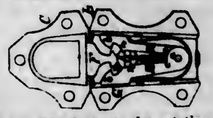
257,140. BOOK-SEWING SLIP. WILLIAM S. HEBB, Philadelphia, Pa., assignor to Francis W. Murphy, same place. Filed Dec. 23, 1881. (No model.)



Claim.—Book-sewing slips formed of strips of integument, and guard-pieces of textile material, substantially as and for the purpose set forth.

257,141. DOOR-BOLT. WILLIAM B. FRAZER, Chicago, Ill., assignor to himself and William Linden, same place. Filed Feb. 18, 1882. (No model.)

Claim.—The hollow casting D, projecting out from one thimble of the bolt-case, in combination with the pin E and spring N, having a reciprocating movement through it in locking and unlocking the bolt, riding on the bolt when the latter is not projected into the catch, and locking the bolt only when the knob thereof is turned between the thimbles H I and against the plate A, as specified.

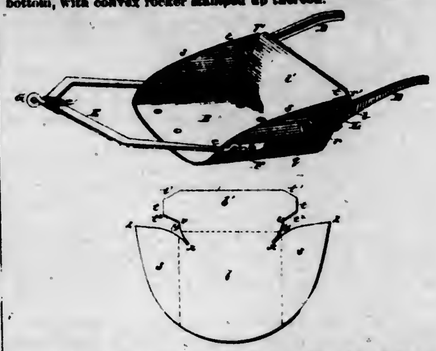


257,142. SASH-BALANCE. THOMAS H. HERMAN, Grand Rapids, Mich., assignor of one-half to William F. Hartwig, same place. Filed Nov. 4, 1881. (No model.)

Claim.—In a window-frame, the ornamental removable top and detachable hollow weight-boxes, in combination with the sash-balancing cords and pulleys arranged behind said removable top and directly on and across the surface of the top of the window-frame, substantially as described.

REISSUES.

10,089. TRUNK-FASTENER. BENJAMIN ANDREWS, Philadelphia, Pa., assignor to J. H. Sessions, Bristol, Conn. Filed Nov. 12, 1881. Original No. 127,810, dated May 21, 1872.



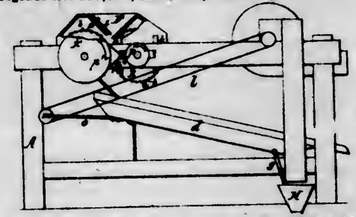
Claim.—1. In a trunk-fastener, the rotating cam-shaft, constructed as described, and operating in combination with the dogs H and catch F, substantially as described.

2. In a trunk-fastener, the dogs having the shoulders *h*, in combination with the cam *f* of the rotating cam-shaft I, acting upon said shoulders to limit the rotation of said shaft, substantially as described, and for the purpose specified.

3. In a trunk-fastener, the combination of the dogs having shoulders *h*, the casing G, having the rib K, the rotating cam-shaft I, having cam *f*, and the catch F, all operating substantially as described, and for the purpose specified.

10,090. DRAG-SCRAPER. JAMES COCHRAN and S. FRANK WELCH, Mount Pleasant, Iowa. Filed Mar. 3, 1882. Original No. 242,815, dated June 28, 1881.

Brief.—The scraper-box has rounded corners on its sides and in its rear, and is formed from a blank cut as shown. The back and side portions thereof being turned up, the projecting ends of the back are bent around upon the sides and made fast by the same bolts that hold the handles. A wear-plate is secured to the bottom, with convex rocker stamped up thereon.



Claim.—1. A scraper-box formed of a blank of suitable material and made with curved surfaces at the juncture of its bottom with its back and sides, and the ends of the back constructed to overlap the rear ends of the sides, substantially as set forth.

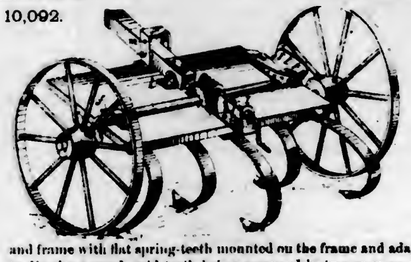
2. A scraper-box formed of a blank cut and the ends of its rear portion, *b'*, and sides *a* bent as described, in combination with the bolts or rivets *l l r r*, plates or clips L L and *q q*, and the handles D D, substantially as described, and for the purposes specified.

3. In combination with the scraper-box, the plate C, having the runners *c c*, substantially as and for the purposes set forth.

10,091. BUCKWHEAT-HULLING APPARATUS. GILES S. CHANNON, Silver Creek, N. Y., assignor, by mesne assignments, to Robert L. Downton, St. Louis, Mo. Filed Aug. 24, 1881. Original No. 217,513, dated July 15, 1879.

Claim.—1. The combination, with a roller, R, provided with ribs having inclined or beveled front sides *b* and abrupt backs *a*, of a roller, R', provided with ribs having abrupt front sides *a* and inclined or beveled backs *b*, substantially as set forth.

2. The combination, with a roller, R, provided with ribs having inclined or beveled front sides *b* and abrupt backs *a*, of a roller, R', provided with ribs having abrupt front sides *a* and inclined or beveled backs *b*, and suitable mechanism whereby a greater peripheral speed is imparted to the roller R than to the roller R', substantially as set forth.



3. A pair of rollers, R R', provided with ribs *r*, having abrupt sides *a* and inclined or beveled sides *b*, with plain faces *c*, formed by portions of the roller-surface between the abrupt and inclined sides of the ribs, substantially as set forth.

4. A pair of rollers, R R', revolving at different peripheral speeds, and provided with ribs *r*, having inclined or beveled front sides *b* and abrupt backs *a* on the fast roller, and abrupt front sides *a* and inclined backs *b* on the slow roller, with plain faces *c* on the surfaces of the rollers between the inclined and abrupt sides of each rib, and suitable mechanism whereby said differential speed is imparted to the rollers, substantially as set forth.

10,092. SULKY-HARROW. CHARLES LA DOW, Albany, N. Y., assignor of one-half to Wheeler & Melick Company, same place. Filed Jan. 4, 1882. Original No. 222,512, dated Dec. 9, 18[illegible].

Claim.—1. In a harrow, the combination of a pole, wheels,

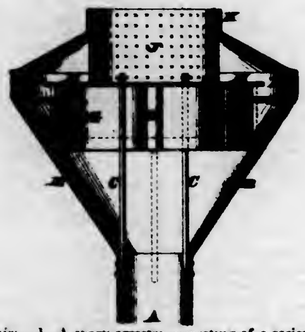
10,092.

and frame with flat spring-teeth mounted on the frame and adapted to dig the ground, said teeth being arranged in two or more rows or ranks transversely to the path of the machine.

2. In a sulky-harrow, the combination of a frame vertically adjustable on wheels and armed with spring-teeth, the inclination of which can be varied, the two adjustments being independent of each other, whereby the frame can be raised and lowered and the angle of inclination of the harrow-teeth can be varied.

3. In a sulky-harrow, the combination of wheels, frame, spring-teeth arranged in rows or ranks across the path of the machine, each row acting simultaneously on the soil, and mechanism for setting and holding all the teeth at different angles of inclination relatively to the draft-pole.

4. In a sulky-harrow, the combination of wheels, frame, spring-teeth in rows or ranks across the path of the machine, each row acting simultaneously on the soil, and mechanism for changing the position and holding the rows of teeth as adjusted relatively to the supporting-wheels.



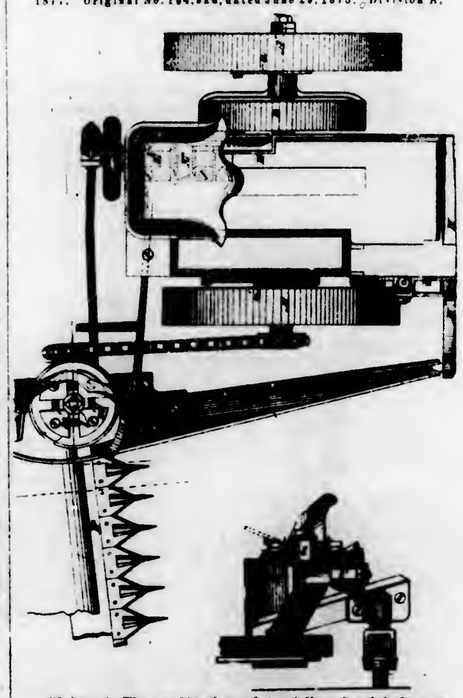
5. A draft-frame and vibratory teeth attached thereto, acting on the soil in different planes across the path of the machine, and capable of conforming to the inequalities of the surface traversed, in combination with wheels or equivalent supports for maintaining the frame a suitable distance above the ground.

6. A flat spring harrow-tooth having an eye-bearing formed out of the tooth itself to act as a hinge for said tooth, substantially as described.

7. The combination, with the rigid harrow-frame, of the rearwardly and downwardly curved vibratory spring-teeth having the upper portions of these curves secured directly under rigid solid portions of the harrow-frame, which forms a continuous bearing for the teeth, so that when the teeth are forced backward by any obstruction they will not be bowed upwardly upward, but will be held down to work by said rigid portions of the frame, essentially as set forth.

8. A curved flat spring harrow-tooth having a longitudinal rib formed on its surface, whereby the tooth is re-enforced and given a proper amount of strength, and is enabled to be made comparatively light, essentially as shown, and for the purpose set forth.

10,093. SPARK ARRESTER. CASPER F. LOCHNER, Jefferson, assignor, by mesne assignments, to Frank Sterne, Houston, Tex. Filed Feb. 8, 1882. Original No. 217,542, dated July 15, 1879.



Claim.—1. A spark-arrester consisting of a series of curved wings or flanges, G, surmounted with a deflecting-plate, E, the inner ends of said flanges being united at or near the axis of the stack so as to avoid a common central opening or chamber communicating with the channels between the flanges G, as herein described.

2. The combination, in a smoke-stack, of deflecting-plate E, perforated cylinder J, and a series of wings or flanges, G, which latter curve outwardly from a common center, as and for the purpose described.

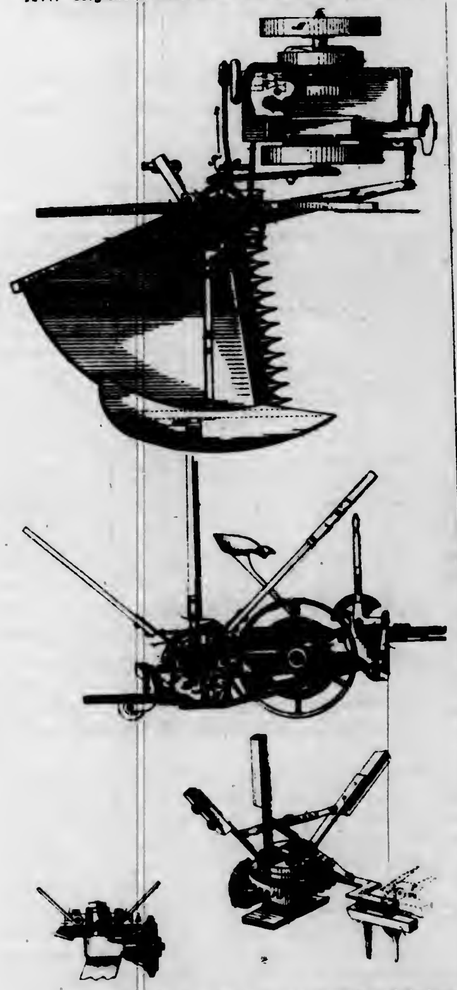
3. The combination, in a smoke-stack, of the deflecting-plate E, provided with curved flanges or wings G, radiating from a common center, said plate being supported on the standards C, arranged as herein described.

4. The combination of shell A B, standards C, perforated cylinder J, and deflecting-plate E, which plate is provided with a series of curved wings or flanges, G, radiating from a common center, said perforated cylinder being secured in the mouth K of the stack, as herein described.

10,094. HARVESTER-RAKE. JAMES S. MARSH, Lewisburg, Pa., assignor to Harry A. Marsh, same place. Filed May 21, 1877. Original No. 184,926, dated June 29, 1875. Division A.

Claim.—1. The combination, substantially as hereinbefore set forth, in a two-wheel hinge-bar rear-cut harvester, of a sprocket-wheel on the inner end of the main axle, a sprocket-pulley supported by the rake-stand on the platform, and a driving-chain connecting the two to drive the raking mechanism.

2. The combination, substantially as hereinbefore set forth, of two main supporting and driving wheels, a main frame supported thereby, a short laterally-projecting finger-beam connected therewith by a hinged drag-bar and coupling-arm, rake-supporting mechanism mounted upon the inner front corner of the grain platform, a sprocket-wheel on the main axle outside of the driving-wheel, a corresponding sprocket-wheel mounted upon the inner front corner of the platform, a driving-chain connecting the two sprocket-wheels, and rake-carrying mechanism driven thereby.



3. The combination, substantially as hereinbefore set forth, of two main supporting-wheels, the main frame supported thereby, the short laterally-projecting finger-beam connected therewith by a hinged drag-bar and coupling-arm, a low rake-supporting standard mounted upon the inner front corner of the platform, the sprocket-wheel on the main axle outside of the driving-wheel, rake-carrying mechanism mounted upon the rake-supporting standard, and a driving-chain actuating the rake-carrying mechanism.

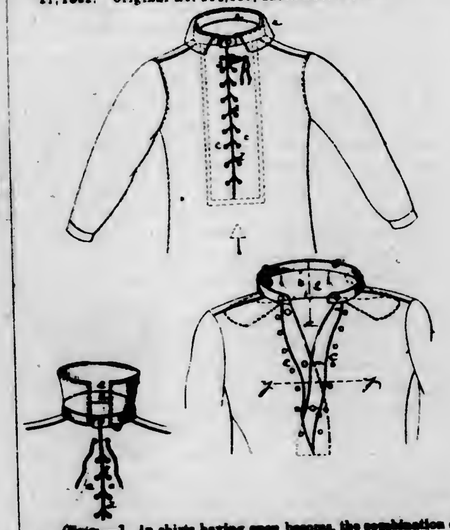
4. The combination, in a two-wheeled hinged-bar harvester, of the rake-driving mechanism mounted upon a low rake-supporting standard at the inner front corner of the platform, the drag-bar vertically adjustable at its forward end, and the fender mounted upon the drag-bar and constructed, as described, with its rear por

tion extending over the platform and surrounding the rake-gearing and its straight front portion extending over the drag-bar, these members being constructed and operating in combination, substantially as hereinbefore set forth, whereby the fender, while protecting the rake-gearing, conforms to the movements of the rake, finger-beam, platform, and drag-bar.

5. The combination, substantially as hereinbefore set forth, in a two-wheeled hinge-bar rear-cut harvester, of rake-driving mechanism mounted upon the inner front corner of the platform and driven from the outer end of the main axle by a chain and sprocket-wheels, with a drag-bar rocked at its forward end by a lever, whereby the cutting apparatus and rake may be tilted in unison.

10,095. HARVESTER-RAKE. JAMES S. MARSH, Lewisburg, Pa., assignor to Harry A. Marsh, same place. Filed May 21, 1877. Original No. 184,926, dated June 29, 1875. Division B.

Claim.—1. The rake and reel arms pivoted at their inner ends to the hub or crown-wheel by means of the cross heads or bars fitting into suitable cavities in said hub or wheel, substantially as described.

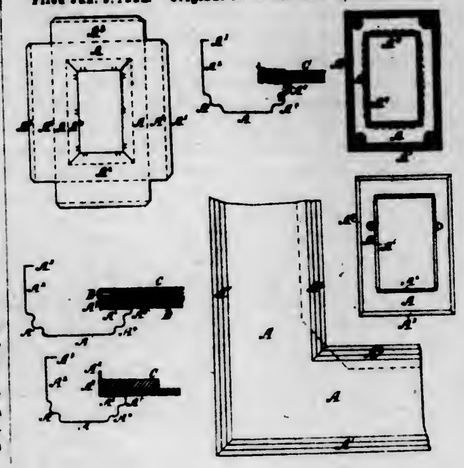


2. The rake attached to its revolving hub or crown-wheel by means of the bar bent backward from the line of attachment, as set forth, to bring the rake parallel with, but in rear of, its supporting-arm, for the purpose of depositing the gavel farther from the standing grain, substantially as described.

3. The combination of the rake-arm, the axially-turning rake-head pivoted axially thereunder, and the angular spring-lever mounted on the rake-head and abutting against the rake-arm, these members being constructed and operating in combination in the manner and for the purpose described.

4. The spring-guide applied to the cam-rail substantially as described.

5. The combination of the crown-wheel revolving on a vertical axis, the beater-arm pivoted thereon, and the longitudinally-adjustable blade forming a prolongation of the beater and sliding directly thereon to vary its length.



10,096. SHIRT. ISAAC SOHNUBB, New York, N. Y. Filed Mar. 21, 1882. Original No. 254,337, dated Feb. 28, 1882.

Claim.—1. In shirts having open bosoms, the combination of inner flaps, *b*, outer flaps, *c*, having eyelets and lacing-cord *d*, substantially as shown and described.

2. In a garment having neckband *g*, the combination thereof with the collar *c*, which is fastened to the inner part of said neckband, below the top edge thereof, and adapted to be entirely concealed when folded inward, and to be folded upward, outward, and downward around the neckband *g*, substantially as herein shown and described.

10,097. PICTURE-FRAME. ABRAHAM WOLF, New York, N. Y. Filed Jan. 3, 1882. Original No. 240,873, dated May 3, 1881.

Claim.—1. A rectangular picture-frame formed of one piece of sheet metal, having the front A in one piece without joint, the outer portion, A^2, bent backward to give depth, and the inner edge, A^1, bent also backward to give depth, and then bent outward, as at A^3, for the purpose of securing the glass or picture, as herein specified.

2. A rectangular picture-frame formed of one piece of sheet metal, having the front A in one piece without joint, the outer portion, A^2, bent backward to give depth, and the inner edge, A^1, bent also backward to give depth, and then bent outward, as at A^3, and then again bent backward, as at A^4, to hold the glass or picture in position, substantially as described.

3. The rectangular picture-frame, of sheet metal, herein described, having the front A in one piece without joint, the outer surface, A', and the inner edge, A^1 A^2 A^3, formed under and bent outward in a plane to match the plane surface of the glass, arranged in the ordinary position, as herein specified.

4. In a picture-frame, the backwardly-extended portion A^2, in combination with the plane portion A', produced in one piece with the main body A^4 A^1 A^2 A^3 A' A, as herein specified.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE UNION PAPER BAG MACHINE COMPANY *et al. v.* NIXON *et al.*, (two cases.) NIXON *et al. v.* THE UNION PAPER BAG MACHINE COMPANY *et al.*, (two cases.)

Decided March 6, 1882.

1. OWNER OF PATENTED MACHINE—EXTENDED TERM.
The right of an owner of a patented machine, without any conditions attached to his ownership, to continue the use of his machine during an extended term of the patent is well settled, and power to sell the machine and transfer the accompanying right of use is an incident of this unrestricted ownership.

2. SAME—SAME—LICENSE.
Whatever may be the effect of an exclusive license within a district upon the right of an owner of a patented machine before the end of the original term of the patent, as that license ceases when the term expires, it follows that during the extended term no question can arise under the license.

3. OWNERS' EXTENDED TERM—LICENSES.
The owners of an extended term of a patent take their title subject to rights of the unrestricted owners of patented machines, and their licensees take their interests, subject to the same rights.

4. SETTLING COSTS.
The decree will not be reviewed on appeal for the mere purpose of settling the costs.

APPEALS from the Circuit Court of the United States for the Southern District of Ohio.

Mr. Geo. Harding for The Union Paper Bag Machine Company *et al.*

Mr. E. W. Kittredge and *Mr. Jas. Moore* for Nixon *et al.*

Mr. Chief Justice WAITE delivered the opinion of the Court.

On the 28th of April, 1857, a patent was granted to Charles H. Morgan and Benjamin R. Smith for an invention by Benjamin F. Rice of a machine for making paper bags. This will hereafter be referred to as the Rice patent. By agreements entered into on the 11th of February and 12th of August, 1859, the owner of this patent executed to Martin Nixon, Thomas Nixon, and William H. Chatfield, partners, under the name of Nixon & Chatfield, a license for the exclusive use of the patented machines within certain territory, which included the States of Ohio and Indiana. Thomas Nixon, one of the licensees, is one of the parties to these appeals, and upon the dissolution of the firm of Nixon & Chatfield in the year 1865, his interest in the license passed to and became vested in Chatfield & Woods. On the 6th of March, 1860, a reissue of this patent was granted to Charles H. Morgan, Leonard Whitney, Jr., and Thurston Priest. Some time about the year 1863 Francis H. Morgan, a brother of Morgan, one of the patentees, became the owner of one of the machines covered by this patent, with an unrestricted license for its use. Morgan, the patentee, was for a time a joint owner of the machine with his brother; but he afterward parted with his interest, and Francis H. Morgan became the sole owner. While there is no testimony in the case showing any instrument in writing by which the other patentees united in a license for the use of this machine, we are entirely satisfied that they gave their assent to what was done by Charles H. Morgan, and are in no condition to claim adversely to the license which he undertook to grant.

On the 17th of March, 1863, another patent was issued to Charles H. Morgan for an improvement in paper-bag machines. This will hereafter be referred to as the Morgan patent. Afterward Francis H. Morgan became the owner of two machines containing the improvements embraced in this patent, with an unrestricted license for their use.

On the 26th of October, 1865, an exclusive license for the use in Philadelphia of machines embraced in both patents was granted to Francis H. Morgan; but there is no testimony showing that his rights in respect to the machines he already owned were confined to that territory, and there is no doubt but that he owned all the machines now in question long before this exclusive license was given.

On the 27th of November, 1865, which was after Thomas Nixon had retired from the firm of Nixon & Chatfield, and transferred all his interest in the exclusive license for the Rice patent to the other partners, Francis H. Morgan sold and conveyed to Thomas Nixon the two Morgan machines which he owned, and agreed to furnish on demand all other machines of like pattern and workmanship which Nixon might want. Nixon on his part bound himself not to use the machines he got in this way, except within the States of Ohio and Indiana, and to pay the owner of the patent a royalty of three cents on every thousand bags made. He also agreed not to use any other machines in the manufacture of bags than such as he procured under this contract. Afterward, on the 2d of November, 1866, Nixon wanted another machine and called on Francis H. Morgan to furnish it under his contract. Morgan, having none of the Morgan machines on hand at the time, offered his Rice machine in the place of the one called for by the contract. This Nixon agreed to accept if he could be released from his obligation not to use any other than Morgan machines within his territory. Morgan thereupon stipulated accordingly and Nixon took the machine.

All these things were done by Francis H. Morgan with the full knowledge and consent of Charles H. Morgan, who was then the sole owner of his own pat-

ent and of a half-interest in that of Rice. An attempt was made to show the contrary of this; but the testimony leaves no doubt in our minds as to the fact.

Nixon took all the machines he got from Francis H. Morgan to Richmond, Indiana, and either himself or through others carried on the manufacture of bags by their use.

On the 21st of April, 1871, the Rice patent was extended for seven years from April 28, 1871, on the application of Roxana Rice, the widow and executrix of the inventor. Mrs. Rice assigned the extended patent to the Union Paper Bag Machine Company, and that company, on the 27th of June, 1871, granted to Chatfield & Woods the exclusive right to use machines constructed under the patent in the States of Ohio and Indiana. At the same time the company granted to the same parties the exclusive right of using within the same territory other machines covered by other patents which it owned, reserving a royalty of four cents on every thousand bags manufactured by any of the machines. On the 17th of July, 1871, after this assignment, the Bag Company and Chatfield & Woods sued Thomas Nixon, Morris H. Nixon, and William Anderson, alleged to be doing business as partners under the name of Nixon & Company, to restrain them from using the Rice machine. The defendants answered, denying the alleged partnership and averring that the business was carried on by Morris H. Nixon and William Anderson alone, they using the machine which belonged to Thomas Nixon and paying him a stipulated rent therefor. The suit was then discontinued as to Thomas Nixon, and from that time it was prosecuted alone against the other defendants. A new suit of a similar character was, however, begun against Thomas Nixon, and the two were carried on together. In both the suits answers were filed, in effect denying the validity of the patent and the infringement; but on the 31st of May, 1873, decrees were entered in both cases, enjoining the defendants from using the machine, and ordering a reference to a master to state an account of profits and damages. The accounting was continued before the master until the 14th of June, 1876, when Thomas Nixon paid to the Bag Company the sum of seven thousand five hundred and forty-three dollars and took a receipt therefor, as follows:

CINCINNATI, *June* 14, 1876.

Received of Thomas Nixon the sum of seven thousand five hundred and forty-three dollars, (7,543.00,) money due under the contract of F. H. Morgan with Thomas Nixon, dated November 27th, 1865, and in full for the amount which the said Thomas Nixon reported to be due as royalties under said contract. May 10, 1876.

$7,543.00. Union Paper Bag Machine Co.,
by EDWIN J. HOWLETT, *Pres.*

The hearing before the master was continued after this payment was made, and on the 23d of October, 1877, a report was filed, in which the master stated that the period covered by his inquiries was from June 27, 1871, the date of the exclusive license to Chatfield & Woods, to June 9, 1875, the date of the service of the injunction in the case. He also set forth the facts as to the contracts with Francis H. Morgan and the payment of the royalties thereunder substantially as they have already been given. He found that the number of bags manufactured by Nixon & Company between the dates above mentioned was 93,500,000, and that the royalty fixed by the Bag Company for the use of all its machines was four cents a thousand.

After the report was filed the defendants in each of the cases asked and obtained leave to put in a supplemental answer, setting up the contract with Francis H. Morgan and the payment to and acceptance by the Bag Company of the royalties due thereunder on the 14th of June, 1876. Upon the final hearing, after these answers were in, the court proceeded on the evidence to state the accounts, and decreed that Chatfield & Woods had no right on the pleadings and evidence to any recovery. As to the Bag Company, it was found that it was the owner of the Rice patent; that it had an established license-fee for the use of the several patents for improvements in paper-bag machinery referred to in its licenses to Chatfield & Woods and others of four cents a thousand bags; that this license-fee included the use of the Rice machine; that the Francis H. Morgan contract operated as a license to Nixon for the use of the Morgan machines, but not of the Rice machine; that 93,500,000 bags had been manufactured by Nixon & Anderson by the use of all three of the machines; that they had already paid three cents a thousand on their royalty, and must now pay one cent a thousand more, amounting in the aggregate to nine hundred and thirty-five dollars, for which a decree was entered against them. From this decree both parties have appealed, the Bag Company and Chatfield & Woods claiming that the defendants were liable to them, not for the license-fee, but for the profits they made by the use of the Rice machine, and the defendants that the payment by Thomas Nixon of the royalty reserved under the Francis H. Morgan contract was a full satisfaction of all claims that could be made on them for the use of this machine as well as those constructed under the Morgan patent.

In the suit against Thomas Nixon the same general conclusions were reached as in that against Morris, Nixon, and Anderson; but a decree for one cent damages only was rendered against him, because he only rented his machines to others to be used and did not use them himself. From this decree also both parties appealed.

Upon the foregoing facts the first question that presents itself is whether the use of the Rice machine was included in the royalty fixed by the contract of Francis H. Morgan with Thomas Nixon. If it was, then clearly, so far as the Bag Company is concerned, the acceptance of the stipulated royalty was a satisfaction of all claims for damages. This was substantially conceded on the argument. The right of an owner of a patented machine, without any conditions attached to his ownership, to continue the use of his machine during an extended term of the patent is well settled. (*Bloomer* v. *McQuewan*, 14 How., 550; *Chaffee* v. *Boston Belting Company*, 22 How., 223; *Mitchell* v. *Hawley*, 16 Wall., 547; *Adams* v. *Burke*, 17 Wall., 445.) Consequently Francis H. Morgan had by his ownership of the Rice machine the right to its use during the extended term of the patent. He could also sell it to others to be used in the same way. Power to sell the machine and transfer the accompanying right of use is an incident of unrestricted ownership. The contract of Morgan was to furnish Thomas Nixon with all the Morgan machines he wanted to use in the designated territory at the stipulated price and royalty. When called upon to furnish one of these machines under the contract he persuaded Nixon to take the Rice machine instead. Under these circumstances there cannot be a doubt that it was the intention of the parties to put the Rice machine in the

place of a Morgan machine under the contract, and that whatever compensation was to be paid to the patentee for the use of the Morgan machine must be paid for the use of the Rice machine. It follows that, so far as the Bag Company is concerned, there should have been no decree against Nixon & Anderson. The payment of the royalty in June, 1876, was in full for the use of the Rice machine as well as the Morgan machines.

Next, as to Chatfield & Woods. Their exclusive right to the use of the Rice machine continued no longer than the term of the original patent. (*Wilson* v. *Rousseau*, 4 How., 646.) The Bag Company does not appear ever to have had any interest in the patent before the extension. Chatfield & Woods have never been anything else than licensees. As such they could not sue for an infringement. All their rights must be enforced through or in the name of the patentee. (*Littlefield* v. *Perry*, 21 Wall., 223.) Their recovery in this case, therefore, must be limited to their rights under the license from the Bag Company. Such was the understanding of the master, for he distinctly states in his report that his inquiries were confined to the period between the date of this license and the service of the injunction, which stopped all further use of the machines.

Whatever may have been the effect of the first exclusive license held by Chatfield & Woods upon the right of Nixon to use his Rice machine in Indiana before the end of the original term of the patent, as that license ceased when the term expired, it necessarily follows that during the extended term no questions can arise under that license. After the extended term began that license did not stand in the way of the use by Nixon of his machine wherever he pleased, and the Bag Company took its title subject to his rights as an unrestricted owner, save in respect to royalties, of one of the patented machines. Chatfield & Woods took their license subject to the same rights in Nixon. They cannot claim as against Nixon more than the company could convey, and as Nixon was in legal effect operating his machine under a valid license superior to theirs, it follows that in this suit there can be no recovery in their behalf. Their remedy, if they have any, is against the company on their contract for the license or to secure the benefit of the royalty.

From what has thus been said it appears that the decree in the suit against Nixon & Anderson as far as it requires the payment of damages was wrong. As the payment of the royalty was not made until long after the interlocutory decree sustaining the validity of the patent, and the supplementary answer setting up the special defense was not filed until after the report of the master was in, it was right to charge the costs against them.

So far as the appeal of Thomas Nixon is concerned, the controversy is really as to costs alone. The decree against him will consequently not be considered. (*Canter* v. *American and Ocean Insurance Company*, 3 Pet., 307; *Elastic Fabric Company* v. *Smith*, 100 U. S., 110.)

The decree in the case against Nixon & Anderson is reversed, with costs, and the cause remanded, with instructions to enter a decree against the defendants for one dollar only and costs of suit. That in the suit against Thomas Nixon alone is affirmed, each party to pay the costs of his own appeal.

Mr. Justice MATTHEWS having been of counsel in the court below took no part in this decision.

THE GOULDS MANUFACTURING COMPANY *v.* COWING *et al.*

Decided March 13, 1882.

1. INFRINGEMENT—MEASURE OF DAMAGES.
   Where there is a limited and local demand for a patented device which is the only one suitable for a particular purpose, and the patentees consequently have control of the market, the measure of damages for infringement is all the profits made by the infringers upon their entire sales.
2. SAME—ESTIMATING PROFITS.
   In estimating profits the use of tools, machinery, power, and other facilities employed in the manufacture should be taken into account, as well as material, labor, wastage, and expenses of marketing. *Mowry* v. *Whitney* (14 Wall., 620) commented on and approved.

APPEAL from the Circuit Court of the United States for the Northern District of New York.

Mr. W. F. Cogswell for the appellant.
Mr. Elisha Foote for the appellees.

Mr. Chief Justice WAITE delivered the opinion of the Court.

The only questions raised on this appeal relate to the amount the appellant is entitled to recover for the infringement of a patent for an improvement in pumps "specially designed for drawing off the gas from oil-wells and conducting the same to the furnace of the engine." The validity of the patent and the infringement are not disputed here.

After the patent and infringement were established below the case was sent to a master to ascertain the damages. The master reported that two hundred and ninety-eight pumps had been manufactured and sold by the defendants, the appellees, out of which a net profit of $47.71 on each pump had been realized, that being the difference between the cost of the material and labor used in making a pump and the price at which it was sold. Upon this report the court ruled that as the patent was only for an improvement on an old pump the profits for which the defendants were accountable must be confined to such as were realized from the manufacture of the patented improvement, and not from the whole pump as improved. For this reason a new reference was ordered to state the account on the proper basis.

The second report was, in its result, substantially the same as the first. The number of pumps made and sold was the same, and the profit on each pump estimated to be $46.46. The mode of calculating the profits was also the same—that is to say, on the second reference, as on the first, the defendants were charged with the price at which they sold the pump as a whole, and credited only with the cost of labor and material used in the manufacture. The master, on the second reference, however, reported further as follows:

I find as further facts from the evidence that the plaintiffs' pump, with their patented improvement, which they had introduced into the market, virtually controlled the market, and had superseded all the other pumps then in use for pumping gas, and the others were literally driven out of the market, as they could not be sold at the places where the plaintiffs' pump had been introduced. The defendants went into the very market where the plaintiffs' pumps had been introduced, and where they had sold, and where plaintiffs were then supplying most of their pumps, and the defendants, in fact, went and employed Wesson, the former agent of the plaintiffs, to sell the pumps for them, and he, from being the plaintiffs' agent in the locality, made very ready sale of the same pumps for the defendants, and had not the defendants interfered in urging the pumps which they manufactured upon this local market the plaintiffs would certainly have had the whole market to themselves, and would, beyond doubt, have secured orders and supplied the demand of the market for the same number of pumps more than they did sell, as the defendants furnished—to wit, two hundred and ninety-eight pumps. The plaintiffs were, by their agent, in the field furnishing pumps in those oil regions, and would

have supplied the market demand had not the defendants intervened and supplied to the market these two hundred and ninety-eight pumps.

This finding as to the facts is in its general effect supported by the evidence. Notwithstanding this, however, the court, still adhering to its holding as to the rule of estimating profits, set aside the report, and inasmuch as the appellant had, on the second reference, failed to show what had been realized upon the principles of accounting prescribed a final decree was entered in its favor for nominal damages only and costs. From that decree this appeal was taken by the complainant below.

The rule applicable to this class of cases was well stated by Mr. Justice Strong, speaking for the whole court, in *Mowry* v. *Whitney*, (14 Wall., 620.) The subject-matter of that suit was a patent for an improvement in the process of manufacturing car-wheels, and in respect to the profits resulting to an infringer from the use of the patented process it was said, page 651:

> The question to be determined * * * is, what advantage did the defendant derive from using the complainant's invention over what he had in using other processes then open to the public and adequate to enable him to obtain an equally beneficial result. The fruits of that advantage are his profits.

It does not necessarily follow from this that where the patent is for one of the constituent parts and not for the whole of a machine the profits are to be confined to what can be made by the manufacture and sale of the patented part separately. If, without the improvement, a machine adapted to the same uses can be made which will be valuable in the market and salable, then, as was further said in *Mowry* v. *Whitney*, page 651, the inquiry is "what was the advantage in cost, in skill required, in convenience of operation, or marketability" gained by the use of the patented improvement. If the improvement is required to adapt the machine to a particular use, and there is no other way open to the public of supplying the demand for that use, then it is clear the infringer has by his infringement secured the advantage of a market he would not otherwise have had, and that the fruits of this advantage are the entire profits he has made in that market. Such, we think, is this case. Pumps for all ordinary and many extraordinary uses were very old; but in the new developments of business something was wanted to take the gas from the casing of an oil-well and conduct it safely to the furnace of the engine. "With that special purpose in view," this inventor took the well-known parts of an ordinary double-action pump, changed some of them slightly in form, added a new device, and produced something which would do what was wanted. While nominally he only made an improvement in pumps, he actually made an improved pump. For ordinary uses the improvement added nothing to the value of the old pump; but for the new and special purpose in view the old pump was useless without the improvement. The testimony shows that there was no market for pumps adapted to this particular use, except in the oil-producing regions of Pennsylvania and Canada. The demand was limited as well as local. Less than a thousand pumps actually supplied all who wanted them. But for that particular use no other pump could at the time be sold. If the appellant kept the control of its monopoly under the patent, it alone had the advantage of this market. Unless the appellees got the improved pump, they could not become competitors in that field, and just to the extent they got into the field they drove the appellant out. Through their infringement they got the advantage of selling the pumps that had upon them the patented improvement. Without it no such sales would have been effected. The fruits of the advantage they gained by their infringement were therefore necessarily the profits they made on the entire sale.

This is an exceptional case. A limited locality required a particular kind of pump to be used only in that locality for a special purpose. The market was not only limited to a particular locality, but it was unusually limited in demand. A single manufacturer, possessing the facilities the appellant had, could easily and with reasonable promptness fill every order that was made. There was no other pump that could successfully compete with that controlled by the patent. Under these circumstances it is easy to see that what has been the appellees' gain in this business must necessarily have been the appellant's loss, and consequently the appellant's damages are to be measured by the appellees' profits derived from their business in that special and limited market. This, as it seems to us, is the logical result of the rule which has been stated. By infringing on the appellant's rights the appellees obtained the advantage of the increased marketability of their pumps. The action of the court below, therefore, limiting the field of inquiry as to damages, cannot be sustained.

We cannot agree with the master, however, in his estimate of the profits made by the appellees from what they have done. He finds that the pumps sold in the market for $80 each, while the cost of manufacturing them was only $33.54. It is true there is some evidence to show that pumps could be made for the sum named; but it is clear to our minds that many things were excluded from the estimate which ought to have been included. All the material and labor of men may have been taken into account; but there is nothing for the use of tools, machinery, power, and other facilities employed in the manufacture, and nothing for wastage and expenses of marketing. One of the appellees is reported as testifying that his firm made the pumps for $31.37 each; but this must be an error, because he at the same time stated he could not say that there was any profit at all at the prices for which sales were made. Clearly this could not be, if what only cost the sum named was sold for $80. Annexed to the statement of the testimony of this witness is a detailed estimate of the cost of manufacture, which, without any allowance for general expenses, made the cost of a single pump $61.69. The appellant furnishes some evidence to contradict this estimate; but the bare fact that the pump when finished brought, as is claimed, at the shop $80 shows that the cost must have been much more than the master has reported. Down to the time of this patent the market had been supplied with some device to accomplish what this improvement did. The change in the old pump was not an expensive one. The valves were put outside of the side chambers instead of inside, and the joints had to be carefully fitted. If the old pump only cost as much as is claimed for the new, we cannot believe it would have commanded in the market any such price as the new sold for. We must conclude, therefore, that the cost of production has been much underestimated by the master. The testimony as reported is very unsatisfactory, and we are strongly inclined to think all has not been sent here which was presented. The attention of the parties was evidently directed much more to the rule of estimating the profits than to the detail of the expense of manufacture and sale. Had there not already been two references, we should be inclined to order another. As it is, we have made the best estimate we can from the material furnished in the record, and conclude that a reasonable allowance for profits will be $15 on each pump, or $4,470 in all.

The decree is reversed, and the cause remanded, with instructions to sustain the fifth exception to the report of the master and enter a decree against the appellees for $4,470 and costs.

DESIGNS.

12,909.—CARPET.—*Frank Allen*, Worcester, Mass., assignor to *Worcester Carpet Company*, same place. Application filed March 22, 1882. Term of patent 3½ years.

12,910.—PRINTING-TYPE.—*George G. Bailey, Jr.*, and *James Gilbert*, Boston, Mass. Application filed October 24, 1881. Term of patent 14 years.

12,911.—CARPET.—*Walter J. Gadsby*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed April 3, 1882. Term of patent 3½ years.

12,912.—FINGER-RING.—*Heinrich Heurich*, New York, N. Y., assignor to *Rosa Heurich*, same place. Application filed April 1, 1882. Term of patent 3½ years.

12,913.—HAIR-ORNAMENT.—*Jean R. Krause*, New York, N. Y. Application filed March 7, 1882. Term of patent 7 years.

12,914.—HANDLE FOR SPOON OR FORK.—*Garry I. Mix*, Yalesville, Conn. Application filed March 14, 1882. Term of patent 7 years.

12,915 to 12,917, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed April 6, 1882. Term of patents 3½ years.

12,918.—CARPET.—*Harriet A. Parker*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed March 27, 1882. Term of patent 3½ years.

12,919.—GIMP.—*Robert Weiden*, New York, N. Y. Application filed March 18, 1882. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 6,191 and upward are registered under the act of March 3, 1881.]

9,330.—REMEDY FOR CORNS, WARTS, BUNIONS, AND INDURATIONS OF THE SKIN.—*Edward A. Abbott*, Savannah, Ga. Application filed January 28, 1882.

"The words 'INDIAN CORN' on the pictorial representation of a human foot and leg."

9,331.—CIGARS.—*Julian Alvarez*, New York, N. Y. Application filed April 8, 1882.

"The portrait of the registrant."

9,332.—CIGARS.—*Alvarez é Hijo*, New York, N. Y. Application filed April 8, 1882.

"The portrait of Mr. Francisco de P. Alvarez."

9,333.—CORSETS.—*Theodore C. Bates*, North Brookfield, Mass. Application filed March 11, 1882.

"The arbitrarily-selected word 'IRONSIDES.'"

9,334.—CORSETS.—*Theodore C. Bates*, North Brookfield, Mass. Application filed March 11, 1882.

"The arbitrarily-selected word 'DERMATOID.'"

9,335.—CORSETS.—*Theodore C. Bates*, North Brookfield, Mass. Application filed March 11, 1882.

"The arbitrarily-selected word 'EXCELSIOR.'"

9,336.—CORSETS.—*Theodore C. Bates*, North Brookfield, Mass. Application filed March 11, 1882.

"The arbitrarily-selected word 'EVERLASTINO.'"

9,337.—PEN-HOLDERS AND PENS.—*George A. Ogle*, Baltimore, Md. Application filed April 3, 1882.

"A circle and straight or dotted lines representing the sun and the words 'THE CENTURY,' located within the field described by the circle."

9,338.—DOUBLE-VANILLA CHOCOLATE.—*Henry L. Pierce*, Boston, Mass. Application filed August 2, 1881.

"The obverse and reverse of the medal of the French Exposition of 1867, connected by a horizontal bar and associated with bars or ribbons, so as to form an elliptical design bearing the words 'W. BAKER & Co's.'"

LABELS.

2,673.—Title: "CAREY'S COMPOUND PETROLEUM PILLS."—*Carey & Co.*, New York, N. Y. Application filed March 8, 1882.

2,674.—Title: "ACID EMULSION COD LIVER OIL."—*Andrew J. Robinson*, Boston, Mass. Application filed April 10, 1882.

2,675.—Title: "SEARS'S IMPROVED INSECT POWDER."—*George T. Sears*, Boston, Mass. Application filed March 21, 1882.

DISCLAIMER.

8,832, (Reissue.)—*William Sternberg*, assignor to *Leman W. Tyler*, dated August 5, 1869. IMPROVEMENT IN CHEESE-HOOPS. Disclaimer filed April 22, 1882, by the assignee.

Enters his disclaimer "to the first claim of said Letters Patent, Reissue No. 8,832, such claim being that part of the said invention of William Sternberg, patented as aforesaid, which your petitioner does not choose to claim or hold by virtue of said reissued letters patent."

PATENTS

GRANTED MAY 2, 1882.

257,143. COMBINED SNAP AND BUCKLE. JOHN ANDERSON, Roseville, Ill. Filed Mar. 20, 1882. (No model.)

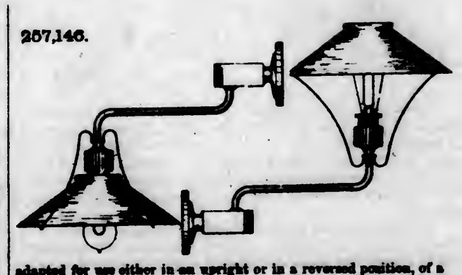
Claim.—1. In a combined snap-hook and buckle, a spiral spring having two projecting arms, one fitting in a depression in the under side of a snap-bar to hold said snap in position, the other extending along the shank of the hook to a slot in the forward end thereof, into which its point is inserted, substantially as described, and for the purpose set forth.

2. The buckle F, consisting of a frame, nearly square, having two cross-pieces, D and D', and the tongue E, by means of which the strap A, having inset end A', is secured thereto, in combination with the hook C, cast integral therewith, and provided with the recess K, longitudinal slot P, and circular slot J, the spiral G, having arms I and E, and the snap B, having a part of its under surface concaved and converged, respectively, the same being secured to the shank of the hook by means of rivet h, substantially as described, and for the purposes set forth.

257,144. CASTER. ERSKINE L. HANCOCK, Cuyahoga Falls, Ohio. Filed Nov. 14, 1881. (No model.)

Claim.—A caster-pintle, *c*, having its corrugated upper portion of a wedge-like form, suitable to be driven into the upper end of the socket in a furniture-leg, a part of the pintle within said socket being made cylindrical to fit the bore of and be laterally supported by the sides of the socket, substantially as described.

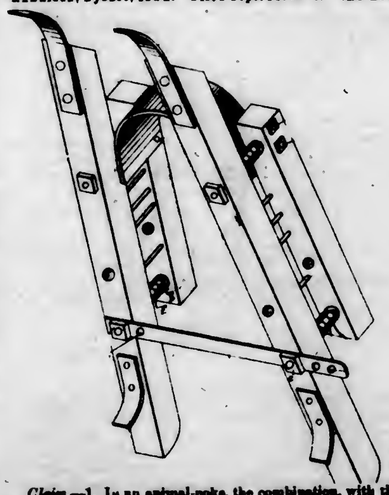
257,145. SASH-FASTENER. FRED E. BAILEY, Manchester, N. H., assignor to himself and Joel P. Bailey, same place. Filed Mar. 30, 1882. (No model.)



Claim.—The combination of the case provided with the notched flange, arranged as described, with two studded bolts, the slotted tumbler, the arbor, and the slotted and studded crank, all arranged and to operate substantially as set forth.

257,146. SHADE-HOLDER FOR ELECTRIC LAMPS. SIGMUND BERGMANN, New York, N. Y. Filed Feb. 28, 1882. (No model.)

Claim.—1. The combination, with an electric lamp and its socket adapted for use either in an upright or in a reversed position, of a shade-holder adapted to properly support the shade whether the lamp is upright or reversed, substantially as set forth.

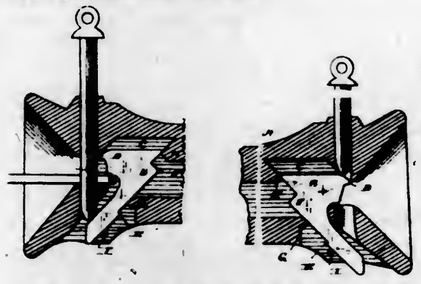


2. The combination, with an electric lamp and its socket

257,146.

adapted for use either in an upright or in a reversed position, of a shade-holder attached at a point beyond the lamp and supporting the shade from its lower or broad edge, whereby the lamp may be used in either position or removed from and replaced in its socket without disturbing the shade-holder, substantially as set forth.

257,147. ANIMAL-POKE. DWIGHT BRINTNAL and WILLIAM HARRISON, Dysart, Iowa. Filed Sept. 15, 1881. (No model.)

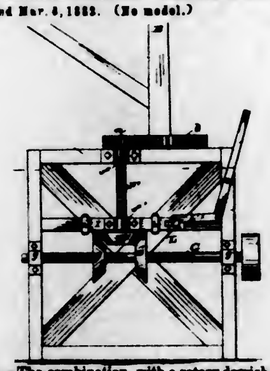


Claim.—1. In an animal-poke, the combination, with the inner slats provided with guide-rods and apertures for the passage of spurs, and the outer slats provided with spurs and apertures for the passage of the guide-rods, of springs encircling said guide-rods, a curved collar removably secured to the upper ends of the inner slats, and hooks secured to the upper and lower ends of the outer slats, substantially as set forth.

2. In an animal-poke, the combination, with the inner and outer slats provided with apertures, guide-rods, and spurs, as described, and a collar or bearing plate secured to the inside slats and adapted to form the support for the poke, of a cross-bar provided with a series of holes by means of which the width of the poke is increased or diminished, substantially as set forth.

3. In an animal-poke, the combination, with the inner and outer slats provided with apertures, guide-rods, spurs, and hooks, if, described, of a collar or bearing plate secured to the inside slats and adapted to form a support for the poke, and a cross-bar provided with a series of holes through which the guide-rods pass for the purpose of increasing or diminishing the width of the poke at its lower end, substantially as set forth.

257,148. CAR-COUPLING. RUFUS H. BROOKS, Jenkinsville, Ga. Filed Mar. 6, 1882. (No model.)

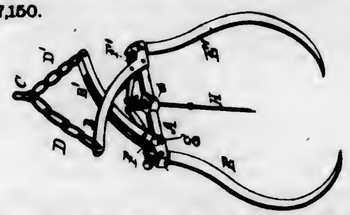


Claim.—1. In a car-coupler, the combination, with the draw-head A, provided with an oblique recess, C, the sliding dog or pawl B, having a shoulder, D, and recess M, and provided with abutments E F, adapted to strike against the abutments G H of the draw-head, whereby the force of the shock of the car will be broken when the dog is thrown back, substantially as and for the purposes specified.

2. In combination with the draw-head having an oblique recess, the sliding dog adapted to move in said recess, and provided with a recess at its lower end adapted to hold the pin in a partially-elevated position during the operation of coupling, substantially as and for the purpose specified.

3. In combination with the draw-head having an oblique recess, the sliding pawl or dog, and the pin L, which serves as a guide for the pawl or dog and to secure it in the draw-head, substantially as specified.

257,149. DERRICK-SWINGER. WALLACE C. BROWN, Monson, Me. Filed Mar. 6, 1882. (No model.)



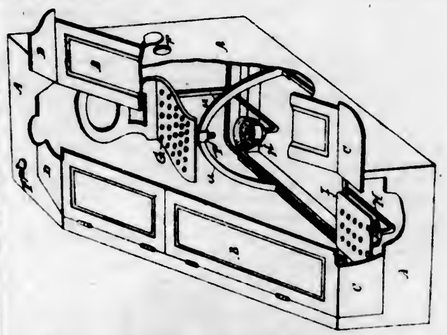
Claim.—The combination, with a rotary derrick-post, B, having mounted thereon the gear-wheel *b*, and the continuously-rotating power-shaft G, carrying the friction-wheels D D', of the swinging shaft F, having the friction-wheel E, adapted to engage with either of the wheels D D', and pinion *a*, meshing directly with the gear-wheel *b* on the derrick-post, substantially as shown and described.

257,150. HAY-FORK. LEWIS C. CHASE, Waupun, Wis. Filed Jan. 27, 1882. (No model.)

Claim.—1. In a hay-fork, the combination of two slotted levers pivotally attached to a rigid cross-bar with two inwardly curved tines having heads or ends projecting upwardly above the said cross-bar, pivoted in said levers within their closed ends, and means for drawing the upper ends of said levers toward each other, substantially as shown and described.

2. The combination of two slotted levers pivotally attached to a

257,150.



rigid cross-bar, and two inwardly-curved tines having heads or ends projecting upwardly above the said cross-bar, pivoted in said levers within their closed ends, with pivoted dogs adapted to be interposed between the upper ends of said tines and levers, substantially as shown and described.

3. The combination of the slotted levers B B', pivotally attached to the rigid cross-bar A, with the tines E E', pivotally attached to the levers, and means, substantially as shown and described, for drawing the upper ends of the levers together and for locking the tines against outward movement at their lower ends, substantially as shown and described.

4. The combination of link C, chains D D', levers B B', dogs F F', cross-bar A, perforated at *a*, rope H A A', and tines E E', pivotally attached to the levers, substantially as shown and described.

257,151. BATHING APPARATUS. JOHN B. CROCKER, Chicago, Ill. Filed Sept. 21, 1881. (No model.)

Brief.—The collar V is adjustable to answer for both large and small necks.

Claim.—1. In a portable bathing apparatus, the casing A, formed of two separate sections, and having folding doors B B, to which are secured the lower front end pieces, C C, and the top pieces, D D, and apertures F F in the sides thereof, substantially as and for the purposes set forth.

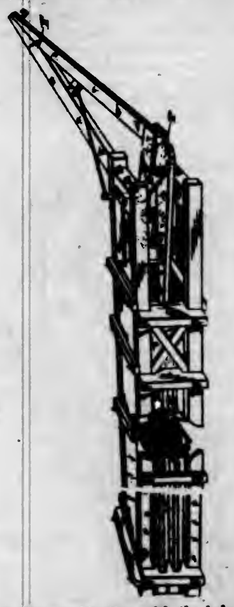
2. The combination, with a portable bathing apparatus, of the adjustable collar V, consisting of two semicircular portions, A' B', pivoted together at C', and having catch D' and perforations E', substantially as and for the purpose set forth.

3. In a portable bathing apparatus, the revolving chair G, having perforated seat, central support, P Q R, and auxiliary supports *a a*, and the hinged and perforated footstool I, substantially as set forth.

4. In a portable bathing apparatus, the gas-generator U T having glass indicator-tube A' and air-passages B' B', perforated heat-radiators H, and connecting-pipe K.

257,152. BALING-PRESS. PETER K. DEBBRICK, Albany, N. Y. Filed Oct. 24, 1881. (No model.)

Claim.—1. The herein-described method of binding bales in a continuous baling-press, consisting in forming the bale within a bight of wire extending from in front of the bale along its sides,



and then bringing the two wires together in rear of the bale and twisting them by automatic twisting devices, substantially as described, the whole operation being performed while the bale is on its way through the press, substantially as described.

2. In a continuous baling-press, the combination, with wires adapted to extend along the sides and front of the bale in the bale-chamber, of wire-carriers for bringing the wires together at the rear of the bale and automatic twisting-gearing for securing said wires together, substantially as described.

3. In a continuous baling-press, the combination, with wires adapted to extend along the front and sides of the bale in the bale-chamber and fed from reels or spools on opposite sides of the press, of the wire-carriers for crossing the wires behind the bale and the follower, provided with twisting-gearing for twisting the crossed wires, substantially as described.

4. In a continuous baling-press, the combination, with wires adapted to extend along the front and sides of the bales in the bale-chamber, of the needles for crossing the wires behind the bale, the followers provided with the slotted wheels or twisters, the intermediate connecting-gearing, and the rack in the bale-chamber, the whole constructed and arranged substantially as described.

257,153. BALING-PRESS. PETER K. DEBBRICK, Albany, N. Y. Filed Dec. 27, 1881. (No model.)

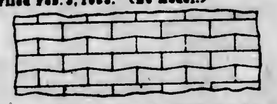
Claim.—1. The combination, with the bale-chamber, of the vibratory adjustable entrance to the same, substantially as described.

2. The combination-arm E, with the arm D, extension or cam P, and sweep or horse lever F, as and for the purpose set forth.

257,154. DEEP-SEA-SOUNDING APPARATUS. ALPHEE G. DELABOY, New York, N. Y., assignor to himself and Charles Scheuing, same place. Filed June 16, 1881. (No model.)

Brief.—The hollow metal sinker is made in two sections. A screw mounted upon a spindle revolves by the rush of water and actuates a train of registering mechanism in a chamber of the sinker. Valves at the top close when the sinker strikes bottom, and prevent counter revolution when being drawn up. Two valves hinged on opposite sides close the top in any position the sinker may fall.

Claim.—1. A sinker composed of two detachable semi-tubular sections, thickened at their lower ends, and provided at their upper ends with perforated ears, said sections being united at their lower ends by means of a solid tubular socket, at their upper ends by means of a band or otherwise, and intermediately by means of dovetail pieces, substantially as described.

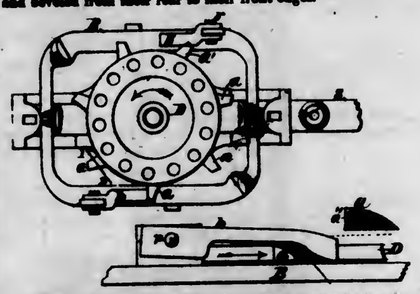


2. The combination of a tubular sinker, a rotary screw or other actuating device within the channel of the sinker, a registering de-

257,154.

vice connected with and operated by the screw, and a valve or valves within the channel, adapted to close automatically when the sinker strikes bottom, substantially as described.

257,155. BRICK. JOSEPH A. DUPUIS, Montreal, Quebec, Canada. Filed Feb. 3, 1882. (No model.)



Claim.—1. A brick or building-block for the construction of walls, columns, piers, &c., having inclined bearing-surfaces, and adapted for use as herein described, whereby the structure is securely bound and lateral displacement prevented, as set forth.

2. A wall, column, or pier composed in whole or in part of bricks or blocks having inclined bearing-surfaces, as set forth.

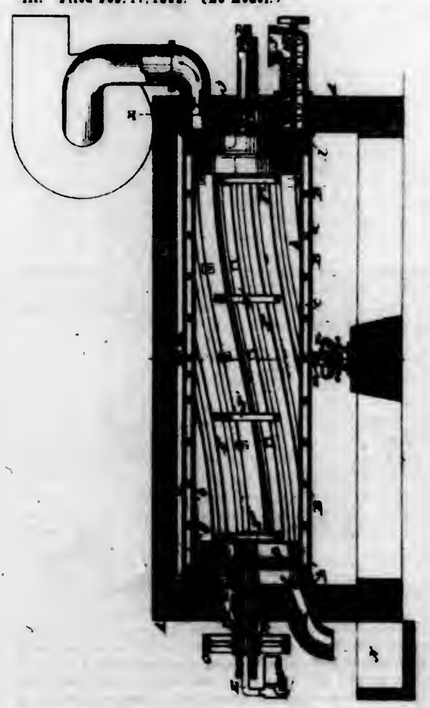
257,156. CORN-PLANTER. AUSTIN C. EVANS, Springfield, Ohio. Filed May 28, 1881. (Model.)

Brief.—The teeth of the disk are tapering from base to point and beveled from their rear to their front edges.

Claim.—The oblong sliding frame B, operated by bar S, and provided with pawls *b b*, in combination with the perforated seed-disk D, formed with the teeth *a*, tapering from base to point, extending radially therefrom, said teeth being beveled from their rear to their front edge to give easy rise to actuating-pawls *b b*, as shown and described.

257,157. CLAMP FOR STATIONARY SPINDLES. LUTHER R. PAGONY Philadelphia, Pa. Filed Mar. 21, 1882. (No model.)

Claim.—1. The combination, substantially as set forth, of a spindle, a split or divided clamping-sleeve having a flattened screw-thread formed upon its periphery, a socket or bushing having an internal thread of corresponding section, and a head or nut, by which the sleeve and socket may be varied in position circumferentially relatively one to the other.



2. The combination, substantially as set forth, of a spindle, a clamping-sleeve and socket, each threaded as described, a pin or stop which prevents rotation of the sleeve in the socket, and a nut fitting a recess in the socket and having an internal thread engaging the thread of the clamping-sleeve.

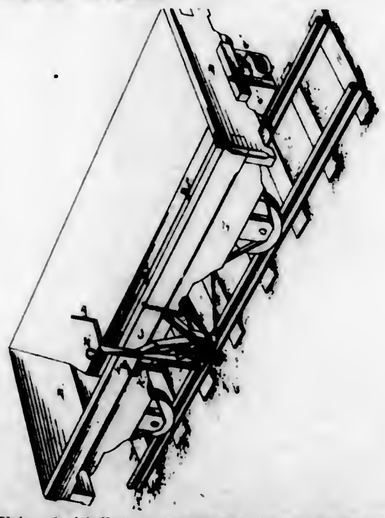
257,158. NECK-YOKE. GREEN FENTON, Streetsborough, Ohio. Filed Nov. 9, 1881. (No model.)

Claim.—The sectional tubular neck-yoke A, having the brace C and the lap-joint *a*, in combination with the ferrule D, having boss E, with slot and groove *e e*, for the reception of the T-headed ring, substantially as set forth.

257,159. DRYING APPARATUS. JOHN F. GREENE, Chicago, Ill. Filed Feb. 17, 1882. (No model.)

Claim.—1. A wall-plate for drying machinery substantially such as described, consisting of the plate C, having a central opening for the passage of the cylinder-shaft, a flange, *h*, concentric with said opening, and a neck, *j*, having a horizontal lower side to receive the bearing or box H, and adapted to be built into the wall of the apparatus, as set forth.

2. A drying-cylinder provided with radial longitudinal shelves secured at their outer edges to the cylinder and connected at their inner edges by hoops or bands, as shown.



3. The spider-head C for a drying-cylinder, having the hollow shaft *d* and spokes *e*, and the double rim *f g*, whereby it is adapted to receive and be attached to the inner and outer casings of the cylinder, as set forth.

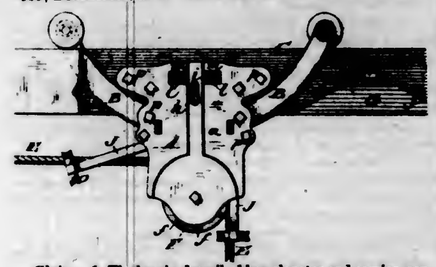
4. In combination with the cylinder B, supported at its ends, rollers *n*, located beneath the cylinder at a point between the end supports, and provided with means for adjusting them vertically, substantially as described, whereby the rollers are adapted to be set up to compensate for wear and to prevent sagging of the cylinder.

5. A drying apparatus consisting of a steam-jacketed rotary cylinder, B, having the spider-heads C, constructed with steam-passages, as explained, spiral blades or shelves F, heads or wall-plates G, hopper J, conveyer K, discharge-spout M, vapor-spout I, and an exhaust-fan connected with said spout, all arranged and operating substantially as explained.

6. In combination with the wall-plates or heads having central openings for the shaft or gudgeon *d* and the neck *j*, the adjustable boxes H, substantially as shown and described.

257,160. BALLAST-CAR. DANIEL B. HARMON, Palmyra, N. Y., assignor of one-half to Isaac T. Van Duzer, same place. Filed Mar. 2, 1882. (No model.)

Claim.—1. A ballast-car consisting of a hopper-body the center of which is carried down between the wheels close to the axles, said body having a continuous longitudinal discharge-opening, opened and closed by a sliding plate actuated by a reversible-pawl mechanism and supported by frame-pieces secured by truss-rods, whereby sagging and springing are prevented, substantially as and for the purpose set forth.



2. In a ballast-car having a longitudinal discharge-aperture, a sliding gate, C, whereby the aperture is closed or opened, said gate consisting of a movable plate secured to a ratchet-bar actuated by a reversible-pawl mechanism, as set forth.

3. In a ballast-car having a longitudinal discharge-opening, a sliding gate actuated by pawl-and-ratchet mechanism, as described, the ends of said gate abutting against guides on the frame-pieces and supported by cross-rods secured to the frame of the car-body, as set forth.

4. In a ballast-car having a longitudinal discharge-aperture, the combination of a sliding gate, supported as described, with a ratchet-bar secured at one end to the gate and ratchet-wheels actuated by a lever and a reversible pawl, substantially as and for the purpose set forth.

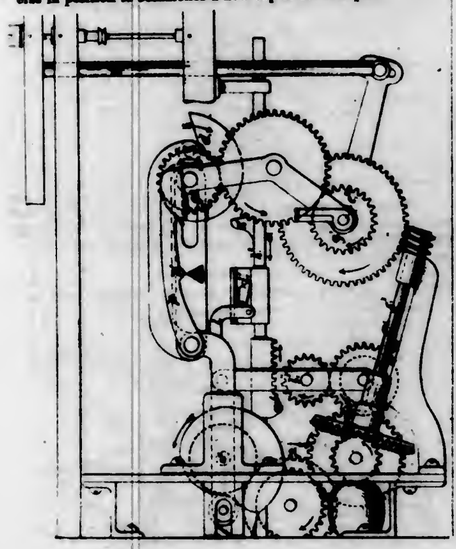
5. The combination, in a ballast-car as described, of a sliding gate, a ratchet-bar secured thereto and resting on a stirrup, J, attached to the car-body, ratchet-wheels F G, lever D, and reversible pawl *e*, substantially as set forth.

267,161. HAY ELEVATOR AND CARRIER. HOWIE HARRINGTON, Manchester, N. Y. Filed Oct. 3, 1881. (No model.)

Claim.—1. The herein-described hay elevator and carrier, consisting of shell A, pivoted arms B, pulley F, brake D, dogs I, and trips or yokes J, combined and operating as set forth.

2. In a hay elevator and carrier, the combination of the body A, pulley F, arms B, and vertically-sliding brake D, controlled by said arms, substantially as set forth.

3. In a hay elevator and carrier, the combination of a pulley, a vertically-sliding brake, and pivoted sustaining-arms extending through the body of the brake and serving to apply the weight of the carriage and load thereto, substantially in the manner explained.



4. In combination with the grooved plates *a* and *b* and pulley F, the brake D, having ribs to fit the grooves of the plates, as and for the purpose set forth.

5. In combination with the rope-pulley having lugs *f* on its sides, the combined brake and clamp D, arranged to slide vertically in the shell or casing, substantially as shown.

6. The vertically-sliding brake and clamp D, provided with laterally-projecting lugs or pins to engage with a fixed incline, as described.

267,162. RING-SPINNING MACHINE. GEORGE P. HAZARD, Providence, R. I. Filed Feb. 8, 1881. (No model.)

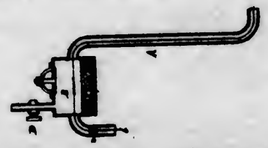
Brief.—The invention embraces novel mechanism for traversing the ring-rail with a slow upward and rapid downward movement, whereby a cop formed either on a bare spindle or on an ordinary cop-tube has the conical layers of yarn thereof laid on the cop in close spirals in one direction and an open spiral for binding the layers in the other direction. When the cop is completed the ring-rail is automatically returned to the point of lowest traverse in position to commence a new cop or set of cops.

Claim.—1. The combination, substantially as before set forth, of the ring-rail, the bell-crank for supporting it, the builder-cam journaled to the bell-crank, the laying-cam, and the slide-rod and link through which the laying-cam operates on the builder-cam for working the bell-crank.

2. The combination, substantially as before set forth, of the ring-rail-supporting rocking bell-crank provided with a stud or pin, A, the slide-rod engaged by said pin and carrying a rack, the movable pinion, a yoke for supporting said pinion, the lever from which the yoke of the pinion is suspended, and the switch on the slide-rod for lifting said lever to throw the pinion in gear with said rack.

3. The combination, substantially as before set forth, of the ring-rail-supporting rocking bell-crank provided with a stud or pin, A, the slide-rod engaged by said pin and carrying a rack constructed with a cam at its heel, the movable pinion, a yoke for supporting said pinion, the lever from which the yoke of the pinion is suspended, and the switch on the slide-rod for lifting said lever to throw the pinion in gear with said rack.

267,163. CARPET-FASTENER. WILLIAM H. HENDERSON, Iron Mountain, Mo. Filed Dec. 26, 1881. (Model.)



Claim.—The within-described carpet-fastener, forming a complete molding on the wall or mop board, composed of holding-strips F and E, each having outer curved surfaces to match or correspond with the other, the former, F, secured to the wall or mop board and the latter, E, with right-angular recess to match the outer edge of F, and serrated on its under surface or edge, and adapted to be secured beneath F by vertical screws which pass through F, substantially as set forth.

267,164. BLANK FOR WAGON-BOX STAPLES. JOHN G. HERMAN, St. Louis, Mo. Filed Feb. 11, 1882. (No model.)

Claim.—A blank for making wagon-box staples, which consists in a strip of metal having alternating half-oval and flat portions, the latter provided with oblique slots, as set forth.

267,165. INSULATING UNDERGROUND LINES. EDWARD A. HILL, Chicago, Ill. Filed June 28, 1881. (No model.)

Claim.—1. The pipe A, containing and inclosing air-tight one or more conducting-wires clothed with cotton or its equivalent and a dry atmosphere surrounding them, in combination with plugs *a*, and with one or more receptacles holding air-drying material in atmospheric communication with the interior of said pipe, substantially as and for the purposes specified.

2. The pipe A, containing one or more conducting-wires clothed with cotton or its equivalent, in combination with plugs *a*, and with pipes D, for giving communication at will with outside air-drying appliances, substantially as specified.

3. The plug *a'*, for subdividing the pipe A into sections, in combination with plugs *a*, with pipe D, and with appliances B E for drying the air, substantially as specified.

267,166. WATER AND AIR WHEEL. DAVID BIRD JAMES, San Francisco, Cal. Filed July 26, 1881. (No model.)

Claim.—1. A water or air wheel having a double row of buckets arranged obliquely on the periphery thereof at right angles to each other, whereby a reactionary force is caused by the passage of water or air from one bucket to another, substantially as specified.

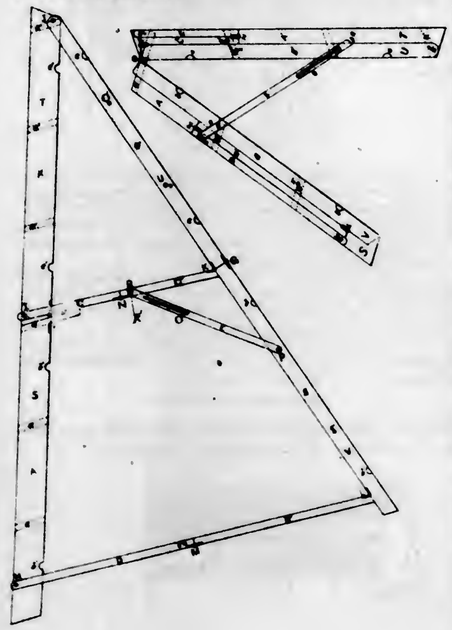
2. The combination, with an air or water wheel having buckets A B set obliquely on the periphery thereof at right angles to each other, of the housing C and pipe D, substantially as shown and described.

257,167. STEAM-PACKING. HENRY W. JOHNS, New York, N. Y. Filed Feb. 28, 1882. (No model.)

Claim.—1. As a new article of manufacture, a steam-packing consisting of strands of asbestus twisted or laid into the form of a rope, with the interstices between the strands filled or built up with a suitable cement or size, substantially as set forth.

2. The asbestus-rope packing for steam-joints, having the interstices filled or built up, as described, and tied or bridged over by the longitudinally laid and felted short fibers, as hereinbefore set forth.

3. The asbestus-rope packing for steam-joints, composed of a series of strands of asbestus, with a central core saturated with a solution of india-rubber, as hereinbefore set forth.



4. The process of closing and building up the interstices of asbestus rope, consisting in longitudinal manipulation of the rope with sizing or water, substantially as hereinbefore specifically set forth.

5. The method of producing a hard smooth finish or polish on the surface of asbestus, consisting in the application of water or other suitable material, as described, and friction.

6. As a sizing for application to the surface of the asbestus, a compound consisting of asbestus and oleaginous or glutinous material with flour and water or other fluid, as hereinbefore set forth.

257,168. STEP-LADDER. GEORGE T. LAPE, Brooklyn, N. Y. Filed Sept. 10, 1881. (No model.)

Brief.—The stiles and the legs are made in sections, and are so pivoted and hinged that each leg-section can be folded upon its corresponding stile-section. The ladder is braced by adjustable tie-rods and hinged braces.

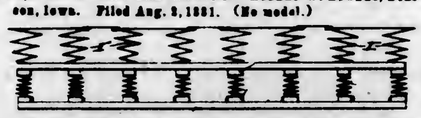
Claim.—1. A folding extensible step-ladder the ladder and legs of which are pivoted or hinged at or near one end thereof, and are each formed of two sections, which sections are so constructed and so connected by pivots or hinges as to permit each ladder-section and its corresponding leg-section to be folded together, and also the pairs of coincident sections, when folded as aforesaid, to be then folded together.

2. The jointed ladder S T, in combination with the jointed legs U V, hinged and pivoted together, substantially as and for the purpose described.

3. The jointed ladder S T, in combination with the jointed legs U V, the tie-rods C and D, and the adjustable tie-rods E, substantially as and for the purpose specified.

4. The sections S V, the sections T U, the hinges F F and G G, and the tie-rods E, all combined substantially as specified.

5. The sections S V, the hinges G G and F F, and the adjustable tie-rods *a*, in combination with the sections T U, the adjustable tie-rods E, and the pins Z on section U, substantially as and for the purpose specified.

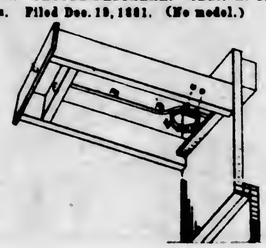


257,169. RUBBER BOOT OR SHOE. SAMUEL LIBBEY, Jr., Bristol, R. I. Filed Mar. 13, 1882. (No model.)

Claim.—1. The improved process for securing rubber heels to rubber boots and shoes, the same consisting in providing the heel with narrow strips, passing said strips through slits or cuts in the sole, and lapping the same over the inner side of the sole and securing the parts together by cementation, as described.

2. The combination, with the sole A, provided with the slits *d d*, of the heel B, provided with the strips *e e*, the whole adapted to be secured together by cementation, as and for the purpose described.

257,170. SPRING BED-BOTTOM. ROBERT W. LOWNDS, Denison, Iowa. Filed Aug. 3, 1881. (No model.)

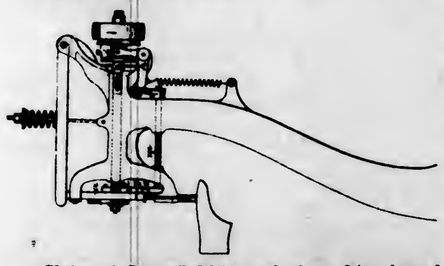


Claim.—A bed-bottom constructed of two parallel horizontal frames having transverse slats connected by intermediate cylindrical coils, in combination with the springs I, secured on top of the upper frame, as described, for the purpose set forth.

257,171. WHIFFLETREE-COUPLING. HENRY A. LUTTGENS, Paterson, N. J. Filed Aug. 23, 1881. (No model.)

Claim.—In a whiffletree-coupling, the combination of a clevis having the wearing-pin *c*, with the cap *h*, inserted in the face of the whiffletree, adjusting-bolt *c'*, and cap *c*, arranged and operating substantially as set forth.

257,172. CATTLE-FASTENER. CHAS. H. T. MANN, Methuen, Mass. Filed Dec. 19, 1881. (No model.)

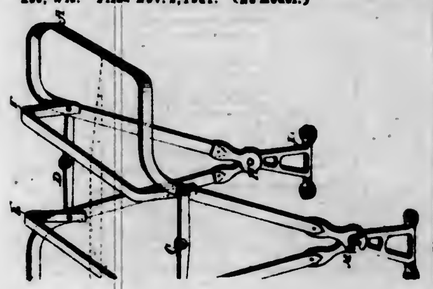


Claim.—In a device for fastening cattle, the stanchion D, bent outwardly at D', standing vertically above the bend, and provided with the sliding collar E, substantially as and for the purpose set forth.

257,173. OIL-CUP. JOHN G. MCBRIDE, Sacramento, Cal. Filed Dec. 19, 1881. (No model.)

Claim.—The valve *f*, stem *g*, cap A, provided with the ring *r*, having recesses *s*, short interposed spring *i*, and cap *t*, having a ring, *t'*, provided with lugs *t''*, the whole being arranged in the side of the lubricator-stem, and combined with said stem so as to be adapted for use with the short spring, as herein set forth.

257,174. NAILING-MACHINE. GORDON MCKAY, Newport, R. I. Filed Dec. 2, 1881. (No model.)



Claim.—1. In a nail-driving mechanism, a driver-bar and driver and device to keep it elevated and its spring compressed, combined with a driven loose pulley, a clutch, clutch-controlling device, and a tripping device next the nail-tube, the movement of which device by the shoe as it is pressed against the nail-tube effects the disengagement of the driver-bar, in order that it may be operated by its spring, and also the engagement of the clutch or disk and driven pulley for a sufficient time to automatically lift the driver-bar and compress its spring, the clutch and pulley being automatically disengaged as soon as the driver-bar is again lifted, for the purpose substantially as described.

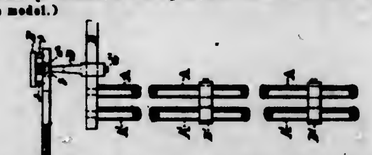
2. The driver-actuating shaft and driving-pulley and clutch thereon, combined with the driver and toggle-levers connected therewith, and the clutch-controlling cam operated by the said levers, substantially as described.

3. The driver-actuating shaft and clutch thereof, combined with the driver and toggle-levers connected therewith, and the clutch-controlling cam operated by the said levers, and the tappet-arm and trip thereof operated by the article being nailed to break the toggle-joint, substantially as described.

4. The clutch provided with a notched controlling-plate and its slipping-lever, combined with the clutch-controlling cam and the roller fixed upon the frame-work to co-operate with the said notched plate, substantially as described.

257,175. CARRIAGE-TOP. FERDINAND HEIDECKE, Milwaukee, Wis. Filed Nov. 2, 1881. (No model.)

Claim.—In carriage-tops, the combination of the two main upright bows A and B, having their central parts bent outward from each other in a horizontal plane at nearly right angles to their ends, secondary small bows E and F, and knee-joints C and D, said secondary small bows and said knee-joint braces being secured to said main bows A and B by the same pivots, substantially as set forth.



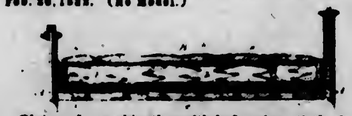
257,176. CAR-COUPLING. WALTER HULING, Albany, N. Y. Filed Feb. 1, 1882. (No model.)

Claim.—1. The combination of the draw-head A, having the transverse slot B, and the bifurcated shank A^1 A^1, with the angular weighted latch hinged at the rear upper corner of the transverse slot, as described, with its forward arm adapted to engage with the draw-head at the upper forward corner of the slot, and with its rear weighted arm adapted to play between the parts of the bifurcated shank and to be guided thereby, substantially as described.

2. The combination of the draw-head having the transverse slot and bifurcated shank and the slotted bearings *a' a'*, with the hinged weighted latch having trunnions *d' d'*, adapted to engage with the slotted bearings *a' a'*, whereby a strong hinge is formed and the latch is enabled to be readily put in and taken out when desired.

257,177. COMPENSATING PENDULUM. FRANK A. HILLS and THOMAS A. HOSMER, Philadelphia, Pa. Filed Nov. 14, 1881. (No model.)

Claim.—1. The combination of the joint-pin *a* and set-screw *d*, having a step, *e*, with the compensating lever C, and rods A and A', for the horizontal adjustment of said lever, substantially as described.

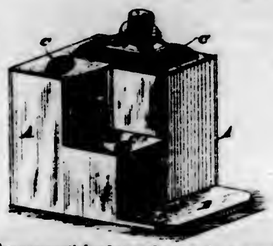


2. The combination of the compensating lever C, having a slide, J, with the rods A and A', by means of the joint-pin *a* and adjustable step *e*, the slide having fulcrum-pins a^2 and being adjusted by means of the screw d^2 and yoke K or other suitable device, substantially as described.

3. The supplemental rod H, having hooks *i i*, and provided with the bob I, in combination with the compensating lever C, having the adjustable slide J, provided with fulcrum-pins a^2 a^2, substantially as and for the purpose set forth.

4. The combination of the adjustable upright D with the bar B and cross-head E, having pins *f f* and joint-pin a^2, substantially as and for the purpose set forth.

5. The combination of the cross-head E, having pins *f f*, with the suspension-bracket G, having agate steps *h h*, which constitute the points of suspension of the pendulum, the cross-head being connected with the upright D of the pendulum by means of the joint-pin a^2, substantially as described.

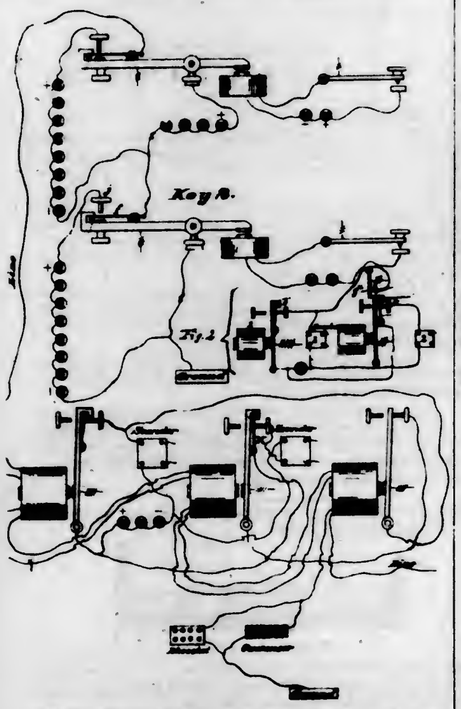


257,178. MATTRESS. GEORGE S. HOCH, Lebanon, Ky. Filed Feb. 26, 1881. (No model.)

Claim.—In combination with bed-springs C, the loosely-resting mattress B, consisting of the flexible top or cover *a* and rigid drooping sides *b*, constructed in such a manner as to be removable from the springs, for the purposes set forth.

257,179. COMBINED CEMENT-CASE AND MIXING-TABLET FOR DENTISTS. JACOB R. HOFFITT, Uniontown, Pa. Filed Mar. 21, 1882. (No model.)

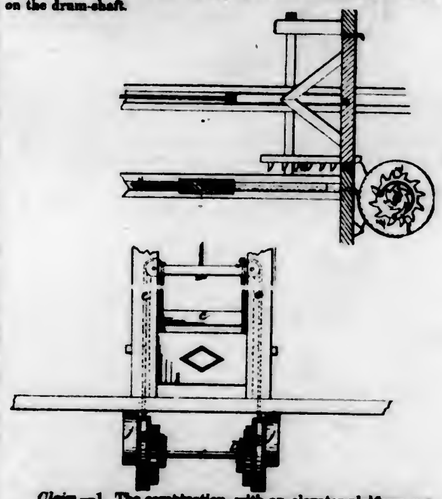
257,179.



Claim.—As a new article of manufacture, the herein-described cement and liquid case and mixing-tablet, comprising the body or case A, provided with wells or receptacles C, and the tablet B, extending from the body at its lower part, all formed of a single piece of glass, porcelain, or other suitable material, substantially as and for the purpose specified.

257,180. CAR-COUPLING. FRANCIS H. HULLER, Hilroy, Ind., assignor of one-half to Daily C. Aldridge and Marshall H. Aldridge, both of same place. Filed Mar. 6, 1882. (No model.)

Claim.—The combination of draw-bar A, having lugs D, recess C, and slots J, pivoted block F, and pivoted pin E, substantially as set forth.

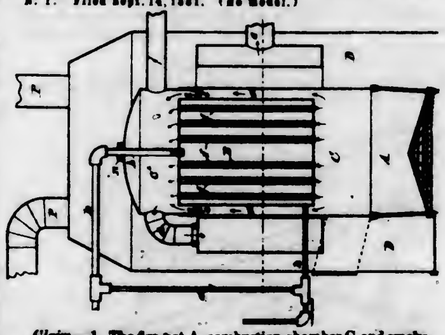


257,181. QUADRUPLEX TELEGRAPH. HENRY C. NICHOLSON, Keuton, Ky. Filed May 2, 1881. (No model.)

Claim.—The combination, substantially as before set forth, of two sounders and three neutral relays for operating the same independently, the local-battery terminals for one of the sounders, consisting respectively of a hook and an insulated contact-spring on the armature-lever of one of the relays, while the local-battery terminals of the other sounder consist respectively of the armature-levers and back contacts of the other relays.

257,182. ELEVATOR. WILLIAM H. PATTERSON, Baltimore, Md. Filed Aug. 15, 1881. (No model.)

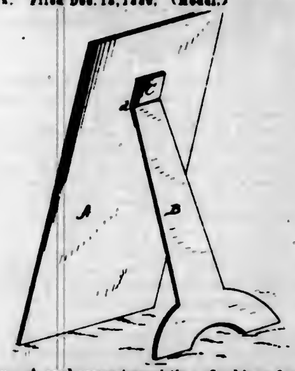
Brief.—Vertical racks, one projecting above, the other below, the elevator. Each engage in turn one of two toothed wheels loosely mounted on the drum-shaft, and connected with the latter by a clutch device when turning in one direction. The vertically-sliding gate is connected by cords and pulleys with the drums and drops by gravity when the engaging-rack is released from action on the drum-shaft.



Claim.—1. The combination, with an elevator-platform provided with vertical racks and a vertically-sliding hatchway gate or guard carried by winding-cords, of a winding and releasing device arranged below the hatchway and operated by the elevator-racks, whereby to wind the cords in opening the gate, and to release the winding device to allow the gate to automatically close, substantially as described, for the purpose specified.

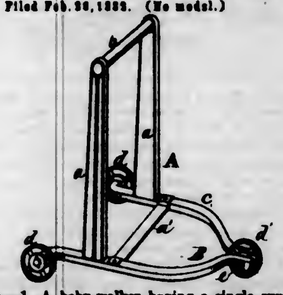
2. The elevator-racks carried by and projecting vertically above and below the elevator-platform, in combination with toothed wheels adapted to engage with said racks, winding and unwinding drums, and a clutch device for each toothed wheel, and a vertically-sliding gate for the hatchway, connected by winding and unwinding cords, substantially as described, for the purpose specified.

3. In an elevator, the combination of a sliding guard-gate, an elevator-platform, and the vertical racks thereof, with winding means for raising and lowering said gate, the said winding means consisting of a toothed wheel and clutch on the winding shaft, as set forth.



257,183. HEATING APPARATUS. JOHN F. PRESS, Syracuse, N. Y. Filed Sept. 14, 1881. (No model.)

Claim.—1. The fire-pot A, combustion-chamber C, and smoke-box C', superstructed successively one upon the other, the radiator R, arranged around the exterior of the combustion-chamber and communicating with the smoke-box C', the boiler B, arranged inside of the combustion-chamber, with the fire-passage a between them, and provided with flues *f f* and the steam-pipe b, all combined and arranged as described and shown, in combination with the inclosing-case D, provided with hot-air ducts P, substantially as specified.

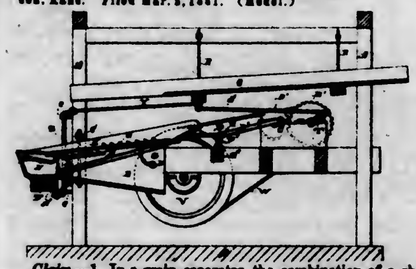


2. The combination of the combustion-chamber C, having the smoke-box C', seated upon the ledge c, on the interior of the combustion-chamber, the boiler B, suspended from said ledge c, and having the fire-passage a around its sides, and the steam-pipe b, extended vertically from the center of the upper end of the boiler through the top of the smoke-box C', and provided above the latter with the nut n, all substantially as described and shown.

257,184. CARD-SUPPORT. HENRY PENNINGTON, Philadelphia, Pa. Filed Dec. 13, 1880. (Model.)

Claim.—A card-support consisting of a hinge device formed by the combination of the hinge-card C and the support B, hinged together by means of muslin *d* or its equivalent, with the space or opening *d'*, adapting the edges of adjacent ends of the support and hinge-card to come together to form a check against the spread of the support B when in position, substantially as set forth and described.

257,185. BABY-WALKER. I. GERWIN PRICE, Springfield, Ohio. Filed Feb. 28, 1882. (No model.)



Claim.—1. A baby-walker having a single supporting-bar connecting the tops of two upright posts, secured at their lower ends in the side bars of a bed-frame supported upon wheels, and having the rear ends of said frame extending in rear of said uprights and turned outward, and terminating in axles or spindles on which said wheels are pivoted, while its front ends converge toward their forward ends, and are connected by a pivot-bolt or spindle on which a forward wheel is pivoted between said ends, substantially as shown and specified, for the purpose set forth.

2. In baby-walkers, a triangular, or nearly triangular, bed-frame supported upon wheels or casters, and having uprights or posts thereon connected by a single supporting-bar, said upright frame being set forward of the rear wheels to allow the child to walk between them, and to prevent the walker from tilting backward when the weight of the child is thrown upon the supporting-bar, substantially as hereinbefore set forth.

3. The combination, with an upright frame having a supporting-bar for the child to bear its weight upon, of a bed-frame of triangular, or nearly triangular, shape supported upon wheels, and having means for locking or clamping the front wheel of the same, as hereinbefore specified.

4. The combination, with frame A, having posts *a* and connecting-bar *b*, of the hounds-shaped bed-frame B, having side bars, *c*, connecting-bar *c'*, and wheels *d*, *d*, and *d'*, the latter being interposed between the front ends of said frame-bars *c* upon the pivot-bolt *e*, and provided with means for locking or clamping the same, as hereinbefore set forth.

257,186. GRAIN-SEPARATOR. GUSTAVUS A. RAASCH, Atchison, Kans. Filed Mar. 2, 1881. (Model.)

Claim.—1. In a grain-separator, the combination of a shoe provided with a series of sieves, and mechanism for rotating the shoe first in one direction and then in the reverse direction, substantially as set forth.

2. In a grain-separator, a shoe provided with a series of sieves, and mechanism for rotating the shoe a series of times in one direction and then in the reverse direction, substantially as set forth.

3. In a grain-separator, the combination of a reciprocating feed-trough, a crank connected to the shoe and trough, and adapted, when moved by the trough, to vibrate the shoe at right angles or obliquely to the reciprocation of the trough and at the same speed therewith, and mechanism for reciprocating the shoe and feed-trough together and in the same direction, substantially as set forth.

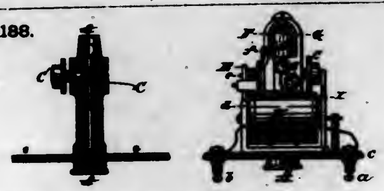
4. In a grain-separator, the combination of a shoe, a crank for imparting thereto a side shake, a pitman for imparting to it an end shake, gears for reversing the resultant movement of the end and side shakes, and means for giving motion to the several parts, substantially as set forth.

5. The combination of shoe B, pinions D' and E', of different diameters, means for connecting the shaft of pinion E' to the shoe and imparting to the latter a side shake, and means for connecting the shaft of pinion D' to the shoe and imparting to the latter an end shake, whereby the several parts will operate to impart to the shoe a reversible rotary shake, substantially as set forth.

6. The combination of shoe B, crank-rod Z, pinions D' and E' and their shafts, reciprocating trough Q, and rods for connecting the several parts, substantially as set forth.

257,187. STOPPER FOR EMPTY BARRELS. FERDINAND REITZ, Birmingham, Ohio. Filed Nov. 16, 1881. (No model.)

Brief.—The device is applicable to the bung-hole as well as to the faucet-hole.

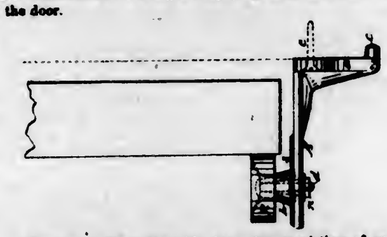


Claim.—The combination, with a movable spring-arm, of a plug secured to one end of said arm and a barrel-head provided with receptacles for the plug when not in the faucet-hole, substantially as set forth.

257,188. ELECTRICAL GAS-LIGHTING APPARATUS. THOS. H. ENDEBE, Brooklyn, N. Y. Filed Nov. 14, 1881. (No model.)

Brief.—The armature E breaks the circuit by striking the lower end of the pivoted electrode F and also simultaneously opens the sliding valve by means of the rod *c*.

257,188.



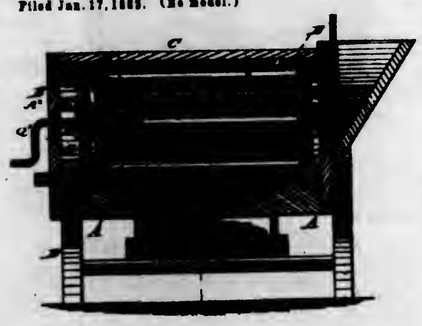
Claim.—1. The pipe A and the sliding valve C, having a conical end and seat, in combination with the magnet D, the armature E, and the rod *e*, substantially as specified.

2. The pipe A and the sliding valve C, in combination with the magnet H, armature I, arm F, magnet D, armature E, and rod *e*, substantially as set forth.

3. In combination with the pipe A, sliding valve C, magnets D H, armatures E I, rod *e*, and the bar P, the pivoted electrode F, adapted to be operated by the movement of the armature E, substantially as described.

257,189. STAY-ROLLER FOR SLIDING DOORS. ELIJAH U. SCOVILLE, Manlius, N. Y. Filed Jan. 5, 1882. (No model.)

Brief.—An arm is secured to the side of the wall beneath the door, and a stud is secured to the free end of said arm adjustably in relation to its distance from the attaching end of the arm, and provided with a suitable bearing for engaging and guiding the bottom of the door.



Claim.—1. The adjustable door-stay consisting of an arm adapted to be secured to the side of the wall beneath the bottom edge of the sliding door, and a stud secured to the free end of said arm adjustably in relation to its distance from the attaching end of the arm and provided with a suitable bearing for engaging and guiding the bottom of the door, substantially as set forth.

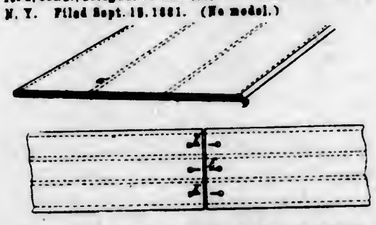
2. The horizontal arm A, provided at one end with the vertical sustaining-plate *a* and at the opposite end with the longitudinal slot *c*, the stud *b*, mounted on the arm A, and having its attaching-bolt passing through the slot *c* and provided on its end with the nut *n*, and the roller R, journaled on the upper end of the stud *b*, all combined as and for the purpose set forth.

3. The improved stay-roll for suspended sliding doors, consisting in the combination of the arm A, having at one end the attaching-plate *a*, provided with the spur *e*, and at the opposite end the longitudinal slot *c*, the stud *b*, secured to the top of the arm A by the bolt *d*, passing vertically through said stud and through the slot *c*, and provided with the clamping-nut *n*, and the roller R, journaled on the stud *b* and sustained thereon by the head of the bolt *d*, all constructed and combined substantially in the manner described and shown.

257,190. GRAIN-CLEANER. ISAAC SHANN, Richwood, Ohio. Filed Jan. 17, 1882. (No model.)

Claim.—1. The combination, with the bottom portion, A, having the end partition, Q, provided in its upper edge with a semicircular recess, Q', of the removable top or upper portion, B, having the partition A', provided in its lower edge with a semicircular recess, A', and the screen G, having the tubular discharge-spout K turning in recesses Q' A', all arranged and operating substantially as and for the purpose specified.

257,191. DARK-LANTERN. JAMES E. STOUT and LEWIS E. LINE, Bloomington, Ill. Filed Mar. 23, 1882. (No model.)



Claim.—1. In a lantern, the combination, with the case A, of a removable dark-slide provided with a removable reflector, substantially as and for the purpose specified.

2. In a lantern, the combination, with the case A, of a removable cover, a dark-slide connected thereto and carrying a removable reflector, substantially as and for the purpose specified.

3. In a lantern, the combination, with the case, of a removable dark-slide provided with side grooves for the reception of a removable reflector, substantially in the manner as and for the purpose specified.

4. In a lantern, the combination, with the case, of a removable cover carrying the cowl or chimney, and a dark-slide and a reflector removably connected to said dark-slide, all substantially in the manner as and for the purpose specified.

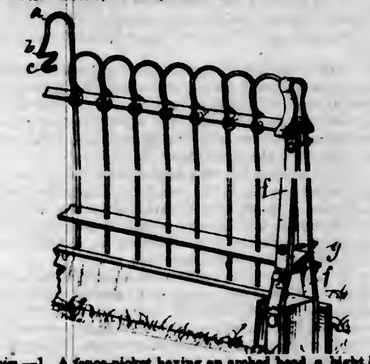
257,192. BELT FOR MACHINERY. WILLIAM B. TATHO, Hartford, Conn., assignor of one-half to John E. Mulford, New York, N. Y. Filed Sept. 15, 1881. (No model.)

Claim.—1. In a belt of the character herein set forth, two or more flat metallic strips or ribbons held in place by a flexible covering and separated by an intermediate welt or welts, said welt or welts being independent of the metallic ribbons, but secured to the covering fabric, substantially as and for the purposes set forth.

2. The separate welts applied at the edges of the belt, in combination with the adjacent independent flat metallic strips and the flexible covering, substantially as set forth.

3. The combination of the flat metallic strips, the intermediate welt or welts, the welts placed on the edges of the belt, and the flexible cover stitched in place, substantially as set forth.

4. In a belt made up of flat metallic strips and intermediate and edge welts, with the covering fabric for holding them in place stitched and secured as explained, the metallic strips perforated at the ends and combined with the simple belt-hooks or fastenings, substantially as set forth.



5. The herein-described improved belt, composed of the flat metallic ribbons perforated at or near their extremities, the intermediate and edge welts, the covering fabric stitched upon the independent welts, the whole covered with a protecting paint or compound, substantially as shown and set forth.

257,193. THILL-COUPLING. CHARLES C. WAGER, Black River Falls, Wis. Filed Feb. 24, 1882. (Model.)

Claim.—The clip B, having flanges C, connected by a bolt, D, having a smooth reduced front side or face, E, in combination with the thill-iron G, having hook H, provided with a shoulder, I, and a spring, K, adapted to pass the front face, E, of the bolt D when the front end of the thill is lowered and to strike against it when the thill is raised, so as to bring shoulder I in contact with the clip, as set forth.

257,194. IRON FENCE. JAMES H. WATERS, Des Moines, Iowa, assignor of one-half to T. L. Palmer and O. P. McCray, same place. Filed Mar. 7, 1882. (No model.)

Claim.—1. A fence-picket having an arched head, *a*, bight *b*, and eye or hook *c*, substantially as shown and described, for the purposes specified.

2. In a fence, the combination of the upright bars or pieces *f*, having bends or shoulders *i*, and a horizontal rail, *h*, substantially as shown and described, for the purposes specified.

3. The improved metal fence composed of fixed posts *f f*, having bends and shoulders *i*, horizontal rails *g* and *h*, and a series of pickets having arched heads *a*, a bight, *b*, and a hook or eye, *c*, substantially as shown and described.

257,195. ELECTRIC GAS-LIGHTER. WILLIAM H. H. WHITING, Chelsea, Mass. Filed Dec. 29, 1881. (No model.)

Claim.—1. The herein-described gas-lighting apparatus, it consisting of a cylindrical coil of wire, contact-electrodes mounted on one end of the case or frame-work of the said coil, and a battery-coil mechanically attached to the other end of the said coil, its poles being connected in circuit through the said coil with the said electrodes supported thereon, substantially as described.

2. The coil and electrodes supported thereon, combined with the battery-coil connected with the case or frame-work of the said coil by a universal joint, substantially as described.

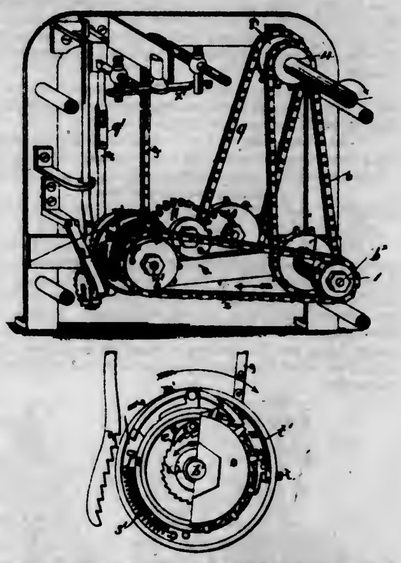
3. The electrode consisting of a fixed U-shaped wire and the bell-shaped hood mounted thereon, combined with the co-operating electrode, consisting of a spring-pressed pivoted arm located between the parallel portions of the U-shaped electrode in position to make electrical contact therewith, near the center of the said hood, substantially as described.

4. The coil of wire and its cylindrical inclosing-case, adapted to serve as a handle, combined with the supporting finger-piece *i*, and the electrodes mounted on one end of the said case, one of the said electrodes being provided with an operating thumb-piece, and the battery-cup attached to the other end of the said case, substantially as described.

257,196. WIRE-FENCE BARB. ROBERT H. WILDS, Freeport, Ill. Filed Sept. 9, 1881. (Model.)

Claim.—1. A fence-barb consisting of a single wire terminating in two opposite straight or slightly-curved points lying in the same plane and parallel to each other, the wire being formed at or near its middle into two opposite loops, one within the other, and the loops thus formed being bent up on opposite sides of the barb, forming two opposite notches or saddles, substantially as and for the purpose shown.

2. The combination, with a two-strand wire cable, of a barb consisting of a single wire terminating in two opposite straight or



slightly-curved points lying in the same plane and parallel to each other, the wire being formed at or near its middle into two opposite loops, one within the other, and the loops thus formed being bent up on opposite sides of the barb, forming two opposite notches or saddles, substantially as and for the purpose shown.

257,197. WITHDRAWN.

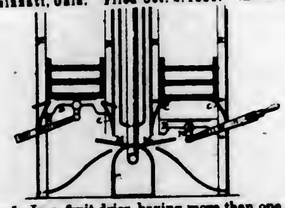
257,198. RING-SPINNING MACHINE. JOHN F. WORRALL, Woonsocket, R. I. Filed Apr. 3, 1880. (Model.)

Brief.—By novel mechanism, combined with the winding-drum, which gives the reciprocating and onward or building movement to the traversing rail, the motion of said drum is automatically reversed the moment the cops or bobbins are filled, and the traversing rail is returned to the position for starting fresh cops. Immediately upon the traversing rail reaching its lowest position the belt is automatically shipped from the driving-pulley to a loose pulley and the machine is stopped.

Claim.—1. The combination, substantially as before set forth, of the chain-drum, the continuously-revolving ratchet-wheel, the pawl connected with said drum, the adjustable stop for throwing the pawl in gear with the ratchet-wheel, and the oscillating lever supporting the drum and provided with a projection for disengaging the pawl from the ratchet-wheel.

2. The combination, substantially as before set forth, of the chain-drum, the ring, the spring connecting the ring to the drum, the pawl pivoted on the ring, and the continuously-revolving ratchet-wheel.

3. The combination, substantially as before set forth, of the chain-drum, ring *c*, spring *d'*, pin *u* on said ring, spring-hook *t*, the latch, the slide-rod *w*, and the spring on said rod.

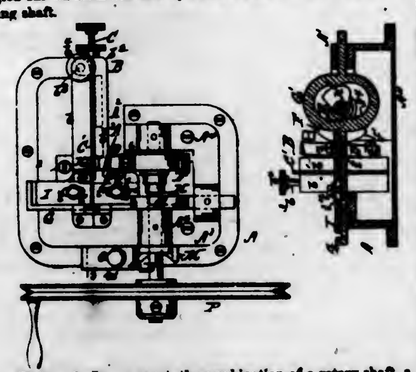


4. The combination, substantially as before set forth, of the chain-drum, ring *c*, spring *d'*, pin *u* on said ring, and spring-hook *t*.

257,199. FENCE-POST. FRED F. WYMAN, Brunswick, Ohio. Filed Jan. 9, 1882. (No model.)

Claim.—The combination, with the fence-post C, of the screw A, provided with the sharpened tang A', adapted to be driven into the lower end of the post, and the brace provided with the vertically-arranged screw portion B and the inclined portion B', the latter adapted to be secured to the side of the post, substantially as set forth.

257,200. FRUIT AND VEGETABLE DRIER. JOHN ZIMMERMAN, Cincinnati, Ohio. Filed Oct. 3, 1881. (No model.)



Claim.—1. In a fruit-drier having more than one drying or rack holding chamber, a hot-air chamber having double perforated walls inclosing furnace smoke-pipe located between said chambers, when said double perforated walls of hot-air chamber constitute also the interior walls of such drying-chambers, substantially as described.

2. In a fruit-drier, the combination of a hot-air chamber having double perforated walls or sides with a drying-chamber, deflectors, and furnace, substantially as described.

3. In a fruit-drier, the hot-air chamber having double perforated sides, in combination with a reciprocating elevating device a lifting-frame, and spring-catches, substantially as described.

257,201. SAW-SETTING MACHINE. GEORGE W. ANNEBURY, Philadelphia, Pa. Filed Dec. 17, 1881. (No model.)

Brief.—A main driving-shaft arranged parallel with the vise-jaws has fastened upon it three cam-wheels, operating respectively to close the movable jaw of the vise through the medium of an adjustable bearing-bar secured to said jaw, reciprocate the die-carrying frame, and actuate the feed mechanism. A spring opens the vise-jaw. The setting-dies are adjustably secured in a reciprocating frame, and the feed-dog is secured to an oscillating right-angled bar which is actuated by a cam on the end of the main rotating shaft.

Claim.—1. In a saw-set, the combination of a rotary shaft, a vise composed of a fixed and a movable jaw, the latter being provided with an adjustable bearing-bar acted on by a cam-wheel secured to said shaft, and a feeding device controlled by mechanism substantially as shown and described, and operated by a cam-wheel, also secured to said shaft, substantially as and for the purpose set forth.

2. In a saw-set, the combination, with a rotating shaft, of a vise composed of a fixed and a movable jaw, the latter being provided with an adjustable bearing-bar designed and adapted to be acted on by a cam-wheel on said shaft, whereby said jaw is closed upon the fixed jaw, substantially as shown and described.

3. In a saw-set, the combination, with a revolving shaft, of a vise having one of its jaws provided with an adjustable bearing-bar, substantially as shown and described, and designed and adapted to be acted on by a cam-wheel upon said shaft and an interposed plate or spring between such jaws, whereby when said shaft is rotated the jaws of the vise are closed upon and released from the saw, substantially as shown and described.

4. In a saw-set, the combination of a base or frame to which is attached the fixed jaw of a vise, the movable jaw being pivoted to said fixed jaw and provided with a bearing-bar which abuts against a cam-wheel secured to a rotary shaft, substantially as shown and described.

5. A saw-set provided with a rotary shaft, a vise having a fixed and a movable jaw, the latter having a bearing plate or bar which abuts against a cam-wheel on said rotary shaft, in combination with an adjustable spring-gage interposed between the vise-jaws, substantially as and for the purpose set forth.

6. In a saw-set, the combination of a vise provided with an adjustable bearing-bar and an adjustable spring-gage, a cam-wheel, a rotary shaft, and setting and feeding devices, substantially as set forth.

7. In a saw-set, the combination of a vise provided with a bearing-bar designed and adapted to be acted upon by a cam-wheel on a rotary shaft, a die carrying or holding frame located in front of said vise and meshing with a cam or crank located upon said rotary shaft, whereby said die-carrying frame is caused to reciprocate in front of said vise, as set forth.

8. In a saw-set, the combination of a vise, a rotary shaft, a cam fastened on said shaft and designed to close the movable jaw of the vise, a reciprocating die-holding frame or bar, a feed-dog located beneath said bar and in front of the vise, an oscillating bar, and an actuating cam-wheel for said bar secured to said shaft, substantially as shown and described.

9. In a saw-set, the combination of a rotary shaft, a saw holding or clamping device composed of a fixed and a movable member, the latter being designed to be closed by a cam-wheel fastened on said shaft, and a reciprocating frame or bar operated by a cam or crank secured to said shaft, said bar carrying adjustable setting-dies, substantially as shown and described.

10. In a saw-set, the combination of a vise, a bearing-bar therefor in engagement with a cam-wheel on a rotary shaft, a reciprocating die-holding bar operated by a crank or cam on said shaft and carrying adjustable setting-dies, and a feed-dog controlled by an oscillating bar operated by a cam on said shaft, substantially as shown and described.

11. In a saw-set, a base or frame, A, a rotary shaft, E, a reciprocating bar, G, and a U-shaped cap, A', constructed to form bearings for both ends of said shaft and for one end of said bar, substantially as shown and described.

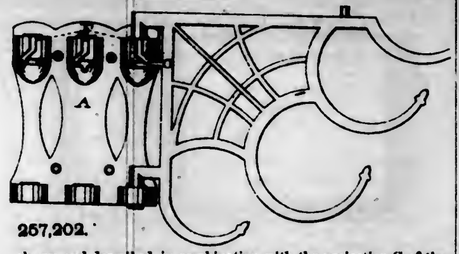
12. In a saw-set, the combination of a rotary shaft having a cam-wheel which closes the movable jaw of a vise located parallel with said shaft, and a reciprocating die-holding bar arranged at right angles with said shaft and vise, and which is designed and adapted to be moved by a crank or cam secured on said shaft, substantially as shown and described.

13. In a saw-set, the combination of a vertically-arranged vise, its movable member being closed by a cam-wheel fastened to a rotary driving-shaft, a reciprocating die-holding bar operated by a cam or crank, also secured to said shaft, and feeding mechanism constructed and arranged substantially as shown and described.

14. The combination of base A, vise B, having fixed jaw *b* and movable jaw *b'*, spring-gage C', provided with adjusting-screw, bearing-plate D, shaft E, carrying cam-wheel F, substantially as shown and described.

15. In combination with a saw-holding vise or clamp and cam-wheel, F, a bar, G, provided with a yoke, G', and adjustable setting-dies I and I', shaft E, and eccentric or cam H, substantially as shown and described.

16. In a machine for setting band-saws, a reciprocating bar carrying two setting-dies, which are rigidly secured thereto, and designed and adapted to be adjusted to and from one another by a sliding movement along or on said bar, the latter being operated by a cam or crank motion, substantially as shown and described.



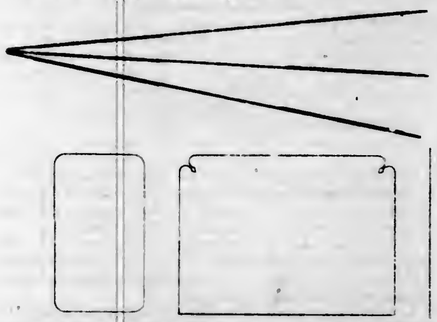
17. In combination with a saw-holding vise or clamp and a setting device, the feed-dog *l*, bar *F*, frame L, pivoted at *l'* to base A, stud L', cam-wheel M, rotating shaft E, substantially as shown and described.

18. The combination of base A, rotating shaft E, carrying cam M, stud L', secured to pivoted frame or bar L, and adjusting-screw O, substantially as shown and described.

19. In a saw-set, the combination of a rotary shaft carrying a cam-wheel actuating an opening and closing vise or clamp, a reciprocating die-holding frame operated by a crank or cam on said shaft, and a feeding-dog pivoted to an oscillating bar carrying a retracting-spring, said bar being operated by a cam-wheel secured to said shaft, substantially as shown and described.

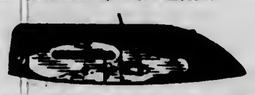
257,202. BRACKET. GEORGE W. BASS, Dayton, Ohio. Filed Jan. 9, 1882. (No model.)

Claim.—1. The wall-plate A, with grooves in face of eye, as



257,202.

shown and described, in combination with the projection C of the bracket to traverse the same, substantially as set forth.



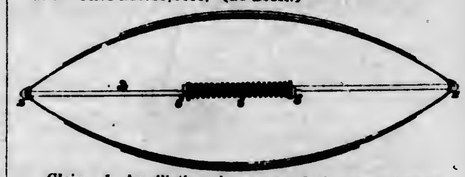
2. The wall-plate A, having a notch on the face of the eye communicating with the transverse groove, in combination with the projection C of the bracket, for the purpose of locking the same in a fixed position, substantially as set forth.

257,203. PHOTOGRAPH AND AUTOGRAPH ALBUM. GEORGE BARTLETT, Boston, Mass., assignor to himself and Arthur W. Eaton, same place. Filed Aug. 1, 1881. (No model.)

Claim.—As a new article of manufacture, a photograph and autograph album constructed substantially as described—viz., with each leaf having to each of its sides not only an open pocket for reception and exhibition of a photograph, but a bordered space for reception of an autograph or other writing, the pockets opening at one edge of and on opposite sides of the leaf, and so arranged with the autograph-receiving spaces or portions of the leaf that one of such bordered spaces or portions and a pocket-opening for the display of a picture shall be on each side of the leaf—all being essentially as specified.

257,204. SEWING-MACHINE SHUTTLE. FRANK BUCKEL, Norwalk, Ohio. Filed Feb. 9, 1882. (Model.)

Claim.—1. The combination, with a shuttle provided with an open thread-slot and with a recess near its forward end, of a tension-spring adapted to be adjustably secured at its rear end to the shuttle and provided with a projection near its forward end that enters an opening in the shuttle, said projection serving as a thread-bearing, the forward end of the tension-spring being constructed to enter a recess in the upper side of the shuttle, substantially as set forth.

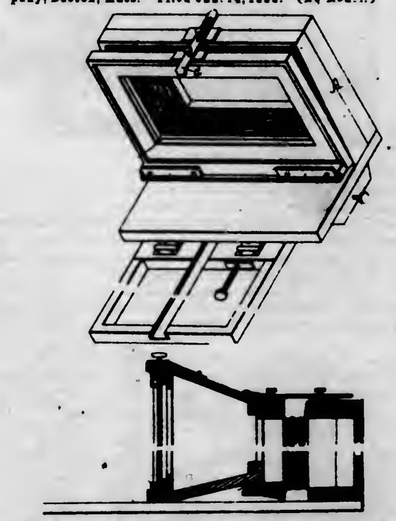


2. The combination, with a shuttle provided with a passage for the thread, of a tension-spring arranged to cover the thread-passage in the shuttle and removably secured to the shuttle by a tension-screw and a hook, said tension-spring being constructed and arranged to allow the thread to be drawn around and beneath its forward end without loosening the spring, substantially as set forth.

3. The combination, with a shuttle provided with an open thread-slot in its upper side, of a tension-spring provided with a hook intermediate its ends, said hook being constructed to be inserted through an opening in the shuttle by a longitudinal movement of the tension-spring, and a tension-screw for securing the rear end of the tension-spring to the shuttle, substantially as set forth.

4. The combination, with a shuttle, of a tension-spring provided with a projecting portion, L, that fits against the upper side of the shuttle, substantially as set forth.

5. A tension-spring having a combined attaching-hook and thread-bearing punched from the spring, substantially as set forth.

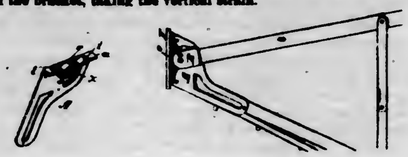


257,205. ELLIPTIC SPRING. GEORGE W. BELL, Brooklyn, N. Y. Filed Nov. 23, 1881. (No model.)

Claim.—1. An elliptic spring composed of upper and lower plates having hook-shaped ends overlapping and fitting upon each other, in combination with tension-rods which pass directly through the hook-shaped ends and are secured thereon by nuts, substantially as described.

2. An elliptic spring having tension-rods secured to the ends thereof, which tension-rods pass and overlap each other and have upset ends and washers, and a spiral spring, C, interposed between said upset ends and washers, substantially as described.

257,206. PHOTOGRAPHIC CAMERA. THOMAS H. BLAIR, Cambridge, assignor to the Blair Tourograph and Dry Plate Company, Boston, Mass. Filed Jan. 14, 1882. (No model.)



Claim.—1. In combination with a photographic camera, an extension, C, having its inner end smaller in cross-section than the interior of the body of the camera and flaring outwardly therefrom, so that its outer end is larger in cross-section than the body of the camera, substantially as and for the purposes set forth.

2. In a photographic camera, the combination of box or body A with the tapering extension C, hinged or removably attached thereto, substantially as shown.

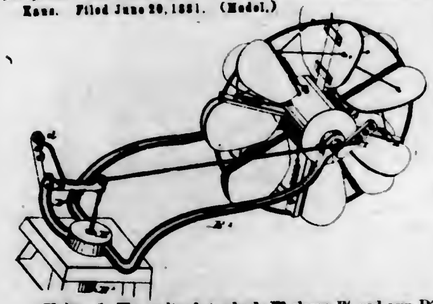
257,207. STEP-LADDER. DAVID W. BROOKS, Frederick, Md. Filed Nov. 3, 1881. (No model.)

Brief.—Perforated round-end cap-pieces, which fit upon the upper ends of the legs, are pivoted and moved in the curved sockets of the bracket, taking the vertical strain.

Claim.—A hinge attachment for step-ladders, consisting of a bracket, A, having a flange, *c*, with a curved socket, *c*, and pin *c*, and a perforated round-ended cap-piece, B, adapted to receive the end of one of the legs, and having its bearing in the curved socket, substantially as set forth.

267,208. CAR-COUPLING. EDWARD J. BURNS, Dayton, Ohio. Filed Mar. 17, 1882. (No model.)

Claim.—1. The detent having projections, as set forth, to engage the lower surface of the projection *m* of the draw-bar to relieve the pin against vertical strain, substantially as set forth.

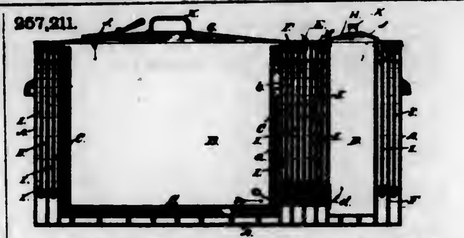


2. The projection *m* of the draw-bar to receive the longitudinal strain made by the draft of the engine, and thereby relieving the pin from strain, in combination with the coupling-bar, substantially as set forth.

267,209. HARNESS-PAD. PHILIP H. CASE, Alexandria, Minn., assignor of one-half to Robert J. McNeil, same place. Filed Feb. 11, 1882. (No model.)

Claim.—In a harness-pad, the burr or nut plate composed of the upper leather section, *d*, provided with the burrs or nuts *i*, and the metal plate *c*, riveted to the under surface of the leather section, all substantially as and for the purpose stated.

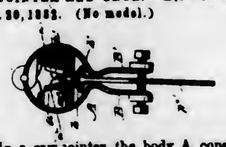
267,210. WIND-ENGINE. WILLIAM CASTERLINE, Concordia, Kans. Filed June 20, 1881. (Model.)



Claim.—1. The inclined standards E', sleeve E', and arm D', forming the frame E in one piece, combined with the winged wheel and proper crank-connections, as shown and set forth.

2. In a wind-engine, the sails arranged in pairs and hinged to radial arms G, in combination with cords A and spring A', substantially as and for the purpose described.

267,211. MEAT AND VEGETABLE PRESERVING CHEST. JOHN GRINGMAN, Dayton, Ohio. Filed Feb. 13, 1882. (No model.)



Brief.—Chambers B and D are covered by lids having wide depending flanges I, which enter water-filled spaces between triple walls A. Drawing lid H upward draws air from chamber B through valve *d*. Pressing it downward forces air out through valve *f*, and so on, forming partial vacuum in B, to aid preservation therein. Air is admitted through valve *f* in large lid to relieve (balance) pressure on lid when to be taken off.

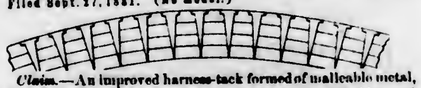
Claim.—1. A preserving-chest for meat, vegetables, and the like, composed of an outer box and an inner preserving-chamber, with space between the two filled with water or other liquid, and having a lid or cover with slides entering the water-space, in combination with an air-exhausting pump and an inflowing-air valve, substantially as described.

2. The herein-described meat and vegetable preserving chest, composed of the outer box, A, preserving-chamber B, with non-conducting walls, supplemental chamber D, division-walls E and F, lids G and H, with pendent sides I, vent *c*, and valves *d* and *f*, the whole constructed and arranged in the manner and for the purpose specified.

267,212. SAW JOINTER AND GAGE. MILO COVEL, Chicago, Ill. Filed Feb. 20, 1882. (No model.)

Claim.—1. In a saw-jointer, the body A, consisting of the semicircular parts *a a'*, hinged together at the back, and having the projecting jaws B B', provided with the set-screws F, and adapted to fold over upon itself, substantially as described.

2. In a saw-jointer, the combination, with the parts *a a'*, hinged together at the back, of the clamping-plates a^2 a^2, provided with the rectangular slots *d d'*, adapting the same to have a lateral adjustment, substantially as described.



3. In a saw-jointer, the combination, with the parts *a a'*, hinged together at the back of the clamping-plates a^2 a^2, the screws d^3 d^3, and the triangular files *b b'*, substantially as described.

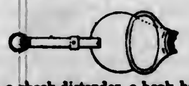
4. In a saw-jointer, the combination, with the parts *a a'*, of the clamping-plates a^2 a^2 and the notched locking-plate E, substantially as and for the purpose described.

5. In a saw-jointer, the combination, with the parts *a a'*, of the spring *f*, substantially as described.

6. In a saw-jointer, the combination, with the parts *a a'*, of the clamping-plates a^2 a^2, substantially as described.

267,213. TACK. ANDREW J. CULBERTSON, San Andreas, Cal. Filed Sept. 27, 1881. (No model.)

Claim.—An improved harness-tack formed of malleable metal, having a T-shaped head, a body having straight parallel sides, and a flattened point.



267,214. BAG-HOLDER. AUGUST CULTUM, Renville, Minn. Filed Jan. 25, 1882. (No model.)

Claim.—The herein-described bag-holder, consisting of standard A, having the folding legs B, pivoted arm E, provided with ring or hoop F, having hooks *a*, and brace H, pivoted to the rear end of beam E and adapted to engage with standard A, the parts being combined and arranged to operate substantially as set forth.

267,215. DENTAL CHEEK-HOLDER. JOHN HARRISON DOYLE, Hillsborough, Ohio. Filed Aug. 17, 1881. (No model.)

Brief.—The cheek-holder is provided with a mirror set in its lower portion.

Claim.—In a cheek-distender, a hook having its curved portion made narrow to accommodate the angle of the mouth and its inner end made large and provided with a reflector set in its surface, whereby the hook shall be adapted to represent the flow of saliva and serve as a speculum while distending the cheek, substantially as specified.

267,216. REFRIGERATOR-CAR. FRANK S. HASTMAN, Washington, D. C. Filed Mar. 7, 1882. (No model.)

Claim.—1. A railway-car provided with one or more refrigerating-chambers isolated from the interior of the car, substantially as shown and described, whereby the car is adapted for the transportation of perishable goods and passengers without subjecting the latter to an unusual temperature or atmosphere.

2. In a railway-car, one or more chambers located below the approximate line of load, and provided with non-conducting walls, substantially as and for the purpose explained.

3. A railway passenger-car provided with refrigerating-chambers beneath its seats, said chambers being isolated from the interior of the car, as set forth.

4. A railway passenger-car provided with chambers or compartments beneath its seats, communicating with an air-duct also beneath the seats, and an ice or cooling chamber communicating with said air-duct, as explained.

5. A railway-car provided with one or more refrigerating or cooling chambers isolated from the interior of the car, and one or more ice-chambers located above the refrigerating-chambers and communicating therewith.

6. The combination, in a railway-car, of one or more refrigerating or cooling chambers located below the line of load, an ice box or boxes located above the chambers and communicating therewith, and a pipe or pipes opening from the upper part of the cooling-chambers into the upper part of the ice-chambers, whereby a constant circulation of air through the ice-box and chambers is secured.

7. In combination with the ice-box F, the water-tank E, located by the side of the ice-box, and furnished with tubes *n*, whereby the water is cooled, as explained.

8. In a car for the transportation of live fish, &c., requiring water, two vertically-adjustable water-tanks arranged, substantially as described, to be alternately raised and lowered, whereby the water may be caused to flow from one to the other alternately in opposite directions.

9. In a refrigerator-car for the transportation of fish, &c., requiring water, two water-tanks suspended from common cables passing over pulleys, whereby the weight of one tank is caused to counterbalance the weight of the other.

10. In a refrigerator-car, the combination of a vertically-moving water-tank and a rack and pinion for raising and lowering the same, as shown.

11. In a refrigerating-car for transporting fish, &c., a water-tank and a water-pipe provided with flexible tubes and couplings, in combination with a series of cans or vessels having nipples to receive said couplings, as and for the purpose set forth.

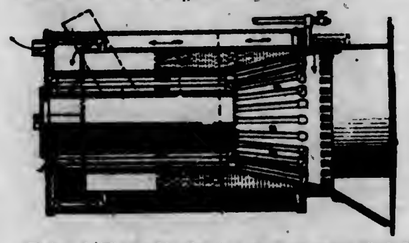
12. In a refrigerator-car, a cooling-chamber located below the line of load and having its inside wall made in the form of a truss, as set forth.

13. A non-conducting wall for the refrigerating-chamber of a railway-car, having its open space filled with papier-maché, as and for the purpose explained.

14. In a railway-car, the combination, with a carrying-wheel of the truck, of a friction-wheel adapted and arranged to bear upon the tread of said wheel and to impart motion to a fan or apparatus in the car.

15. In combination with the pulley U', secured upon a shaft carried by the car-body, the friction-wheel Q, carried by the truck and provided with spool or pulley E', the pulley X', also carried by the truck, and a belt passing about said pulleys, as and for the purpose specified.

16. In combination with a car-truck, a vertically-moving standard, S, secured to the truck and carrying a friction-wheel, Q, as and for the purpose explained.



17. The combination, in a car for transporting live fish, &c., of a water-tank, a series of vessels connected with said tank by a pipe or pipes, and an air-pipe opening into said vessels, whereby the fish are supplied with fresh air and water.

18. A refrigerator-car provided with a refrigerating or cooling chamber below the side trussing of the car, and a door above said trussing extending to the roof-plate and the full width of the panel, whereby a proper opening for the entrance and removal of goods is provided without weakening the car-wall.

19. In a car provided with side doors, as shown and described, the combination of an overhead truck, a trunk running upon said truck, and a pivoted lever suspended from said truck, whereby goods may be lifted, transported, and thrust through said side doors, as set forth.

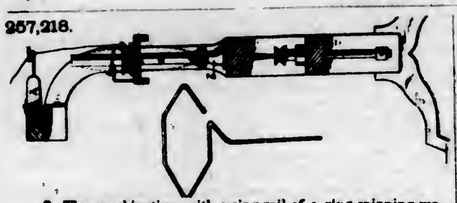
20. In a car substantially such as shown and described, a water-tank beneath the car, provided with cross-bearers *p*, as and for the purposes set forth.

267,217. STEAM-GENERATOR. CHARLES GORTON, Philadelphia, Pa. Filed Mar. 23, 1882. (No model.)

Claim.—1. The combination, in a steam-generator, of a boiler composed of two independent cylindrical sections concentrically arranged in such manner that an annular flame-space is formed between them their entire length, the inner cylinder forming a fuel-magazine and terminating at the crown of a conical fire-chamber, said chamber having at its lower end or base a casting provided with fingers or serrations flaring upward in opposite directions from the downwardly-diverging conical fire-box, whereby an angular air-space is formed for the better supply of air to the fuel above the grate when the latter is choked with ashes, substantially as described.

2. The combination, in a vertical steam-generator, of an outer water-space angular in transverse section at its base, the inner wall diverging outwardly and forming a conical fire-chamber, and a circle of tubes forming a fire-lining for said chamber, said tubes encircling the base of a fuel-magazine at their upper ends, in the manner shown and described.

3. The combination, in a steam-boiler, of the outer water-space with a central fuel-magazine, the single series of water-tubes forming the fire-box lining, and the double nest of tubes interposed between the fuel-magazine and the outer water-space, and connecting with the lower tubes, whereby a rapid circulation of water is maintained and an increased generating-surface produced, in the manner set forth and described.

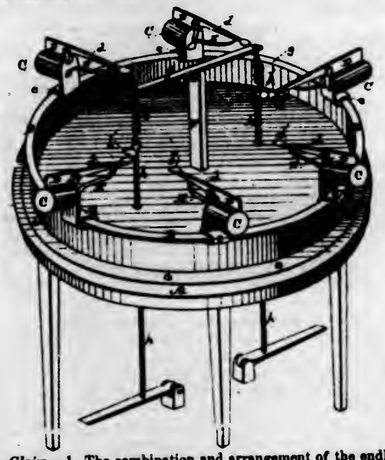


4. In a steam-generator of the vertical type, an outer water-space provided preferably at its bottom with a conical combustion-chamber, a central magazine, a series of circulating and generating tubes annularly arranged between the water-space and the magazine, and a fingered or serrated casting surrounding the grate, with or without the air-supplying tubes, all arranged and combined in the manner and for the purpose set forth.

5. In a steam-generator of the vertical type, an outer water-space provided at its bottom with a conical combustion-chamber, a central magazine, and a series of circulating and generating tubes annularly arranged between the water-space and the magazine, said series of tubes extending down and forming the fire-box lining, substantially as described.

267,218. THREAD GUARD OR CONTRACTOR FOR SPINNING-MACHINES. JUSTUS H. GRIFFIN, Holyoke, Mass. Filed Nov. 21, 1881. (No model.)

Claim.—1. A thread guard or contractor having a series of angular sides or faces, substantially as and for the purpose set forth.

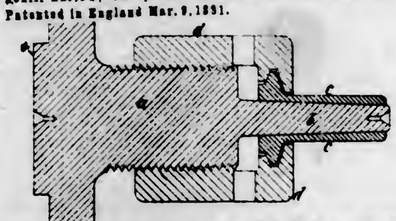


257,218.

2. The combination, with a ring-rail of a ring-spinning machine, of a thread guard or contractor having a series of angular sides or faces, and connected to said ring-rail, substantially as and for the purpose described.

257,219. ENDLESS TRACK FOR SEAMING-CYLINDERS FOR CANS. JOSEPH P. HALLAN, San Francisco, Cal., assignor of one-half to Solomon Wangenheim, same place. Filed Feb. 8, 1882. (No model.)

Brief.—Independent soldering-clamps sliding on the flanged edge of the stationary ring B.

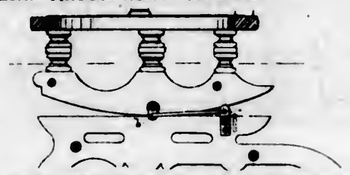


Claim.—1. The combination and arrangement of the endless track B and the seaming or forming cylinders C C, fitted upon the track and adapted to slide thereon, substantially as and for the purpose herein described.

2. The combination and arrangement of the endless track B, seaming or forming cylinders C C, having the pivoted retaining-knives D D and a spring, E, and a mechanism for raising said knives, substantially as and for the purpose herein described.

3. The combination and arrangement of an endless track, B, seaming or forming cylinders C C, having the pivoted retaining-knives D D, with stems *d d*, and held down by a spring, E, and the means for raising said knives, consisting of the rods *h h*, attached to a treadle, and having beads *h'*, adapted to engage with the ends of the stems *d d*, said rods being attached to springs *g g*, suspended from a standard, F, substantially as and for the purpose herein described.

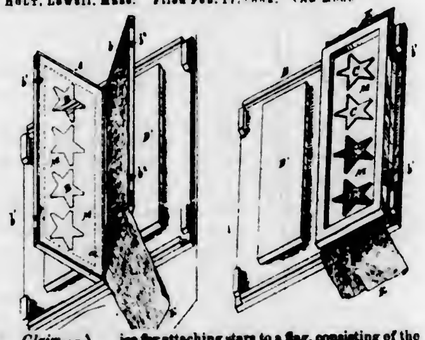
257,220. EXPANDING MANDREL. JOSEPH HARRISON, Manchester, County of Lancaster, England, assignor to Henry Burnehill Barlow, same place. Filed Feb. 6, 1882. (No model.) Patented in England Mar. 9, 1881.



Claim.—1. In an expanding mandrel, the boss *a*, having a flange at its outer end, said flange having a projection, *a'*, for the purpose set forth.

2. The combination, with boss *a*, having tapering spindle *b*, of the nut *d* and the dies *c*, said dies being formed concave on the inner surface to fit the surface of the spindle, and provided with projections *c'*, substantially as shown and described.

3. The solid tapering spindle *b*, formed with or attached to boss *a*, in combination with the dies *c*, each provided at its outer end with a projection, *c'*, and at its inner end with a flange which connects with nut *d*, substantially as and for the purpose set forth.



4. The combination, with boss *a*, having solid spindle *b* and dies *c*, of the nut *d*, which engages at one end with said boss by means of screw-threads and at the other end with the dies by means of a recessed part, which fits and connects with a flange formed on the dies, substantially as set forth.

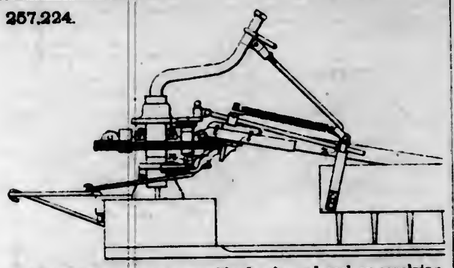
257,221. BASE ROCKING-CHAIR. LEVI HAYWOOD, Gardner, Mass. Filed Dec. 8, 1881. (No model.)

Claim.—The rocking portion and base of a base rocking-chair, combined with right-angled torsional springs loosely connected to the rocking portion by centrally-arranged links, and extending thence rearwardly, and rigidly connected to the base on one side at their angles and on opposite sides by their extreme ends, all substantially as herein shown and described.

257,222. DEVICE FOR ATTACHING STARS TO FLAGS. JOHN HOLT, Lowell, Mass. Filed Feb. 17, 1882. (No model.)

Claim.—A [illegible] ice for attaching stars to a flag, consisting of the frame A, provided with hinges *a*, hooks and eyes *b'* and *b²*, respectively, and also equipped with the linings M, said linings containing the star-shaped openings B, said openings within each side of the frame being exactly opposite each other, the abrasive strips *b*, the mold-board D, with two moldings, D', the holding-weight H, and the drying-weight G, constructed, arranged, and combined substantially as described and shown.

257,223. VEHICLE-HUB. FREDERICK H. HURTLE, Dowagiac, Mich. Filed Sept. 10, 1881. (Model.)



Claim.—The vehicle-axle having screw-thread I and annular flange H, in combination with the interiorly-threaded sand-band J, abutting against the said flange H, and the hub having double-flanged band D, as shown and specified.

257,224. HARVESTER-RAKE. J. HENRY JONES, Rockford, Ill., assignor to Ralph Emerson and William A. Talcott, same place. Filed July 28, 1879.

Claim.—1. The combination of the crown-wheel, the bent or

257,224.

overhanging rake-post, a combined rake and reel or revolving rising and falling arm provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, a flexible lengthening and shortening connection between the rake-head and upper part of the rake-post, which connection admits of the distance between the rake-head and upper part of the post being increased when acting as a rake and decreased when the rake-head is changed to a reel-bat, and a dog having the capability of being interposed between the crown-wheel and the rake-arm to cause said head to act as a reel-bat, substantially as hereinbefore set forth.

2. The combination of the crown-wheel, the bent or overhanging rake-post, a combined rake and reel or revolving rising and falling arm provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, a flexible lengthening and shortening connection between the rake-head and upper part of the rake-post, which connection admits of the distance between the rake-head and upper part of the rake-post being increased when acting as a rake and decreased when the rake-head is changed to a reel-bat, a dog for interposition between the crown-wheel and rake-arm, and tripping mechanism, substantially as and for the purpose hereinbefore set forth.

3. The combination of the crown-wheel, the bent or overhanging rake-post, a combined rake and reel or revolving rising and falling arm provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, the flexible lengthening and shortening connection (consisting of a jointed pitman or link and swinging bracket) between the rake-head and upper part of the rake-post, which connection admits of the distance between the rake-head and upper part of the post being increased when acting as a rake and decreased when the rake-head is changed to a reel-bat, and a dog having the capability of being interposed between the crown-wheel and the rake-arm to cause said head to act as a reel-bat, substantially as hereinbefore set forth.

4. The combination of the crown-wheel, the bent or overhanging rake-post, a combined rake and reel or revolving rising and falling rake-head having the capacity of acting either simply as a reel-bat or as a rake, the flexible lengthening and shortening connection (consisting of a jointed pitman or link and swinging bracket) between the rake-head and upper part of the rake-post, which connection admits of the distance between the rake-head and upper part of the post being increased when acting as a rake and decreased when the rake-head is changed to a reel-bat, a dog for interposition between the crown-wheel and rake-arm, and tripping mechanism, substantially as and for the purpose hereinbefore set forth.

5. The combination of the crown-wheel, the bent or overhanging rake-post, the hinged rake-arm, a lengthening and shortening flexible or link connection between the rake-head and upper part of the rake-post, and a spring having the capacity of assisting in holding the rake-head down to its work, and yet allowing it to yield and its teeth to rise above the platform, substantially as and for the purpose hereinbefore set forth.

6. The combination of the crown-wheel, the bent or overhanging rake-post, the hinged rake-arm, a lengthening and shortening connection between the rake-head and upper part of the rake-post, a spring having the capacity of assisting in holding the rake-head down to its work, and yet allowing it to yield and its teeth to rise above the platform, and means controllable by the driver to prevent the descent of the rake-head to the platform when it is desired to have said head act as a reel-bat simply, substantially as hereinbefore set forth.

7. The combination of a combined rake and reel or revolving rising and falling arm provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, the bent or overhanging rake-post, the flexible lengthening and shortening connection (consisting of a jointed pitman or link) between the rake-head and the upper part of the rake-post, and a spring assisting to hold the rake-head down to its work when operating as a rake, and yet allowing of the action of said head as a reel-bat when desired, substantially as hereinbefore set forth.

8. The combination of a combined rake and reel or revolving rising and falling arm provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, the crown-wheel, the bent or overhanging rake-post, the flexible lengthening and shortening connection (consisting of a jointed pitman or link) between the rake-head and the upper part of the rake-post, a spring assisting to hold the rake-head down to its work when operating as a rake, and yet allowing of the action of said head as a reel-bat when desired, and a dog having the capability of being interposed between the crown-wheel and the rake-arm, substantially as hereinbefore set forth.

9. The combination of a combined rake and reel or revolving rising and falling arm provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, the crown-wheel, the bent or overhanging rake-post, the flexible lengthening and shortening connection (consisting of a jointed pitman or link) between the rake-head and the upper part of the rake-post, a spring assisting to hold the rake-head down to its work when operating as a rake, and yet allowing of the action of said head as a reel-bat when desired, a dog for interposition between the crown-wheel and rake-arm, and tripping mechanism, substantially as and for the purpose hereinbefore set forth.

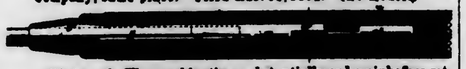
10. The combination, substantially as hereinbefore set forth, of the bent or overhanging rake-post, the crown-wheel, a rising and falling rake-arm hinged to the crown-wheel and provided with a rake-head having the capacity of acting either simply as a reel-bat or as a rake, the flexible lengthening and shortening connection (consisting of a jointed pitman or link) between the rake-head and upper part of the rake-post, which connection admits of the distance between the rake-head and upper part of the rake-post being varied, and a dog having the capability of being interposed between the crown-wheel and rake-arm for converting the rake-head into a reel-bat, whereby when said head is acting as a reel-bat the arm in passing over the platform will be supported by the dog resting on the crown-wheel, and during a corresponding time in its revolution, when the head is acting as a rake, the arm will be supported on the crown-wheel.

11. The combination, substantially as hereinbefore set forth, of the crown-wheel, the inwardly-bent or overhanging rake-post, the rake-carrying arm hinged at its heel to the crown-wheel near its edge and playing vertically, and a compensating connection between the rake and the rake-post, said connection being both flexible or transversely yielding and self-adjusting in length, for the purpose described.

12. The combination of the crown-wheel, the inwardly-bent or overhanging rake-post, the rake-arm hinged to the crown-wheel remote from its center and playing vertically, and a self-compensating connection between the rake-arm and the rake-post, having a constant spring-pressure exerted upon it, acting with a tendency to elongate it, and limited in its contractive adjustment, substantially as and for the purpose set forth.

13. The combination, substantially as hereinbefore set forth, of the crown-wheel, the inwardly-bent or overhanging rake-post, the rake-carrying arm hinged at its heel to the crown-wheel, so as to play vertically, and a self-compensating connection between the rake-arm and rake-post, the link or pitman portion of which connection is adjustable to vary the distance between the points of attachment of the compensating connection with the rake-post and the rake-arm, for the purpose described.

14. The combination, substantially as hereinbefore set forth, of the crown-wheel, the inwardly-bent or overhanging rake-post, the rake-arm hinged at its heel to said crown-wheel near its edge or remote from its center, and the bracket and pitman of the self-compensating connection, said bracket being pivoted on the rake-arm and swinging in a path at, or about at, a right angle with the plane of movement of the rake about its heel-pivot, and said pitman being doubly jointed at one end to the bracket and flexibly connected at its opposite end with the rake-post, about which it turns eccentrically to the crown-wheel, for the purpose set forth.



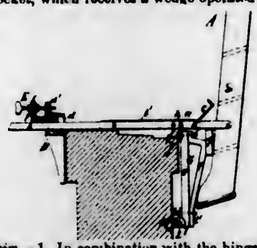
15. The combination of the rake-arm, the swinging bracket, the rod provided with a stop and playing loosely endwise in said bracket, and the spring, substantially as set forth.

16. The combination of the rake-arm, the pivoted swinging bracket thereon, the pitman turning about the rake-post, and the rod which plays loosely endwise in said bracket, substantially as set forth.

17. The combination of the crown-wheel, the rake-arm, the swinging bracket, the rod which plays loosely endwise in the bracket, the pivoted dog, and the spring-latch, substantially as set forth.

18. The combination of the rake-carrying arm carried by the crown-wheel and having vertical play about its hinged connection therewith, the inwardly-bent or overhanging rake-post, the swinging bracket and pitman adjustably connecting the rake-arm and rake-post, the rod sliding or moving endwise in the rake-arm bracket and serving to limit its inward play, the spring connecting said bracket and rod, and the crank-plate turning at intervals to positively move the sliding rod, for the purpose described.

257,225. DENTAL TOOL-HOLDER. Gideon Harris, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Mar. 13, 1882. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of a sectional handle, a tool-holding chuck carried by said handle and movable endwise therein, and a connection between said tool-holding chuck and a movable section of said handle, whereby said tool-holding chuck is operated to clamp or release a tool by being moved endwise in said handle.

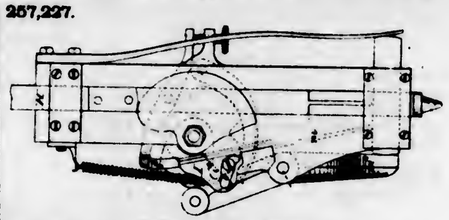
2. The combination, substantially as hereinbefore set forth, of the handle composed of a tubular or socketed front section to receive a split or spring jawed chuck, an intermediate tubular section having an operating-connection with the rear end of said chuck, and a third section connected with the front section by a connecting-piece around which the intermediate section turns to manipulate said chuck.

257,226. COMBINED STEP-LADDER AND WINDOW-SCAFFOLD. Mary S. Kjellbergh, New York, N. Y. Filed Feb. 16, 1882. (No model.)

Brief.—The leg-frame having a platform has brackets pivoted thereto by means of lug-castings. The bracket consists of a straight bar with an angular piece having flanges, by which it is bolted to the straight piece. The angular pieces are connected by a cross-bar. The lower end of the straight bar has a lug with curved slot to receive a rod. The legs each have a sliding bracket provided with a socket, which receives a wedge operated by a set-screw.

Claim.—1. In combination with the hinged leg-frame B of a ladder, A, provided with the exterior platform-supporting brackets, G, the socketed sliding brackets D, and the screw-clamped tightening-wedges F, to support the apparatus as a window-scaffold, substantially as set forth.

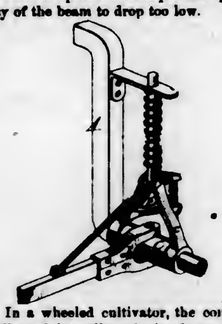
2. In combination with the hinged leg-frame B and ladder A, the brackets G, hinged to the said leg-frame, and provided with the cross bar or board *g*, bearing with its upper edge against the leg-frame and with its outer edge against the ladder-frame when in use as a scaffold, substantially as and for the purpose set forth.



3. In combination with the leg-frame B of the ladder A, the brackets G, consisting of the bar H, the triangular bracket I, having flanges *i i'*, the lipped casting J, having pivoting-lug *h*, the lipped casting L, having lug M, and the fastening-bolts K *k*, substantially as specified.

4. In combination with the platform-supporting brackets G of a combined step-ladder and window-scaffold, the castings L, having lugs M, and curved slots *m* in the said lugs, for the reception of a rod to afford bearing against the outer wall, substantially as specified.

257,227. MAILING-MACHINE. Albion Knowlton, Boston, Mass. Filed Jan. 7, 1882. (No model.)



Claim.—The combination of intermittently-reciprocating wire nipper, the slide to which the nipper is pivoted, the cam-actuated lever, the spring to retract the nipper-slide, and the actuating-lever and the adjustable stop to limit the upward stroke of the nipper, substantially as and for the purposes specified.

257,227.

257,228. CULTIVATOR. Edward F. Lynch, Davenport, Iowa. Filed Feb. 24, 1882. (No model.)

Brief.—Two springs, one to aid in lifting the shovels out of the ground, the other to operate as a suspension-spring to counteract any tendency of the beam to drop too low.

Claim.—1. In a wheeled cultivator, the combination of the axle, the vertically and laterally swinging beam journaled to the axle, the lifting-arm journaled upon the axle independently of the beam-coupling, the vertically-sliding rod jointed to the lifting-arm, the spring depressing said rod, and the connection extending from the lifting-arm to the beam, substantially as shown and described.

2. The combination of the axle, the coupling-box mounted upon the axle, the beam jointed to the coupling-box, the lifting-arm mounted upon the axle independently of the coupling-box, the vertical rod jointed at one end to the lifting-arm, the spring, and the connection from the beam to the lifting devices, substantially as shown.

3. In combination with the laterally and vertically swinging beam, the lifting-arm arranged to swing about a horizontal axis, and a jointed connection between the lifting-arm and the beam and a spring, applied substantially as described, to urge the upper end of the lifting-arm downward.

4. In combination with the beam, the axle, and the coupling-box connected to said parts, the lifting-arm arranged to straddle the coupling-box and connected by intermediate devices, substantially as shown, with the beams.

5. The combination of the axle, the coupling-box, the beam, the lifting-arm independent of the coupling-box, the connection between the lifting device and the beam, the vertical rod with forward extension at its foot, and the two springs, applied substantially as described and shown.

257,229. CULTIVATOR. Edward F. Lynch, Davenport, Iowa. Filed Feb. 8, 1882. (No model.)

Brief.—A rigid arm and a loose arm upon the beam-coupling. Two springs, one attached to each arm. One spring is intended to lift the beam out of an operative position and the other to resist any tendency to go below and to act as a spring-suspension.

Claim.—1. The combination of the beam and the arm connected therewith, the secondary arm having a limited play in relation to the first arm, the rod pivoted to the second arm, and the two springs, applied substantially as described and shown.

2. The combination of the beam and the arm connected therewith, the second arm mounted loosely on the axle, and the lifting-spring and the suspending-spring, substantially as described and shown.

3. In combination with a beam and a rigid arm connected therewith, a second arm actuated by a beam-lifting spring, and a suspension-spring between the two arms, substantially as shown.

4. The combination of the beam and its arm, the independent arm, the suspension-spring, and the spring-adjusting device.

5. The combination of the beam, the upright arm connected therewith, the independent arm, the intermediate spring, the rod united to the independent arm, the knuckle-joint, and the spring mounted upon the rod, as shown.

6. In combination with the vertically-swinging cultivator-beam, a spring tending to elevate the same, and a second and stronger spring located intermediate between the arm and the first spring, in the manner and for the purpose substantially as described and shown.

257,230. BREECH-LOADING ORDNANCE. Henry F. Mann, Pittsburg, Pa. Filed Mar. 2, 1882. (No model.)

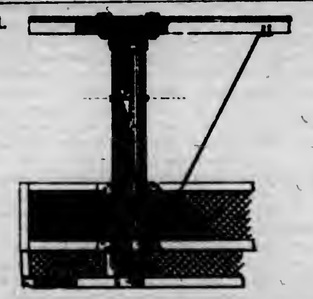
Claim.—1. The combination, with a barrel pivoted on side straps, of a breech-block, a transom or cross-head, a breech-screw in the transom or cross-head to operate the breech-block, and side straps pivoted on a carriage, substantially as and for the purpose specified.

2. In breech-loading ordnance, the combination, with a barrel pivoted on side straps, the side straps pivoted on the carriage and having a slotted block on its under side near the breech, of a breech-block and a crank-shaft pivoted on the side straps and passing through the slotted block, the side straps having separate trunnions, substantially as and for the purpose specified.

3. In breech-loading ordnance, the combination, with a barrel reduced and re-enforced at its breech, of side straps in which the barrel is pivoted on trunnions integral with said barrel, the side straps being pivoted on a suitable carriage by separate trunnions, substantially as and for the purpose specified.

4. In breech-loading ordnance of the character described, in which the breech-block is connected to the trunnions of the gun by side straps, a rack formed on the rear face of the barrel, a shaft passing transversely through side straps, a pinion or pinions on said shaft to engage the rack, and a crank for turning the shaft, all constructed and arranged substantially as described, for the purpose of opening and closing the barrel.

5. In breech-loading ordnance, the combination, with a barrel pivoted on side straps, of a saddle attached to the side straps and a slotted link pivoted on the barrel and connected with the saddle, substantially as and for the purpose specified.

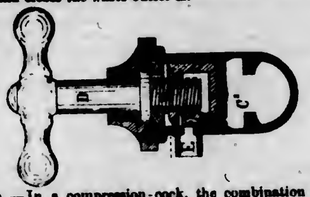


6. In breech-loading ordnance, the combination of side straps having a saddle for the support of the rear end of the barrel, a barrel pivoted on the side straps and having a rack attached to or formed on its rear end, a slotted link pivoted on the barrel and connected with the saddle, and a breech-block having pinions mounted on a shaft and let into the breech-block, substantially as and for the purpose specified.

7. The combination, with a pivoted barrel having a rack on its rear end, of a breech-block having pinions let into it and mounted on a shaft journaled in the side straps, said shaft having lateral play in the breech-block, a cross-head, and a breech-screw, substantially as and for the purpose specified.

257,231. SHIELD FOR RAILWAY-CARS. Seth G. Mason and John L. Hanson, Somerville, Mass. Filed Aug. 8, 1881. (No model.)

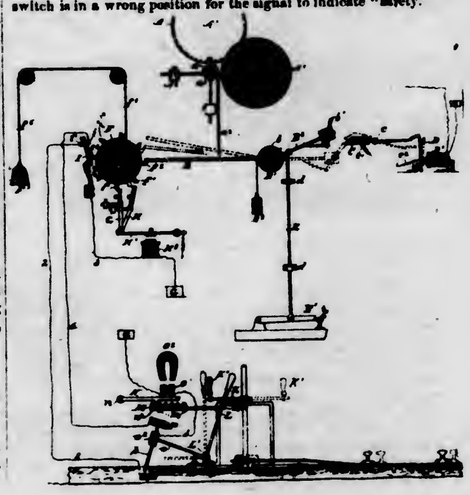
Claim.—1. The combination, with a railway-car, of the cylinder-posts, pistons, divided shields, and their attaching mechanism, all arranged and operating in the manner set forth.



257,231.

2. The spiral spring-belt and curve, with its connecting mechanism at the ends of the movable shield, all arranged substantially as and for the purposes specified.

257,232. WASTE COMPRESSION-COCK. Edward W. McGeniss, New York, N. Y., assignor to Charles Harrison, same place. Filed Feb. 6, 1882. (No model.)

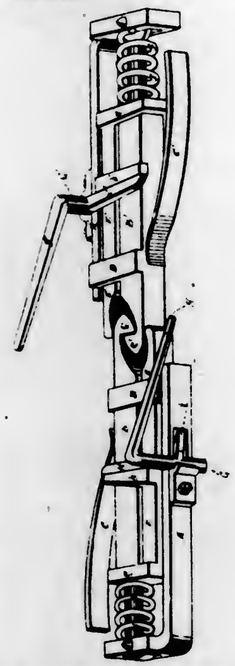


Brief.—Wedge F is fitted loosely in the side of the plug, and opens and closes the waste-outlet E.

Claim.—In a compression-cock, the combination of the actuating stem D, the valve-plug C, and the wedge F, for closing the waste-outlet, substantially as set forth.

257,233. ELECTRIC SIGNAL FOR RAILWAYS. Charles J. Mears, Boston, Mass. Filed Nov. 14, 1881. (No model.)

Brief.—A signal is held normally at "safety" through weighted connections, and is operated to "danger" by a passing train, and there secured through an electro-magnetic locking device until the train passes a given point ahead, when said lock is released through a current from said point, and the signal thereby resumes "safety." The signal is also capable of being operated to indicate the position of a switch through a weighted motor controlled by an electro-magnet, two wires extending from the signal-operating mechanism to the switch-stand, a current-changer operated by the motor being so arranged that currents by one wire set the signal to "danger" and by the other allows it to go to "safety," it being impossible to close the latter circuit when the switch is in a wrong position for the signal to indicate "safety."



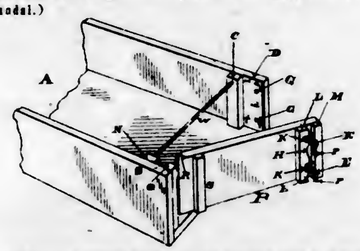
Claim.—1. In an electric railway-signal, the combination of the following elements, namely: a weighted signal, A', having a tendency to turn to indicate "danger," weight B', normally holding the said signal at "safety," mechanism operated by a passing train entering the section of railroad-track to raise said weight to allow the signal to gently rotate to "danger," and an electro-magnetic locking device for holding the weight in its raised position until said locking device is operated by the train leaving the said section of track, substantially as and for the purpose set forth.

2. The combination of the weighted signal A', chain *a'*, arm B, weight B', acting on said arm and overbalancing the weighted signal A', arm B', bearing a pawl, *b'*, latch-lever C, and armature-lever D, substantially as and for the purpose set forth.

3. The combination of the toothed wheel F, latches G and H, separated from one another by a distance equal to about three-fourths of the distance between the teeth of the toothed wheel, and an electro-magnet controlling said latches, substantially as and for the purpose set forth.

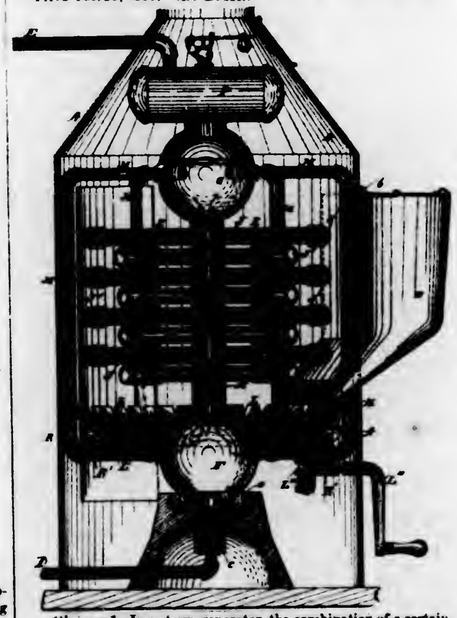
4. In a magneto-electric switch-signal apparatus, the combination of the following elements, namely: a lever, L, normally in the path of the switch-operating crank K, a magneto-electric generator caused to be operated by the said lever L when it is moved in either direction, a commutator which transmits the magneto-currents over the wire which sets the signal at "danger" when the lever L is moved out of the path of the switch-operating crank K and over the safety-wire when the lever L is moved into the path of the switch-operating crank K, and a frame, S, which prevents the last-mentioned movement except when the switch-rails are in their normal position, substantially as and for the purpose set forth.

257,234. CAR-COUPLING. FRANK MILLER, Olema, Cal. Filed Mar. 7, 1882. (No model.)



Claim.—1. In combination with the meeting horizontal coupling hooks or bars B B', pivoted at their rear ends and having hooked heads *e e'*, and the impinging springs C C', the horizontal sliding guard-bars E E', lying parallel with said coupling-bars B B' upon opposite sides of each, respectively, and held forward in position by the springs *f f'*, substantially as and for the purpose herein described.

2. The combination and arrangement of the pivoted coupling hooks or bars B B', with their hooked heads *e e'*, and guide-sockets D D', springs C C', and guide-bars E E', with their guide-sockets *e e'* and springs *f f'*, substantially as herein described.



3. The meeting horizontal coupling hooks and bars B B', pivoted at their rear ends and having hooked heads *e e'*, and the impinging springs C C', in combination with the horizontal sliding guard-bars E E', lying parallel with said coupling-bars upon opposite sides of each, respectively, and held forward by springs *f f'*, and a means for uncoupling the coupling-bars, consisting of the vertical shafts G G', with their arms H H' impinging against lugs *h h'* upon the guard-bars, arms *i i*, and cranks *g g'*, or equivalent means, as shown, substantially as herein described.

257,235. END-GATE FOR WAGONS. OTIS WARREN MOORE, Monticello, Ill., assignor of two-thirds to Caleb Dana Moore and Carlton Wright, same place. Filed Aug. 26, 1881. (No model.)

Claim.—In combination with the side-boards of a wagon-body, said sides having chambered standards or cleats N O, forming a recess, X, on one board, and the standard C and perforated plate G on the opposite board, the end-gate B, having standards or cleats M L S, and provided with right-angled bolts E and snap-catch P, said bolts engaging with notches and perforations in the standards L M, respectively, and adapted to enter perforations in the plate G, substantially as and for the purpose set forth.

257,236. STEAM-GENERATOR. THOMAS G. MORSE, Erie, Pa. Filed Oct. 28, 1881. (No model.)

Claim.—1. In a steam-generator, the combination of a certain vertical tube containing a second central vertical tube, with tubes radiating from the outer vertical tube in series, arranged at stated intervals, and having tubes contained therein, substantially as shown, and radiating from the inner central vertical tube, substantially as set forth.

2. In a steam-generator, the combination of a central vertical tube containing a second vertical tube having its lower end opening into a mud-drum with tubes radiating from the outer vertical tube in series, arranged at stated intervals, and having tubes contained therein, substantially as shown, and radiating from the inner central vertical tube, substantially as and for the purpose set forth.

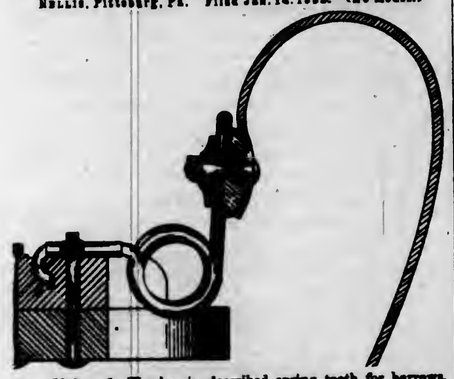
3. In a steam-generator, the combination of a central vertical tube containing a second vertical tube, and having a mud-drum attached to the bottom and a steam-chamber at the top, with tubes radiating from the outer vertical tube in series, arranged at stated intervals, and having contained therein tubes radiating from the inner vertical tube, substantially as described.

4. In a steam-generator, the combination of a central vertical tube containing a second vertical tube, and having a mud-drum attached to the bottom and a steam-chamber at the top, with tubes radiating from the outer vertical tubes in series, arranged at stated intervals, and having contained therein tubes radiating from the inner vertical tube, and a series of communicating tubes connecting the steam-chamber and the mud-drum, substantially as described.

5. In a steam or hot-water generating boiler which has two concentric vertical tubes and tubes radiating from each of said tubes concentrically, the combination, with the outer radial tubes, of T-shaped caps J' at their outer extremities, substantially as and for the purposes mentioned.

6. In a steam-generator, a system of tubes for the circulation of water, having a grate arranged within and partly supported upon the outer series of tubes, substantially in the manner described, and for the purpose set forth.

7. In a steam-generator, a system of tubes for the circulation of water, having a grate arranged within and partly upon the outer series of tubes, and the whole mounted upon and in combination with a swivel-joint on the supply-pipe, in the manner substantially as described, and for the purpose set forth.



8. In a steam or hot-water generating boiler having the tubes H and I and J and K, and the sphere or chamber F, the combination therewith of the pedestal C, friction-rollers O, and swivel-joint *c*, substantially as and for the purposes set forth.

9. In a steam or hot-water generating boiler, the combination, substantially as and for the purposes set forth, of the following elements: the upright pipes H and I, the radial pipes J and K, the chambers F and G, the connecting-pipes M, the pedestal C, friction-rollers O, supply-pipe D, and swivel-joint *c*.

10. A steam or hot-water generator consisting of the combination, substantially as described, of the following elements: a boiler consisting of the tubes H I J K M and spheres F and G, arranged together substantially in the manner specified, a furnace consisting of the case A, magazine B, grate L, grate-mountings R R', and grate-actuating mechanism L' L'' L'''.

11. In a steam or hot-water generating apparatus, the combination, substantially as described, of the following elements: the case A, grate L, grate-mountings R R', grate-actuating devices L' L'' L''', boiler-mountings C and O, and boiler F G H I J K M.

257,237. HARROW OR CULTIVATOR TOOTH. AARON J. NELLIS, Pittsburg, Pa. Filed Jan. 14, 1882. (No model.)

Claim.—1. The herein-described spring-tooth for harrows, cultivators, and like implements, composed of a cutting or tooth proper and a coiled spring-section, the coil of the spring-section arranged opposite the face of the tooth-section, and the center of the coil-section below the suspension-arms by which the tooth is attached to the frame, substantially as and for the purpose specified.

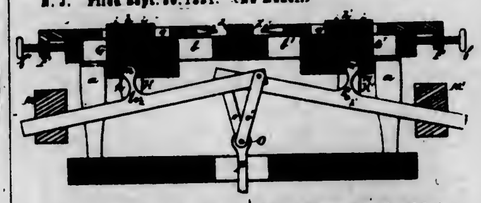
2. In a harrow, cultivator, or like implement, the combination, with the frame, of a spring-tooth composed of a cutting or tooth section proper and a coiled spring-section secured thereto opposite the face of the cutting-section, the suspension-arms of the spring-section being arranged above the center of the coil and attached to the upper surface of the harrow-frame, substantially as and for the purpose specified.

3. In a spring-tooth for harrows, cultivators, and like implements, the combination of a spring-section having the vertical loop or arm, a cutting-section or tooth proper having the curved heel, and the interposed saddle having the curved face, the cutting-section adjustable on the spring-section in the arc of a circle, and also vertically, whereby both the draft and cutting-angle of the tooth can be changed, substantially as and for the purpose specified.

4. In a tooth for harrows, cultivators, and like implements, the combination of the cutting-section having the curved heel, the coiled spring-section having the vertical loop or arm, and the interposed saddle having the curved face to receive the heel of the cutting-section, substantially as and for the purpose specified.

5. In a spring-tooth for harrows, cultivators, and like implements, the combination of a hooked section or tooth proper, and the coiled spring-section having the vertical arm or loop for the attachment of the hook-section, and the suspension-arms which project at a right angle to the loop-section and in a plane above the center of the coil, substantially as and for the purpose specified.

257,238. SPINNING-RING AND HOLDER THEREFOR. HORATIO L. PERRY, Providence, R. I., assignor of one-fourth to William W. Johnston, same place. Filed July 10, 1880. (No model.)



Claim.—1. The combination, with the holder adapted to be secured to the rail concentrically with the spindle-aperture thereof, of the ring and devices for loosely connecting the same to the top of said holder, whereby a limited play laterally thereon in all directions is permitted to the ring, substantially as described.

2. The combination, with the holder A, adapted to be secured in the spindle-aperture of the ring-rail of a spinning-machine, and having a flange, *a*, recessed in its under side, and provided with apertures *i i*, of the ring C, sitting loosely upon the top of said flange and provided with downwardly-projecting pins fitting loosely through the apertures in said flange, and headed on the under side thereof, substantially as described.

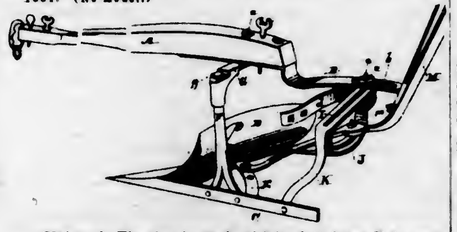
257,239. PROCESS OF UTILIZING SPENT LIME FOR BRICKS AND TILES. ERNEST L. RANSOME, San Francisco, Cal. Filed May 26, 1881. (No specimens.)

Claim.—A brick or tile composed of spent lime which is first pulverized and then subjected to heavy pressure in molds, substantially as described.

257,240. PUNCHING-MACHINE. JOHN M. RILEY, Kearney, N. J. Filed Sept. 30, 1881. (No model.)

Claim.—1. In a punching-machine, the combination of the punch-slides E E', having the plots *g g'*, with the adjustable blocks G G' and levers L L', all constructed and arranged substantially as described.

2. In a punching-machine, the combination of the actuating-levers L' L and blocks G G', secured to the slides E E' and adjustable therein, with the removable die C, substantially as shown and described.



3. In a punching-machine, the slides E E', having the shoulders F F' and set-screws *f f'*, in combination with the adjustable blocks G G' and levers L L', constructed and arranged substantially as and for the purpose described.

4. In a punching-machine having separately-adjustable punch-slides, and actuating-levers for causing the punch-slides to simultaneously operate upon opposite sides of a die, the combination,

with such punch-slides and actuating-levers, of separately-adjustable counterbalance-weights, substantially as and for the purpose described.

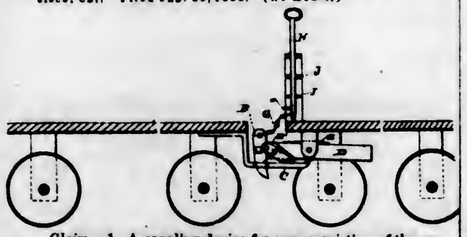
5. In a punching-machine, the combination of the slides E E' and blocks G G', adjustable in said slides, with the levers L L', having arms *l l'*, weights M M', and straps *o o'*, to attach the said levers to the treadle-rod O, the said parts being constructed and arranged substantially as and for the purpose described.

257,241. PLOW. MILTON ROSS, San José, Cal. Filed Aug. 5, 1881. (No model.)

Claim.—1. The plow-beam A, with its slotted arm B, in combination with the crank G, standards F and K, landside C, beam-adjusting plate I, and handle-adjusting plate J, secured thereto, substantially as herein set forth.

2. The mold-board D, with its extension *d*, in combination with the slotted plates I and J and plow-beam A, with its slotted arm B, said beam being adapted to shift upon the crank G, substantially as herein described.

3. The mold-board D, with its extension *d*, in combination with the slotted plate J and handle-stem M, pivoted to the cross-brace E and adapted to travel on the slotted plate J, substantially as described.



257,242. MANUFACTURE OF BROWN DYE-STUFFS. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Feb. 18, 1882. (Specimens.)

Claim.—The brown coloring-matter formed by the reaction of nitrous acid upon the salts of the alphanaphthylaminesulphonic acid in neutral or very slightly acid solution.

257,243. MANUFACTURE OF BROWN DYE-STUFFS. CARL RUMPFF, Aprath, near Elberfeld, Prussia, Germany. Filed Feb. 18, 1882. (Specimens.)

Claim.—The brown coloring-matter formed by the reaction of nitrous acid upon the salts of the betanaphthylaminesulphonic acid in neutral or very slightly acid solution.

257,244. CAR-COUPLING. ADOLPH SCHULENBURG, San Francisco, Cal. Filed Jan. 26, 1882. (No model.)

Claim.—1. A coupling device for cars, consisting of the centrally-pivoted arm D, supported from one car and having the T or hammer headed hook or pin B hinged to it, in combination with the perforated plate C, projecting from the opposite car, substantially as and for the purpose herein described.

2. The centrally-pivoted arm D, having the hammer-headed coupling-pin B B' pivoted to it, and the spring E, in combination with the hinged swinging latch F, depending from the coupler, and the perforated coupling-plate C from the opposite car, substantially as herein described.

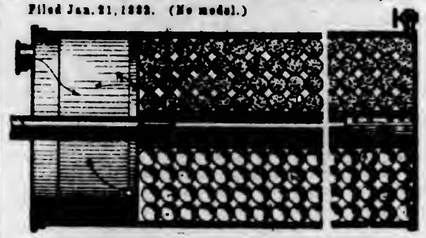
3. A coupling device for cars, consisting of the centrally-pivoted weighted arm D, having the hammer-headed coupling-pin B B' hinged to it, the spring E, and the swinging latch F, in combination with the vertically-moving rod H, connected with the pin B by a chain, G, the perforated slotted guide J, and the pin I, substantially as herein described.

4. The |—shaped coupler B B, hinged to the side of the tilting arm D, the swinging latch F, the vertically-moving rod H, connected with the pin or coupler B, the slotted guide J, and the pin I, in combination with the lever-arm *a*, projecting from the rod H, and the lever *b*, connected with the arm and sliding freely in its fulcrum, so that the rod H may be both raised and turned, substantially as herein described.

257,245. BOND, CHECK, OR OTHER SECURITY. JOHN SCOTT, Washington, D. C. Filed Dec. 12, 1881. (No specimens.)

Claim.—A bond or check having the series of numbers arranged radially in the different circles, from units upward, each set having one concentric line across the faces of the figures for each unit in the denomination printed diametrically across the face of the circle.

257,246. DEVICE FOR MOLDING CAST SCREWS. EDWARD W. SARGENT, Springfield, Mass. Filed Oct. 29, 1881. (No model.)



Claim.—1. The combination of guards F F F and screw-pattern A with half-pattern B, used in molding heads upon cast screws to prevent sand from dropping out of the mold, constructed and operating together in the manner and for the purpose described.

2. The combination of guards F F F, pattern-screw A, guiding-rod H, and nut J, constructed and operating together in the manner and for the purpose described.

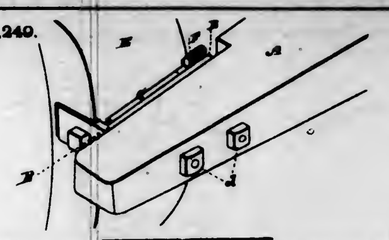
3. In an apparatus employing, to mold screws, a pattern-screw of varying diameter, the thin circular guards F F F, of metal or other suitable material, constructed with or without projections upon their concave edges, and operating substantially as and for the purposes set forth.

257,247. CARBURETOR. IRA W. SHALER, Brooklyn, N. Y. Filed Jan. 21, 1882. (No model.)

Claim.—1. In combination with a carburetor, a porous absorbent packing consisting of a composition of peat and plaster-of-paris mixed and pressed into spheres, substantially as shown and described.

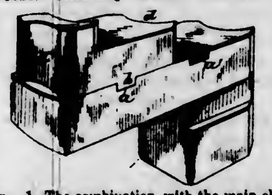
2. In a carburetor, the combination, substantially as shown, of an outlet-pipe, extending from near the bottom of the carburetor to and out of the top, with an inclosing perforated tube, H, extending through the absorbent chamber, an air-chamber, and shell provided with an inlet-pipe, substantially as set forth.

257,248. COMPOUND FOR TEMPERING STEEL. ALEXANDER H. SIEGFRIED, Selin's Grove, Pa. Filed Sept. 24, 1881. (No specimens.)



Brief.—Heats the iron to red heat, applies compound, reheats, and works to shape. Heats again to cherry red, applies compound, and then cools to harden.

Claim.—The compound for tempering steel, consisting of salt, sulphate of copper, soda-ash, sal-ammoniac, oxide of manganese, sulphate of iron, and nitrate of potassa, in substantially the proportions specified.



257,249. BRAKE-BLOCK. EDWARD G. SPENCER, Iowa Hill, Cal. Filed Feb. 21, 1882. (No model.)

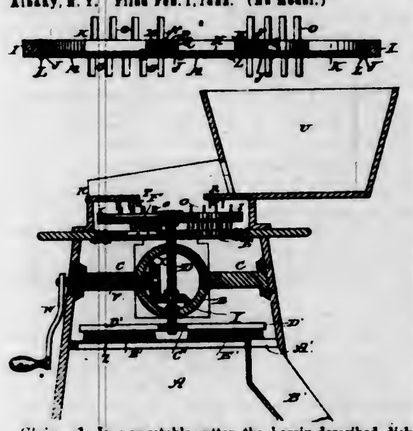
Claim.—The combination and arrangement of the brake-beam A, sliding or adjustable clamp or jaw B, with its slots *b*, stationary clamp or jaw C, securing-bolts D D, with their nuts, brake-block E, with its transverse groove *e* and notched sides, and the separate clamping and adjusting bolt F, substantially as and for the purpose herein described.

257,249.

257,250. JAW FOR LATHE-CHUCKS. JOHN C. STEVENS, New Haven, Conn. Filed Aug. 10, 1881. (Model.)

Claim.—1. The combination, with the main chuck-jaw, having transverse grooves *a a'*, of a removable jaw provided on its under side with tenon *b* and adapted to be secured in either of said grooves, substantially as set forth.

2. The combination, with the main chuck-jaw, provided with two transverse grooves or mortises, of a double-faced removable jaw provided on its under side with a depending tenon, and a screw for securing the parts together, substantially as set forth.



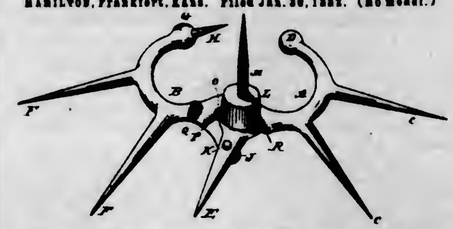
257,251. STAIR-CARPET FASTENER. CHARLES D. STONE, Brooklyn, N. Y. Filed Mar. 6, 1882. (No model.)

Claim.—1. In a carpet-fastener, the combination of a toothed or pointed device adapted to be forced through the carpet and into the steps with the plate, screw, and follower, substantially as and for the purpose specified.

2. The combination of the plate having a central longitudinal groove and triangular end pieces, the articulated toothed leaves or jaws, and the screw having the follower, substantially as and for the purpose set forth.

257,252. ROTARY VEGETABLE-CUTTER. DAVID STRASSER, Albany, N. Y. Filed Feb. 1, 1882. (No model.)

Claim.—1. In a vegetable-cutter, the herein-described disks E and F, having detachable perforated plates, as set forth.



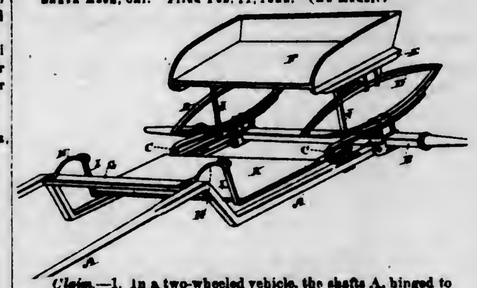
2. In a vegetable-cutter, the herein-described disks E and F, having detachable perforated plates and detachable cutter-bars, as set forth.

3. In a vegetable-cutter, the combination, with the rotary disk having detachable perforated plates and cutters, of the stationary cover having knives or cutters, and the stationary disk having detachable perforated plates and knives or cutters, as set forth.

4. In a vegetable-cutter, the combination, with the cutting apparatus, of a stationary sieve or screen and a revolving brush, arranged substantially as set forth.

5. As an improvement in vegetable-cutters, the combination of the casing A, the shaft D, carrying disk F and brush C' D' E', the disk E, cover R, sieve Z, hopper U, and chute B', all constructed, arranged, and operating substantially as and for the purpose herein set forth.

257,253. CALF-WEANER. ANDREW J. TAYLOR and MILO A. HAMILTON, Frankfort, Kans. Filed Jan. 30, 1882. (No model.)

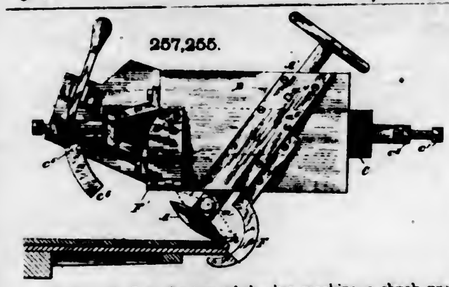


Claim.—1. The combination of the part A, having perforation O and segmental groove or recess P, with the hinged part B, having latch-pin M and lip Q, substantially as and for the purpose set forth.

2. In a calf-weaner, the combination, with the barbed part A, having stem E, of the barbed part B hinged to said stem, and having flange R, overlapping the corresponding portion of part A, substantially as and for the purpose set forth.

3. As an improvement in calf-weaners, the combination, with the part A, having barbs C, ball D, provided with recess I, stem E, perforation O, and groove P, of the hinged part B, having barbs F, ball G, provided with prong H, flattened barb J, spring latch-pin M, lip Q, and flange R, all substantially as herein shown and described, for the purpose specified.

257,254. TWO-WHEELED VEHICLE. SAMUEL S. THOMPSON, Santa Rosa, Cal. Filed Feb. 11, 1882. (No model.)



Claim.—1. In a two-wheeled vehicle, the shafts A, hinged to the axle, in combination with the seat-sustaining springs D, and the connecting-springs C, secured to the axle, and springs D, and to the shafts, substantially as and for the purpose herein described.

2. In a two-wheeled vehicle, the shafts A, having a cross-bar, G, and spring-arms H, in combination with the foot-rest-supporting straps I, hinged to the spring-arms, and straps J, secured to the body and hinged to strips I, substantially as and for the purpose herein described.

3. In a two-wheeled vehicle, the shafts A, hinged to the axle and seat-sustaining springs D, connected by supplementary springs C with the shafts, for the purpose described, in combination with the foot-board K, supported upon strips I, hinged to the spring-arms H and to the straps J, secured to the seat, substantially as and for the purpose herein described.

257,255. SHEET-METAL-SHAPING MACHINE. ISAAC VAN HAGEN, Chicago, Ill., assignor to the Adams & Westlake Manufacturing Company, same place. Filed Dec. 9, 1881. (No model.)

257,255.

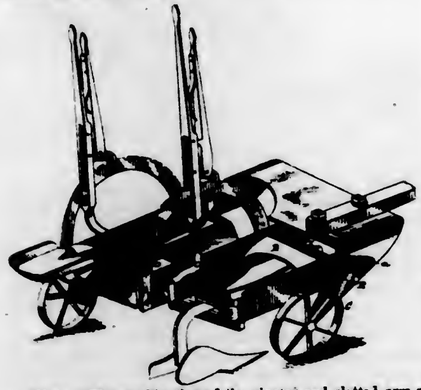
Claim.—1. In a sheet-metal-shaping machine, a chuck provided with the rim *i*, in combination with the wheel A, frame B, and tool G, substantially as and for the purpose set forth.

2. In a sheet-metal-shaping machine, a chuck provided with the rim *i*, in combination with the wheel A, frame B, bed-plate C, and tool G, substantially as and for the purpose set forth.

3. In a sheet-metal-shaping machine, a chuck, in combination with the wheel A, screw-shaft A′ in line with the pivot of the wheel A, and the reciprocating frame B, substantially as and for the purpose set forth.

4. In a sheet-metal-shaping machine, a chuck, in combination with the wheel A, having a sharp edge at its periphery, substantially as shown, screw-shaft A′, frame B, and bed-plate C, having a pivot parallel with the plane of revolution of the wheel A, substantially as and for the purpose set forth.

5. In a sheet-metal-shaping machine, a chuck, in combination with the wheel A, screw-shaft A′ in line with the axis of wheel A, frame B, and bed-plate C, having a pivot parallel with the plane of revolution of the wheel A, substantially as and for the purpose set forth.

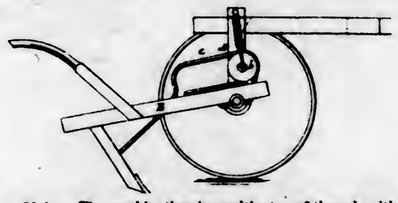


6. In a sheet-metal-shaping machine, a chuck, in combination with the wheel A, having a sharp edge at its periphery, substantially as shown, screw-shaft A′, and reciprocating frame B, substantially as and for the purpose set forth.

7. In a sheet-metal-shaping machine, a chuck, in combination with the wheel A, having a sharp edge at its periphery, substantially as shown, screw-shaft A′, frame B, and bed-plate C, substantially as and for the purpose set forth.

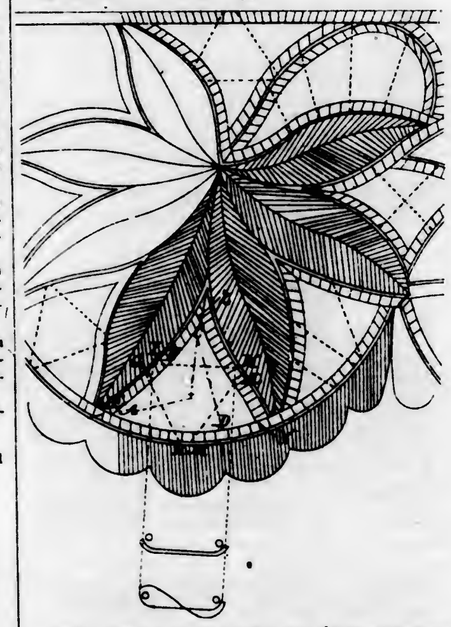
8. In a sheet-metal-shaping machine, a chuck, in combination with the wheel A, having a sharp edge at its periphery, substantially as shown, screw-shaft A′, frame B, and bed-plate C, substantially as and for the purpose set forth.

9. In a sheet-metal-shaping machine, a hinged rest, F′, substantially as and for the purpose set forth.



257,256. SULKY-PLOW. JAMES WARD, Handley, Tex. Filed Jan. 21, 1882. (No model.)

Claim.—The combination of the pivoted and slotted arm or hanger E, carrying furrow-wheel C, and the bolt I, passing through said slotted arm, and provided with an end nut, J, with the plow carriage or frame and the plow hanger or yoke hung on the bolt I, as and for the purpose set forth.

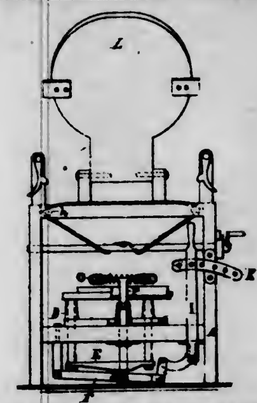


257,257. CULTIVATOR. ALANSON P. WEBBER, Saratoga, Ill. Filed Mar. 10, 1880. (No model.)

Brief.—A pulley attached to a spring and arranged to ride upon a longitudinal rod, and thus shift the lifting-point upon the plow-beam.

Claim.—The combination, in a cultivator, of the axle with the swinging shovel-beams B, the springs secured at their upper ends to the axle and at their lower ends provided with pulleys or rollers, and the rods *c*, secured to the shovel-beams and passing over the said rollers, said members being constructed and adapted for operation substantially as described.

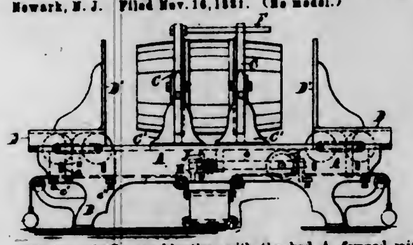
257,258. EMBROIDERY. JAMES WIGHT, Arbon, assignor to Wetter Brothers, St. Gall, Switzerland. Filed Dec. 2, 1881. (No model.)



Claim.—The process of manufacturing embroidery consisting in the following steps: first, marking or indicating the outlines of a design on the body of the fabric; secondly, perforating the body of the fabric in a line or lines outside of said design and near some part thereof; thirdly, fastening to the fabric an auxiliary thread or threads extending across said line or lines of perforations to keep the fabric firm and even at the edges of the design; fourthly, in gathering into the outline of the design that part of the cloth or fabric which is between the outline thereof and the lines of perforations referred to; and, finally, in repeating these steps until all the material inside of these perforated lines is gathered into the design, and then removing the auxiliary threads, substantially as set forth.

257,259. MACHINE FOR SETTING UP BARRELS. HENRY WILDE, Newark, N. J. Filed Dec. 23, 1881. (No model.)

Claim.—1. In a barrel-raising machine provided with a gage-ring arranged to move vertically, as described, the combination, with the ring and its guiding-rods D, of means, as tripod E, levers F and I, and segment K, provided with holes *d* and suitable stop-pin, all for regulating the movement of the gage-ring, substantially as and for the purpose set forth.



257,259.

2. In combination with a ring for setting-up staves, an internal annular spring arranged and operating substantially as described.

3. In combination with a bed-plate and gage-ring, operating substantially as described, the hinged face-plate L and automatic catches arranged and operating to lock the plate upon the top of the staves, substantially as and for the purpose set forth

257,260. BARREL-TRUSSING MACHINE. HENRY WILDE, Newark, N. J. Filed Nov. 16, 1881. (No model.)

Claim.—1. In combination with the bed A, formed with grooves *a*, and provided with mechanism for supporting and operating the truss-rings C, the squaring-plates D′, supported upon carriages D, fitted to the grooves *a* and mounted upon anti-friction rollers, as described, and the treadle *m*, straps *l*, and pulleys *n*, arranged and operating substantially as and for the purpose set forth.

2. The combination, with the squaring-plates D′ and carriages D, of the anti-friction rolls *g* and the adjustable tracks *h*, the carriages being fitted to grooves for guiding them in the bed or frame A, and the tracks being movably secured to the frame, substantially as and for the purpose set forth.

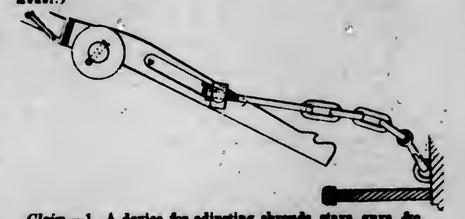
3. The combination, with the divided truss-rings C C, having a hinge at one side, of spring-catches operating to lock them automatically when closed, and the tie-bar F and counter-balance G, operating to support the upper halves of the rings automatically when opened, as herein shown and described.

257,261. SHOULDER-BRACE AND CORSET. CATHARINE A. WILLIAMSON, St. Louis, Mo. Filed Oct. 29, 1881. (Model.)

Claim.—1. The combination of the corset parts A A, the lacings B B, the flat elastic supports or stays E E, extending upward above and downward below the corset proper, and the elastic connection C, substantially as described.

2. The combination of the corset parts A A, the lacings B B, the flat elastic supports or stays E E, and the elastic connection C and inelastic connection D, said stays extending upward and downward, as described, and at each side of the spine, substantially as set forth.

3. The combination of the corset parts A A, lacings B B, flat elastic supports or stays E E, extending upward and downward, as described, elastic connection C, inelastic connection D, and the wholly or partially elastic arm-pieces F F, substantially as described



257,262. CARRIAGE-BOW. HENRY S. WING, Ashtabula, Ohio, assignor to Jennie A. Wing, same place. Filed Jan. 19, 1882. (No model.)

Claim.—1. The combination, with a spring-metal carriage-bow socket bent in an oval or any suitable form, with its side edges slightly separated, and a leather or any suitable covering the side edges of which are turned over the adjacent side edges of the socket, of a wedge or key adapted to be introduced between the adjacent edges of the socket and hold the covering in position.

2. The combination, with a spring-metal carriage-bow socket bent in the form shown, and a leather or any suitable covering the side edges of which are turned over the adjacent edges of the bow-socket, of a wedge adapted to be introduced between the said adjacent edges of the spring-metal socket and hold the covering in position, and curtain-buttons the shanks of which pass through one side of the socket and enter the wedge and hold the same in position.

257,263. DEVICE FOR SLACKENING AND TIGHTENING STAYS, GUYS, &c. JOHN B. WOOD, Brooklyn, N. Y., assignor to Mary Manross Wood, same place. Filed Mar. 24, 1882. (No model.)

Claim.—1. A device for adjusting shrouds, stays, guys, &c., consisting of two hinged levers, in combination with a slot and traveling cross-head, to which cross-head is fixed a clevis, substantially as and for the purpose shown and described.

2. In a device for adjusting shrouds, stays, guys, &c., the combination of two hinged levers with a pivoted shackle, substantially as and for the purpose shown and described.

3. In a device for adjusting shrouds, stays, guys, &c., a sliding cross-head, in combination with two hinged levers, substantially as and for the purpose shown and described.

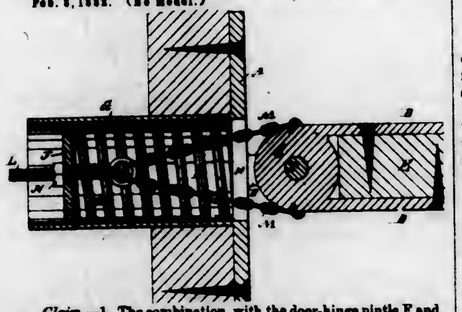
257,264. DENTAL PLUGGER. HANK ABBOTT, New York, N. Y., assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Mar. 21, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a hammer to give blows upon a tool-holder, with an elliptical spring formed by uniting the ends of bow or bent springs to central blocks or hubs acting upon said hammer.

2. The combination, substantially as hereinbefore set forth, of a hammer to give blows upon a tool-holder, an impelling-spring acting upon said hammer to impart said blow, and an interposed connecting-block between said hammer and said spring.

3. The combination, substantially as hereinbefore set forth, of a hammer, an elliptical spring composed in part of central hubs or blocks, one of which acts upon said hammer, and a screw for adjusting the power of said spring, working in the other of said hubs, whereby the force of the blows administered by the hammer may be regulated.

257,264.

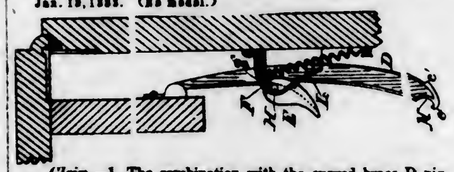


4. The combination, substantially as hereinbefore set forth, of a hammer, a spring acting upon said hammer, a movable hub or block to vary the power of said spring, and a turning-screw working in said hub or block to move it relatively to said screw.

5. The combination, substantially as hereinbefore set forth, of the casing, the bearing-guides of said casing, and the reciprocating hammer guided and supported in said casing by the said bearing-guides, whereby the friction of the hammer in the casing is reduced.

6. The combination, substantially as hereinbefore set forth, of the casing, the tool-holder, the hammer to deliver blows upon said holder, the impelling-spring of said hammer, the bearing-guides upon which the hammer reciprocates so as to have great freedom of reciprocation, and the catch connected with said tool-holder and acting upon said hammer.

7. The combination, substantially as hereinbefore set forth, of the casing-sections, the tool-holder fitted to move endwise in one of said sections, and provided with a longitudinal channel, and a screw passing through said casing-sections to unite them and into the channel of the tool-holder to form a guide for said holder and prevent its rotation in the casing.

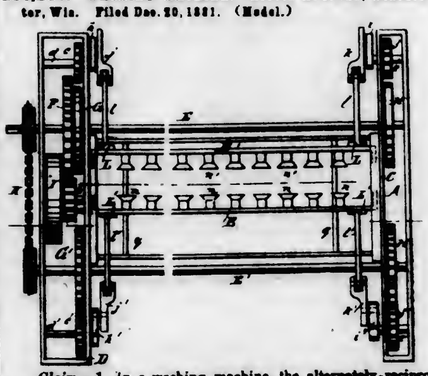


257,265. SPRING-HINGE. EZRA ALE, Altoona, Pa. Filed Feb. 8, 1882. (No model.)

Claim.—1. The combination, with the door-hinge pintle F and hinge-loop C, of the chains M M, one extending from each side of loop C to the ring on the end of a spring-retracted bolt, as shown and described.

2. In a spring-hinge, the combination, with the hinge-plates A D, of the casing G, the spring K, the plate J, the screw-rod L, the nut N, and the chains M, substantially as herein shown and described, and for the purpose set forth.

257,266. TABLE-LEAF SUPPORT. JOSEPH W. ALLISON, Dayton, Ohio, assignor to Charles P. Snyder, same place. Filed Jan. 19, 1882. (No model.)



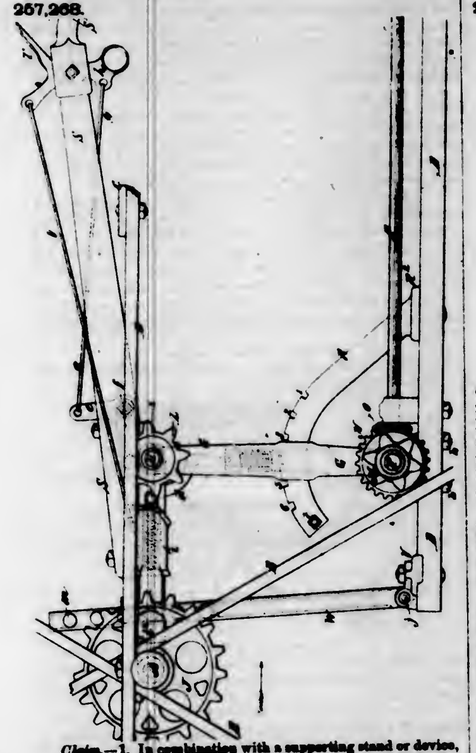
Claim.—1. The combination, with the curved brace D, pivoted at one end to the leg-frame of the table and provided at its outer end with a recess, N, of the bracket F, secured to the under side of the hinged table-leaf, and the depending latch E, having its upper end pivoted in the said bracket beneath the curved brace and serving to support the latter in its movements, and also to engage the notch in the outer end thereof to lock the brace in position, substantially as shown and described.

2. The combination, with the curved brace D, pivoted at its inner end to the leg-frame of the table and provided at its outer end with the recess N, hook *e*, and shoulder *e'*, of the bracket F, secured to the hinged table-leaf and provided with the projection or lug *d*, and the depending latch E, having its upper end pivoted to the bracket beneath the curved brace, and serving to support the latter in its movements and to engage the recess and hook thereof to lock said brace in position, substantially as described.

3. The combination, with the curved brace D, pivoted to the leg-frame of the table and provided at its outer end with a recess, N, of the bracket F, secured to the hinged table-leaf, the depending latch E, having its upper end pivoted to the bracket, and provided with an arm, *g*, and a spring, L, connected at one end to the said arm and at its other end to the table-leaf, said parts being arranged to operate substantially as described.

257,267. WASHING-MACHINE. KITTIL ARNESEN, Winchester, Wis. Filed Dec. 20, 1881. (Model.)

Claim.—1. In a washing-machine, the alternately-reciprocating boards B B', in combination with the suds-box A and means for reciprocating said boards, substantially as and for the purpose set forth.



2. In a washing-machine, the shafts E E', provided with the mutilated cog-wheels G G' and H H', in combination with the pinions *e e'* and *f f'*, shafts *d d'* and *c c'*, cranks *h h'* and *i i'*, connecting-rods *j j'* and *k k'*, slotted angle-plates L L', and the boards B B', the shafts E E' being connected by the endless chain K, substantially as described.

3. In a washing-machine, the alternately-reciprocating boards B B', provided with the head-pins *n n'* and perforations *p*, in combination with the suds-box A and means for reciprocating the said boards, substantially as and for the purpose set forth.

4. In a washing-machine, the alternately-reciprocating boards B B', provided with the slotted angle-plates L and the grooves *r* in their lower edges, in combination with the suds-box A, provided with the rails *q* in its bottom, the shafts E E', and means for reciprocating said boards, substantially as set forth.

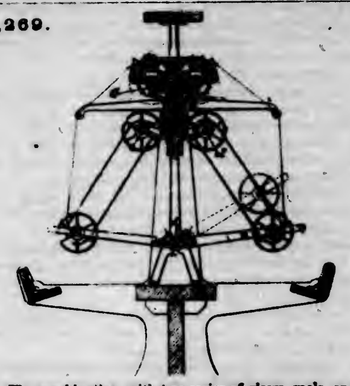
257,268. HARVESTER. JOHN P. APPLEBY, Minneapolis, Minn., Assignor to the Minneapolis Harvester Works, of Minnesota. Filed Feb. 8, 1882. (No model.)

257,268.

Claim.—1. In combination with a supporting stand or device, G, hinged at its lower end, as described, and a frame hinged at its rearmost part to the upper end of said device G and carrying at its forward end the spindle or arbor of the reel, belt-wheels J, K, L, and M, arranged in the manner specified, and a hand-lever, S, adapted to move the said stand G about its pivotal point of support, and also to move the said frame about its pivotal connection with said stand.

2. In combination with a supporting-stand, G, hinged at its lower end, and the reel-carrying frame hinged to the upper end of said stand, as specified, the hand-lever S and a locking mechanism operating to fasten the stand G in different positions, all substantially in the manner set forth.

3. In combination with the hinged stand G, the reel-carrying frame hinged thereto, and the hand-lever S, a bar, W, hinged at its lower end forward of the stand G, and means for effecting an interlocking of said bar with the forward end of said reel-carrying frame, all substantially in the manner and for the purpose set forth.



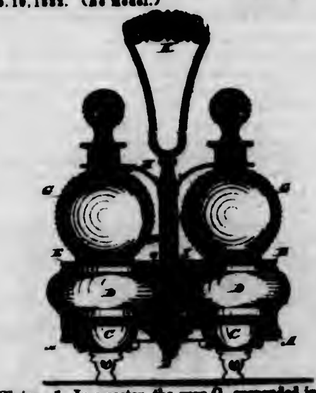
4. In combination with the hinged stand G, the reel-carrying frame, and the hand-lever, a spring latch-bolt arranged in stand G and adapted to engage with a stationary device, R, a lifter device, *d*, angle-lever *c*, rod *g*, and trigger A, the whole arranged to operate substantially as set forth.

5. In combination with the hinged reel-carrying frame and hand-lever S, a supporting-bar, W, adapted to engage at one side with a boss on said frame and at the other side with a spring-bolt device, *i*, provided with a rod extending back to within close proximity to the handle of said lever, all substantially as and for the purpose set forth.

257,269. MACHINE FOR WINDING SILK AND OTHER FIBROUS MATERIALS. JOHN E. ATWOOD and EUGENE ATWOOD, Stonington, Conn. Filed Mar. 8, 1881. (No model.)

Claim.—1. The combination, with the risers or reels, of independent adjusting-levers containing or carrying the bearings for the same, one or more stationary shafts upon which said levers may be turned, and devices for securing said levers to said shaft or shafts, so that they will be held in fixed positions after their adjustment by frictional engagement with said shaft or shafts, substantially as and for the purpose specified.

257,269.



2. The combination, with two series of risers, reels, or swifts on opposite sides of the machine, of a single stationary shaft arranged between said series of risers, reels, or swifts, two series of levers projecting in opposite directions from said shaft and carrying said risers, reels, or swifts, and devices for securing said levers to said shaft, so that they may be turned thereon, and yet will be held in fixed positions after their adjustment by their frictional engagement with the shaft, substantially as specified.

3. The combination, with a riser or reel and a lever for supporting and adjusting the same, of a stationary shaft for supporting said lever, and a box and adjustable cap on the fulcrum end of said lever for obtaining an adjustable hold of the said lever on the said shaft, substantially as specified.

4. The combination, with a winding-bobbin provided with a spindle-head and a driving-wheel for operating on said spindle-head to drive the bobbin, of a sector-faced lever arranged opposite that portion of the bobbin on which material is wound, and adapted to be moved by the friction upon it of the material on the bobbin for the purpose of lifting the bobbin and taking its spindle-head out of contact with the driving-wheel when sufficient material is wound upon it, substantially as specified.

5. The combination, with the winding-bobbin provided with a spindle and the friction-wheel for driving the said spindle and bobbin, of the lever G, constructed at its free end, against which the material on the bobbin bears, with an eccentric forward portion, *m*, terminating in a shoulder, *S*, and a reduced after portion, *n*, whereby the bobbin, when filled, is stopped, and after its stoppage the lever is held by it, substantially as described.

257,270. CASTER. SETH W. BABBITT, Meriden, Conn. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a caster, the cups C, suspended in the base A of the caster-frame, substantially as shown, and for the purpose specified.

2. In a caster, the boxes D, secured to a sleeve and revoluble on the standard B, and serving as a cover for the cups C, arranged substantially as and for the purpose described.

3. In a caster, the boxes D, secured to a sleeve revolving on the standard B, and provided with a lug, *b*, for engaging with a

notched projection, *d*, on the base A, substantially as set forth.

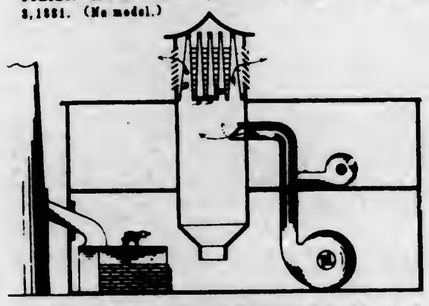
4. In a caster, the boxes D, secured to a sleeve, F, revolving on the standard B, in combination with the suspended cups C in the base A, all arranged substantially as shown, and for the purpose set forth.

5. In a caster, the revolving platform E, for supporting the bottles, and provided with a lug, *e*, for engaging with a notch in the collar I on the standard B, substantially as specified.

6. In a caster, a spring-holder, H, open at its outer ends, and carved to securely hold the bottles by clamping around their necks, substantially as shown, and for the purpose described.

7. In a caster, the combination of the revolving boxes with the revolving platform for supporting the bottles, and serving as a cover for the boxes, substantially as specified.

8. In a caster, the combination of the suspended cups in the base A with the revolving boxes D and the revolving platform E, arranged substantially as shown, and for the purposes herein set forth.



9. In a caster, the revolving platform secured to a sleeve, F, in combination with the spring bottle-holder, arranged substantially as shown, and for the purpose specified.

10. In a caster, the revolving platform secured to a sleeve, F, and provided with means for holding it in position, in combination with the spring bottle-holder H, open at its outer ends, and serving to hold bottles by clamping around their necks, substantially as herein set forth.

11. In a caster, a revolving platform supporting the bottles held and clamped by spring bottle-holders, in combination with the revolving boxes and the cups suspended in the base, substantially as shown, and for the purpose described.

12. A caster consisting of a base, A, standard B, cups C, revolving boxes D, and revolving table E, for supporting bottles G, held and clamped by spring bottle-holders H, and a handle, K, all arranged substantially as specified.

257,271. DUST-ARRESTER FOR WOOD-WORKING FACTORIES. ABSALOM BACKUS, Jr., Detroit, Mich. Filed Sept. 3, 1881. (No model.)

Claim.—The combination, with a house or building having inclosed compartments or rooms, of a dust-tower extending from the interior to the outside of said building, and having an inward extension into one or more rooms thereof, a screen of loose-meshed fabric arranged across the interior of said tower, one or more blowers arranged in a room or rooms of the building and provided with openings or an opening communicating with the interior of said room or rooms, and a discharge pipe or pipes leading from the said blower or blowers to the dust-tower below the screen therein, said tower having an opening or openings at or near its top, substantially as described.

257,272. LAMP-BURNER. ALPHEUS L. BAKER, Bellaire, Ohio, assignor to himself, Benjamin F. Cockayne, and William T. Rafer, all of same place. Filed Dec. 8, 1881. (No model.)

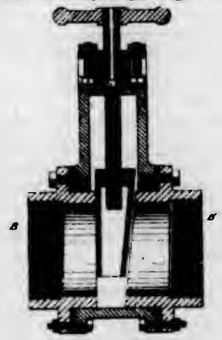
Claim.—1. In a lamp-burner, the combination of a wick-tube and a deflector with outwardly-corrugated corners, the deflector being adapted to touch only at its corners the inner surface of the burner-cone, whereby separate and independent air-currents may pass over the upper sides of said deflector between its corrugated corners to feed combustion of the flame, substantially as set forth.

2. In a lamp-burner, the combination of a wick-tube and a deflector with outwardly-corrugated corners, as described, the deflector being constructed and arranged to rest only at its sides upon the base of the wick-tube, whereby separate and independent air-currents may pass up the corrugated corners between said wick-tube and deflector, as and for the purposes set forth.

3. In a lamp-burner, the combination of the wick-tube, its base, and the burner-cone with a deflector having outwardly-corrugated corners, said deflector resting at its sides upon the base of the wick-tube and touching the burner-cone at each of its corrugated corners, whereby independent air-currents pass up within the corrugated corners and other independent air-currents pass over the top of the deflector between its corners and mutually assist in maintaining an equilibrium of air-supply, substantially as described.

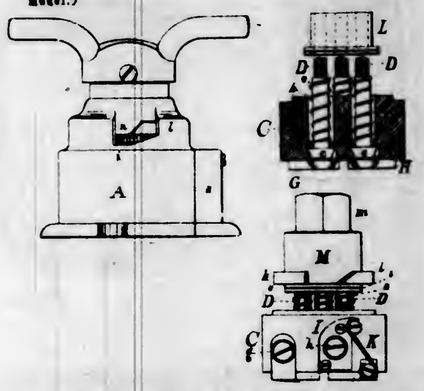
257,273. RIDING-SADDLE. JOSEPH BASELER, San José, Cal. Filed Mar. 10, 1881. (No model.)

Claim.—In a cushion for a riding-saddle, the combination of the springs *a*, secured by metallic base-supports *c*, and bottom *d'*, cushion A, and cover *d*, substantially as shown, and for the purpose described.



257,274. EXTENSION-TABLE. NICKLAS BAUER, Springfield, Ohio. Filed Nov. 26, 1881. (No model.)

Claim.—An elastic tenon or tongue for the slide-bars of an extension-table, constructed of a single piece of hickory or other suitable material, provided with a spring, H, said spring being constructed by a saw-cut, G, extending across the tongue near its narrowest point and backward from one end a suitable distance, and held down by a screw, I, substantially as shown and described.



257,275. STOP-VALVE. RICHARD BEAUMONT, Kankakee, Ill. Filed Apr. 5, 1881. (Model.)

Brief.—The seating-surfaces for the valve are on bells B, which may be removed easily for grinding, &c

Claim.—The valve described, consisting of the chambered case C, having a horizontal passage through the same for the reception of the bells B, and in combination with said bells, fixed, flanged, and secured to the case, all substantially in the manner and for the purposes set forth.

257,276. SWITCH FOR ELECTRIC-LIGHT CIRCUITS. SIGMUND BERGMANN, New York, N. Y. Filed Feb. 25, 1882. (No model.)

Claim.—1. In switches for electric-light circuits, the combination, with the reciprocating circuit-controlling device, of a key-block adapted to be revolved continuously in one direction, substantially as and for the purpose set forth.

2. In switches for electric-light circuits, the combination, with the reciprocating circuit-controlling device, of a key-block adapted to be revolved continuously for giving movement in one direction and a spring or springs for moving such device in the other direction, substantially as set forth.

3. In switches for electric-light circuits, the combination, with suitable contact-plates arranged in the same circuit, of two or more split bolts and means for moving such bolts into and out of contact with the plates simultaneously, substantially as set forth.

4. In switches for electric-light circuits, the combination, with one or more circuit-controlling bolts retracted by a spring or springs, of the cap of insulating material and the key-block turning on such cap, substantially as set forth.

5. In switches for electric-light circuits, the combination, with beveled contact-plates, of a split circuit-controlling bolt, having beveled head withdrawn wholly away from such plates in breaking circuit, substantially as set forth.

6. In switches for electric-light circuits, the combination, with the inclosing-case having inclines *n n*, of the key-block M, having inclines *k l*, the insulating-block C, carrying contact-plates and binding-screws, the split circuit-controlling bolts D, retracted by springs *e*, and the insulating-cap I, substantially as set forth.

7. In switches for electric-light circuits, the combination, with case A, containing circuit-controlling device, of the removable side plate, *a*, for giving access to the connections, substantially as set forth.

8. In switches for electric-light circuits, the combination, with the insulating-block C, of the binding-screws *g h*, the safety-catch and contact-plates arranged in circuit between such binding-screws, and the circuit-controlling device composed of two or more split bolts, substantially as set forth.

9. In switches for electric-light circuits, the case A, having removable side plate, *a*, in combination with insulating-block C, carrying contact-plates and circuit-controlling bolts, and the binding-screws *g h* and safety-catch K, located on the side of such block next to the removable plate, substantially as set forth.

257,277. SOCKET FOR ELECTRIC LAMPS. SIGMUND BERGMANN, New York, N. Y. Filed Feb. 25, 1882. (No model.)

Claim.—1. An electric socket having two terminals or contacts composed, one of a plate located in the bottom of the socket against which a terminal on the end of the entering base or plug impinges, and the other of a horizontal screw-ring or similar device located between the bottom plate and the mouth of the socket, with which ring or device engages a similar ring or device on the entering base or plug, so as to force the end terminal of the base or plug upon the bottom plate of the socket and compress such base or plug between its terminals, substantially as set forth.

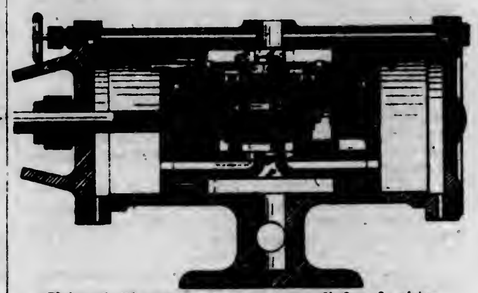
2. In an electric socket, the combination, with the body of insulating material, of a plate in the bottom of the socket, and a horizontal screw-ring located between the bottom plate and the mouth of the socket, said plate and ring engaging opposite parts on an entering base or plug, and serving to compress the base or plug between the terminals carried by it, substantially as set forth.

3. In an electric socket, the combination of the flanged metal ring, the insulating-washer, and the metal plate secured within the socket, substantially as set forth.

257,278. METHOD OF WELTING OR HEMMING FABRICS. JOHN BIGELOW, Philadelphia, Pa. Filed Feb. 27, 1882. (No model.)

Claim.—1. The method herein described for welting or hemming fabrics, which consists in folding the fabric back on itself, as shown, uniting the same by a line of stitching, which passes at each stitch or at each alternate stitch through the material and a bend or fold of the same, and simultaneously with the sewing trimming off the surplus fabric close to the line of the seam, substantially as set forth.

2. The method herein described for welting or hemming fabrics, which consists in folding the fabric back on itself, as shown, uniting the same by a line of stitching, which passes through the material and a bend or fold of the same, and trimming off the surplus fabric close to the line of the seam, substantially as shown and described.



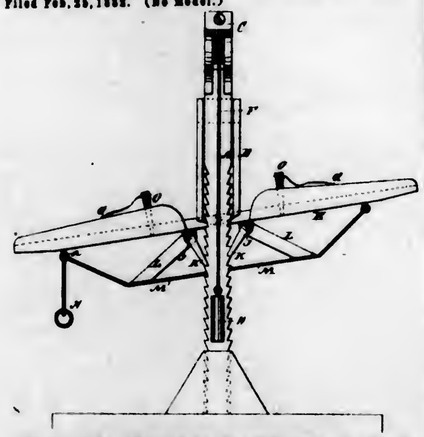
257,279. FELLY-PLATE. JOHN B. BLATT, Reading, Pa. Filed Mar. 14, 1882. (Model.)

Claim.—1. As an improved article of manufacture, the spring felly-plate herein described and shown, curved in the direction of its length, and concaved transversely to correspond to the circle and convexity of the felly and converging ends, with bolt or rivet holes, for the purpose set forth.

2. The combination and arrangement, in a vehicle-wheel, of the spring felly-plate curved to suit the circle and convexity of the felly, and connected at the ends to the felly and tire by means of bolts and nuts or rivets located near the spokes, as shown and described.

257,280. AUTOMATIC STEAM-VALVE. JAMES H. BLESSING, Albany, N. Y. Filed Mar. 6, 1882. (No model.)

Claim.—1. The combination, in a steam-cylinder, of a piston, a main valve located within said piston and carried by it, and



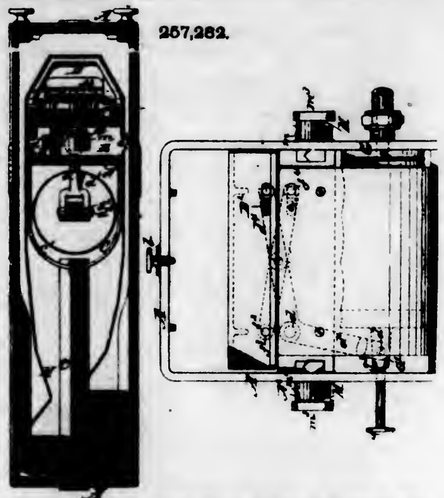
serving to operate said piston, and an auxiliary valve, also carried by and moving with said piston, which valve serves to operate the main valve, substantially as shown and described.

2. The combination, in a steam-cylinder, of a piston, an interior auxiliary piston operating a main valve carried by said piston, and an auxiliary valve located in the main piston, serving to operate the auxiliary piston, substantially as shown and described.

3. The combination, in a steam-cylinder provided with a steam-inlet above and an exhaust-outlet below, of a main piston carrying a steam-valve operating said piston, and arranged at the bottom of said piston, an auxiliary piston for operating the main valve, an auxiliary valve for operating said auxiliary piston, and the steam and exhaust passages passing around or through the main piston for conveying the steam from the steam-inlet to the steam-outlet, substantially as shown and described.

4. The combination, in a steam-cylinder, of a main piston carrying a slide-valve for operating itself, an interior auxiliary piston located centrally with relation to the axis of the main piston, and an auxiliary valve for operating the auxiliary piston, and itself carried by the main piston, substantially as shown and described.

257,281. LIFTING DEVICE. ADAM BURNS, Grand Rapids, Mich., assignor of one-half to John J. A. Shultz, same place. Filed Feb. 25, 1882. (No model.)



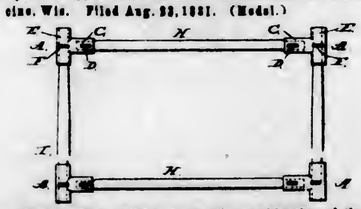
Claim.—1. In a lifting device, the combination, with the rack-standards A, of the rocking platform E, the ropes or chains F, the counter-weights H, and the pawls K on the frame E, substantially as herein shown and described, and for the purpose set forth.

2. In a lifting device, the combination, with the rack-standards A, of the guide boxes or slides D, the rocking platform E, the pawls K, the ropes or chains F, and the counter-weights H, substantially as herein shown and described, and for the purpose set forth.

3. In a lifting device, the combination, with the rack-standards A, of the rocking platform E, the shafts J, provided with pawl-arms K and with arms L, and of the strap or rope M, attached to the platform E and resting against the ends of the arms L, substantially as herein shown and described, and for the purpose set forth.

4. In a lifting device, the combination, with the rack-standards A, of the rocking platform E, provided with a series of apertures, *d*, the pawls K, and the pegs O, substantially as herein shown and described, and for the purpose set forth.

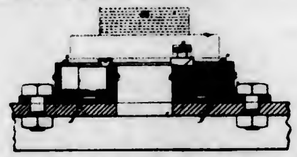
257,282. STATION-INDICATOR. EDWD. S. BOUTON, Bridgeport, Conn. Filed Sept. 29, 1881. (No model.)



Claim.—1. In a station-indicator or similar instrument, the combination, substantially as before set forth, of a card-elevator, a vacuum or pressure cylinder, a lever connected to the piston or piston-rod of said cylinder, and lazy-tongs connecting such lever with the card-elevator.

2. In a station-indicator or similar instrument, the combination, substantially as before set forth, of a series of hinged cards and the spring card-stops E E', constructed with inclines at their lower sides and with square shoulders above, so as to permit the ascent but prevent the descent of a card.

3. In a station-indicator or similar instrument, the combination, with a series of hinged cards, of the card-stops E E', controlled in position by eccentric-pins *m*, operated by shafts M and thumb-screws *m'*, substantially as shown and described.



257,283. QUILTING-FRAME. CHRISTOPHER C. BRANDT, Racine, Wis. Filed Aug. 22, 1881. (Model.)

Claim.—In a quilting-frame, the combination of the legs G, winding-rails H, and adjusting-rails I, with the corner-brackets A, composed of the sockets B and C, sleeve E, and set-screws D and F, substantially as and for the purposes set forth.

257,284. MACHINERY OR APPARATUS FOR SPINNING AND DOUBLING YARN OR THREAD. THOMAS BRIGGS, Manchester, County of Lancaster, England. Filed Nov. 17, 1881. (No model.)

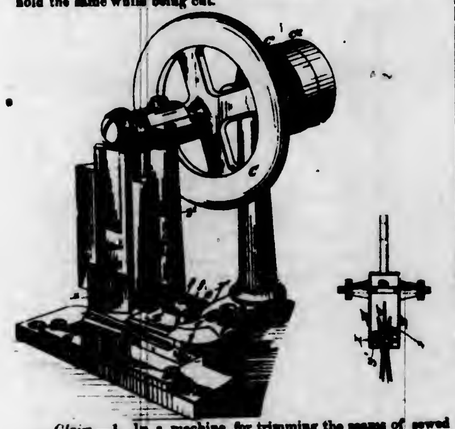
Brief.—Upon the upper side of a disk attached to the under side of a bobbin, said disk revolving within a circular box, are cast four radial arms, forming spaces, in which weights are loosely inserted, which, by reason of the centrifugal force imparted thereto by the rapid revolution of the said bobbin, press against the side of the box, thereby producing the drag.

Claim.—The combination of the rail of a spinning or doubling machine and a box carried thereby with a disk or boss therein adapted to be connected to the bobbin, and carrying centrifugal friction devices bearing against the wall of said box as the bobbin is rotated, all substantially as set forth.

257,285. ARTIST'S BOX. WILLIAM H. BROWNELL, Brooklyn, N. Y. Filed Mar. 11, 1882. (No model.)

Claim.—1. The box-cover containing pad-holding flanges *k l*, the spring-catch *n*, and the box A, the latter adapted to receive the palette beneath flanges *k l*, separating the palette and pad, as described.

2. The box A, formed with compartments, and with the projecting flanges *k l* on the body and cover to receive and retain the palette, substantially as described.



3. The double sketching-pad C, combined with a cover, *h*, having supports *m* and the spring-catch *n*, as and for the purpose specified.

4. The combination of box A, provided with projections *o o* and hooks *p*, the cover *h*, provided with hooks *q*, and the elastic bands *r*, substantially as described, and for the purpose of receiving and retaining the sketching-pad.

257,286. MACHINE FOR TRIMMING THE SEAMS OF GARMENTS, &c. NORMAN H. BRUCH, West Troy, N. Y. Filed Mar. 29, 1882. (No model.)

Brief.—A guide passes the article to be trimmed to the knives. A centering-guide fits the seam and acts in conjunction with the retaining-guide to guide the article to be trimmed to the knives and hold the same while being cut.

Claim.—1. In a machine for trimming the seams of sewed articles, a retaining-guide adapted to hold and direct the article to be trimmed to the cutting-knives, and composed of a pair of spring plates or leaves, with an intermediate space for receiving the seam, substantially as described.

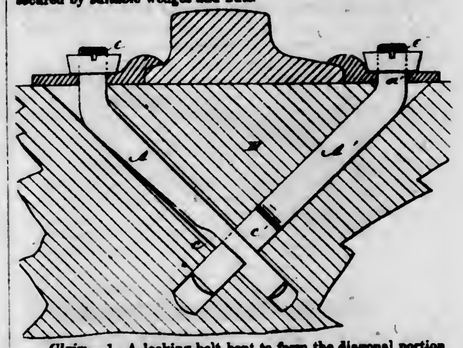
2. In a machine for trimming the seams of sewed articles, the retaining-guide E, provided with the lip I, extending inwardly from its front edges, so as to leave a space between the upper and lower walls of the guide and the said lips for receiving the curled loose edges of the sewed article, substantially as described.

3. In a machine for trimming the seams of sewed articles, the retaining-guide E, located in position to direct the article to be trimmed to the knives, and formed with its inner walls converging toward the knives, substantially as described.

4. In a machine for trimming the seams of sewed articles, the retaining-guide E, located and adapted to direct the article to be trimmed to the knives, and comprising a pair of spring-leaves with a screw-threaded rod passing through the said leaves, and the tightening-nuts fitted upon said rod for the purpose of contracting the guide when desired, substantially as described.

5. In a machine for trimming the seams of sewed articles, a spring centering-guide, J, located within the retaining-guide and adapted to enter between the loose portions of the seam, substantially as described.

6. The combination, in a machine for trimming seams, of the retaining-guide H, having the inwardly-projecting lips I, with centering-guide J, having a wedge-shaped front edge and located within the retaining-guide, substantially as described.



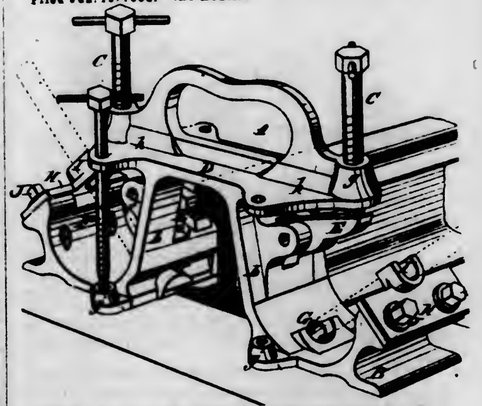
7. The combination, in a machine for trimming seams, of a guide for directing the article to be trimmed to the knives, with the centering-guide located within the retaining-guide, and composed of a spring-plate, *f'*, with a flexible metal strip bent into V shape and secured to said plate to form the wedge-shaped front edge of the guide, substantially as described.

8. The combination, in a machine for trimming the seams of sewed articles, of the reciprocating knife having an inclined cutting-edge, with the spring centering-guide J extended slightly in the path of the knife, whereby the article that is being trimmed will be caught and held between the guide and the knife during a portion of the movements of the latter, substantially as described.

9. The combination, in a machine for trimming the seams of sewed articles, of the knives, with the horizontally-adjustable retaining-guide E, and the adjustable centering-guide J, located within the retaining-guide, substantially as described.

257,287. LOCKING-BOLT. THOMAS J. BUSH, Lexington, Ky. Filed Sept. 14, 1881. (No model.)

Brief.—The locking-bolt is bent to form a diagonal, having a neck at its upper end and a notch at its lower end. The bolts are secured by suitable wedges and nuts.



Claim.—1. A locking-bolt bent to form the diagonal portion *a* and the neck *a'*, and formed with a notch near its lower end, substantially as and for the purposes set forth.

2. The bent bolt A, formed with the notch *c*, in combination with the bent bolt A', formed with the notch *c'*, substantially as and for the purposes set forth.

3. The bent bolts A and A', formed with the notches *c* and *c'*, in combination with suitable wedges or nuts for tightening the bolts, substantially as and for the purposes set forth.

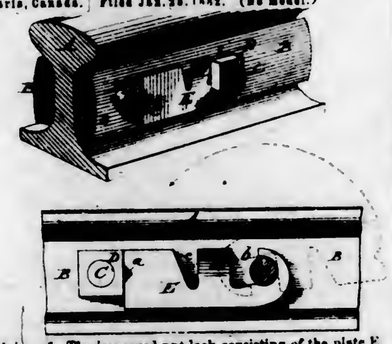
257,288. BORING-GAGE. THOMAS J. BUSH, Lexington, Ky. Filed Jan. 12, 1882. (No model.)

Claim.—1. A gage for boring intersecting diagonal holes, consisting of a suitable frame adapted to be secured upon the object to be bored, and formed with inclined passage rests or supports for the tool, substantially as described.

2. The frame A of the gage, provided with the hinged jaws E E, substantially as and for the purposes set forth.

3. The combination, with the frame A, of the screw-rods F, substantially as and for the purposes set forth.

4. The combination, with the frame A, formed with the passages G, of the adjustable rests or plates H, substantially as and for the purposes set forth.



5. The gage for boring diagonal intersecting holes, made substantially as herein shown and described, consisting of the frame A, formed with the elevated table D, and the passages G, in combination with rests or plates H, jaws E, and the screw-rods C C, substantially as and for the purposes set forth.

257,289. BUTTON-HOLE CUTTER. CHARLES C. B. CARLTON and HERMAN W. CLAPP, Springfield, Mass. Filed Mar. 6, 1882. (Model.)

Claim.—The combination, with the bifurcated shank C, having apertured and recessed branch *d*, the cutter-plate A, having a series of holes, *i*, and the pivot-screw *e*, of the flat spring F, having the end stud, *f*, and the slotted obtuse-angled lever H, having the thumb-piece *h*, as and for the purpose specified.

257,290. NUT-LOCK. SAMUEL E. ST. O. CHAPLEAU, Ottawa, Ontario, Canada. Filed Jan. 28, 1882. (No model.)

Claim.—1. The improved nut-lock consisting of the plate E, having the hook-shaped end, and the tongue *d*.

2. The plate E, constructed with the notches or openings *a*, *b*, and *c* and the tongue *d*, as described and shown.

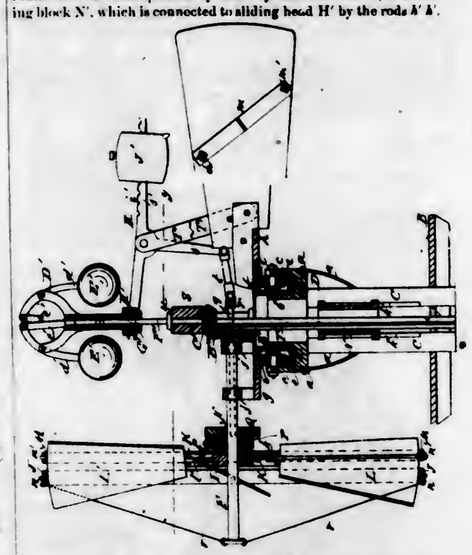
257,291. BRAKE-LOCK. GRENVILLE E. CLARKE, Racine, Wis. Filed Jan. 16, 1882. (No model.)

Claim.—1. The cylindrical base-plate or casing B, having exterior lugs, *a*, interior hub, *b*, and ratchet-teeth *c*, substantially as set forth.

2. The ratchet-plate or lock-plate C, having an oblong center, *d*, curved slot *e*, beveled slot *f*, and stop or shoulder *g*, and provided with a set or series of ratchet-teeth, *c'*, substantially as shown and set forth.

3. The tumbler D, consisting of a curved plate having the beveled boss *h*, beveled rib *i*, and concave shoulder *k*, substantially as set forth.

4. The face-plate E, cast with the extension E', having guide-plates *o* and *p*, eye *n* for the attachment of the brake-rod, and flanges or ribs *m m*, intersecting the annular rim or flange *q*, and provided with the slot or aperture *r*, studs *s t*, and central tubular hub or pintle, *l*, substantially as shown and set forth.



5. The combination of the flanged face-plate E, constructed as described, central bolt, K, lever G, and housing-plate I, as set forth.

6. The combination of the base-plate or casing B, constructed as described, ratchet-plate C, tumbler D, face-plate E, lever G, and bolt K, all constructed and combined to operate substantially in the manner and for the purpose herein shown and specified.

7. The combination, with the base-plate B, having the stationary inside ratchet, *c*, and the adjustable ratchet-plate C, adapted to engage with said ratchet, of the tumbler D, actuated by lever G to interlock with the ratchet-plate, substantially as and for the purpose herein shown and set forth.

257,292. WINDMILL. SANFORD P. COAD, Medicine Lodge, Kans. Filed Jan. 17, 1882. (Model.)

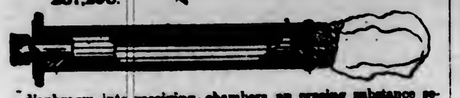
Brief.—The sails are automatically opened and closed by the governor D' acting through sliding head H', bell-crank lever R, arm *s*, link *t*, plate *r*, rods *q*, and collar P, which is connected by rods *p* with the inner ends of the sails L', bent to form cranks. The same result is accomplished by hand by means of rod O, and sliding block N', which is connected to sliding head H' by the rods A' A'.

Claim.—1. In a windmill, the combination, with the hub I, the spokes *k*, and the rims J K M, of the sails L L', pivoted to the said rims, the cranks *l* on the sails L', the connecting-rod *p*, the sliding collar P, connecting-rods *q*, and the weighted bell-crank lever R, substantially as and for the purpose set forth.

2. In a windmill, the combination, with the head-plate D, provided with the collar *b*, the projections *c*, and the friction-wheels pivoted to the said projections, of the turn-table E, provided with the flange *e*, resting under the friction-wheels, substantially as herein shown and described, whereby the table is held securely in place upon the head-plate, as set forth.

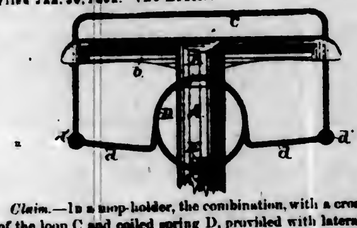
3. In a windmill, the combination, with the posts C, provided with the ways *k' k'*, of the cross-head H' and connecting-rods *h'*, the sliding block N', and the rod O, substantially as and for the purpose set forth.

4. The combination, with the lever R, attached to the sliding cross-head H', and provided with the weight J', of the collar P, sleeve N, sliding rods *q q*, and pitman or connecting rod *t*, the latter connecting with the arm *s* of the lever, substantially as and for the purposes set forth.



5. The combination, with the lever R, provided with the weight J', and connected to the sliding cross-head H', of the sliding block N', rods *h' h'*, and the operating-rod O, substantially as and for the purposes set forth.

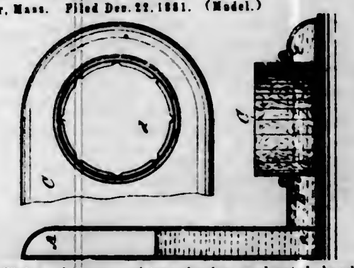
6. The annular turn-table E, in combination with the annular head-plate D, whereby the shaft F and the connecting-rod T are permitted to pass through the same to the ground or platform of the mill, as and for the purposes set forth.



257,293. SLATE-CLEANER. PHŒBE S. CORY and MARY E. HOGAN, Westfield, N. J. Filed July 30, 1881. (No model.)

Claim.—As a new article of manufacture, a slate-cleaner formed of the tubular body B, open at each end and separated by a diaphragm into receiving-chambers, an erasing substance secured in one of said chambers, a perforated cork having a channeled head arranged therewith, and a cap closing the channel in said head, the whole being arranged and operating substantially as and for the purposes set forth and shown.

257,293.



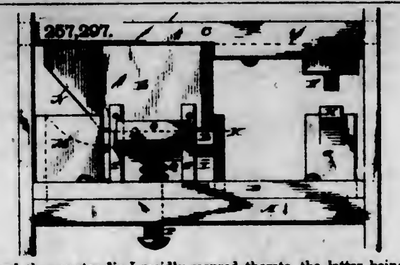
257,294. MOP-HOLDER. FRANK DAVIS, North Adams, Mass. Filed Jan. 30, 1882. (No model.)

Claim.—In a mop-holder, the combination, with a cross-piece, B, of the loop C and coiled spring D, provided with laterally-projecting arms *d*, flexibly connected to the loop C, all constructed and arranged to operate as herein specified.

257,295. STAMP-MOISTENER. FRANCIS V. DAVIS, Worcester, Mass. Filed Dec. 22, 1881. (Model.)

Claim.—A stamp-moistener having an elevated chamber, A, a lower chamber, B, connected therewith by orifice *a*, and a notched lip, *c*, about the opening *d* of said chamber B, in which is inserted the felted pad C, as shown and described.

257,296. DRAFT ATTACHMENT FOR VEHICLES. DANIEL D. DUCKER, St. Catharine, Mo. Filed Jan. 20, 1882. (Model.)



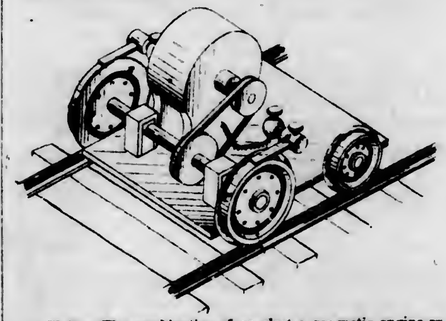
Claim.—The combination, in a platform-wagon, of the draft-rod H, having its front end turned upward, as shown, and connected to the tongue C by a single link, I, and fastening device J, which is secured to the tongue, with the tongue C, which is secured at its rear end to the springs B, the rear end of the draft-rod being bifurcated, so as to be secured to the two clips F on the axle A, substantially as shown and described.

257,297. MACHINE FOR MAKING DRILL-TEETH. SAMUEL DELANO, New Orleans, La., and GEORGE ANZL, Killbuck Township, Allegheny County, Pa. Filed Oct. 7, 1881. (Model.)

Claim.—1. In a machine for making drill-teeth, the combination, with the counter-die having a straight cutter at one end and a V-shaped cutter at the opposite end, of a plunger having a die-head secured thereto, and provided on one end with a straight cutter and at its opposite end with a V-shaped cutter so inclined as to make a gradual or sawing cut, the straight cutter, at one end of the machine, being adapted to cut one tooth from the blank, while the V-shaped cutters are adapted to form the point of the tooth, substantially as set forth.

2. In a machine for making drill-teeth, the combination, with the bed of the machine, having the die G adjustably secured thereto and the counter-die I rigidly secured thereto, the latter being shaped as shown, and provided on the side near the die G with a straight cutter and on the opposite side with a V-shaped cutter, of a plunger having the punch F adjustably secured thereto, which is adapted to register with the opening in the die G, and a die-head, E, rigidly secured thereto, the under surface of the latter being adapted to conform to the shape of the upper surface of the counter-die I, the said die-head being provided with a straight cutter on one end and a V-shaped cutter on the opposite end, substantially as set forth.

257,297.

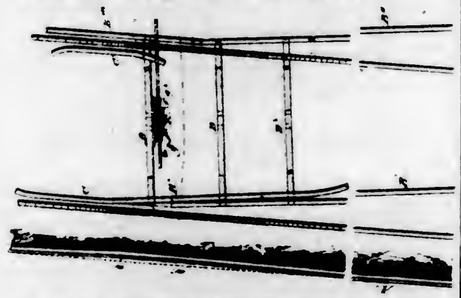


3. The combination, with the bed A, die G, having the guides H secured thereto, and the counter-die I, provided with the straight and V-shaped cutters on opposite ends thereof, of a plunger, C, punch F, and die-head E, the latter being provided with straight and V-shaped cutters, which are adapted to engage with the straight and V-shaped cutters on the counter-die I, substantially as set forth.

4. The combination, with the counter-die secured to the bed of the machine, and provided with a straight and V-shaped cutter, respectively, on its opposite ends, and the die-head secured to the plunger, and provided respectively with a straight and V-shaped cutter on its opposite ends, the under surface of the said die-head adapted to conform to the upper surface of the counter-die, of spring-actuated gages situated on opposite sides of the counter-die and adapted to guide the blank to position over the counter-die being forced down with the tooth, and automatically elevate the tooth from off the counter-die to the level of the cutters on the said die after the same has been shaped, substantially as set forth.

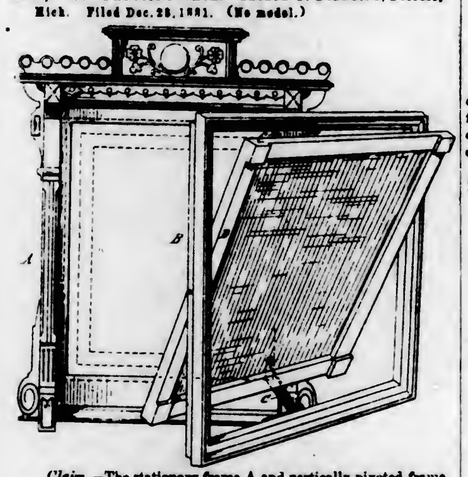
5. The combination, with the counter-die I, the cutters K and M, die-head E, and cutters L and N, of the gages O, provided with the arms P and lips R, springs Q, and standards T, substantially as set forth.

257,298. WHEEL FOR ELECTRO-MAGNETIC LOCOMOTIVES. EDWARD M. DICKERSON, Jr., New York, N. Y. Filed Jan. 5, 1881. (No model.)



Claim.—The combination of an electro-magnetic engine or locomotive running upon rails, with paper wheels supporting such locomotive upon the rails, and provided with a metallic conducting-tire and springs for conducting the electricity from the track to the engine, while at the same time the current is insulated from the main frame of the locomotive, substantially as described.

257,299. RAILROAD-SWITCH. WILSON P. DUNSON, Philadelphia, assignor of one-half to Alexander H. Ege, Mechanicsburg, Pa. Filed Feb. 23, 1881. (No model.)



Brief.—A safety-switch in which the main line is unbroken, the rails thereof being depressed where the wheels are diverted therefrom and carried by a higher outside rail to a siding to allow

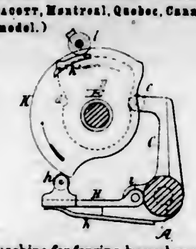
the wheel-flanges to clear the main-track rails without contact therewith. A replacing-spring is arranged in connection with swivel tie-bars to return the switch to the connection to which it is set after a train has passed it from the other line.

Claim.—The combination, with the depressed main track, of the switch composed of rails B' B''', *connected* by suitable bars D D' D², switch-bar *c*, spring E, and guard-rails C C', *to form* a safety-switch, substantially as and for the purpose set forth.

257,300. DRESSING-CASE. GEORGE F. DORNLING, Detroit, Mich. Filed Dec. 28, 1881. (No model.)

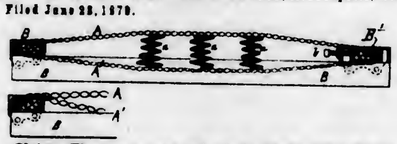
Claim.—The stationary frame A and vertically-pivoted frame B, combined with the mirror D, having horizontal pivots, and with the hinge-arms C, connected to the top and bottom of the frame B, all operating together as and for the purpose specified.

257,301. DEVICE FOR OPENING EYELET-HOLES. GEO. A. DURRBUIL, Baltimore, Md., assignor to himself, Jacob Hecht, and Solomon J. Hecht, all of same place. Filed Mar. 17, 1882. (No model.)



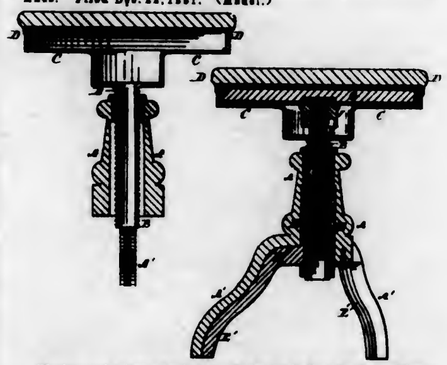
Claim.—1. The described tool, consisting of the stud having concave end and the central pin, in combination with the perforated boss set opposite said pin and with suitable arms for the pin and boss, substantially as described.

2. The combination of the arms A B, suitably connected, the perforated boss *d*, the threaded stud *e*, having concave end, and pin, substantially as described.



3. The described implement for the purpose described, consisting of arms A B, formed from one piece of spring metal, the lower arm having a boss, *d*, and the upper a threaded stud, *e*, and a handle, the parts being constructed and arranged substantially as described.

257,302. MACHINE FOR FORGING HORSESHOE-NAILS. CHARLES E. ELLACOTT, Montreal, Quebec, Canada. Filed Sept. 19, 1881. (No model.)



Claim.—In a machine for forging horseshoe-nails, the combination, with the rock-shaft A, the arm C, and the cam D, mounted on the shaft E, of a supplementary cam, K, also mounted on the shaft E, and an arm, H, hinged at *i* to the rock-shaft A approximately at right angles to the arm C, provided with a roller, *h*, working on the periphery of said cam K, and adjusting device *k*, substantially as and for the purpose set forth.

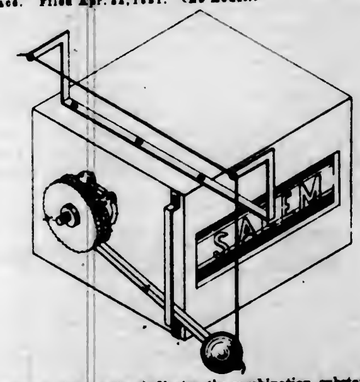
257,303. SPRING-BED. JAS. T. ELWELL, Minneapolis, Minn. Filed June 22, 1870.

Claim.—The woven-wire webs A A', of the same degree of elasticity, and having springs *a* interposed between them, suspended from end rails, B B', the rail B' sliding in the flanged plates C and operated by screws *b*, whereby the several parts are adapted to operate as set forth.

257,304. PIANO-STOOL. JAMES ERICSON, Williamsett, Mass. Filed Dec. 22, 1881. (Model.)

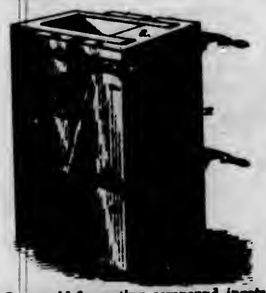
Claim.—A piano-stool composed of a hollow body and legs A A', a hollow screw, B, and a hollow seat, C D, in combination with a piano-stool composed of a body and legs, E E', adapted to fit within A A', a nut, J, separate from the body E, a screw, H, adapted to fit within the screw B, and the seat G, adapted to fit within the seat C D, substantially as described.

257,305. UMBRELLA-DRIPPER. CHARLES L. L. EMERY, Biddeford, Me. Filed Mar. 8, 1882. (No model.)



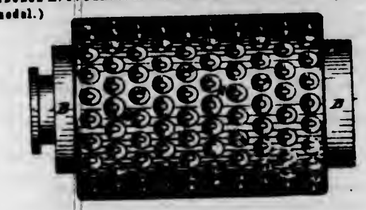
Brief.—A rubber cup is adapted to hold a sponge and receive the lower end of the staff of a closed umbrella, so as to receive and absorb the water dripping therefrom.

Claim.—1. As an improved article of manufacture, an umbrella-dripper consisting of the rubber cup A, provided with an opening in its upper and lower ends, and having its upper end below its mouth contracted to form the neck *a*, and the sponge D, arranged within the said cup, between the neck and its lower end, substantially as herein shown and described.



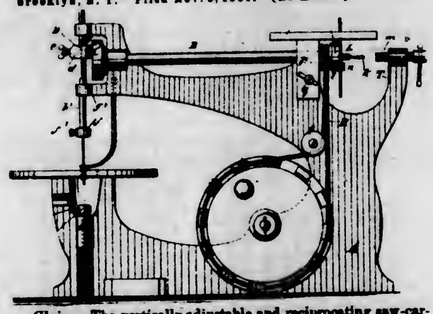
2. The combination, with the cup A, provided with the neck *a*, and containing the sponge D, of the washer E, arranged between the neck and sponge, substantially as herein shown and described, whereby the sponge is prevented from coming in contact with the cloth of the umbrella, as set forth.

257,306. STATION-INDICATOR. MICHAEL FORLEY, Portland, Oreg., assignor to L. D. Brown and H. Burbank, same place. Filed Apr. 22, 1881. (No model.)



Claim.—In a station-indicator, the combination, substantially as before set forth, of the canvas rolls, the main roll for driving them, the double ratchet mounted on the shaft of the main roll, the elbow-lever fulcrumed on the shaft of the main roll, and carrying on its short arm a double pawl to actuate the double ratchet in either direction and on its long arm a weight, the cord, and a bracket provided directly above the free end of the lever with an eye through which the cord is run.

257,307. MOLD FOR CASTING COMPOUND INGOTS. PATRICK J. FITZSIMONS, Newark, N. J. Filed Feb. 8, 1882. (No model.)



Claim.—In a mold for casting compound ingots, an adjustable cover or side plate, B, a central follower, *d*, formed upon said cover and adapted to fit accurately within the mold, and devices for securing the cover when adjusted, substantially as described.

257,308. ROLL FOR BUFFING AND POLISHING MACHINES. GEORGE H. P. FLAGG, Boston, Mass. Filed Nov. 30, 1881. (No model.)

Claim.—The improved roll above described, consisting of the central core, B, having secured upon it the rubber covering A, made with a large number of cells, *a*, in it, substantially as described.

257,309. SCROLL-SAWING MACHINE. WILLIAM FORD, Brooklyn, N. Y. Filed Nov. 8, 1881. (No model.)

Claim.—The vertically adjustable and reciprocating saw-carrying rod F, having removable collar *f* and shoulders *g g'*, in combination with the slotted yoke D, having boss *d*, provided with set-screw *e*, and the crank-wheel C, shaft B, and driving mechanism, substantially as shown and described.

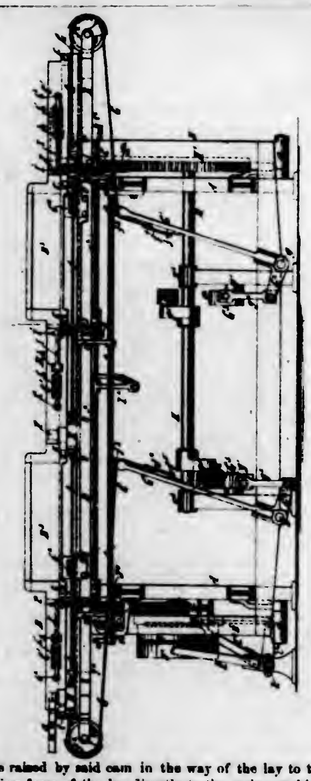
257,310. LOOM. CHARLES GABRIEL, New York, N. Y. Filed May 20, 1881. (No model.)

Brief.—The lay, having provisions for two or more reeds to weave a number of fabrics side by side and a corresponding number of shuttle-boxes, is formed below the shuttle-raceway with a slideway, to which the shuttle-drivers are fitted. The latter are cast in a single piece and have sockets for the pickers, end hooks for attachment to the rods which connect them together, and wrist-pins for connection to the picking-straps. The picking-treadles are connected by links having ball-and-socket joints with arms extending inwardly from the picker-sticks, and their weight keeps the straps and chain of shuttle-drivers taut. A rock-shaft mounted near the breast-beam carries a cam at one end, on which rests a pawl attached to a spring-bumper secured to the breast-beam. The pawl, when raised by the rotation of the shaft, caused on the failure of a shuttle to enter its box, engages with the lay to check its forward movement.

Claim.—1. The shuttle-driver constructed with an eye or socket, *d*, a hook, *e*, at one end, and a wrist-pin, *e'*, at the other end, substantially as specified.

2. The shuttle-driver constructed with an eye or socket, *d*, and a hook, *e*, at each end, substantially as specified.

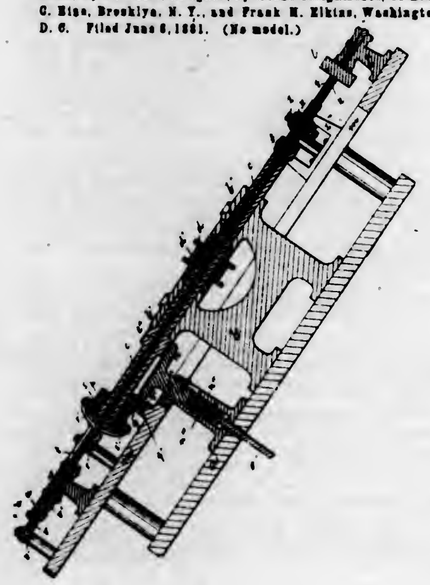
3. The combination, with a number of shuttle-drivers, E, each having a socket or eye, *d*, of rods having eyes or spade-handles connecting said drivers, the latter having hooks fitting said eyes or spade-handles, and the two end drivers having wrist-pins at their outer ends, straps attached to the end shuttle-drivers, and mechanism connected with said straps for operating them, substantially as specified.



4. The combination of the lay B, having the raceway, and the slideway *c²* below the raceway, with shuttle-drivers E, externally fitting said slideway, and having sockets *d*, removable pickers F, inserted downward into said sockets, rods *f*, arranged between and in line with said shuttle-drivers and detachably connected with the ends thereof, and mechanism for operating said shuttle-drivers, all substantially as specified.

5. The combination of the lay B, constructed with shuttle-boxes C, having removable fronts (', and containing the slideway *c²* below said shuttle-boxes, and grooves *c³*, with the shuttle-drivers E, externally fitting said slideway, and having sockets *d*, mechanism for actuating said shuttle-drivers, and the pickers F, fitting said sockets and adapted to be inserted downward into them, and having tongues *d'* engaging with the grooves *c³*, substantially as specified.

6. The combination, with a number of connected shuttle-drivers, of the straps G, the bell-crank picker-sticks G' G², the treadles G³, the links *g²*, having ball-and-socket joints and connecting the treadles with the picker-sticks, whereby the weight of the treadles serves to keep the said straps tight, and mechanism for operating said treadles, substantially as specified.



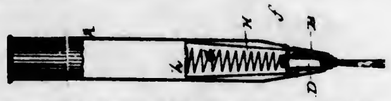
7. The combination of the lay and mechanism for operating it with the spring-cushion or elastic buffer P, the rock-shaft O and mechanism for turning it, the cam *o*, and the pivoted pawl *o'*,

257,310.

adapted to be raised by said cam in the way of the lay to transmit the striking force of the lay directly to the spring-cushion or elastic buffer, substantially as specified.

257,311. CORK-SHELL-CUTTING MACHINE. BERNARD GALLAGHER, Lynn, Mass., assignor, by mesne assignments, to Ethel C. Hine, Brooklyn, N. Y., and Frank H. Elkins, Washington, D. C. Filed June 6, 1881. (No model.)

Claim.—1. In a cork-shell-cutting machine, the herein-described shell-delivery mechanism, consisting, in combination with the rotary and longitudinally-adjustable shaft e and its cylindrical cutters *g* and *k*, of the annular piston *y*, slides *y' y'*, secured to the grooved collar *x*, the forked lever *z*, and adjustable stops *z'' z''*, as and for the purpose set forth.

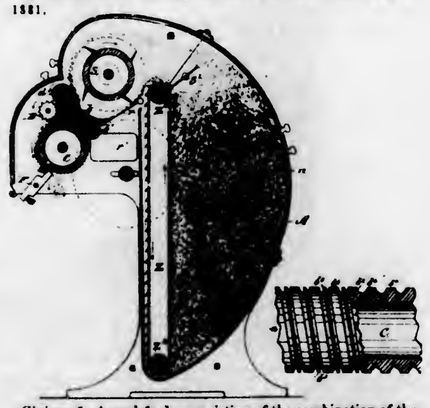


2. In a cork-shell-cutting machine, the combination of the cylindrical hollow cutters *g* and *k*, hollow main shaft e, its screw-collar *e''*, and vertically-adjustable rack-piece *n*, as and for the purpose set forth.

3. In a cork-shell-cutting machine, the combination of the hollow main shaft e, its screw-collar *e''*, adjustable rack-piece *n*, the hinged hook *q*, with its spring *q''*, and collar *p* on the shaft e, as described.

4. In a cork-shell-cutting machine, the combination of the hollow shaft e, its cylindrical cutters *g* and *k*, grooved collar *s*, ring *s'*, and spring-lever *r r'*, as and for the purpose set forth.

5. In combination, the rotary and sliding shaft e, cutters *g* and *k*, central rod, r, grooved collar *s*, ring *s'*, spring-lever *r r'*, lick *t*, lever *u*, and collars *r' r''* on the rod r, and frictional bearing *w*, as and for the purpose set forth.



257,312. SELF-FEEDING BRUSH. THOMAS F. GAYNOR and WILLIAM J. FITZGERALD, New Haven, Conn. Filed Mar. 9, 1882. (No model.)

Claim.—1. In a fountain-brush, the combination, with the handle or fountain, of the hollow bristle-receiving thimble F, screw-threaded on its exterior, interiorly screw-threaded brush-holder and valve D, having flange *f*, and the sleeve B, substantially as and for the purpose set forth.

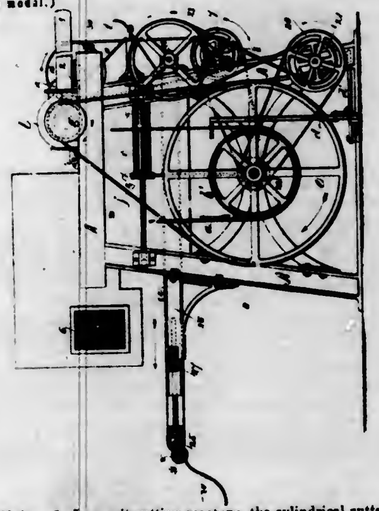
2. A marking-brush consisting of the fountain A, sleeve B, rigidly attached thereto at its lower end, screw-threaded thimble F, brush E, valve D *f*, yoke H, attached at its lower end to the sleeve B, and the spiral spring G, attached at one end to the valve D *f*, said spring, valve, and brush-holder being adapted to operate within said yoke, substantially as and for the purpose set forth.

257,313. FEEDING DEVICE FOR CARDING-MACHINES. ERNST GESSNER, Aue, Saxony, Germany. Filed Sept. 3, 1881. (No model.) Patented in England June 17, 1881, in Belgium Aug. 30, 1881, in France Sept. 16, 1881, and in Germany Sept. 5, 1881.

Claim.—1. A card-feeder consisting of the combination of the following elements: a wool-box, the vertical lift-apron Z, the final feed-rolls, the grate *r*, interposed between the upper portion of the lift-apron and the final feed-rolls, the revolving beater and transferring-cylinder S, located above the grate and arranged, as described, to transfer the wool, clean it in transit, and return the excess over the top of the lift-apron, and driving mechanism for operating the parts, substantially as described.

2. In a wool-feeding device, the combination of a revolving transferring and equalizing beater, S, a final feed-roll, C, and an intermediate lap-roll, *b*, with means for operating the same, the said elements being arranged the relation described, whereby the feed-roll is made to take wool uniformly from the lap-roll and

the beater is made to equalize or remove the excess of wool from the lap-roll, substantially as described.



3. In a wool-feeding device, the combination of a revolving transferring and equalizing beater, S, a final feed-roll, C, the intermediate lap-roll, *b*, and the roll D, arranged to hold back the wool on the lap-roll against the pull of the feed-roll C, and means for operating the same, substantially as shown and described.

4. The combination, with the lap-roll *b* and the roll D, of the feed-roll C, having upon its periphery alternating teeth and plain surfaces of equal height, with means for operating the same whereby the lap-roll may be arranged close to the feed-roll and the wool pulled out in long shreds, as and for the purpose described.

5. The roller C, having a groove cut around its periphery and a narrower groove cut in the bottom of this groove, in combination with the strip of saw-teeth set in the narrow groove in the bottom of the main groove, with its teeth flush with the alternating plain surfaces of the cylinder, substantially as and for the purpose described.

6. The combination of the box A, apron Z, first beater S', transfer and equalizing beater S, grate *r*, rollers C D *d b*, and brush F, with means for operating them, substantially as shown and described.

257,314. MACHINE FOR CUTTING UP PELTS. THOMAS GIBSON and EDWARD ARMSTRONG, Brooklyn, assignors to Hitchcock, Darmody & Co., New York, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a pelt-cutting machine, the cylindrical cutter-head, grooved longitudinally and at an inclination to the axis, and provided with the twisted cutters bolted upon the head and within such grooves, substantially as set forth.

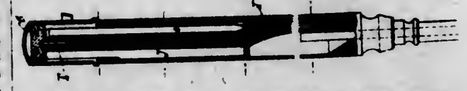
2. In a machine for cutting up pelts, the combination of the shear *k*, revolving cutters *i'*, feeding-rollers *m* and *n*, and belt *r*, substantially as and for the purposes set forth.

3. In a machine for cutting up pelts, the combination of the feeding-rollers *m* and *n*, shear *k*, revolving cutters *i'*, inclines *o* and *l*, and belt *u*, substantially as and for the purposes set forth.

4. In a machine for cutting up pelts, the combination of the feeding-rollers *m* and *n*, revolving cutters *i'*, receptacle *p*, belt r, and incline *o*, substantially as and for the purposes set forth.

5. The combination, in a machine for cutting up pelts, of the adjustable revolving cutters *i'*, cutter-bar *k*, cleaning-brush 29, dust-receptacle *p'*, and removable grating 6, substantially as and for the purposes set forth.

6. The combination, in a machine for cutting up pelts, of the feeding-rollers *m* and *n*, adjustable revolving cutters *i'*, cutter-bar *k*, cleaning-brush 29, and dust-receptacle *p'*, substantially as and for the purposes set forth.

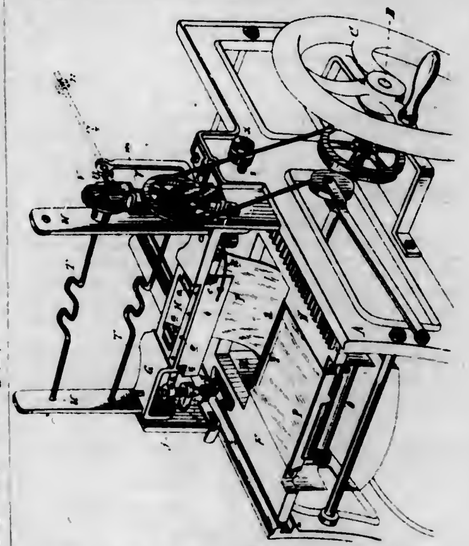


7. The combination, in a machine for cutting up pelts, of the revolving head and adjustable cutters *i'*, dust cap or cover *l*, arms 2, and weighted arm-rest 3, substantially as and for the purposes set forth.

8. The combination, with the endless belts *r* and *u*, of the brackets and rollers 25 and 24 and the adjusting-screws 19 and 27, for tightening up the belts as they become loose, as set forth.

9. The combination of the feeding-rollers *m* and *n*, revolving cutters *i'*, cutter-bar *k*, inclines *o* and *l*, belt *u* for the delivery of the fleece of fur, the roller *r*, and incline *w*, substantially as and for the purposes set forth.

10. In a machine for cutting up pelts, the combination of the inclined curved adjustable revolving cutters *i'*, body *i*, cutter-bar *k*, and adjusting-bolts 30, for setting the cutters up to the cutter-bar, substantially as set forth.



257,315. LEAD AND CRAYON HOLDER. ALBERT GORTS, Hoboken, N. J. Filed Jan. 28, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the tubular stock or handle having the lead-holding tip secured to its lower end, the filling-piece inserted in the lower part of the handle and formed with a longitudinal lead-guiding channel communicating with the lead-holding tip, the rotating case inclosed in the upper part of the handle and formed with a series of longitudinal lead-receiving channels adapted to register with the lead-guiding channel of the filling-piece, the head fixed to the upper end of the rotating case, and the catch adapted to hold the rotating case in the required positions.

2. The combination, substantially as hereinbefore set forth, of the catch E, having the thumb-piece E', the spring S, acting on the catch, the tubular handle A, having notches in its upper end adapted to receive the thumb-piece of the catch, the head D, and rotating case C, having channels J, the whole arranged to operate as specified.

257,316. CIGAR-MACHINE. ALEXANDER GORDON, Detroit, Mich. Filed Dec. 15, 1881. (No model.)

Claim.—1. In a machine for bunching cigars, a hopper provided with an intermittently-reciprocating horizontal knife, a trough having adjustable ends and pivoted doors, a reciprocating table, and a bunching-cloth, the whole combined with and operating from a common power automatically, for the purpose set forth.

2. The combination of the following devices: an automatic dropper delivering a measured supply of filler, a bunching-cloth wound and unwound upon a roll, a bunching-roll, and a reciprocating table, the motion of all these parts being positively connected together, all substantially as described and shown.

3. A trough provided with adjustable ends, and having doors provided with mechanisms for opening them automatically and intermittently, substantially as described.

4. The combination of the bunching-cloth P, reciprocating

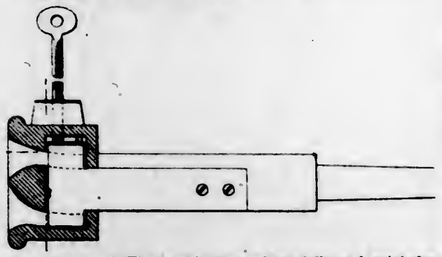
table F, rolls I J O, welt R, and operating mechanism, as and for the purposes described.

5. The combination of the reciprocating table F, rack N, gears L and M, rolls I, J, and O, and cloth P, as and for the purpose specified.

6. The combination of the shaft *f*, knuckle *g*, projection *h*, catch *i*, arm *l*, levers *d d*, and hinged doors *b b*, when combined and operating as described.

7. The adjustable catch *i*, combined with the knuckle *g*, shaft *f*, and connections with the doors *b b*, whereby the said knuckles may be thrown in or out of operation, as may be desired, as specified.

8. The combination of the pusher-bars T T, having crank-arms, as shown, with the hopper S, standards *s s*, pulleys V V, and trough, as and for the purposes specified.

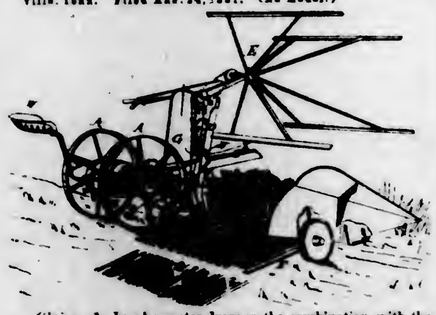


9. The combination of the knife R' with the trough having adjustable ends and automatically opening and closing hinged doors adapted to operate alternately, as and for the purposes set forth.

10. The combination of the knife R', cloth P, trough having automatically opening and closing doors, the rolls I J O, gears L M, table F, and operating mechanism, as specified, for the purpose set forth.

11. In a cigar-bunching machine, the trough having adjustable ends *a* and automatically opening and closing doors *b*, provided with interchangeable linings *p*, of various thicknesses, adapted to produce bunches of different sizes, as set forth.

12. The roller J, journaled eccentrically in boxes X, and set-screws *s*, combined with the cloth P and reciprocating table F, and adapted to be adjusted and secured in any desired location, as and for the purposes set forth.

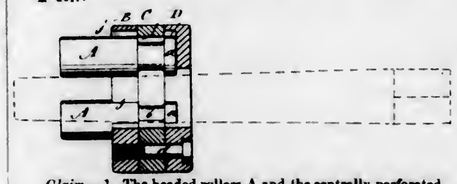


257,317. CAR-COUPLING. DUANE A. GRANT, Nyack, N. Y. Filed Feb. 21, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the draw-head, the coupling-pin, the laterally-movable spring having an offset to sustain the coupling-pin, and the pivoted latch on the exterior of the draw-head adapted to be automatically operated by the entrance of a coupling-link and capable of being operated from the exterior by the brakeman, as and for the purpose set forth.

2. The combination, substantially as hereinbefore set forth, with the draw-head and the coupling-pin, of the pin-holding latch having a flat pivot which extends vertically through the mouth of the draw-head and takes a diagonal position when the latch is in use, for its reversal by the thrust of a coupling-link.

257,318. HARVESTER-DROPPER. SHEPHERD GRAHAM, Nashville, Tenn. Filed Aug. 24, 1881. (No model.)



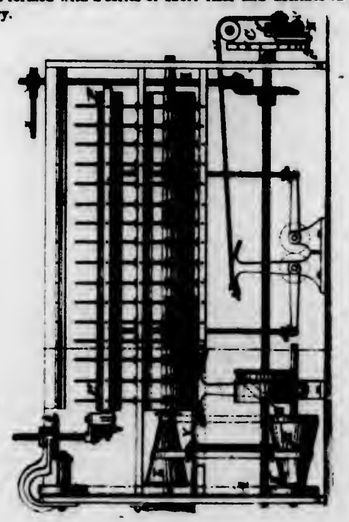
Claim.—1. In a harvester-dropper, the combination, with the dropper F, the reel-post G, and the reel-driving mechanism, of the chain J, the chain-wheels K I, the clutch M, the spring N, the shaft H, the crank-arm X, the connecting-rod Y, the pivoted plate Z, the collar *c*, and the arm *d*, substantially as herein shown and described, whereby the dropper will be lowered and raised automatically, as set forth.

2. In a harvester-dropper, the combination, with the chain-wheel I, the crank-arm X, connecting-rod Y, and the dropper F, of the clutch M, provided with a spiral groove, P, and the spring-actuated bolt, substantially as shown and described, whereby the dropper will be held stationary when in a position to receive the grain, as set forth.

3. In a harvester-dropper, the combination, with the connecting-rod Y and the pivoted plate Z, of the stop-pin *a* and spring *b*, substantially as herein shown and described, whereby the said rod is allowed to continue its movement should the dropper strike an obstruction, as set forth.

4. In a harvester-dropper, the combination, with the rod Y, the collar *c*, and arm *d*, of the fulcrum-arm *g*, lever *f*, catch-hook *h*, rod *j*, and spring-pressed bent lever *k*, substantially as herein shown and described, whereby the dropper can be adjusted to descend to a higher or lower point, as set forth.

257,319. TUBE-EXPANDER. JOSEPH T. GRISCOM and WILLIAM H. H. GRISCOM, Nashville, Tenn. Filed Mar. 7, 1882. (No model.)



Claim.—1. The beaded rollers A and the centrally-perforated and radially-slotted plates B and C, in combination with the annular recessed plate D, the plates being secured together by the screw-bolts *d*, substantially as described.

2. The combination, with the beaded rollers A, the recessed plate D, and the radial slotted plate C, of the plate B, provided with the radial slots *j*, having their inner ends contracted, substantially as and for the purpose set forth.

257,320. RING-SPINNING FRAME. ELISHA HARRIS, Providence, R. I., assignor to himself and Abraham W. Harris, same place. Filed May 16, 1881. (No model.)

Brief.—Improvement upon Letters Patent No. 232,818, dated October 5, 1880. A driving-cylinder having vertical motions in unison with the ring-rails is employed for driving the rings, which are caused to be rotated on hollow supports with a variable rotation in relation to the movements of the ring-rail. The traverse-cam is formed with a series of short rises and declines in its periphery.

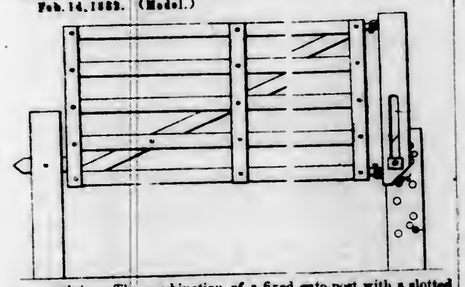
Claim.—1. In a ring-spinning frame, the combination of a ring-rail having hollow supports fastened to it for the rings to revolve upon, and allowing the bobbin to pass through the same, a ring fitted for a traveler and grooved to receive a band, and a horizontal band-cylinder having vertical motions in unison with the ring-rails, with mechanism for imparting such motion and rotating said cylinder, substantially as herein set forth.

2. The traverse-cam C, constructed as herein shown and described—that is, with a series of short rises and declines in its periphery, substantially as herein set forth.

3. The traverse-cam C, constructed with a series of short rises and declines, as described, and a ring-rail combined with mechanism for operating said cam, and for imparting motion from the same to said ring-rail, essentially as set forth.

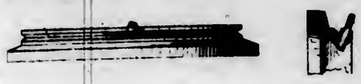
4. The combination, with a ring-rail, a series of ring-holders mounted thereon, a series of rings adapted to rotate upon said holders, a movable and rotatable driving-cylinder, F, and a series of bands for connecting said cylinder with the rings, of mechanism for imparting a rising and falling motion to said ring-rail and cylinder, and for imparting a variable rotation to the latter, whereby the rings and ring-rail are properly traversed, the driving-cylinder caused to move in unison therewith, and the rings caused to rotate with a variable rotation in relation to the movement of the ring-rail, as specified.

257,321. CHAIN-PUMP BUCKET. JOSEPH J. HARRIS, Petersburg, Mich. Filed Aug. 19, 1881. (No model.)



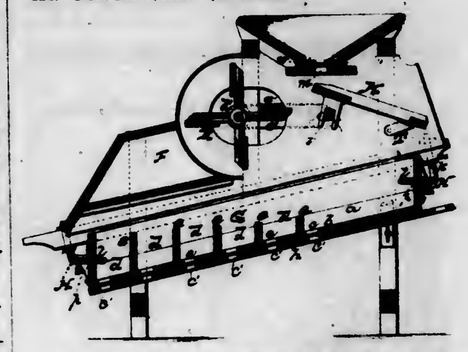
Brief.—The pin *f* may be transferred from one hole, *e*, to another, so as to hold the bucket in whatever position it may be adjusted.

Claim.—1. In a chain-pump bucket, the combination of the bucket having a conical recess in one end, the link *a*, having a conical enlargement to fit in said recess, and two or more washers, *g*, made to fit over the link in the recess, the said washers being made of unequal size and removable from the link, substantially as shown.



2. In a chain-pump bucket, the combination of the bucket *d*, having a conical recess in one end, the link *a*, having an enlargement to fit in the end of the recess, and provided with a series of holes at its upper end, washer *h*, pin *f*, and removable conical washers *g*, the parts being arranged to operate substantially as set forth.

257,322. GATE-POST. EDWIN J. HART, Butler, Pa. Filed Feb. 14, 1882. (Model.)

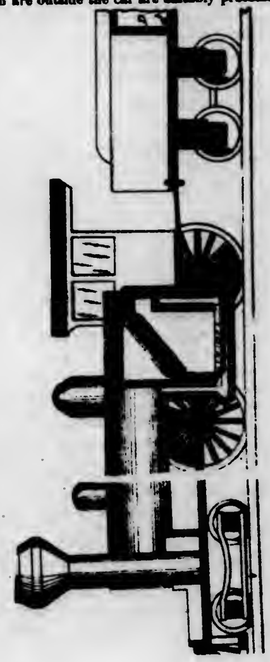


Claim.—The combination of a fixed gate-post with a slotted bar or piece that is pivoted and upheld by a bolt passing through the post and slotted bar or piece, to which piece the gate is hinged, and can be adjusted to various heights and inclinations by changing the position of the piece to which it is hinged, substantially as described.

257,323. BELT-REPLACING DEVICE. HENRY C. HARTLEY, Springfield, Ohio. Filed Aug. 18, 1881. (Model.)

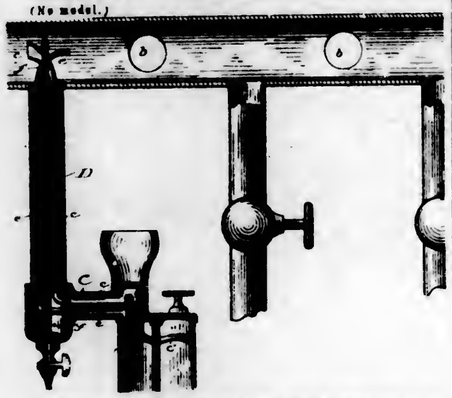
Claim.—As a means for replacing a belt upon a pulley, and in combination therewith, a lag secured within one edge, at the periphery of the same, its inner plain face having a radial and laterally-outward inclination, and its edges being beveled or rounded, substantially as and for the purpose specified.

257,324. GRAIN-SEPARATOR. JAMES F. HATFIELD, Dublin, Ind. Filed Feb. 7, 1882. (No model.)



Claim.—1. The screen-shoe having the sloping sides *a*, the perforated center board, *b*, and the partitions between said perforations *c*, forming compartments *d*, in combination with the perforated slide and cut-off *h*, substantially as specified.

2. The screen-box G, provided with the reversely-arranged inclined planes *e e* and a bearing-box, *p*, at each end, in combination with the adjustable bracing-rods H H, provided with bearing lugs or centers *l* and common gearing and connections, whereby an endwise and a vibratory motion is imparted to the screen-box during its operation, as specified.



257,325. CAR-HEATER. FRANK S. HEATH, Corry, Pa. Filed Feb. 15, 1882. (No model.)

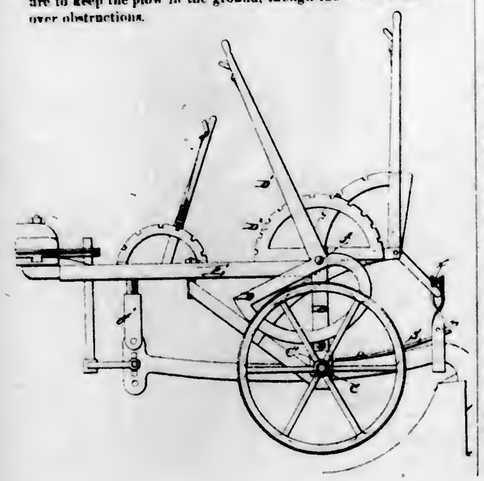
Brief.—Back pressure in the water-pipe from the heater toward the tank is prevented by suitable valves. The portions of the pipe which are outside the car are suitably protected.

Claim.—A continuous circuit or circuits of water-pipe for heating cars extending from the fire-box of a locomotive throughout the train and returning through the fire-box, the water within said pipes being heated in passing through the fire-box, substantially as described.

257,326. LUBRICATOR. ROSS J. HOFFMAN, Binghamton, N. Y., assignor to himself, Orson A. Jenks, George W. Lester, and Richard W. Lester, all of same place. Filed Mar. 24, 1882. (No model.)

Claim.—1. The combination of the main steam-supply pipe with two or more branch pipes, separate engines connected therewith, and an automatic lubricator connected to the main supply-pipe between the generator and the branch pipe nearest thereto, all substantially as described.

2. The combination of the steam-supply pipe and branch pipes, the pipe D, and pipe C *c c*, all in communication with the lubricator, substantially as set forth.



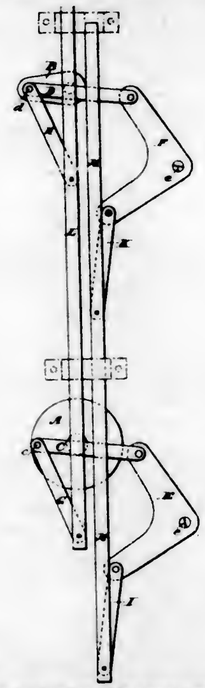
3. The pipe *f*, in combination with the pipe D, and the pipes C *c c*, with steam-supply pipe and lubricator, as set forth.

4. In combination with the oil-cup of a lubricator and with the steam-passage *c* thereof, the tube *h*, pipes 2 and *i*, all combined and operating substantially as set forth.

5. In combination with the oil-cup of a lubricator, the hollow bias or tube *k* and glass *l*, and the pipe *c'*, having inclined end or face, all arranged to operate substantially as described.

257,327. SULKY-PLOW. JOHN I HOKE, South Bend, Ind. Filed Feb. 14, 1882. (No model.)

Brief.—A lever with an enlarged cam engages with the spindle-box and raises or lowers the wheel upon the arch. The rear hanger of the plow rides laterally upon the bail or crank. A spring upon the plow-beam is designed to impart a yielding pressure to keep the plow in the ground, though the wheel should rise over obstructions.



Claim.—1. In a sulky-plow, the short landside-axle C, constructed with a sleeve, C', a stud, *a*, and a lip, *b*, in combination with the arched axle B, anti-friction roller *c*, cam D, its lever D', and a locking device therefor, substantially as and for the purposes described.

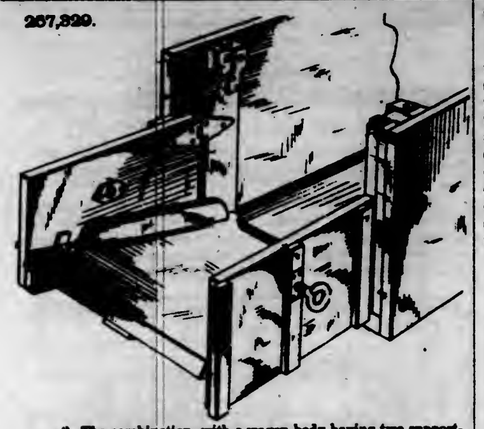
2. The combination of the sleeve C', bearing the short axle C, and adjustably applied on the vertical limb of the arched axle, with a lever having a flanged cam on its end adapted to engage with sleeve C, for leveling the machine, substantially as described.

3. The combination of the pivoted bail, its hand-lever and locking device, the arched axle, the plow-beam pivoted vertically and horizontally at its front end to the sulky-frame, the suspension-stirrup for this beam, adapted to ride on said bail, and the suspension-spring S, having a bearing, *n*, on the stirrup, substantially as described

257,328. MECHANICAL MOVEMENT. WILLIAM H. HOLCOMB and CLIFFORD A. HOLCOMB, Beloit, Wis. Filed Nov. 3, 1881. (No model.)

Claim.—1. The combination of the cranks, connecting-links, bell-crank levers, and rods or tubes, arranged substantially as shown, to form a mechanical movement, as and for the purpose described.

2. In a mechanical movement, the combination of cranks A B, with the bell-crank levers E F, rods or tubes L M, and connecting-links, substantially as shown, and for the purpose specified.



3. The combination of the cranks A B, links G H, connected to rod L, and links C D, attached to one end of the bell-crank levers E F, with the links I K, connected to the rod M, all constructed and arranged for operation substantially as shown, and for the purpose described.

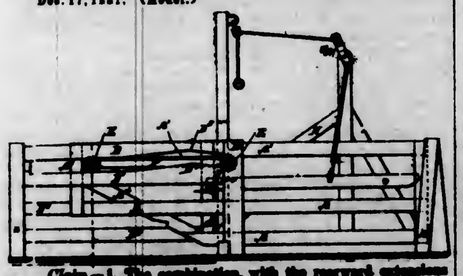
4. In a mechanical movement, the pitmen I K, connected to the bell-cranks E F, links C D, cranks A B, and rods or tubes L M, arranged substantially as and for the purpose specified.

257,329. COMBINED END-GATE AND SHOVELING-BOARD. GEORGE W. HOLLY, Camanche, Iowa. Filed Aug. 6, 1881. (No model.)

Claim.—1. The combination, with a wagon-body provided with cleats and supporting-pieces removably secured to the body, of a shoveling-platform pivoted to the supporting-pieces and provided with a central slotted piece and arms, substantially as described, for locking said platform to the side supporting-pieces, as set forth.

257,329.

2. The combination, with a wagon-body having two supporting-pieces provided with straps, of a pivoted shoveling-platform provided with projections which fit under said straps, and with a central slotted piece, two locking-arms, and a locking-screw, said arms entering slots of the supporting-pieces, substantially as set forth.



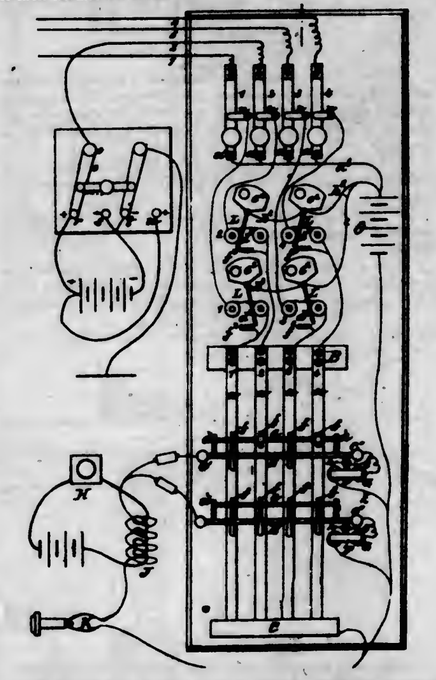
3. The combination, with a wagon-body, of the pivoted shoveling-platform, and means for locking the same to the side pieces of the wagon, and two end-gates, the inner one being provided with a vertical cleat to prevent the swing of the gate beyond the line of the side of the wagon, while the other is hinged at the opposite side of the wagon and provided with an end brace, which overlaps the cleat of the inner gate, substantially as set forth.

4. The combination, with a wagon-body, of the pivoted removable shoveling-platform, and two sliding arms for locking the platform to the side pieces of the wagon, and two end-gates hinged at opposite sides of the wagon and arranged so that the outer gate will overlap and lie parallel with the inner one, and a locking-screw for firmly holding the gates in place, substantially as set forth.

5. The combination, with a wagon-body, of two removable supporting-pieces of different widths, two end-gates arranged to overlap and lie parallel to each other, and a pivoted shoveling-platform having hinged supporting-links and side pieces or guards, substantially as set forth.

6. The combination, with a wagon-body, of side pieces provided with metallic-lined slots, a pivoted shoveling-platform having sliding locking-arms arranged to enter said slots, and two end-gates overlapping each other and provided with a central locking-bolt, substantially as set forth.

257,330. GATE. WILLIAM C. HOOKER, Abingdon, Ill. Filed Dec. 17, 1881. (Model.)



Claim.—1. The combination, with the rearward extensions A' A' of the gate and the double track D D', of the double-flanged rollers E, having links or extensions outside of the said flanges, and the forked connecting-bar F, between whose forks the said rollers are journaled, substantially as and for the purpose set forth.

2. In a gate, the combination, with the track-bars D' and the connected rollers E, of the double inclines D', substantially as herein shown and described, whereby the momentum of the gate is made to carry the said gate more surely to the desired point, as set forth.

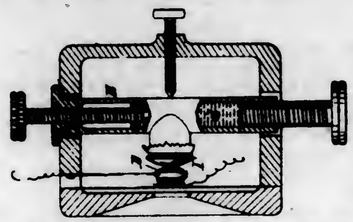
257,331. TELEPHONE CENTRAL-OFFICE SYSTEM. GEORGE H. HOPKINS, New York, N. Y. Filed Feb. 16, 1882. (No model.)

Brief.—The line-strips of the switch-board are spring-bars normally in contact with a ground-connection. The connecting strips or bars are provided with cam-levers, which, when turned up to connect a line-strip with a cross-bar, break the contact of the line-strip with the ground-connection. The subscribers' annunciators are polarized, and their armatures, in passing from one side to the other, make contact with mercury-cups and close the circuit of a local battery through magnets which act to release the cam-levers. Upon the completion of conversation a current of opposite direction in that used to call central office is sent by the subscriber, which effects the restoration of the switching devices to their normal condition.

Claim.—1. In a telephonic central-office switch-board, a series of spring-bars, a series of weighted cam-levers on a support movable by an electro-magnet, and a corresponding series of relays for controlling a local circuit for operating the said electro-magnet, constructed and combined substantially as herein specified.

In a telephonic central-office system, the combination of the *n a*, cam-levers *f*, rock-shaft E, and magnet G, as herein specified.

3. The combination, in a central-office system, of two or more spring-bars, *a*, two or more weighted cam-levers, *f*, the rock-shaft E, carrying the rod *e*, the magnet G, and the annunciators L, adapted to control a local circuit, substantially as herein specified.



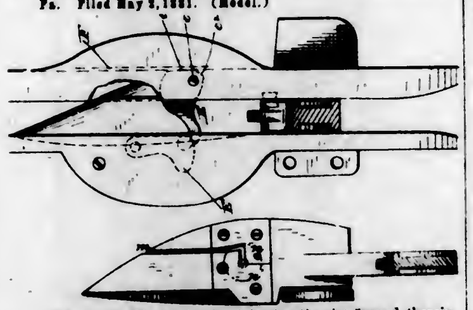
4. In a telephonic central-office switch-board, the polarized annunciators L and mercury-cups *f''*, in combination with a local circuit, including the battery O, magnet G, spring switch-bars *a*, and cam-levers *f*, as herein specified.

5. In a telephonic central-office switch-board, the combination of the double-contact keys 1, 2, &c., annunciators L, bars *a*, and cam-levers *f*, substantially as specified.

6. In a telephonic central-office switch-board, a series of spring-bars, *a*, a series of cam-levers, *f*, and the ground-connecting plate C, in combination with a series of subscribers' lines, whereby one subscriber's line may be disconnected from the central-office ground and connected with another subscriber's line, substantially as specified.

7. The combination of the receiving-instrument K and transmitting-instrument H with the rock-shaft E, bars *a*, lines 1, 2, &c., and interrupting devices, substantially as herein specified.

257,332. TELEPHONE-TRANSMITTER. GEORGE M. HOPKINS, Brooklyn, N. Y., assignor, by mesne assignments, to the People's Telephone and Telegraph Company, of New York. Filed May 31, 1880. Renewed Aug. 6, 1881. (No model.)



Claim.—1. In a telephone-transmitter, a hydrostatic column confined by a flexible diaphragm, in combination with a movable electrode adapted to receive the pressure of the hydrostatic column through the medium of the flexible diaphragm, as herein specified.

2. In a telephone-transmitter, the tube E, diaphragm I, and mercury column *d*, in combination with the vibratory electrode D, as specified.

3. In a telephone-transmitter, the combination of the adjusting-screw K and elastic packing *e* with the tube E, as shown and described.

4. In a telephone-transmitter, the siphon-tube E', containing an inclosed air-space, *g*, and provided with a diaphragm, I', in combination with the vibratory electrode D, as herein specified.

257,333. GRAIN-BINDER. MOSES G. BUNNARD, Norristown, Pa. Filed May 2, 1881. (Model.)

Claim.—1. The binder-head having the slot formed therein in tangential relation to the journal of the twister-pinion, or thereabout, in combination with the overhanging ledge or flange on the rack-segment.

2. The binder-head provided with the entering-slot, terminating in the retaining-slot at right angles, or nearly so, thereto, in combination with the flange on the rack-segment overhanging the entering-slot, substantially as described.

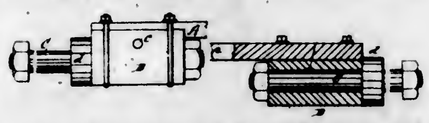
3. The removable shouldered plates, forming the retaining slot or notch in the binder-head, substantially as described.

4. The binder-head provided with the guiding-wheel, in combination with the flanges or ribs forming a shield thereto and holding it out of frictional contact with the side wall of the rack-segment, substantially as described.

5. The pivoted retaining-latch E, having the flattened heel end *e* and the inclined face *e'*, terminating in the lower face of said latch, in combination with the spring F, arranged and operating substantially as described.

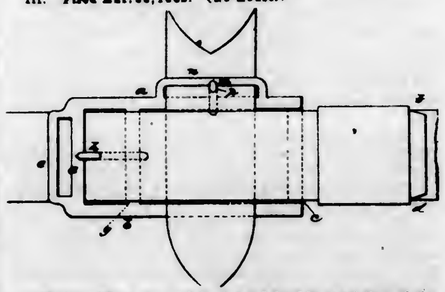
6. The pendent locking-latch E', provided with the pin or spur, in combination with the flat retaining-spring, arranged and operating substantially as described.

257,334. LOCK FOR TRAVELING-BAGS. VALENTIN HEPPE, Offenbach-on-the-Main, Germany, assignor to himself and Adam Philippe Bender, same place. Filed Oct. 15, 1881. (Model.) Patented in Germany Sept. 18, 1880, and Feb. 3, 1881, in England Nov. 10, 1880, in Austria January, 1881, in Hungary January, 1881, and in France Jan. 13, 1881.



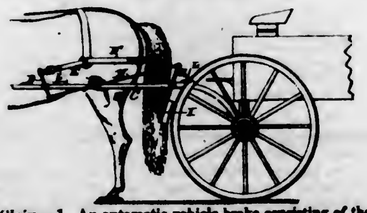
Claim.—1. In a bag-lock, the combination of the elongated bolts B B', the springs *s*, for drawing them outward, pins *h h'* upon said bolts, the fixed cap F, the angle-pieces A A', and the pressure-

caps E E', attached to said angle-pieces and adapted to be pressed inward for drawing the bolts B B' inward, substantially as specified.



2. The combination of the elongated bolts B B', the springs *s*, for drawing them outward, the pins *h h'* upon said bolts, the pressure-caps E E' and their attached angle-pieces A A', engaging with said pins, and the bolt 1 and bell-crank or elbow 6, adapted to fit between said pins *h h'*, substantially as specified.

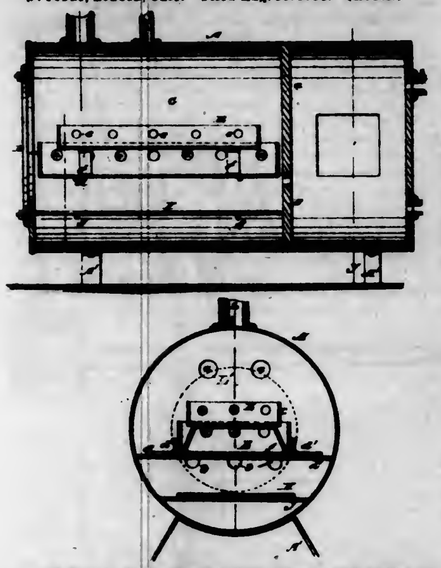
257,335. VEHICLE-AXLE. ROBERT P. IVEY, Cuthbert, Ga. Filed Jan. 28, 1882. (No model.)



Claim.—The combination, with the boxes B B, secured under each end of axle A, of the independent spindles C C, each having a median collar, *d*, formed of corresponding size on each side of said collar, provided with a nut at each end, one side rotating in the box and the other made fast to the wheels, whereby the spindles may be reversed to equalize wear, as described, and the wheels rigidly clamped to the spindles to turn with them, as set forth.

257,336. TRACE-BUCKLE. MARSHALL S. JOHNSON, Robinson, Ill. Filed Mar. 28, 1882. (No model.)

Claim.—The trace and back-band buckle consisting of the side bars, *a b*, curved inward or depressed in front and connected by the hame-tag bar *c*, and raised at their rear ends and connected by the breeching loop-bars *e e*, the intermediate bar, *g*, carrying the main or trace tongue A, and the raised bracket *n*, extending from the upper side bar, *a*, the latter carrying a tongue, *m*, for the back-band billet, substantially as specified.



257,337. VEHICLE-BRAKE. WILLIAM T. JOHNSON, Washington, D. C., assignor of one-half to Charles H. Miller, Eureka, Ark. Filed Oct. 18, 1881. (No model.)

Claim.—1. An automatic vehicle-brake consisting of the upright pivoted lever D, one arm of which is adapted to be secured to the holdback-strap E and the other to rod H, and the upright pivoted lever G, arranged on the shaft or pole in front of the wheel, and carrying the brake-shoe I at one end and connected at the other end to rod H, the whole arranged for operation and constructed to act in combination substantially as set forth.

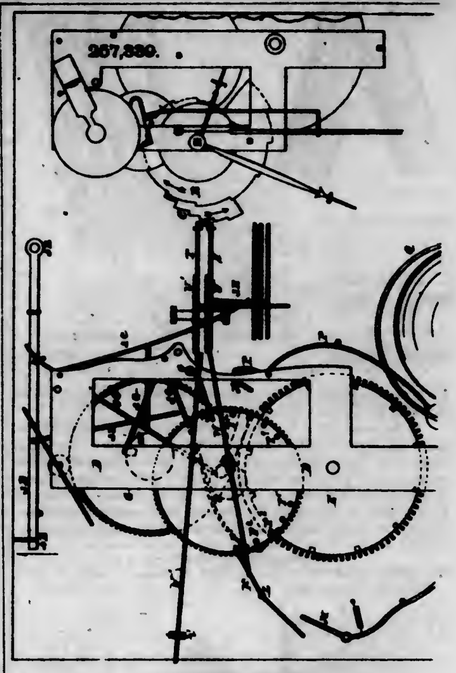
2. An automatic vehicle-brake consisting of the upright lever D, shaft or pole C, upright lever G, carrying brake-shoe I, rod H, connecting levers D and G, and pivoted locking-block L, the whole constructed to act in combination, substantially as set forth.

257,338. FEED-WATER HEATER AND PURIFIER. ROBERT W. JOHNS, London, Ohio. Filed Aug. 18, 1881. (Model.)

Claim.—1. An improved feed-water heater and purifier consisting of a cylinder divided into two unequal chambers by a vertical perforated partition, the smaller one of which is provided with the exhaust and water exit pipe, and the larger one with steam and water supply pipes, and with sediment-collecting pans having perforated sides arranged one above the other, and a grating below the said pans, substantially as and for the purpose set forth.

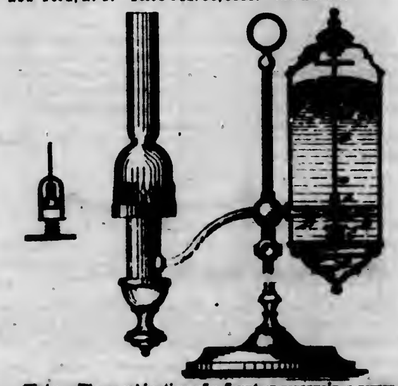
2. In a feed-water heater and purifier, the combination, with the cylinder A, provided with the vertical partition D, of the purifying-chamber C, provided with the pans E, having perforated sides and placed one above the other, and the grating F, arranged below said pans, substantially as and for the purpose set forth.

257,339. REPEATING MECHANISM FOR CLOCKS. ERWIN Y. JUDD, Hartford, Conn. Filed Nov. 12, 1881. (No model.)



Claim.—1. The hour-snail C, concentric with the arbor of the minute-hand of a clock-train and provided with a series of teeth or notches on the side, in combination with said arbor and a ratchet or spring pawl, C', and a device, B', turning with the minute-arbor for operating said pawl, whereby the said snail is moved one notch for each revolution of the minute-arbor, substantially as described.

2. The combination of one or more fusees, S T, connected by suitable mechanism with the striking-levers K N, for operating them, with said levers and a series of pins of different lengths upon the wheel F, whereby said levers are made to engage a greater or less number of the pins, according to the position of said fusees, and with mechanism for releasing said fusees at will and allowing them to drop upon snails operated by the clock-movement and withdrawing them after one turn of the wheel F, substantially as described.

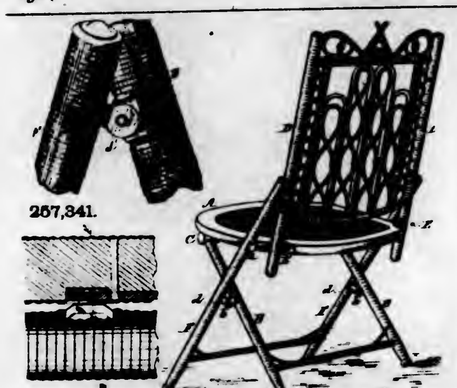


3. The combination of the bar P, the lever P', having the arm P² and the spring P³, the fusees S T, and the wheel F, having a slot for the end of the arm P², whereby the said fusees are released and kept released during the revolution of the wheel F, and then withdrawn, substantially as described.

4. The combination of the snails C R, the fusees S T, the levers K N, having their positions regulated by said fusees by connecting mechanism, the repeating-train, constructed as described, and driven by a spring, H, or its equivalent, the levers M P, carrying the hammers of the bells Q R, the releasing-bar P, the lever P' P², and the lever P⁴ P⁵, with a clock-movement, the whole forming an independent repeating mechanism for clocks, substantially as described.

257,339.

257,340. OIL FOUNT OR RESERVOIR. JÖRGEN KASCHAN, New York, N. Y. Filed Jan. 16, 1882. (No model.)

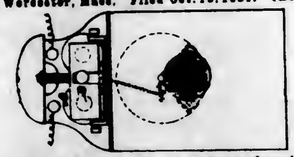


Claim.—The combination of a fount or reservoir, a screw-cap at the top thereof, an eduction-pipe having a valve-opening opposite the screw-cap, a spring-actuated valve adapted to close automatically, a perforated guide-piece or bridge below the top of the fount, a forked spindle passing through said guide-piece, the lower end of which rests upon the valve, while the upper end is adapted for contact with the screw-cap, and a float upon said spindle, substantially as described.

257,341. FOLDING CHAIR. ERWIN EDLEBY, New Haven, Conn. Filed Aug. 1, 1881. (No model.)

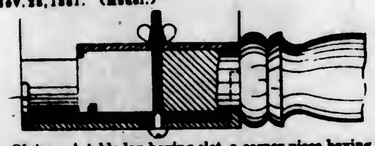
Claim.—1. In a folding rattan-bound chair, the combination of the back and of the front legs with the bowed or offset irons *g*, fastened to the back, having the rivet-pivots and the irons *f*, fastened to the legs and pivoted to said bowed irons, whereby to separate the rattan-bound surfaces from the abrading and wearing action, substantially as described.

2. The combination of the seat provided with hangers E with the back covered with rattan, and having bowed irons pivoted to



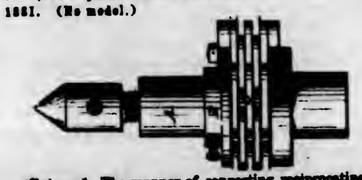
257,841.

the said hangers, whereby to separate the rattan-bound surfaces of the back from the seat-hangers, as set forth.



3. In combination, the legs B F, their pivot-joined right-angled plates *b b'*, the rigid seat-frame A, its hangers E E, and its pivoted connection C, with the rear legs, the back D, its inside and outside bowed irons, *g g*, and the bearing-plates *f* of the front legs, the said bearing-plates of the pivoting-connections being partially covered by the rattan wrapping, and the several parts constructed and arranged for use in a folding rattan-bound chair, substantially as described.

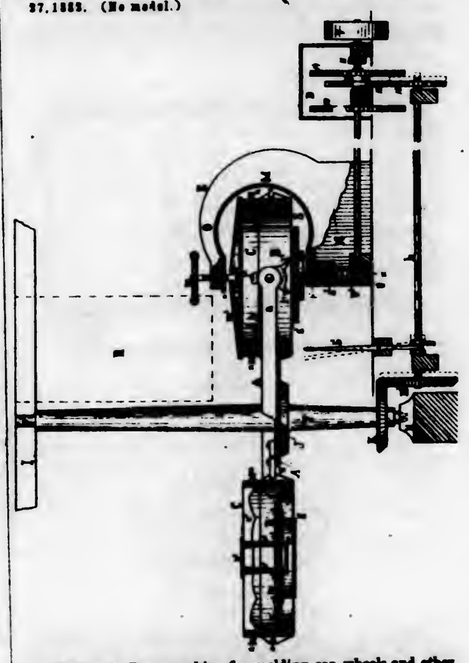
257,842. ELECTRIC CALL-BELL SIGNAL. JAMES F. KNOWLTON, Worcester, Mass. Filed Oct. 13, 1881. (No model.)



Claim.—A clock-mechanism, a disk or other visible signal carried thereby, an arm adapted to be operated by the operating mechanism of an electric bell or other alarm, and suitable stops on the clock-work engaging said arm, the whole constructed to act in combination in the manner and for the purpose set forth.

257,843. TABLE. FRANK T. KNAUSS, Scranton, Pa. Filed Nov. 26, 1881. (Model.)

Claim.—A table-leg having slot, a corner-piece having a lug fitting said slot, and a back plate having a lug also fitting said slot, in combination with a bolt and nut, as and for the purpose specified.



257,844. DEVICE FOR CONVERTING MOTION. WLADYSLAW T. KOSINSKI, Brooklyn, N. Y., assignor of two-tenths to Hubert West, same place. Filed July 31, 1880. Renewed May 16, 1881. (No model.)

Claim.—1. The manner of converting reciprocating into rotary motion by means of chain, steel band, or wire rope, (the ends of which are connected to a lever,) encompassing the object to be rotated by alternate grip and slip motion, as and for the purpose set forth.

2. The combination of the stock and cap, chain, and lever, as described.

257,845. MACHINE FOR MOLDING CAR-WHEELS AND OTHER CASTINGS IN SAND. JOHN LAIR, Hyde Park, Ill., assignor of one-half to H. S. Benton, same place. Filed Feb. 27, 1882. (No model.)

Claim.—1. In a machine for molding car-wheels and other castings in sand, a horizontally-rotating molding-bench carrying the sand-box B, containing a movable pattern, and a half-flask, C, seated on the top end of the said sand-box, substantially as and for the purpose set forth.

2. A horizontally-revolvable molding-bench carrying a sand-box containing a movable pattern, with a half-flask, in combination with a compressor operating to move the pattern and compress the sand, substantially as and for the purpose set forth.

3. In a machine for molding in sand, a horizontally-rotating molding-bench carrying about a center the sand-box, the pattern, and half-flask, substantially as shown, in combination with a sand-conveyer for distributing the loose sand over the pattern when the pattern and half-flask are under the conveyer, and with a compresser moving the pattern and compressing the sand out of the sand-box into the half-flask, arranged and operating substantially as shown, and for the purpose set forth.

4. In a machine for molding in sand, a horizontally-rotating molding-bench, A, constructed with arms *a* to support the sand-box, the sand-box being trunnioned in the outer ends of the said arms, with a locking-slide to engage with the sand-box and hold it in a horizontal position, as specified.

5. The combination, in a machine for molding in sand, of a horizontally-revolvable molding-bench, A, flange J, and post F, arranged, as shown, with the arms *a*, sand-box B, having pivots in the arms *a*, and the half-flask C, arranged and operating substantially as shown, and for the purpose set forth.

6. In a machine for molding in sand, the horizontally-revolvable molding-bench, the sand-box, the pattern, and half-flask, revolvable about a center, all constructed and arranged as shown and described, in combination with suitable mechanism to automatically move the molding-bench step by step, in the manner described, and for the purpose set forth.

7. In a machine for molding in sand, the horizontally-revolvable molding-bench, the sand-box, the pattern, and half flask, revolvable about a center, all constructed and arranged as shown and described, in combination with suitable mechanism to automatically move the molding-bench step by step, and with mechanism, such as shown and described, for dumping the required quantity of sand into the sand-box, for compressing the sand into the half-flask, for withdrawing the pattern, and for removing the half-flask, substantially as shown, and for the purpose set forth.

8. In a machine for molding in sand, which consists of the combination of a horizontally-revolvable molding-bench, sand-box with pattern, and a half-flask, means for revolving the same about a center, a compresser having a movable head, G, cam U, pitman U', and a slide, *g'*, arranged and operating substantially as shown, and suitable mechanism for stopping the revolving of the molding-bench, by which the sand-box and half-flask will be at rest while the compresser-head G is moving the pattern, substantially as shown, and for the purpose set forth.

9. In a machine for molding in sand, the sand-box B, constructed with open ends and with trunnions *i*, slotted ears *e*, and ear-lugs A, with dowels *i*, in combination with a half-flask, C, and with a horizontally-rotating molding-bench having arms *a*, and with a locking-slide to engage with the sand-box and hold it in a horizontal position, substantially as shown, and for the purpose set forth.

10. The combination, in a machine for molding in sand, of the sand-box B, and the pattern P, with the spring *d*, arranged and operating substantially as shown, and for the purpose set forth.

11. The combination, in a machine for molding in sand, of a locking-clamp, *l*, constructed with a catch, *l'*, and handles *F*, as shown, the said clamp pivoted to the trunnion *i*, and the catch *l'* being arranged to engage with the lug *F*, locking the half-flask to the sand-box, substantially as specified.

12. The combination, in a machine for molding in sand, of the sprue-stick *u*, constructed, substantially as shown, with a cone-shaped recess in its bottom end, and with the extension *u'*, constructed with a pointed cone-shaped top end fitting the bottom end of the sprue-stick, as shown, the extension *u'* being movably seated in perforations in the pattern, substantially as shown, and for the purpose set forth.

13. The combination, in a machine for molding in sand, of the sprue-stick *u* and the extension *u'* with the spring *u²*, the latter bearing on the extension *u'*, as shown, and for the purpose shown.

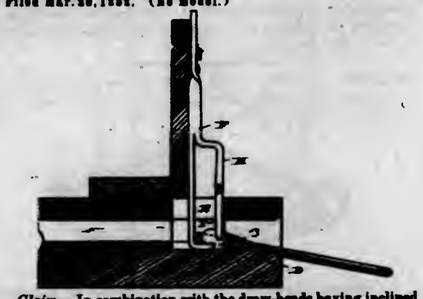
14. The combination, with a machine for molding in sand, of the conveyer R, constructed, substantially as shown, with a series of scattering-bars, *r*, arranged in succession, whereby loose sand, in passing through the conveyer, will be scattered and distributed over the surface of the pattern, substantially as specified.

15. The combination, in a machine for molding in sand, of the conveyer R, with a series of scattering-bars, *r*, arranged in succession, and with a cone-shaped scatterer, *r'*, arranged and operating substantially as shown, and for the purpose set forth.

16. In a machine for molding in sand, a horizontally-rotating molding-bench, sand-box with pattern, and a half-flask, revolving about a center, in combination with a compressor and crane, T, with grapple W, arranged in succession, whereby the loose sand will be compressed by the compressor, after which a move is made from the compressor and then the pattern withdrawn from the compressed sand by the crane and grapple, all arranged and operating substantially as shown, and for the purpose set forth.

17. The combination, with a machine for molding in sand, of the power-donkey D, consisting of a series of cogged wheels with pinions, and one wheel bare of cogs for the greater portion of its rim, as shown, arranged and operating with the compresser E and rotating molding-bench A, substantially as shown, and for the purpose set forth.

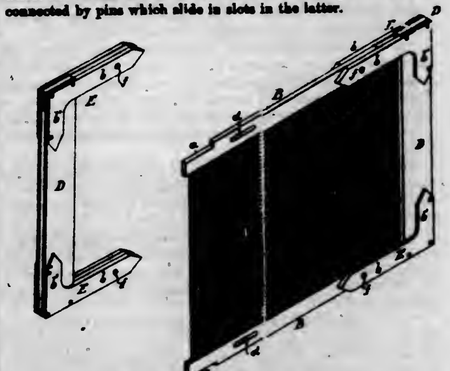
18. In a machine for molding in sand, a horizontally-revolvable molding-bench, constructed with arms *a*, and a sand-box trunnioned in the said arms at each end of the said molding-bench, in combination with suitable mechanism to move the molding-bench, carrying the sand-boxes about a center, in the manner described, and for the purpose set forth.



257,846. SHAFT-HITCH FOR VEHICLES. JOHN S. LAYTON, Springfield, Ohio. Filed Feb. 21, 1882. (No model.)

Claim.—1. In combination with the casings A, adapted to be secured to the shafts of a vehicle, the independently-movable draw-bars C D, having hooks at their outer ends adapted to be secured to the breast and breech straps of a hame, the plates I I, secured to the draw-bar, and the interposed spring S to take up the strain on said draw-bars, substantially as and for the purpose specified.

2. The combination of the case A, spring S, independent draw-bars C D, plates I, clamps *l*, *l*, and swiveled thumb-button H, substantially as and for the purpose specified.

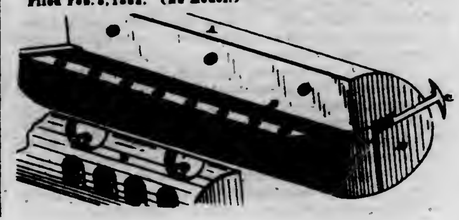


257,847. CAR-COUPLING. JOHN D. LEWIS, Columbus, Miss. Filed Mar. 30, 1881. (No model.)

Claim.—In combination with the draw-heads having inclined guides C, spaces D at each side of said guide, and vertical mortise E, the vertically-sliding frame F, provided with a horizontal arm at its lower end, and a bent arm, H, carrying a hinged pin, I, the whole arranged to operate substantially in the manner and for the purposes specified

257,848. ADJUSTABLE WINDOW-SCREEN. EDWIN L. LLOYD, Philadelphia, Pa. Filed Feb. 2, 1882. (No model.)

Brief.—The side edges of the netting are secured in bars recessed at their ends to fit into slots in box-like frames. The latter receive the unconfined ends of the netting, and have angle-irons whose inner ends embrace the ends of the netting-bars, and are connected by pins which slide in slots in the latter.



Claim.—1. The combination of the screen A, having top and bottom bars, B, and having unconfined ends, with the adjustable box-like end frames, D, guided on the bars B and adapted to receive and protect the unconfined ends of the screen, as set forth.

2. The combination of the box-like end frames, D, with the screen A, having bars B, with recesses *a* for the reception of the top and bottom strips of the frames D, as set forth.

3. The combination of the screen A and its bars B, having slots *d*, the end frames, D, adapted to said screen and its bars, and the corner plates, E, having projecting arms *b*, with transverse pins or bolts *f*, adapted to the slots *d*, as set forth.

4. The combination of the screen A and its bars B with slots *d*, the end frames, D, the corner plates, E, having thickened arms *b*, and the connecting pins or bolts *f*, adapted to the slots *d*, as set forth.

257,849. GUTTER-HEAD. ERNEST P. LOSEE, New York, N. Y. Filed Feb. 8, 1882. (No model.)

Claim.—A circular cylinder-head, A, having the right-angled recesses made in opposite sides, and provided with the parallel grooves B, in combination with the cutters C and the blocks D, which fill the recesses in the sides of the cylinder, substantially as shown and described.

257,350. POCKET. DAVID LUBIN, Sacramento City, Cal., assignor of one-half to Harris Weinstock, same place. Filed Feb. 6, 1882. (No model.)

Claim.—1. As a new article of manufacture, an attachment or frame for pockets, pouches, or other like articles, the same consisting of a frame constructed of metal or other suitable material, in sections, hinged together at the sides and ends and adapted to be secured to the pocket or other suitable article, substantially as specified.

2. In combination with a pocket, pouch, or other like article constructed of textile fabric, the attachment or frame constructed of hinged sections, as described, and made to conform to the shape of the body of the wearer, substantially as and for the purposes set forth.

3. In combination with the pocket or pouch and the hinged frame, made to conform to the shape of the body, a belt to which said frame and pocket or pouch are secured, whereby the pocket may be adapted to be worn either inside or outside of the garments, substantially as and for the purposes set forth.

4. In combination with the hinged attachment or frame and the pocket, the small pouches at the end of the mouth of the pocket, and the elastic looped bands secured therein, whereby the device may be temporarily secured to a coat, vest, pants, dress, or shirt pocket, or to other articles of male and female wearing-apparel and held by the elasticity of the bands, substantially as set forth.

5. In combination with a pocket or pouch, the hinged frame or attachment, formed as described, and provided with a recess in which a link of a watch-chain may be hooked to secure the watch, substantially as specified.

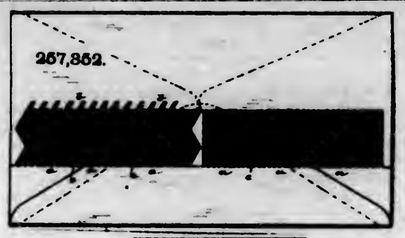
6. In combination with the pocket provided with small pouches at the mouth and with elastic bands secured in said pouches, of the hinged frame or attachment provided with apertures, whereby it may be stitched to the garment, substantially as and for the purpose set forth.

7. In combination with the hinged frame, the intermediate section consisting of the hinged stripe *i* and the hinged rectangular tubes or slides *i'*, hinged together as described, whereby the pocket may be provided with a dividing-partition, substantially as specified.

8. In combination with the hinged attachment or frame, the perforated stripe P, secured to the said frame, whereby the same may be attached to the garment, substantially as specified.

257,351. PIN. DAVID LUBIN, Sacramento City, Cal., assignor of one-half to Harris Weinstock, same place. Filed Feb. 1, 1882. (No model.)

Claim.—1. As a new article of manufacture, a pin for holding garments together, having its head concaved on the upper face thereof and its shank or body of triangular form in cross-section and longitudinally grooved, as shown and described.



2. As a new article of manufacture, a pin for holding garments, having a triangular shank in cross-section and longitudinally grooved, as shown and described.

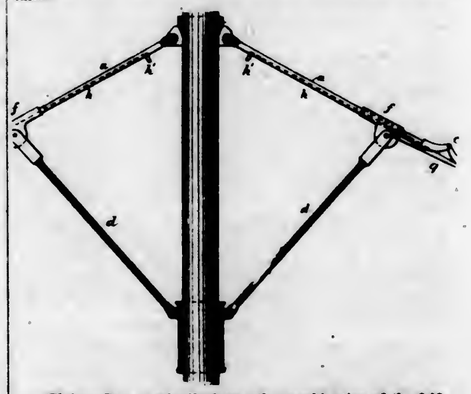
257,352. ENVELOPE. DAVID LUBIN, Sacramento City, Cal., assignor of one-half to Harris Weinstock, same place. Filed Jan. 31, 1882. (No model.)

Claim.—1. An envelope having its closing-flaps fringed, as described, and a tissue-paper backing cemented to the fringe, substantially as described.

2. An envelope having slips *a*, of different lengths, formed on its flap, and a tissue-paper backing cemented to said slips, for the purpose substantially as described.

3. An envelope having its closing-flap fringed and the ends of the slips *a* extended beyond the tissue-paper backing sealed to the fringe and gummed, substantially as described.

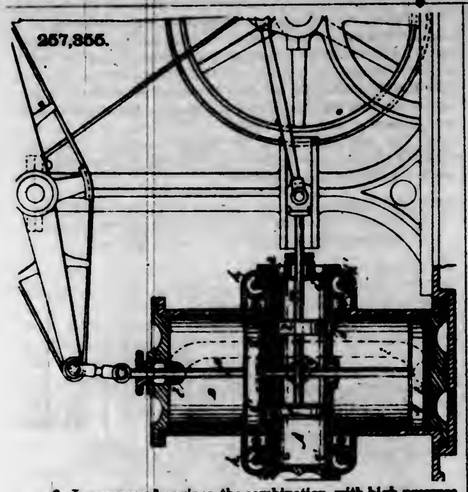
257,353. GUIDE FOR THE STEMS OF STAMP-MILLS. JAMES B. LUCAS, Tybo, Nev. Filed Jan. 19, 1882. (No model.)



Claim.—1. The combination, with the guide-rail A, provided with the mortise *a*, having radial wings *a'*, tapering inwardly from top to bottom, and bearing-blocks *b b'*, placed in the radial wings *a'*, of the two plates or caps *d d*, having their inner or adjacent ends provided with semi-circular recesses and longitudinal slots d^2, and having their outer ends made fast to the guide-rail, and the wedges *c c*, substantially as set forth.

2. The combination, with the guide-rail provided with the mortise *a*, having radial wings *a'*, stamp-stem E, blocks *b b'*, and wedges *c c*, of the plates *d d*, made fast to the upper and under sides of the guide-rail, and provided with semicircular end recesses and radial slots d^2, the upper and under plates being arranged in the same vertical plane, substantially as set forth.

257,354. UMBRELLA. AUGUST HALMROS, Helsingborg, Sweden. Filed Nov. 28, 1881. (No model.)



Brief.—One part of each jointed rib has an elongation, to the outer end of which is hinged a thin metal rod, which rests in the concavity of the other part of the rib and terminates in a small catch

Claim.—In an umbrella-frame, the combination of the folding ribs *a b*, provided with the joint or hinge *c*, arm *g*, projecting from the outer part, *b*, of the jointed rib, hooked rod A, hinged in the outer end of arm *g*, sliding sleeve or thimble *f*, and brace or stretcher *d*, hinged at its outer end in said thimble, the whole constructed and combined to operate substantially in the manner and for the purpose herein shown and described.

257,355. COMPOUND STEAM-ENGINE. GIDEON B. HAGENY, New York, N. Y., assignor to Jacob Lorillard, Trustee, same place. Filed Dec. 21, 1881. (No model.)

Claim.—1. In compound engines, the combination of the intersecting cylinders A B, communicating by ports *b' b'*, pistons *l l* on rod *m*, pistons *q q* on rod *p*, and the steam and exhaust ports *c' o g* of the high-pressure cylinder, substantially as shown and described.

2. In compound engines, the combination, with high-pressure cylinder A, of the low-pressure cylinder B, connected directly therewith, the pistons *q q*, rod *p*, and pipe *i*, substantially as shown and described.

3. In compound engines, the combination of two intersecting cylinders communicating with each other by open ports and a compound piston in the high-pressure cylinder fitted to act as valves for the low-pressure cylinder, substantially as shown and described.

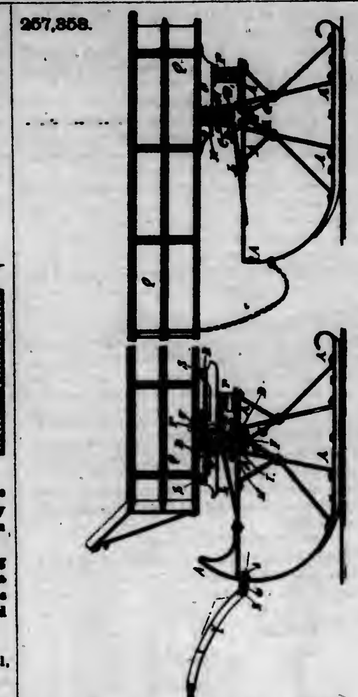
257,356. BURGLAR-ALARM. WILLIAM D. HAYNEY, Harvel, Ill. Filed Nov. 5, 1881. (No model.)

Claim.—1. The combination of the spring-supported platform, wires of an electric circuit, contact-points in an alarm-circuit that are brought into contact by the downward movement of the platform, and movable supports arranged to sustain the platform rigidly when required, substantially as shown and described.

2. The combination of spring-platform A, movable block *n*, and the circuit-wires *o o'*, connecting with the blocks and platform, respectively, substantially as shown and described.

3. The movable bars *b b'*, *c c*, and *c' c'*, connected together and provided with studs *h*, in combination with the spring-platform A, substantially as and for the purposes set forth.

4. The movable bar *b*, links *d*, rock-shaft *f*, arms *h m*, and jointed block *n*, substantially as shown and described, combined with the spring-platform A, for operation as set forth

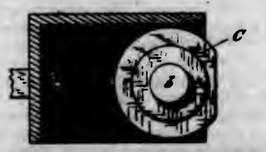


257,357. UNDERGROUND CONDUIT FOR ELECTRIC WIRES. ARCHIE F. HOLDEN, San Francisco, Cal. Filed Dec. 17, 1881. (No model.)

Claim.—In an underground conduit for electric wires, the combination of the pipe A, having an enlarged end, as described, to receive the smaller end of a corresponding pipe, with such corresponding pipe and disk G, provided with apertures for the passage of telegraph or other electric conducting-wires, and having an enlarged portion or shoulder constructed to fit the interior of the enlarged portion of pipe A, and a smaller portion constructed to fit the interior of the smaller end of the connecting-pipe, substantially as and for the purpose set forth.

257,358. BOB-SLEIGH. HIRAM MCILROY, Poplar Ridge, N. Y. Filed Oct. 27, 1881. (No model.)

Claim.—1. In a bob-sleigh, the combination, with the bolster M and the runners A, of the tubes C, the rods H, and the plates K, having lugs J, substantially as herein shown and described,



whereby the runners can move independently of each other in passing over an uneven roadway, as set forth.

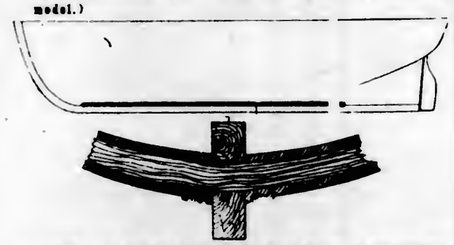
2. In a bob-sleigh, the combination, with the runners A, the tubes C, and the rods H, of the concaved bars D, the clips E, having lugs F, and the braces G I, substantially as herein shown and described, whereby the runners are held firmly in place, as set forth.

3. In a bob-sleigh, the combination, with the body Q, the bolster M, and the runners hinged to the said bolster, of the springs P, interposed between the said body and runners, with their ends resting upon the upper sides of the raves of the runners, substantially as shown and described, whereby the flat surfaces of the runners will be kept upon the roadway, as set forth.

257,359. CAR-COUPLING. WILLIAM J. MCTIGUE, Pittsburg, Pa., assignor of one-fourth to Gilbert T. Rafferty, same place. Filed Mar. 6, 1882. (No model.)

Claim.—1. In a car-coupling, the rotary block C, journaled on a horizontal axis, and having the recess *d* and slot *e*, in combination with suitable means for rotating said block, substantially as described.

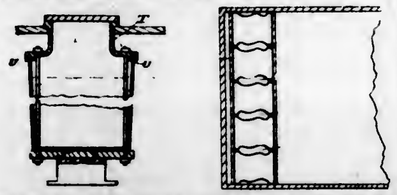
2. In a car-coupling, the rotary block C, journaled on a horizontal axis, and having slot *e*, opening into recess *d*, and at a point about opposite the recess *d*, provided with ball-ended coupling-bar D, in combination with suitable means for rotating said block, substantially as described.



3. In a car-coupling, the rotary reversible block C, provided at one side with the recess *d* and at the other side with ball-ended coupling-bar D, and having the slot *e*, in combination with a spring, *f*, and suitable means for locking or setting the block against the tension of said spring, substantially as described.

4. The combination of the draw-head B, block C, having recess *d*, slot *e*, ball-ended bar D, and journals *b*, and spring *f*, substantially as described.

5. The combination of draw-head B, rotary coupling-block C, and chain *i*, substantially as described.

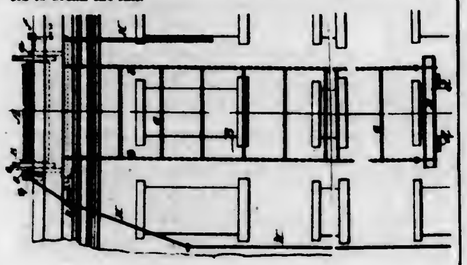


6. The combination of draw-head B, coupling-block C, journaled therein, and having plunger *k*, and spring-lever *l*, having spur *m*, substantially as set forth.

257,360. HULL OF VESSELS. EDWARD A. MERRIMAN, Medford, assignor, by direct and mesne assignments, to John M. Watson, Trustee, Brookline, Mass. Filed Jan. 17, 1882. (No model.)

Claim.—A marine or navigable vessel having a longitudinal groove in its exterior surface located in the re-entrant angle or recess immediately above the keelson, and a pipe or pipes communicating with a refrigerating apparatus and placed in said groove, whereby said plates, while exposed to the cooling action of the water on which the vessel floats, are protected from injurious contact with external objects, as set forth.

257,361. REFRIGERATOR. EDWARD A. MERRIMAN, Medford, assignor, by direct and mesne assignments, to John M. Watson, Trustee, Brookline, Mass. Filed Feb. 6, 1882. (No model.)

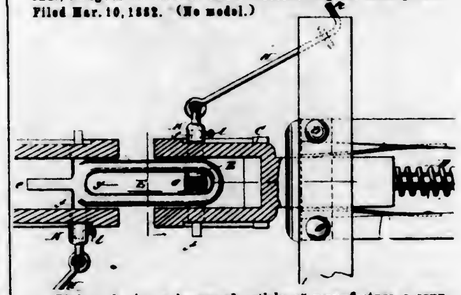


Claim.—1. In a refrigerator, a series of tanks or receptacles formed, as described, on their approximate surfaces, whereby when the tanks are placed in contact with each other said proximate surfaces will form narrow parallel-sided S-shaped vertical air-passages, the entire surfaces of which are cooled by the refrigerant in the tanks, as set forth.

2. In a refrigerator, the tanks or receptacles having S-shaped or tortuous air-passages between their proximate sides, contracted upper ends projecting through the top of the refrigerator, and spaces between said contracted upper ends connecting said air-passages with the upper portion of the preserving-chamber, as set forth.

3. The improved tank composed of the cast-metal top T, having a groove, U, the sheet-metal body having its upper end contained in said groove, and the bottom cleats connected to the top by vertical rods, as set forth.

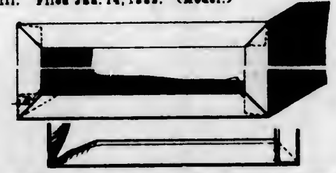
257,362. FLEXIBLE LADDER. JOSEPH T. HILLS, Brooklyn, N. Y. Filed Feb. 18, 1882. (No model.)



Brief.—The pawl which releases the ladder-drum and the hinged door are released simultaneously by a pull on the operating-rope. The weight at the bottom of the ladder has rubber buffers to break the fall.

Claim.—1. In a fire-escape, the combination, with the reel A, provided with the ratchet-wheel G, the ladder B, and the hinged door K, of the bent pawl *g*, the bent rod or button *k*, and the wire or cord H, attached to the said pawl and passing through an eye of the button, substantially as herein shown and described, whereby the said pawl and button will be simultaneously operated by a pull upon the wire or cord, as set forth.

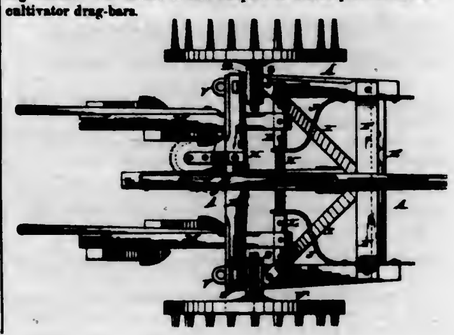
2. The combination, with the ladder B and reel A, of the weight D, attached to the end of the ladder and provided with the buffers *d d*, substantially as described.



257,363. CAR-COUPLING. MAGOIN A. MORAN, Fort Wayne, Ind., assignor to herself and Frederick Rogers, same place. Filed Mar. 10, 1882. (No model.)

Claim.—1. As an improved article of manufacture, a coupling-link, E, provided with a longitudinally-extending projection, *e*, and two laterally-extending projections or trunnions, *f f*, the said projection and trunnions being integral with the link, whereby said link serves as both link and pin, substantially as herein described.

2. In a car-coupling, the combination, with the link E, provided with the trunnions *f*, integral therewith, and having square ends, of the detachable key K and the rod H, connected by a hook-and-eye joint to the said key, and provided with the handle *h*, substantially as and for the purpose set forth.

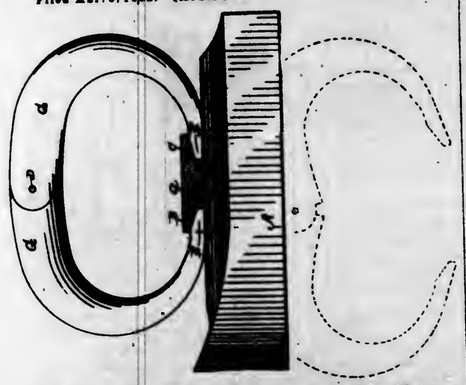


257,364. PORTABLE OVEN. JONATHAN L. MORGAN, Decatur, Ill. Filed Jan. 14, 1882. (Model.)

Claim.—A portable oven having a door front or opening formed of the extended turned-down portion of the sides, top, and bottom of said oven, the overlapping corners of the said turned-down portion being formed by folding the corners and swaging down the fold, substantially in the manner shown and described.

257,365. COMBINED PLOW, HARROW, AND CULTIVATOR. JOHN C. MOSS, Rosston, Tex. Filed Sept. 28, 1881. (Model.)

Brief.—The rotary harrows have rigid journals or spindles. The frame has two sets of bearings, adapting the harrows for bearing wheels. The frame is also adapted to attach plow-beams or cultivator drag-bars.



Claim.—In a combined implement, the frame A, composed of the cross-beam B, uprights C C, side beams, D D, and draft-bar E, the frame being provided with the horizontal double bearings S S and the vertical double bearings V V, the curved beams J J, and the perforated pivoted arms L L, adapted for interchangeably connecting thereto the breaking-plow, the cultivators, and the harrow-wheels, substantially as specified.

257,366. FIRE-PROOF-TILE FURRING. GEORGE H. MOULTON and ERNEST V. JOHNSON, Chicago, Ill. Filed Oct. 26, 1880. (No model.)

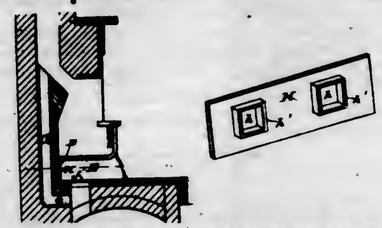
Claim.—The combination of the furring-tiles *b*, made in the shape shown, applied to a brick or other form of wall, with the nails *c*, and forming the air-spaces *d*, whereby a continuous circulation of air is allowed over the whole of the furred surface, thus avoiding dampness and affording means for ventilation, all as substantially set forth and described.

257,367. SAD-IRON. THEODORE C. MULLINIX, Clinton, Ind. Filed Mar. 8, 1882. (Model.)

Claim.—The iron A, having the boss *a*, provided with tapering sockets B and C, in combination with the handle G D, hinged in the center and having the tapering wedge-shaped ends E F, substantially as and for the purpose set forth.

257,368. TOOL FOR TRIMMING THE SOLES OF BOOTS AND SHOES. JAMES NUNDELL and WILLIAM J. GORDON, Philadelphia, Pa., assignors of one-third to John Nundell, same place. Filed Mar. 28, 1882. (No model.)

Claim.—1. The combination, with the arbor and a rotary cutter, of a ring-gage bearing and a vertical face-gage secured upon the arbor in the described relation to each other and said revolving cutter, for the purpose specified.

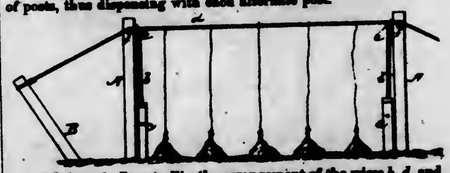


2. The combination, with the arbor and a rotary edge-trimming and rand-finishing cutter fixed thereon, of a ring-gage bearing having a fixed relation to said cutter, and a vertical face-gage having an adjustable relation to said cutter over said ring-gage, substantially as described, for the purpose specified.

3. The combination, with a rotary edge-trimming and rand-finishing cutter, of an adjustable vertical face-gage and a reversible ring-gage bearing secured in the described relation to the cutter and to the adjustable gage, for the purpose specified.

4. The combination, with the arbor and the beveling-cutter, of the adjustable ring *r*, having a vertical face bearing-gage, *f*, and a circular gage-bearing, *e*, projecting at right angles from said vertical face-gage, substantially as described, for the purpose specified.

5. The rotary tool herein described for trimming and randing the tap-sole and beveling the outsole, consisting of the arbor having a fast and loose pulley, a trimming and randing cutter on one end, and a beveling-cutter on the other, each cutter having a circular gage-bearing and an adjustable vertical face-gage, substantially as described, for the purpose specified.



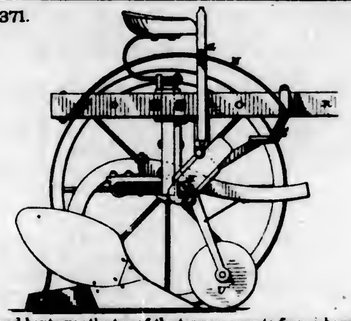
257,369. FIRE-PLACE. DAVID E. MURDOCH, Pittsburg, Pa. Filed Feb. 8, 1882. (No model.)

Claim.—The combination, with the fire-place back, of the flues D and the plates H, having openings h and flanges h', adapted to extend through the tile J, as shown and described.

257,370. VINE-TRELLIS. JOSEPHUS NELLIS, Palatine Bridge, N. Y. Filed Mar. 29, 1882. (No model.)

Brief.—Series of wires running crosswise. First series attached to posts outside trellis and passed over pins in the posts of the trellis. Second series run in same direction, attached by hooks to wires fastened to staples at each end of line of posts and to top of posts, thus dispensing with each alternate post.

Claim.—1. In a trellis, the arrangement of the wires *b*, *d*, and *g*, the former secured to the posts A and attached at each end to the stakes *c*, and the latter running crosswise the same and connected thereto by the hooks *e*, and secured at the ends to the stake B, as shown and described.



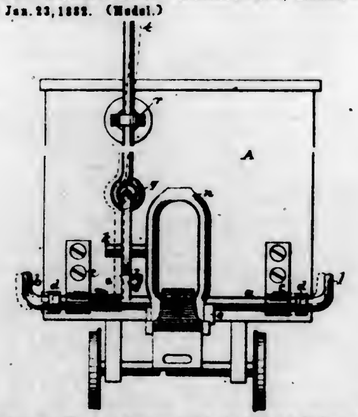
2. In a trellis, the hooks *e*, attached to the wires *b*, in combination with the wires *d*, posts A, and stakes B *c*, as described, and for the purpose specified.

257,371. WHEEL-PLOW. JOHN W. NELSON, Hutchinson, Kans. Filed Jan. 27, 1882. (No model.)

Brief.—The axle of the furrow-wheel forms the plow-ball, which is journaled in bearings upon the main axle and arch. The furrow-wheel has also a spindle-crank of adjustable length and a rigid lever, which, by one motion, raises the plow-ball and lowers the furrow-wheel. The furrow-wheel spindle may be set straight with the axle. A channeled block upon the arch casts a frame-bar, upon which a tongue is centrally pivoted. Set-screws in the clamp adjust the plow-point to or from land.

Claim.—1. The combination of the axle A, arched at its inner end, the casting P, secured to one side of the arch and clamped against the inner side of the beam O, the rack-bar X, having its

257,371.



front end bent over the top of the tongue, so as to form a bearing or pivot for it, and the bar S, the rear end of the tongue being made to bear against the casting, substantially as shown.

2. The combination of the casting P, provided with the flange T, the clamping device P', the tongue R, having a fastening device to catch under the flange, and suitable bearings for the tongue, substantially as described.

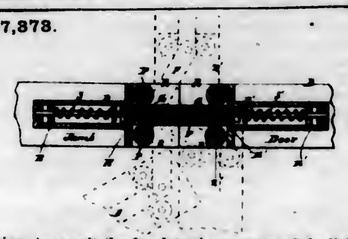
3. The combination, in a wheel-plow, of the part A of the axle, the grooved casting P, secured thereto, a suitable clamping device, P', and the beam O, to which the ratchet-bar and the tongue are secured, substantially as set forth.

4. The combination of the arched axle A, the crank-axle D, the grooved casting F, the spindle H, having an adjustable shank adapted to slide in the grooved casting, and the rigid lever G, substantially as specified.

257,372. CAR-COUPLING. SYLVESTER OAR, Kansas, Ill. Filed Jan. 23, 1882. (Model.)

Claim.—1. The combination, with the pivoted link *a*, provided with the lateral arm *b*, of the rock-shaft *c*, provided with the arms *c c'*, having a slot between them, catch *b*, and spring *m*, performing the double purpose of holding the link coupled, and moving the arm *c* laterally into engagement with the catch to hold the link uncoupled, substantially as described, and for the purpose set forth.

2. The combination, with the car A, provided with the catch *b* and boxes *c c*, rock-shaft *a*, provided with handles *b b*, and arms *c c'*, having a slot between them, of spring *m*, secured to the car and rock-shaft, and rod *l*, substantially as described, and for the purpose set forth.

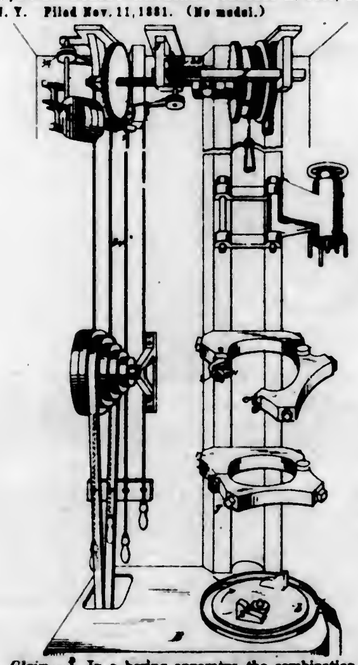


257,373. SPRING-HINGE. PATRICK E. O'LALLY, Boston, Mass. Filed May 19, 1879.

Claim.—1. The combination of springs S S', a link, F, pivotally connected with the same, and rollers P P Q Q, substantially as and for the purpose described.

2. The combination of the castings or mortises D D', the friction-rollers N O, the vertical rollers or fulcrums P P Q Q, the plates E E', the springs S S', and the link F, as set forth.

3. The castings or mortises D D', containing the sliding plates, springs, and link, and provided at their outer ends with lateral



257,378.

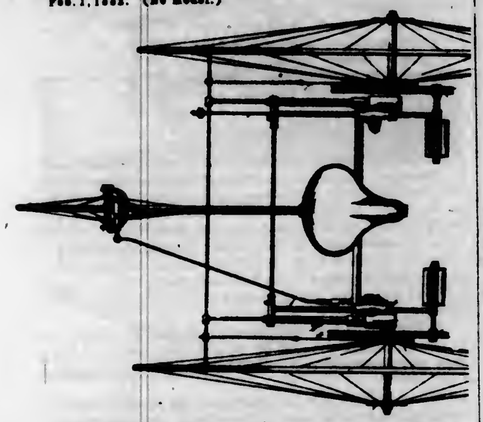
openings to permit the free lateral movement of the link, as set forth.

4. In combination with a door and its jamb or their equivalents, connected by a hinge adapted to swing in both directions and give the door a lateral movement, a rounded projection or roller, T, located on the edge of one of the parts connected by the hinge, and a recess in the edge of the other part, adapted to receive said projection, substantially as and for the purpose specified.

257,374. BORING-MACHINE. CHARLES R. OTIS, Yonkers, N. Y. Filed Nov. 11, 1881. (No model.)

Claim.—1. In a boring apparatus, the combination, with a vertical bed or sheers, of a rotating head-stock, tail-stock capable of lateral adjustment to carry it out of line with the head-stock, and elevating mechanism constructed and arranged to raise and lower the cylinder and boring-bar, substantially as set forth.

2. The combination, with the tail-stock, of the fingers *f*, arranged to be struck by the star-wheel on the screw of the boring-bar, substantially as set forth.



3. The combination, with the bench and head-stock, of a flange, 4, and vane 6, substantially as set forth.

4. The combination of the head and tail stocks, arranged vertically, the hoisting mechanism, driving-shaft, clutch device for throwing said mechanism into and out of operation, and appliances extending to the bench, whereby the clutch may be operated, substantially as set forth.

5. The combination, with the hoisting-drum, driving-shaft, and driving and idler pulleys, of the shifting devices and appliances extending to the bench B, constructed to shift both belts, one ahead of the other, substantially as set forth.

6. The combination, with the shaft *n* and cam-wheel M, of the shifting-bars and the rope 34, passing around a pulley on the shaft and extending to the bench B, substantially as set forth.

257,375. TRICYCLE. ALBERT R. OVERMAN, Hartford, Conn., assignor to the Overman Wheel Company, same place. Filed Feb. 1, 1882. (No model.)

Claim.—1. In a tricycle, the combination, with the driving-wheels supported on spindles provided with driving-disks and foot-pedals for actuating the driving-disks, of rearwardly and downwardly curved side frame-pieces having their lower portions connected by a cross-bar on which are mounted the rear ends of the treadle-levers, and a cross-bar supporting the seat and secured to the side frame-pieces in rear of the spindles, substantially as and for the purpose set forth.

2. In a tricycle, the combination, with the driving-wheels provided with driving-disks and foot-pedals for actuating the driving-disks, of the guide-wheel and a frame consisting of two rearwardly and downwardly curved side pieces for supporting the treadle-levers, a central frame-piece extending rearwardly and supporting the guide-wheel, and a cross-bar secured to the forward portions of the three frame-pieces and supporting the driver's seat, substantially as and for the purpose set forth.

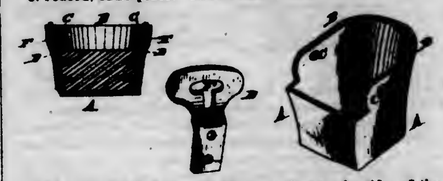
3. In a tricycle, the combination, with the driving-wheels provided with driving-disks and foot-pedals for actuating the driving-disks, of the guide-wheel, a handle-rod supported in a bracket located below the driving-wheel spindles, a pinion secured to the lower end of the handle-rod, and a rod secured at one end to the yoke of the guide-wheel, and its forward end provided with a rack-bar, substantially as and for the purpose set forth.

4. In a tricycle, the combination, with the guide-wheel, rod, rack-bar, and pinion, of the vertically-adjustable guiding-handle, substantially as set forth.

5. In a tricycle, the combination, with the brake-rod, of the eccentric and vertically-adjustable brake-handle, substantially as set forth.

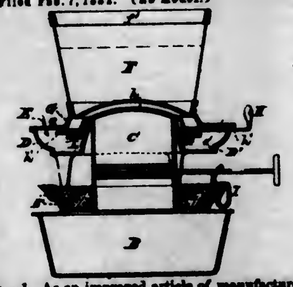
6. In a tricycle, the combination, with vertically-adjustable brake and guide handles, of the vertically-adjustable seat, substantially as and for the purpose set forth.

7. In a tricycle, the spindle-hanger and the rack-bar guide formed integral therewith, substantially as set forth.



8. In a tricycle, the spindle-hanger and the eccentric support, made integral therewith, substantially as set forth.

257,376. PLANTING-PLOW. THOMAS PAYNE, Alton, Ill., assignor to Hapgood Plow Company, same place. Filed Nov. 16, 1881. (No model.)



Claim.—In a planting-plow, the drag-bar *a*, having its forward end bent and slotted, fitting the back of the mold-board and adjustably attached thereto, and the rear end bent downwardly and slotted, and fitting the back of the covering-blades, and adjustably attached thereto, substantially as and for the purpose set forth.

257,377. CAP OR COVERING FOR BOOT OR SHOE HEELS. WILLIAM A. PRAY, Calhoun, Ky., assignor of one-half to Jeptha C. Jenson, same place. Filed Feb. 25, 1882. (No model.)

Claim.—The plates D, suitably secured upon the sides of the heel of a boot or shoe, and having T-shaped slots F, in combination with the herein-described heel cap or covering A, having collar B, provided with buttons C, substantially as and for the purpose herein shown and specified.

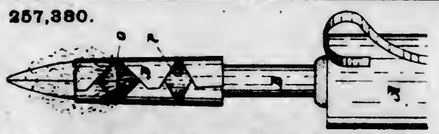
257,378. COAL-OIL STOVE. WILHELM PETERSEN, Buffalo, N. Y. Filed Feb. 7, 1882. (No model.)

Claim.—1. As an improved article of manufacture, a burner for oil-stoves, lamps, &c., consisting essentially of the oil-reservoir B, having the flaring top portion, B', provided with the cover B'', the receptacle D, provided with the air-chamber D', cover E, with perforations *e*, and depressed portion E', with perforations *e'*, cap G, and a suitable chimney, F, the whole being constructed and combined with a wick-tube, substantially in the manner as and for the object specified.

2. In oil lamps or burners, the combination, with the chamber D, having the perforated disk E, provided with central depression, E', of the crank-shaft A' A', with handle H and the plate A, substantially as and for the object stated.

257,379. TOY CATAPULT. CHARLES F. PORLMAN and HARRY THOMPSON, Fremont, Ohio. Filed Aug. 8, 1881. (No model.)

Brief.—Improvement on Letters Patent No. 239,865.



Claim.—In a toy sling or catapult of the described construction, the elastic band C, having the pocket D, and strap or loop *d*, affixed to the back of said pocket, substantially as and for the purpose herein shown and specified.

257,380. SELF-ACTING BLOW-PIPE LAMP, SOLDERING-IRON HEATER, AND PAINT-BURNER. THOMAS POTTER, San Francisco, Cal. Filed Feb. 21, 1882. (No model.)

Brief.—By moving the cylinders E and D up or down the flame is caused to burn at a greater or less distance from the tube B, thus causing the formation of more or less vapor in said tube, so that the flame may be increased or diminished.

Claim.—1. The can A, having the wick-tube B and cap C, with open reservoir or recess F and perforation G, and the wick W and packing V, in combination with the combustion-tube E, having

257,380.

the single side opening, P, to use as a portable blow-pipe and heater and burner, substantially as and for the purposes set forth.

2. The can A, having the wick-tube B and cap C, with open reservoir or recess F and perforation G, and the wick W and packing V, in combination with the combustion-tube D, with the two side openings, O and P, as used for soldering, substantially as and for the purposes set forth.

257,381. COMPOUND FOR REMOVING STAINS. EDWARD F. PRESTON, Bismarck, Mich., and LUCY A. WHITNEY, Phelps, N. Y. Filed Feb. 27, 1882. (No specimens.)

Brief.—The detergent liquid is applied by means of a brush or rag to the object to be cleansed. It is composed of deodorized or refined gasoline, one gallon; alcohol, two ounces; oil of cassia, one-half ounce; oil of winter-green, one-half ounce; sulphuric ether, three ounces; borax, one-eighth dram.

Claim.—The herein-described compound for removing grease, dirt, and spots, consisting of deodorized gasoline, alcohol, oil of cassia, oil of winter-green, sulphuric ether, and borax.

257,382. SASH-HOLDER. FREDERICK W. QUITMAN, South Norwalk, Conn. Filed Jan. 27, 1882. (No model.)

Claim.—A sash-fastener consisting of the plate A, provided with a horizontal rearwardly-extended finger-rest, *a*, a horizontal slotted wall, A, and a socket, *c'*, the lower side of which forms a bolt-guide, the pivoted cam-lever B, provided with a handle, *a'*, the spring *c*, interposed between the socket *c'* and lever B, and the horizontal bolt C, having a downwardly-projecting handle, *k*, substantially as described.

257,383. PUMP. LAFAYETTE D. RAILSBACK, Indianapolis, Ind. Filed Sept. 18, 1881. (No model.)

Claim.—1. In a force-pump constructed as described, the combination of the cylinder H, having its top end closed, the set-length I, secured by an air-tight joint to said top and to the base of the pump-body, and provided with the opening *i*, thus serving the three purposes of a set-length, a stay for the pump-rod D, and an overflow-pipe for the cylinder, and the air-chamber J and discharge-pipe L, secured to a single projection, A, upon one side of said cylinder, all substantially as shown and described, and for the purposes set forth.

2. The combination of the body A, formed of pipe, secured to the base A' at the bottom, and having the bracket B upon its top, the discharge-pipe L, and the clamp M, connecting said body and said discharge-pipe, all substantially as shown and specified.

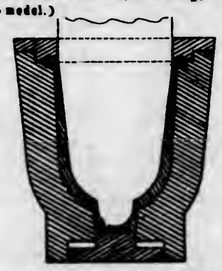
3. The combination of the body A, bracket B, handle C, pump-rod D, valves E F G, cylinder H, set-length I, air-chamber J, suction-pipe K, and discharge-pipe L, all constructed, arranged, and operating substantially as shown and described, and for the purposes specified.

257,384. FEED MECHANISM FOR SAW-MILLS. THOMAS J. REANY, Rocky-Mount, N. C. Filed Feb. 6, 1882. (Model.)

Brief.—Two friction-face disks are placed upon the driving-shaft. Upon a swinging shaft is placed an edge disk, which may engage with either of the face-disks, and which is movable upon its shaft to engage with such disks at different distances from their centers.

257,384.

Claim.—1. The combination of mandrel B, having secured to it the two face-plates D C, of unequal size, the friction-disk E, and the shaft G, to which the disk is secured, and upon which the disk slides back and forth, substantially as shown.

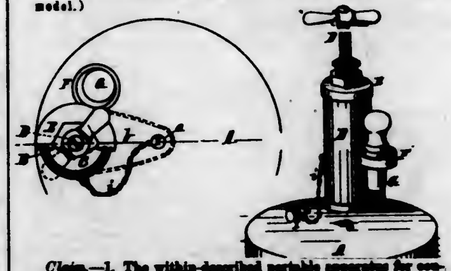


2. The combination of the mandrel B, having secured to it the two face-plates D C, the disk E, the shaft G, and the rod Q, provided with the clutch T, the disk being adapted to be brought in contact with either one of the face-plates, substantially as described.

3. The combination of the mandrel B, the face-plates C D, the disk E, and shaft G, having its ends journaled in pivoted boxes, with the rod Q, by which the disk is moved, substantially as set forth.

4. In a saw-mill, the combination of the mandrel, the two face-plates, the boxes N, supported directly upon the mandrel, the support P, the lever L, shaft G, provided with the friction-disk, and the endwise-operating lever, whereby the friction-disk is moved both back and forth upon the shaft and the shaft is moved laterally, substantially as specified.

5. The combination of the mandrel B, face-plates C D, disk E, shaft G, journaled in pivoted boxes, lever L, and rod Q, provided with a clutch and cam, substantially as shown.



257,385. MANUFACTURE OF GLASS LAMP SHADES AND GLOBES. DANIEL C. RIPLEY, Pittsburg, Pa. Filed Mar. 22, 1882. (No model.)

Claim.—1. The method herein described of making glass shades, consisting in forming a cup-shaped or tubular casting by pressing in a mold, and then reheating and forming one end of the casting into the desired shape, substantially as and for the purposes described.

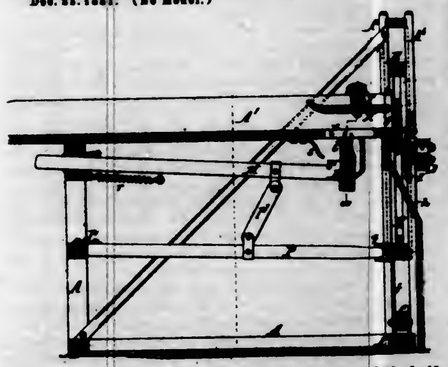
2. A glass shade having one end or opening molded and the other end or opening drawn, flared, or expanded, substantially as and for the purposes described.

257,386. PALETTE AND RESERVOIR FOR STENCILING-INK. LEVI E. ROCKWOOD, Worcester, Mass., assignor of one-half to F. Linus Child, same place. Filed Dec. 19, 1881. (No model.)

Claim.—1. The within-described portable apparatus for containing and delivering stenciling ink or color of a viscid or semi-liquid nature, consisting of the flat disk or palette-plate having a small orifice in its surface and a reservoir connected therewith, from which the color or ink is mechanically forced upon said palette through said orifice, said apparatus being adapted for use in the stenciling or marking of packing-cases, substantially as herein set forth.

2. The combination of the flat circular palette A, having the central orifice, *a*, the reservoir-cylinder B, mounted upon the side of said palette, with passage *b*, communicating therewith, the piston C, fitted within said cylinder, and the long screw D, arranged for moving said piston, all constructed and operating substantially as and for the purpose hereinbefore described.

3. The combination of the palette-plate A, having orifice *a*, the cylinder B, communicating therewith, the piston C, the screw D, the cap E, the brush-holder F, and the stopper I, substantially as shown, and for the purpose set forth.



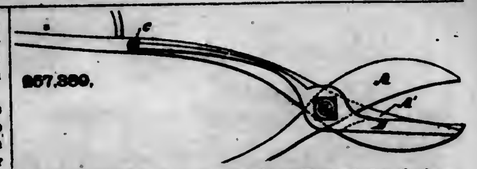
257,387. VEHICLE-SPRING. DAVID A. EDE, Columbus Junction, Iowa, assignor to Walter P. Hall, same place. Filed Feb. 23, 1882. (No model.)

Claim.—1. In a side-bar buggy, the combination of a frame, A, which is to be attached to the under side of the end of the buggy, the rods D, pivoted thereto, the hanger I, and the spring that is placed upon the top of the frame, substantially as shown.

2. In a spring for side-bar buggies, the combination of the frame A, which is to be attached to the under side of the end of the body, the rods D, pivoted at their inner ends in this frame, the hooks G, hanger I, having notches or recesses in its lower end, and the cap or cover J, having openings in its lower edges, substantially as set forth.

257,388. STRAW-CUTTER. CARL ROEHL, Lockport, N. Y., assignor of one-half to William S. Camp, same place. Filed Dec. 22, 1881. (No model.)

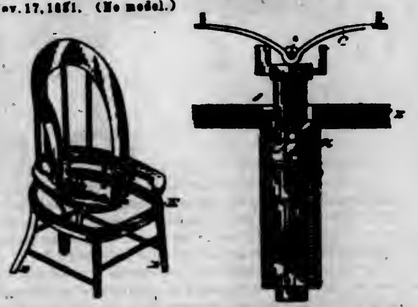
Claim.—1. In a straw-cutter, the combination, with the knife *b*, of the frame B, sliding at one end in the reciprocating frame E, and connected at the other end with the swinging arm C, whereby a drawing-cut is imparted to the knife, substantially as set forth.



2. The combination, with a trough A', of the cutter *b*, frame B, provided with arm B', cross-arm C, reciprocating frame E, in which the knife-frame slides, and connecting-rod *f*, whereby the frame E is connected to the arm C, substantially as set forth.

3. The combination, with the trough A', of the cross-head I, provided with studs or rollers *n*, arm M, having shoulder *d'*, grooved plates E, a spring, *r*, tending to draw the arm M backward, and a spring, *s*, whereby the rearward movement of the arm M is prevented when in its highest position, substantially as set forth.

4. The combination, with the arm C, link *f*, and reciprocating frame E, of the cross-head I, arm M, springs *r s*, lever F, and connecting-rod *p'*, all arranged to operate substantially as set forth.



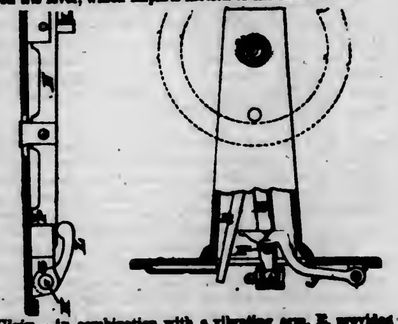
257,389. GRAPE-SHEARS. JOHN SAGER, Thamesville, Ontario, Canada, assignor to himself and Ephraim Sanford, same place. Filed Aug. 22, 1881. (Model.)

Claim.—In an implement for use in gathering grapes, the combination, with the jaws or blades A A', one having a beveled

and the other a flat edge, of the flat finger B, attached to the jaw-pivot *a*, and lying close alongside the jaw A', and having a spring-extension which is attached to the shank of said jaw, as set forth.

257,390. CHAIR. SAMUEL L. SAUNDERS, Lynn, Mass. Filed Nov. 17, 1881. (No model.)

Claim.—1. In a chair, the combination of the seat A, the supporting legs and frame, the spring-rockers, and an independent yielding or elastic support for the chair-seat between the seat-frame and rockers, the seat having both a rocking and a vertical movement.



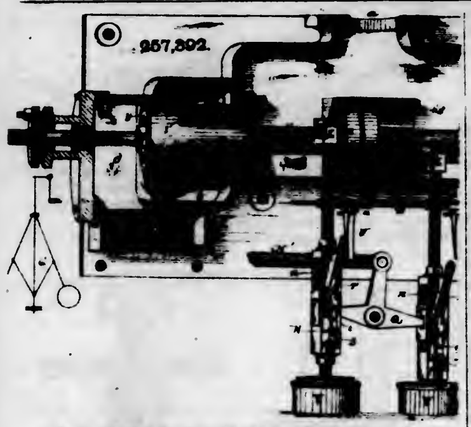
2. In a chair, the combination of the right supporting legs and frame, the vertical yielding spring-support, and the spring-rockers mounted upon each vertical support and carrying the chair-seat.

3. In combination, a chair-seat, A, the rigid frame and legs, the sliding rods F, having the spiral spring, and the supporting springs or rockers mounted upon the sliding rods.

4. The combination of the frame E, the tubes *c*, the sliding rod *f*, having collar or shoulder, the spring inclosed by the tube, the springs *c s*, and the adjustable cone *d*.

257,391. SEWING-MACHINE. HENRY F. SCHLEYTER, Cincinnati, Ohio. Filed Feb. 18, 1882. (No model.)

Brief.—The rock-shaft which lifts the feed-bar is operated by a stud on the lever, which imparts motion to the shuttle-lever.



Claim.—In combination with a vibrating arm, E, provided with a stud or roller, H, and operating the shuttle-lever of a sewing-machine, substantially in the manner herein described, the lever J, having a curve, I, and connected to a rock-shaft, K, which latter carries a device, L, for lifting the reciprocating feed-bar M, as and for the purpose stated.

257,392. CUT-OFF-VALVE GEAR. FRANCIS SERGEANT, Trenton, N. J. Filed Feb. 27, 1882. (No model.)

Claim.—1. A cylindrical valve combined with means whereby a simultaneous longitudinal and rotary movement is imparted to it to open and close ports cut diagonally in the perimeters of valve and case.

257,892.

2. A cylindrical valve and means whereby a simultaneous longitudinal and rotary motion is imparted to it, combined with means whereby said valve is automatically liberated from the device which produces the rotary movement, and thereby permitted to rotate backward and cut off the steam, as described.

3. A cylindrical valve and corresponding cylindrical valve-case, and ports the leading edges whereof are cut in the perimeters of said valve and case on a helical line, combined with means whereby a longitudinal reciprocation and a simultaneous rotary movement is imparted to said valve, and means whereby said valve may be automatically liberated from the mechanism which imparts a rotary motion, and thereby be permitted to rotate backward and cut off the steam, as set forth.

4. The hollow cylindrical valve D, closed at its outer end and provided in its perimeter with a port, the leading edge whereof is cut in a helical line, and a tubular hub, *g*, and disk *h* at the outer end of the same, whereby it is mounted and adapted to rotate upon the valve-rod H, combined with mechanism whereby its rotary motion is determined and controlled.

5. The hollow cylindrical valve D, its tubular hub *g*, and the disk *h* at the extremity of the same, and the rod K, extending longitudinally parallel with the axis from the base of the valve to said disk, near the periphery, the whole mounted upon the valve-rod and capable of rotating thereon, combined with the box L, fitted to move within the steam-chest in a line transverse to the direction of reciprocation of the valve D, whereby the rotation of said valve is determined and controlled.

6. The reciprocating and rotating valve D and the reciprocating box L and rod N, whereby it is carried, combined with a sliding box, P, connected with said rod, and a latch whereby said box P and rod N are locked or unlocked, combined with automatic mechanism whereby said latch may be unlocked at a certain point in the stroke, and the valve thereby permitted to revolve backward and cut off the steam, as set forth.

7. The reciprocating and rotating valve D, and the reciprocating box L and rod N, whereby said box is carried, and the sliding box P and mechanism for actuating the same, combined with a latch, R, whereby said box P is locked to said rod N, and the latch-lever T and adjustable arm U, whereby the latch R may be caused to unlock the box P and liberate the rod N at any desired point in the stroke of said box P, substantially as set forth.

8. The reciprocating and rotating valve D, the transversely-moving box L and rod N, the sliding box P, and the locking mechanism for the same, combined with the adjustable arm U, the adjusting-plate W, and its oblique guide, whereby the position of said arm is determined and controlled and the point of cut-off determined, as set forth.

9. The reciprocating and rotating valve D, its controlling mechanism L N, the attachable box P, the latch R, and its lever T, combined with the adjustable arm U, adjusting-slide W, and the governor, whereby the position of said slide is controlled and regulated in accordance with the speed of the engine.

10. The reciprocating and rotating valve D, mounted upon the valve-rod H as an axis, combined with the non-rotating disk Y, also mounted upon said rod outside said valve, whereby said valve is balanced, substantially as set forth.

257,893. DENTAL ENGINE. SPARHAM B. SCRAVEN, Philadelphia, Pa. Filed Feb. 27, 1882. (No model.)

257,893.

Claim.—1. In a dental engine, the springs A″ E′, in combination with the upper and lower parts of the stand and main shaft, and constituting integral portions thereof, respectively, substantially as and for the purpose set forth.

2. The rising and falling arm journaled to a stationary bearing-piece at the top of the stand, the edge of the journal of the arm being pressed against the edge of the bearing-piece by the spring of the arm, substantially as and for the purpose set forth.

3. The arm formed of spring rods or bars with collars H′ and the tubular or socket piece G, combined and operating substantially as and for the purpose set forth.

4. The piece G and the spring rods or bars J, in combination with the slide G′, substantially as and for the purpose set forth.

5. The shaft, in combination with the arm F, the bent *b*′, and fastening *c*, substantially as and for the purpose set forth.

6. The coupling of a dental hand-piece and driving-shaft, consisting of the box L, the connected spindle N, the bevel-pinion P′, the bevel-wheel Q, the spindle N′, the bevel-pinion P″, and the connected rotatable disk or plate R, combined and operating substantially as and for the purpose set forth.

257,894. CONNECTION FOR POLISH AND PUMP RODS. E. P. SHUTTAS, Bullion, Pa. Filed Oct. 22, 1881. (No model.)

Claim.—1. The combination, with a polish-rod provided with means for holding the standing pipe thereon after the same has been disconnected from the tubing, and a sucker-rod, of an intermediate piece adapted to connect the lower end of the polish-rod to the upper end of the sucker-rod and hold them securely in position, substantially as set forth.

2. The combination, with a polish-rod provided with means for holding the stand-pipe thereon after it has been disconnected from the tubing, and a sucker-rod, of an intermediate connecting-piece adapted to be removably secured to the lower end of the polish-rod and the upper end of the sucker-rod, substantially as set forth.

3. The combination, with the polish-rod provided with an enlarged head having a female screw-threaded cavity therein and an annular cup-shaped shoulder on which the standing pipe rests after it has been disconnected from the tubing, and a sucker-rod provided at its upper end with screw-threads, of a connecting screw or piece provided with a screw-threaded shank adapted to fit in the cavity in the head of the polish-rod, and a head having a screw-threaded cavity in which the upper screw-threaded end of the sucker-rod fits, substantially as set forth.

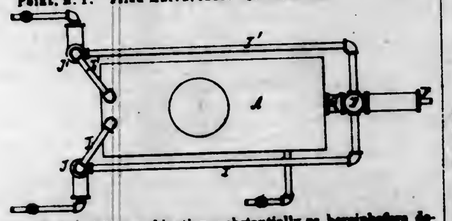
4. The combination, with a polish-rod provided with an enlarged head having a female screw-threaded cavity therein, an annular shoulder on which the standing pipe rests after it has been disconnected from the tubing, and a sucker-rod provided at its upper end with screw-threads, of a connecting screw or piece provided with a screw-threaded shank adapted to fit in the cavity in the head of the polish-rod, and a head having a screw-threaded cavity in which the upper screw-threaded end of the sucker-rod fits, and a lock-nut situated on the shank of the connecting screw or piece and adapted to lock it firmly to the polish-rod, substantially as set forth.

5. The combination, with the polish-rod C, shoulder G, head D, cavity E, and sucker-rod N, provided with a screw-threaded end, M, of the connecting screw or piece F, provided with shank I, head K, cavity L, wrench-square P, and the lock-nut J, all adapted to operate substantially as set forth.

257,895. TUFTED FABRIC. MALCOLM SELKIRK, Yonkers, N. Y. Filed July 9, 1881. (No model.)

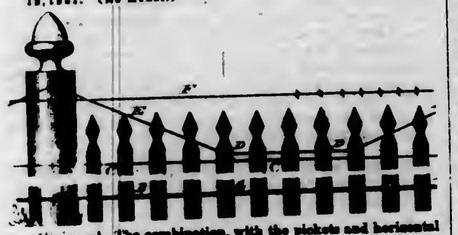
Brief.—The warp is divided into sets of four threads each, the outer threads of each set passing alternately over and under the shoots of back filling and binding them together in pairs. The middle threads pass alternately over and under a shoot of tufting-filling and the back filling on each side thereof. When additional tufting-filling threads are employed the outer warps of each set may alternately pass over the same.

Claim.—1. The new fabric consisting substantially of warp-



257,895.

threads and filling-threads combined as above set forth—that is to say, with the shoots of two back-filling threads and the warp-threads forming a practically continuous backing, upon and to which the upper-filling thread is bound by some of the warp-threads.

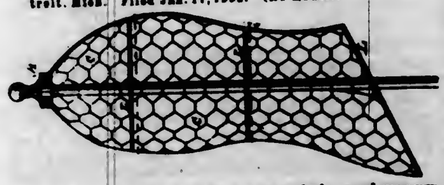


2. The new tufted fabric consisting substantially of warp-threads, filling-threads, and tufting material combined as above set forth—that is to say, with the shoots of two back-filling threads and the warp-threads forming a practically continuous web, upon and to which the tufting-filling and the tufts are bound by some of the warp-threads.

257,896. FEED-WATER HEATER. GEORGE W. SLOANE, Green Point, N. Y. Filed Mar. 3, 1882. (No model.)

Claim.—The combination, substantially as hereinbefore described, of the boiler A, the drums D J J′, the pipes I, leading from the drum D into the drum J, the pipes I′, leading from the drum D into the drum J′, the pipe G, and the pipes L L′, forming a triple connection between the drum D and the boiler.

257,897. FENCE. HORACE SMITH, Kirksville, Mo. Filed Dec. 19, 1881. (No model.)

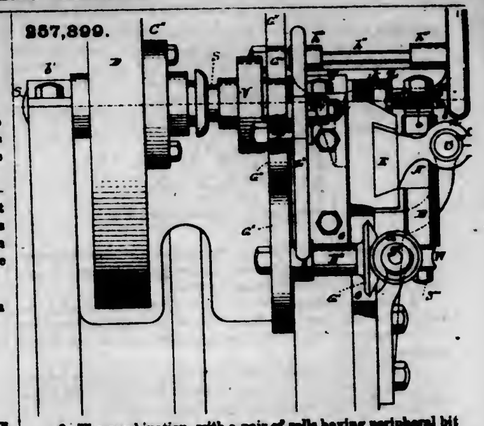


Claim.—1. The combination, with the pickets and horizontal wires, of the securing double staple which passes through the picket and has its ends driven into the same.

2. In combination with the post A, pickets G, wires B, F, and E, and double staple C, the short wire D, as before described.

3. The combination, with the posts A, of the wires B, diagonal suspending-wires E, short wire D, pickets G, and securing double staple C, arranged as and for the purposes described.

257,898. WIRE CLOTHES-FORM. THEODORE L. SMITH, Detroit, Mich. Filed Jan. 17, 1882. (No model.)



Claim.—A wire dummy form composed of a seamless woven-wire netting, in combination with rings L, rods or wires K, and a top piece, A, recessed for the reception of a supporting-standard, substantially as described.

257,899. MACHINE FOR TWISTING AUGERS. FRED A. SHELL, Pickdale, Mass. Filed Feb. 9, 1882. (No model.)

Claim.—1. The rolls R R, having formed in their peripheries the matrices *b* of a bit or auger hollow or concave, substantially as specified

257,899.

2. The combination, with a pair of rolls having peripheral bit or auger hollow matrices, and a hollow rotating shaft extending at right angles to the plane of the axes of said rolls, of connecting-gear operating said rolls and said shaft at the same time, substantially as specified.

3. The combination, with the rolls R and their shafts, the slides E, having bearings B, and box-nuts n′ n′, of the right-and-left worm C, and mechanism for turning the same, as specified.

4. The combination, with a pair of hollow matrix rolls and the shafts S‴ S‴, on which they are seated, of the hollow rotary bit-holding shaft, its thimble having a rectangular aperture, and mechanism, substantially as described, connecting the shafts S‴ S‴, as specified.

5. The combination, with the rolls R, their bearing-slides E, nuts n′, and right-and-left worms C *g*, of the hollow shaft S, loose pulley D, clutch C″, collar and gearing W G G′ G″ G‴ G⁗, substantially as specified.

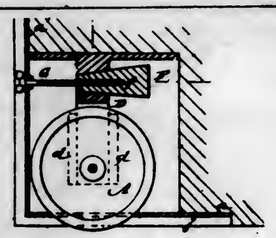
6. The combination, with the rolls R, their bearing-slides E, nuts n′, and right-and-left worms C *g*, of the hollow shaft S, loose pulley D, clutch C″, collar V, gearing W G G′ G″ G‴ G⁗, and slotted lever L′, substantially as specified.

7. The combination, with the rolls, their bearing-slides E, nuts n′, right-and-left worms C *g*, and the hollow shaft S, loose pulley D, clutch C″, and collar V, of the connecting-gear, the hand-wheel H, its shaft A″, and gear-wheel G′, substantially as specified.

257,400. TOOL-HOLDER. NICHOLAS H. SNIDER, Pittsburg, Pa. Filed Jan. 9, 1882. (No model.)

Claim.—1. A bit handle or holder for grindstone-dressers, said handle consisting of a bed or rest for the bit, in combination with an eccentric pivoted on the bed and adapted to clamp the bit to the same, the bed or rest and the eccentric being provided with handles adapted to be brought together or parallel when the bit is held by the eccentric, substantially as specified.

2. In a bit-holder for grindstone-dressers, the combination of the bed or rest *c*, having the handle *d*, and provided with lugs at its forward end, and the eccentric *e*, pivoted between the lugs on the forward end of the bed and provided with handle *e*′, substantially as and for the purpose specified.



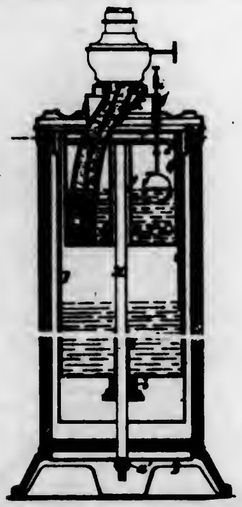
257,401. SHEAVE FOR SLIDING DOORS. ISAAC SOMERS, Detroit, Mich. Filed Jan. 25, 1882. (Model.)

Brief.—The sheave is journaled in a saddle that is adjusted vertically by means of a wedge and screw, the latter of which passes to the outside of the case. The case has two concaved angle-plates, one on the front edge and the other on the bottom edge of the door.

Claim.—1. In a door-sheave, the wheel A, adapted to have vertical movement, in combination with the saddle D, the wedge F, and means for adjusting the wedge, substantially as described.

2. The wheel A, journaled in the saddle D, in combination with the wedge F and the casing formed with the flanges *d d*, substantially as described.

267,401.



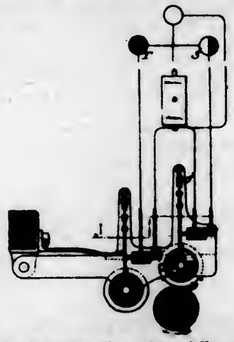
3. The casing formed with the guttered or concaved angle-plates *a a'*, in combination with the wedge F and screw G, substantially as and for the purpose set forth.

4. The combination, with the vertically-movable wheel A and wedge F, of the screw-rod G, secured to the wedge and reaching to the outside or edge of the casing, substantially as and for the purpose set forth.

5. The casing formed with the plates *a a'* and flanges *d d* and E, in combination with the wheel A, saddle D, wedge F, and screw-rod G, substantially as and for the purpose set forth.

267,402. LAMP. WILHELM STAEBLER, Brooklyn, N.Y. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination, substantially as herein described, of an outer cistern, D, adapted to slide vertically, a supporting-plate, E, attached to the upper end of the cistern, and carrying a lamp-burner and serving as a medium for raising and lowering said cistern, and a stationary inner cistern suspended in a fixed position at the upper end of the outer cistern, as and for the purpose described.

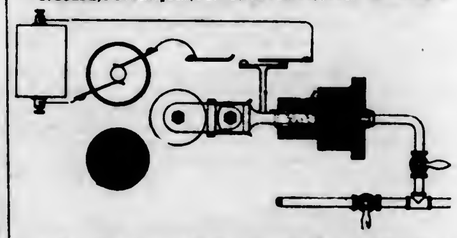


2. The combination, substantially as hereinbefore described, of the two oil-cisterns, one within the other, one being fixed while the other is movable in the direction of its axis, the rod fixed to the inner cistern and extending through a stuffing-box in the bottom of the outer cistern, and the burner secured to the outer cistern.

3. The combination, substantially as herein described, of the outer cistern, D, and the suspended inner cistern, G, provided respectively with the guide-groove *c* and the key *d*, whereby the outer cylinder can slide vertically, but not rotate, with a supporting-plate, E, attached to the upper end of the outer cistern, and carrying a lamp-burner, and serving as a medium for raising and lowering the outer cylinder, as and for the purposes set forth.

4. The combination of the two oil-cisterns, arranged one within the other, one of said cisterns being adapted to slide vertically and the other provided with an air-vent extending through it in the form of a tube, and a rim attached to the movable cistern and carrying a burner, and serving as a medium for raising and lowering the movable cistern, as and for the purposes set forth.

5. The combination, substantially as hereinbefore described, of the two oil-cisterns, one within the other, the inner cistern being fixed and the outer being made movable in the direction of its axis, the burner secured to the outer cistern, the float in the inner cistern having its stem extending through the supporting-plate of the burner and the adjustable stop on said stem.



267,403. ELECTRIC LIGHTING APPARATUS. ELI T. STARR, Philadelphia, Pa. Filed Mar. 21, 1882. (No model.)

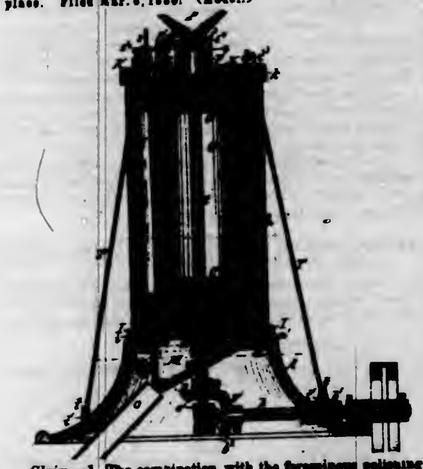
Claim.—1. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, an axle or moving part of said vehicle or train, electric lamps carried by said vehicle or train, an electric circuit including said lamps and a source of electricity, circuit-breakers also included in said circuit, and mechanism operated by said axle or moving part, whereby one of said lamps is made to give an intermittent light when said axle is turned in one direction, while the other of said lamps is made to give an intermittent light when said axle is turned in the other direction.

2. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, an axle or moving part thereof, a source of electricity, electric lamps, circuit-connections including said source of electricity and said lamps, circuit-breaking mechanism, substantially as described, which normally closes the circuit-connections, so as to give out constant lights from said lamps, and mechanism operated by said axle to operate said circuit-breaking mechanism, whereby when said axle is moving in one direction the light of one of said lamps will be interrupted at intervals, while when said axle is turned in the opposite direction the light of the other of said lamps will be interrupted.

267,404. MECHANISM FOR DRIVING DYNAMO-ELECTRIC MACHINES BY THE MOTION OF A MOVING VEHICLE. ELI T. STARR, Philadelphia, Pa. Filed Jan. 31, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, a brake mechanism to brake or impede the motion of said vehicle or train, a mechanical generator of electricity carried by said vehicle or train, driving mechanism to connect said generator with an axle or moving part of the vehicle or train, and a connection between said brake and said driving mechanism, whereby when the brake mechanism is operated to retard the motion of the vehicle or train the generator will be operated.

2. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, a brake mechanism therefor, a mechanical generator of electricity and devices to throw said generator into action by the operation of the brake mechanism, so as to be driven by a moving part of the vehicle or train, and mechanism to cut out the generator so that the brakes may be applied without throwing said generator into action.



3. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, a brake mechanism therefor, a mechanical generator of electricity, driving mechanism between said generator and axle or moving part of said vehicle or train, adapted to be thrown into action by said brake mechanism, and mechanism, substantially as described to regulate the action of said brake mechanism relatively to the driving mechanism, so as to insure a proper driving-connection between said generator and said axle.

4. The combination, substantially as hereinbefore set forth, of the vehicle and axle or moving part of said vehicle, the mechanical generator of electricity, the driving-wheel of said generator, the gear-wheel to establish a driving-connection between said generator and said axle, a movable arm carrying said gear-wheel to establish or interrupt the driving-connection, and a piston to move said movable arm.

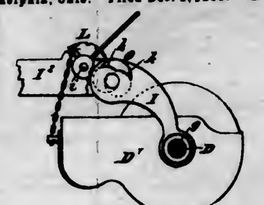
5. The combination, substantially as hereinbefore set forth, of a vehicle, and axle of said vehicle, a mechanical generator of electricity, a gear-wheel to establish the driving-connection between said generator and said axle, a piston governing the movements of said gear-wheel, a cylinder in which said piston moves, a pipe-connection by which pressure is brought to bear upon said piston to move it and the gear-wheel in the direction to establish the driving-connection, and a spring to move said piston and wheel in the direction to interrupt or sever the driving-connection.

6. The combination, substantially as hereinbefore set forth, of an axle or moving part of a vehicle, a mechanical generator of electricity, a driving-connection between said axle and said generator, means for operating said driving-connection at will, so as to throw said generator into or out of action, a secondary battery connected with said generator by circuit-connections, and mechanism, substantially as described, connected with said driving-connection, to complete the circuit to the battery when said connection with the generator is completed and break said circuit when the driving-connection is broken.

267,405. MACHINE FOR POLISHING RICE, &c. HENRY B. STEVENS, Buffalo, N. Y., assignor to George L. Squier, same place. Filed Mar. 6, 1880. (Model.)

Claim.—1. The combination, with the foraminous polishing-case H, having a base, A, provided with an annular flange, *a*, of the adjusting grain-pot M, provided with a flange, *m*, resting loosely upon the flange *a*, substantially as set forth.

2. The combination, with the shaft *e* and grain-pot M, of the sleeve *n*, formed with the grain-pot, and the sleeve *n'*, secured to the shaft and overlapping the sleeve *n*, substantially as set forth.



3. The combination, with the drum C, provided with leather strips G, of the plate G', constructed with a downwardly-curved rim overlapping the ends of the leather strips G, substantially as set forth.

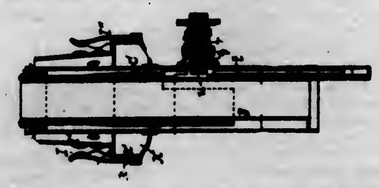
4. The combination, with the top plate, K, constructed in two or more sections, each provided with a section of the bearing *p*, of the sleeve *g*, fitting over the sections of the bearing *p*, thereby securing the sections of the plate K together, and the hopper P, substantially as set forth.

5. In a grain-polishing machine, the combination, with the grain-receiving hopper having a discharge-spout, *p'*, of a secondary hopper, R, arranged to receive the grain from the spout *p'*, and provided with a discharge-spout, *r*, and adjustable sleeve *r'*, substantially as set forth.

6. The combination, with the base A, of the case H and top plate, K, made in two or more sections held together by clamps *l* and sleeve *q*, and the removable tie-rods T, connecting the top plate with the base, substantially as set forth.

267,406. HARVESTING-MACHINE. BENJAMIN F. STEWART, New Philadelphia, Ohio. Filed Dec. 5, 1881. (Model.)

Claim.—1. The combination, with the shaft E and the pitman H, having the ring G', of the eccentric ring or crank G', fixed on the shaft E, and the parallel disks G G, fixed eccentrically on the shaft E, abutted against the sides of and arranged diametrically opposite to the eccentric ring or crank G', the pitman-yoke G^3 being placed on the ring G' and held in place by the disks G G, as and for the purposes set forth.



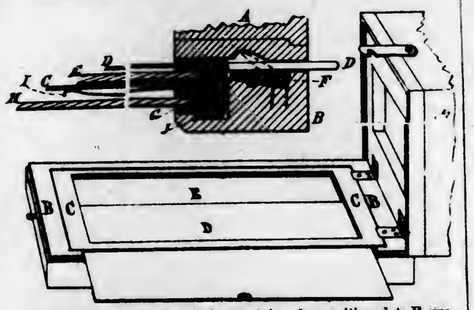
2. The combination of the tongue J, the brackets or iron I I, journaled on sleeves *g g*, surrounding the shaft D, and provided with journal-bearings I' I', the crank-od axle N M, supported in the bearings I' I', and the driving-wheel F', substantially as set forth.

3. The combination, with the axle-brackot I, having the shoulder or stop *o*, having the concavities *k*, of the driving-axle having an eccentric-arm, N, an eccentric, N', and the lever P, substantially as and for the purpose specified.

4. The combination of the grain-platform, the finger-bar B', the cutter-bar, the pitman having the ring G', the shaft E, having the eccentric ring, the counterbalancing-disks, and the pinion *e*, the shaft D, having the worm-gear, the bevel-gear *d'*, and pinion *f*, the reel-post shaft having a pinion, and the driving-wheel having the internal gear, substantially as set forth.

5. The combination, with the shaft D, provided with the spur-pinion *f*, and the driving-wheel F', having the gear F, of the platform A, connected to and tilting upon the shaft D, and the coupling-arm C, having one end made fast to the front edge of the platform A and its other end extended in front of the shaft D toward the driving-wheel and coupled adjustably to the framing, substantially as set forth.

267,407. LAMP-BURNER. CHRISTOPHER STOCKMANN, Brooklyn, N. Y. Filed Feb. 15, 1882. (No model.)

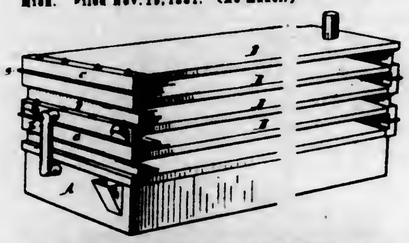


Claim.—1. The combination, substantially as hereinbefore set forth, with the outer or main tube and wick-raising rod, of the stuffing-box having an annular recess opening outward and surrounding the rod, the outwardly-tapering hard-rubber packing-sleeve embracing the rod within the stuffing-box, and the follower screwing into the box-recess and having its bore flared to engage the tapering outer end of the packing-sleeve, for the purpose specified.

2. The combination, substantially as hereinbefore set forth, with the main tube and wick-tube, of the wick-concentrating ring fitted into and resting upon the upper end of the main tube and formed with a groove opening upward for catching cinders, as specified.

3. In an Argand burner, the gallery H, secured to the main tube and provided with an annular recess, *h*, formed by two vertical walls, the inner one, *h'*, of which is higher than the outer one, as described, in combination with the chimney-holder I I', detachably arranged in the annular recess of the gallery, and against which the inner wall, *h'*, binds, substantially as and for the purpose described.

257,408. PHOTOGRAPHIC APPARATUS. SERENO E. STODDARD, Glens Falls, N. Y. Filed Jan. 19, 1882. (No model.)



Claim.—1. The box C, for receiving the sensitive plate E, provided with the sliding shutter D, in combination with the attachment B, substantially in the manner and for the purpose herein described.

2. The attachment B, hinged or pivoted to the back of camera A, inclosing the ground-glass frame H and plate-holder C, and provided with a cut-off, F, which closes the opening formed by the non-meeting edges of attachment B and camera A when shutter D is withdrawn, substantially as and for purposes described.

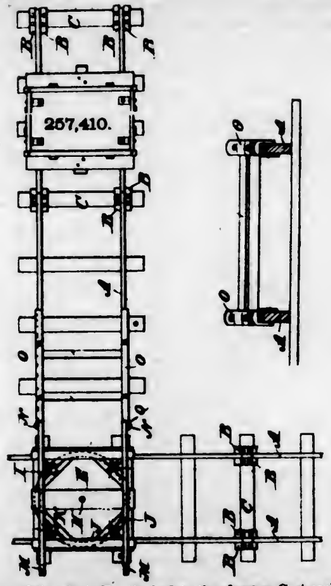
3. The combination, in a camera, of the inner box, C, with an inclosing box or frame, B, having a spring or springs, I J, for holding the plate-holder C with its sensitive plate E in position, and having an aperture provided with a cut-off, through which the shutter D may be drawn, substantially as and for purposes specified.

4. The combination of the adjustable ground-glass frame G with plate-holder C and attachment B, as and for the purposes above described.

257,409. FRUIT-DRIER. JAMES H. TRASSALE, Howell, assignor to the Steam Heat Evaporator Company, Charlotte, Mich. Filed Nov. 19, 1881. (No model.)

Claim.—1. In a fruit-drier, and in combination with the main flues thereof, end flues made in sections detachable from each other and adapted to receive the ends of the main flues, substantially as and for the purpose specified.

2. In a fruit-drier, and in combination with the series of steam-flues B, the end flues, C, provided with the flanges *a* and designed to be secured together to form a steam-connection between two adjacent flues B, substantially as and for the purpose specified.



3. In a fruit-drier, and in combination with the end flues, C, and generator A, the flues B, provided with drip-pipes for the purpose of conveying the water of condensation back to the generator from said flues B, substantially as described.

4. In a fruit-drier, and in combination with the detachable end flues or sections, C, the main flues B and the walls D, as and for the purpose specified.

257,410. PORTABLE RAILWAY. GEORGE W. THOMAS, Frenchier Home Place, La. Filed July 26, 1881. (No model.)

Brief.—The wooden rails have their adjacent ends beveled in opposite directions and are secured by cleats attached to the sleepers. The rotating frame is provided with a central bearing and side beams, which rest against the sides of the rails which have beveled ends and staples and engage with inclined removable rails provided with hooks.

Claim.—1. In a portable railway, the combination, with the wooden rails A, having their adjacent ends beveled in opposite directions, of the cleats B, attached to the sleepers C at each side of the rail, substantially as shown and described, whereby sockets are formed for the preceding or succeeding section, as set forth.

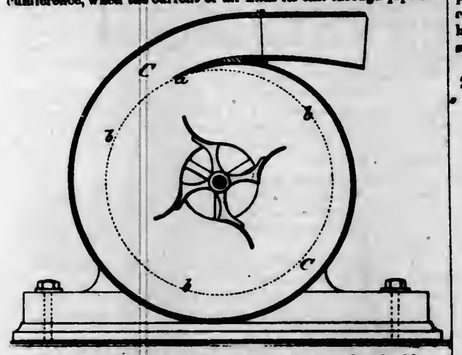
2. In a portable railway, the combination, with the rails and the rotating frame J, of the base-frame E, provided with the central bearing-beam, G, and the side beams, F, which rest against the sides of the rails, substantially as and for the purpose set forth.

3. In a portable railway, the combination, with the base-frame E and the rails A, of the rotating frame J, provided with the rails I, having beveled ends M and the removable inclined rails O, substantially as and for the purpose set forth.

4. In a portable railway, the combination, with the inclined removable rails O, provided with hooks Q, of the rails I, beveled at one end and provided with the staples N at the other, substantially as and for the purpose set forth.

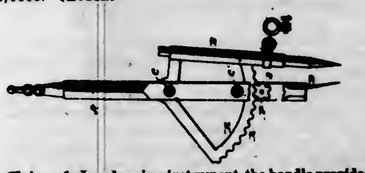
257,411. LADDER. WINFIELD S. THOMAS, East Dixfield, Me. Filed Mar. 15, 1882. (No model.)

Brief.—The sections are pivoted together, and a locking-rod passes through slots in the upper section and rests in notches in the ends of the lower section, and is held by pins inserted over it.



Claim.—1. In a ladder, the combination, with the lower section provided with the notches N in the ends of its side bars A, of the upper section pivoted to the said lower section and having its side bars G provided with the slots M, and the rod L, working in the said slots and adapted to be locked in the notches of the side bars of the lower section, substantially as and for the purpose set forth.

2. In a ladder, the combination, with the convergent side bars A of the lower section, having their upper ends provided with notches N, of the convergent side bars G of the upper section, provided with the slots M and the spike J, the rods K L, and the pins O, substantially as and for the purpose set forth.



257,412. CENTRIFUGAL BLOWER. ROBERT H. THURSTON, Hoboken, N. J. Filed Oct. 17, 1881. (No model.)

Brief.—The axis of wheel A is located eccentrically to the periphery of the case F, by which construction a vortex space, B, is formed whose outer line is *b*. C is a spiral delivery-channel gradually increasing in width from the point *a* throughout its circumference, when the current of air finds its exit through pipe D.

Claim.—A blower formed by the combination of a wheel having longitudinally-curved vanes whose outer extremities are parallel to radii of the wheel, and a case in which said wheel is located eccentrically, it being nearest the point *a* of inception of the delivery-pipe with the body of the case, but at a greater distance therefrom than the diameter of the spiral delivery-channel C, which is gradually increased from the point *a* until merged in said delivery-pipe, all as shown and described.

257,413. DIVIDERS. HORTON TOELMIN, Washington, D. C., assignor of one-half to John Sherman, same place. Filed Mar. 20, 1882. (Model.)

Claim.—1. In a drawing-instrument, the handle provided with a needle or other metal point and having a longitudinal slit or slits, in combination with a pivot and binding-screw, substantially as described, and for the purposes set forth.

2. In a drawing-instrument, the holder B, cut out of sheet metal, and having its lower edges cut into the form of an arc, K, and provided with teeth R, in combination with pinion P and thumb-nut *p*, substantially as shown and described, and for the purposes set forth.

3. In a drawing-instrument, a center, measuring, or caliper point consisting of a band or tube adapted to fit over the leg of the instrument, a binding-screw for retaining it in position, and a point, substantially as shown and described, and for the purposes set forth.

4. In a drawing-instrument, the mechanism attached to the pencil-holder B, so arranged as to force the pencil in or out of the holder for nice adjustment, substantially as described, and for the purposes set forth.

5. In a drawing-instrument, the handle forming one leg thereof, provided with a point divergent to its axis, and a longitudinal slit or slits, substantially as described.

6. In a drawing-instrument, one leg thereof adapted to hold a pencil or other scribing device, struck up from metal or other suitable material, consisting of a tube and a two-part wing the leaves whereof are adapted to spring apart, for the purpose set forth.

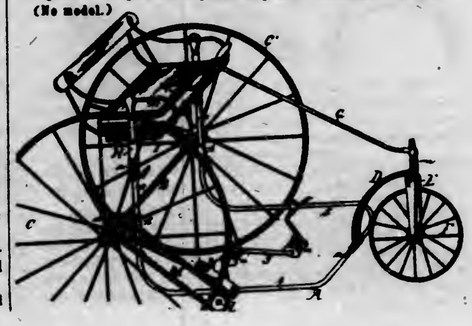
7. In a drawing-instrument, the combination of a needle-leg, having a longitudinal slot therein, with a pencil-leg constructed of sheet metal, adapted to hold a pencil or other scribing device, and provided with an elastic wing, substantially as shown and described.

8. In a drawing-instrument, the combination of a needle-leg with a pencil-leg constructed of sheet metal and adapted to hold a pencil or other scribing device, and provided with a wing adapted to be pivoted to and guided by the opposite leg, for the purposes set forth.

9. In a drawing-instrument, the combination of a needle-leg having a longitudinal slot, a shaft journaled thereto carrying a pinion or equivalent, and a wheel adjustable thereon, with a pencil-leg constructed of sheet metal, adapted to hold a pencil or other scribing device and provided with an elastic toothed wing.

10. In a drawing-instrument, the combination of a needle-leg provided with a shaft journaled thereto carrying a pinion or its equivalent, and a wheel adjustable thereon, with a leg adapted to hold a pencil or other scribing device, having a toothed wing, substantially as described and set forth.

257,414. WRENCH FOR BUNG-BUSHES. CHARLES TRAPP, Port Washington, Wis., assignor to Henry W. Lyman and James W. Vail, same place. Filed Sept. 27, 1881. (No model.)



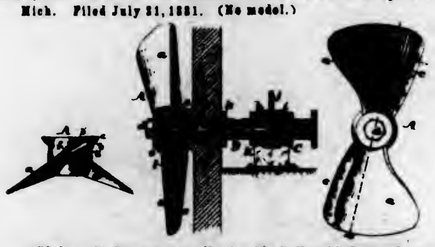
Claim.—1. A wrench for driving the bushes in and out of bung-holes, consisting of a flanged core, and eccentrics having knife-edges loosely arranged thereon, and means, substantially as described, for holding the specified parts together.

2. A wrench for bung-bushes, having flanges *a*, wedge-shaped in cross-section, and flanges *b*, dovetailed in cross-section, the flanges *a* and *b* alternating with each other, in combination with eccentrics 1 2 3, &c., arranged in the recesses between these flanges, with their knife-edges lying nearer to flanges *a* than to flanges *b*, and with means, substantially as described, for holding the specified parts together.

3. The combination of the flanged core, eccentrics, cap E, and rim C, as set forth.

4. A bush-wrench having flanged core F, rim C, base B, and shank *A*, in combination with eccentrics 1 2 3, &c., and cap E, as set forth.

257,415. VELOCIPEDE. OTTO UNSICKER, Chicago, Ill., assignor to Adolph Sheuinger, same place. Filed Jan. 18, 1882. (No model.)



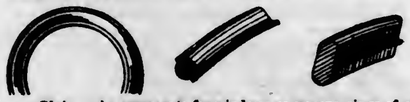
Claim.—1. A tricycle composed of frame A, consisting of a single piece of tubing horizontally bent into U shape, *a b*, and having standards *c c*, axle B, journal-boxes *d*, having a sleeve at one end to adapt the same to pass over said standards *c*, wheels C, rigidly mounted upon one end of the axle, and having sprocket-wheel *d*, wheel C', fitted loosely upon the other end of said axle, crank-shaft J, having sprocket-wheel L, and endless chain M, arc-shaped bracket D, having vertical hub *m*, bifurcated pivotal standard E, steering-wheel F, cross-bar H, having tubular ends to adapt the same to be passed over the standards *c*, coiled springs *e*, adjustable collars *f*, and seat I, secured to said cross-bar H, substantially as and for the purpose set forth.

2. The combination of the frame A, having standards *c*, cross-bar H, having end hubs to adapt the same to be passed over said standards *c*, seat-board I, secured to said cross-bar supporting springs *e*, and adjustable collar *f*, all constructed and arranged substantially as shown and described.

3. The combination, with the frame A, having standards *c*, brackets *l*, sleeved upon said standards and forming the journal-boxes for axle B, drive-wheel C, with sprocket-wheel *d*, rigidly secured thereon, and wheel C', loosely pivoted thereon, of the double-crank shaft J, pivoted in journal-boxes *j*, also sleeved upon such frame A, and adjustably secured thereto by set-screws *k*, of a sprocket-wheel, L, mounted upon the end of such crank-shaft, and of an endless chain, M, stretched over both sprocket-wheels L and *d*, all substantially as set forth.

4. In a tricycle, the guard-plate or fender N, having a sleeve or clamp formed on one end, to adapt the same to be adjustably secured to the frame A, substantially as and for the purpose set forth.

257,416. SCREW-PROPELLER. RICHARD UREN, Houghton, Mich. Filed July 21, 1881. (No model.)



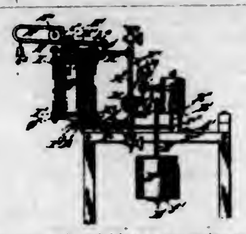
Claim.—1. A screw-propeller having hollow blades, each provided with one or more orifices in close proximity to its front radial edge and opening toward the rear radial edge of said blade, substantially as described.

2. A screw-propeller having hollow blades, each provided with two or more orifices in close proximity to its front radial edge and opening toward the rear radial edge of said blade, one or more upon each side of said blade, substantially as described.

3. The combination of the propeller A, having hollow arms *a a*, each provided with one or more openings, *b b*, the hoods *c c*, and mechanism for forcing air through the hollow arms *a a* and the orifices *b b*, substantially as and for the purposes described.

257,417. ORNAMENT OF GLASS FOR WINDOWS, SCREENS, &c. ELIAS VEDDER, New York, N. Y. Filed Dec. 19, 1881. (No model.)

Brief.—Provides rings or open figures of glass with external and internal flanges, by which they are clamped together with ordinary stained-glass plates to form a window or screen.



Claim.—As ornaments for windows or screens, rings of glass or equivalent open figures, provided with flanges externally and internally to receive the clamping devices for holding them in position, as hereinbefore set forth.

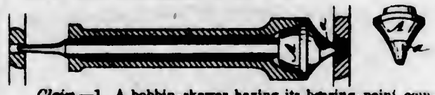
257,418. AUTOMATIC GRAIN-WEIGHING MACHINE. CHRISTIAN WAHL, Newport, Ky., assignor to Simpson & Gault, Cincinnati, Ohio. Filed Oct. 5, 1881. (No model.)

Claim.—1. In an automatic weighing and measuring machine, the combination, with a rising and falling scale-beam and a receiving-bucket, of a fluid brake mechanism, each substantially as described, for retarding the movement of the scale-beam a sufficient length of time to permit the complete emptying of the bucket, as set forth.

257,418.

2. In an automatic weighing or measuring machine, the combination, with the rising and falling scale-beam and receiving-bucket suspended therefrom, of a retarding brake mechanism for the scale-beam, composed substantially of a cylinder, G', a valved piston, H H', pipes K, K', and K'', and valve M, arranged for operation substantially as and for the purposes described.

3. The combination, with the scale-beam and brake mechanism composed of a cylinder, G', a valved piston, H, piston-rod H', and pipes K, K', and K'', and valve M, of the lever S, resting on said piston-rod, and provided with a traveling weight, S'', a movable frame, Q, a pivoted lever, R, and a rod, R', arranged for operation substantially as and for the purpose described.

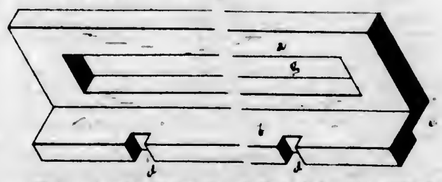


4. In an automatic weighing or measuring machine, the cylinder G', having orifices J J', and valved piston H H', in combination with a vertically-movable frame, Q, and pipes K, K', and K'', and valve M, arranged for operation substantially as and for the purpose described.

5. The combination of the weights E', the cover F', and the cylinder F, adapted to slide vertically over the weights, and provided with a slotted bottom to engage and disengage a cross-bar on the rod which is suspended from the scale-beam, substantially as described.

6. The combination of the rod suspended from the scale-beam, the weights E' thereon, and the cover F' of the removable and replaceable cylinder F, adapted to slide vertically over the weights, and means for confining it in position to cover said weights, substantially as described.

7. In an automatic weighing apparatus, the combination of the rising and falling scale-beam and the pivoted trip-lever N, having projecting lugs or arms *n n'*, arranged to be acted on by the scale-beam, with the valve P, the shell *m*, having the ports O O', the pins or stops O'', the stem M', on which the valve is mounted between the stops, and the pipes K'', said members being organized for operation substantially as shown and described.



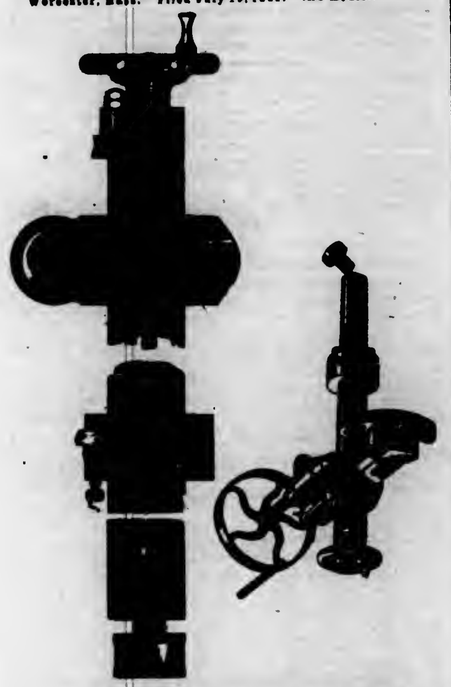
257,419. BOBBIN-SKEWER. JAMES WARBURN, Fall River, Mass. Filed Oct. 26, 1881. (No model.)

Claim.—1. A bobbin-skewer having its bearing-point composed partly of wood and partly of metal, substantially as and for the purposes set forth.

2. The skewer A, provided at its lower end or bearing-point with the metal tip *a*, substantially as and for the purposes described.

257,420. NUT-LOCK. WILLIAM C. WATSON, Puyallup, Wash. Filed Sept. 28, 1881. (No model.)

Claim.—A nut-lock consisting of a flanged plate, A, provided with a longitudinal rabbet, *e*, and with a longitudinal slot, *g*, and recesses *d*, the said plate being adapted to be secured over the nuts on the joining-bolts of the rail, whereby they are held in position, substantially as specified.



257,421. MEASURE FOR LIQUIDS. FRIEDRICH WEBER, Brooklyn, N. Y. Filed Dec. 1, 1881. (No model.)

Claim.—The combination, with the open-mouth liquid-measure, of the central vertical fixed partition, B, the oblique fixed partition C, and discharge-point *c*, forming the compartments D' D² D³, each of said partitions terminating below the mouth of the vessel, forming a compartment above their upper edges for the vessel to measure its full capacity, substantially as and for the purpose specified.

257,421.

257,422. METAL-BORING MACHINE. JEROME WHEELOCK, Worcester, Mass. Filed July 19, 1881. (No model.)

Claim.—1. The combination, with a boring-bar and its front cross-head, of gearing for rotating said bar, which is housed within said cross-head, substantially as described.

2. The combination, with the boring-bar and the cross-head, of the worm and its shaft, and the gear serving at its periphery as a journal for the bar and meshing with the worm, substantially as described.

3. The combination of a boring-bar, provided with a semi-spherical journal, and a cross-head provided with a bearing to receive said journal, substantially as described.

4. The combination, with the tubular bar and rotating mechanism, the feed-screw, its gear, and a cutter-head, of the non-rotative central spindle and the geared sleeve thereon, which meshes with the gear on the feed-screw, substantially as described.

5. The combination, with the tubular bar and rotating mechanism, the feed-screw, its gear, and a cutter-head, of the non-rotative central spindle, the geared sleeve meshing with the gear on the feed-screw and mounted on said spindle, and a hand-wheel for rotating said sleeve, substantially as described.

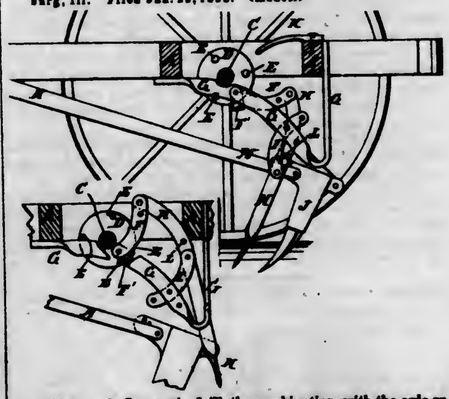
6. The combination, with the tubular bar and rotating mechanism, the feed-screw, its gear, and a cutter-head, of the non-rotative central spindle, the geared sleeve meshing with the gear on the feed-screw, a hand-wheel for rotating said sleeve, and a locking-nut for rendering said sleeve non-rotative during the rotation of the bar, substantially as described.

7. The combination, with the cutter-head provided with one or more recesses for the reception of cutters, of lifting-blocks and their lifting-screws within said recesses for radially projecting the cutters, and a clamping screw or screws for confining each block and cutter within a recess, substantially as described.

8. The combination, with a boring-bar provided with longitudinal grooves, of a cylindrical cutter-head provided with inwardly-projecting portions, which occupy the grooves in the bar and are recessed radially from the periphery for the reception of cutters, substantially as described.

9. The combination, with a boring-bar cross-head, of detachable brackets provided with seats for the ends of the cross-head and means for securing the cross-head thereto and variably adjusting it thereon, substantially as described.

257,423. STENCIL-PLATE. JOSEPH T. WILLIAMSON, Raleigh, N. C. Filed Feb. 2, 1882. (No model.)



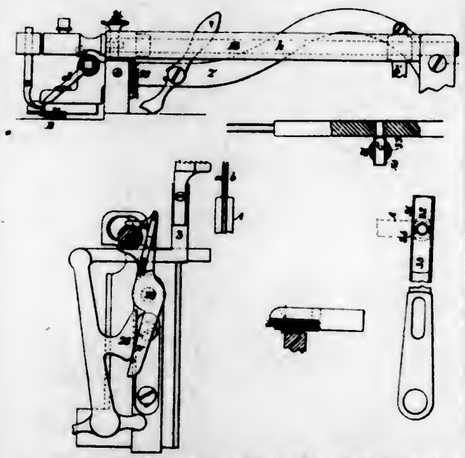
Claim.—1. The combination of a plate having suitable figures, letters, or numbers stamped through its edge with a pivoted frame which is provided with a brush and ink-reservoir, substantially as shown.

2. The combination of the stencil-plate, the pivoted frame provided with an ink-reservoir, and a brush which can be adjusted back and forth upon the frame, substantially as described.

3. The combination of the stencil-plate, a pivoted frame, and a spring locking device which catches in holes made in the stencil-plate for the purpose of locking the pivoted frame in any desired position, substantially as set forth.

4. The combination of a stencil-frame, the pivoted frame provided with a handle, the sliding plate provided with an ink-reservoir, and the handle made adjustable upon the frame, substantially as specified.

257,424. GRAIN-DRILL. WILLIAM W. WINEGAR, Chambersburg, Ill. Filed Jan. 28, 1882. (Model.)



Claim.—1. In a grain-drill, the combination, with the axle or shaft C, of the wheel D, having pins E, the pivoted lever F, having pawl F', the holding-bar H, and the crank-bar I, substantially as herein shown and described, whereby the holding-bar will be operated to hold the trash until the drill-hoes have been drawn past it, as set forth.

2. In a grain-drill, the combination, with the pivoted lever F that carries the holding-bar H, of the hook K, substantially as herein shown and described, whereby the said holding-bar can be supported above the ground and held stationary, as set forth.

3. In a grain-drill, the combination, with the holding-bar H, of the projecting pin L, substantially as herein shown and described, whereby the said holding-bar can be raised by and with the drill-hoe and its draw-bar, as set forth.

257,425. STRAW-BRAID SEWING-MACHINE. EDMUND WISEMAN, Luton, County of Bedford, England. Filed Dec. 8, 1881. (No model.)

Brief.—The invention relates to means for elevating the looper when the presser-foot is raised to remove or insert the work, to a presser-foot of peculiar construction for guiding the work, and to the feeding and needle-operating mechanisms, all as indicated by the claims.

Claim.—1. The looper *c*, combined with a presser-foot extending beneath the same and with a rock-spindle and devices whereby the latter is turned to insure the rise and fall of the looper along with the lifting movement of the presser-foot, for the purpose set forth.

2. The combination of the work-plate, needle-carrier below the same, looper above the same, presser-foot extending between the looper and work-plate and mounted on an arm provided with an elevating device, and a spindle carrying the looper and having a bearing upon the arm *z*, as set forth.

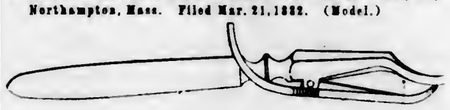
3. The combination of the vibrating lever *e*, the lever 5, connected to the feeder, and arranged substantially parallel to the lever *e*, and provided with an arm, 28, having an extended face, against which the lever *e* bears, whereby the bearing-point changes vertically with the movement of the levers, producing a varying speed in the feed, substantially as and for the purpose set forth.

4. The combination of the shoe 30, with the eccentric 12, and lever *e*, as and for the purpose set forth.

5. The presser-foot of a straw-braid sewing-machine, provided with two or more steps at the under part thereof, arranged successively on different planes, as and for the purpose specified.

6. The combination of the needle-actuating lever, the needle-slide, and a lever tubular at the free end with lateral slots 32 in the tubular part and a longitudinal sliding piece, 33, and transverse bush 34, for receiving the pin *c'* on the needle-slide, as and for the purpose specified.

257,426. ROLLER-SKATE. GEORGE L. WITZEL, Philadelphia, Pa., assignor to Edward G. Edwards, Brooklyn, N. Y. Filed Nov. 22, 1881. (No model.)



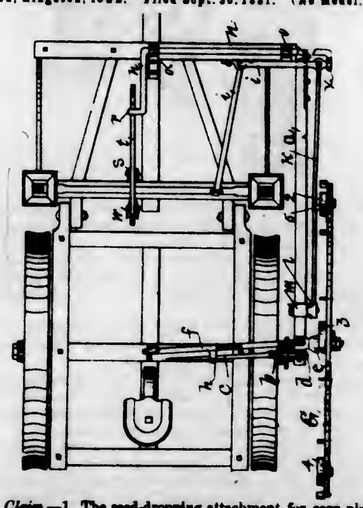
Claim.—1. In a roller-skate, the combination, with the foot-rest, of spheroidal rollers having integral gudgeons and brackets having integral bearings, substantially as and for the purpose set forth.

2. The rollers having gudgeons set into the sides thereof and grooves surrounding said gudgeons, in combination with the brackets having bearings which enter said grooves and encircle the gudgeons, substantially as and for the purpose set forth.

3. The combination, in a roller-skate, of rollers with gudgeons, and brackets with countersunk bearings for said gudgeons, substantially as and for the purpose set forth.

257,427. CARVING-FORK GUARD. EDWARD E. WOOD, Jr., Northampton, Mass. Filed Mar. 21, 1882. (Model.)

Claim.—The guard B, having the spring in its legs, and the tongue D integral therewith, the fork-shank having thereon the pivot-lugs C C, provided with the horizontal and vertical bearing-faces, said guard and shank being pivoted one to the other through the lower end of said tongue and through said pivot-lugs.



257,428. BRUSH. LOUIS YVON, Brooklyn, N. Y. Filed Feb. 11, 1882. (No model.)

Claim.—1. A brush having its back grooved in line with the rows of holes that receive the bristles and the grooves filled with metal, substantially as herein shown and described, and for purpose set forth.

2. In a brush, the combination, with the stock A, provided with the grooves C in line with the rows of holes that receive the bristles, of the metal bars E, substantially as herein shown and described, whereby the bends or loops of the bristles and the fastening-wire are covered and the brush protected from being injured by heat and moisture, as set forth.

257,429. CORN PLANTER AND MARKER. CHARLES A. ANDERSON, Mineral Ridge, assignor of one-half to Charles Nelson, Kingston, Iowa. Filed Sept. 30, 1881. (No model.)

Claim.—1. The seed-dropping attachment for corn-planters, composed of the hinged beam *a*, the pivoted fulcrum *b*, the lever *c*, link *d*, stub-axle *e*, hinged stay *f*, having a hook, *h*, the auxiliary wheel G, having cam-plates 1 2 3 4, the bell-crank *i i*, and the pitman *k*, having a pin, 5, substantially as shown and described, to be operated as set forth.

2. In a corn-planter, the combination, with the hinged beam

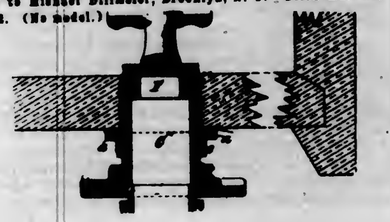
a, cam-wheel G, axle and stay *e f*, pitman *k*, and bell-crank *i*; of the rock-shaft *n*, having arm *s* and extension *r*, the beam *t*, and marker *w*, all constructed and adapted to operate substantially as described.

257,430. AVERAGING-MACHINE. WILLIAM S. AUCHINCLOSS, Philadelphia, Pa. Filed Feb. 16, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the platform provided with a series of suitable grooves or receptacles to receive the representative weights, and corresponding to the marks on a scale, the pivots or knife-edge bearings on which said platform oscillates, and mechanism for changing in a horizontal direction the position of said platform in relation to its bearings.

2. The combination, substantially as hereinbefore described of the platform provided with a series of suitable grooves or receptacles to receive the representative weights, and corresponding to the marks on a scale, the pivots or knife-edge bearings on which said platform oscillates, mechanism for changing in a horizontal direction the position of said platform in relation to its bearings, and the counter-weight.

3. The combination, substantially as hereinbefore described, of the platform provided with a series of suitable grooves or receptacles to receive the representative weights, and corresponding to the marks on a scale, the saddle which supports said platform and allows of moving the same in the direction of its length, and the knife-edge bearings extending from the saddle.



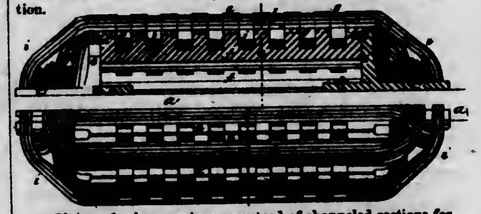
4. The combination, substantially as hereinbefore described, of the platform provided with a series of suitable grooves or receptacles to receive the representative weights, and corresponding to the marks on a scale, the saddle which supports said platform and allows of moving the same in the direction of its length, the knife-edge bearings extending from the saddle, and a counter-weight connected to the platform so as to move in a direction opposite to that in which the platform is moved.

5. The combination, substantially as hereinbefore described, of the platform, the saddle which supports the platform and allows of moving the same in the direction of its length, the knife-edge bearings extending from the saddle, the counter-weights connected to the platform, the pulleys secured on the saddle, and the chains or cords extending from the counter-weights round the pulleys to the platform.

6. The combination, substantially as hereinbefore described, of the platform, the saddle which supports said platform and allows of moving the same in the direction of its length, the knife-edge bearings extending from the saddle, the tubular side bars of the platform, the counter-weights fitted into said side bars, and mechanism for connecting the counter-weights and the platform so as to cause them when moved to move in opposite directions.

7. The method, substantially as hereinbefore described, of determining the point of common effect or the average location of a number of representative weights by distributing said weights on a balanced platform and then changing in a horizontal direction the position of said platform in relation to its bearings without disturbing the equilibrium of the platform until the representative weights are in equilibrium in regard to the bearings of the platforms.

257,431. CLEANING ATTACHMENT FOR FERMENTING AND STORAGE TANKS. JOHN BAUER, New York, assignor of one-half to Michael Dillmeier, Brooklyn, N. Y. Filed Mar. 30, 1882. (No model.)



Claim.—1. The combination of a metal socket adapted to be inserted into the bottom of a tank, a hose-coupling fitted to the outer or lower end of the said socket, and a plug screwed into the inner or upper end thereof, substantially as and for the purpose specified.

2. The combination of the socket C, provided with internal and external screw-threads, and having the collar *a*, the hose-coupling fitted to the lower end of said socket, and the plug F, substantially as and for the purpose specified.

257,432. ARMATURE FOR MAGNETO-ELECTRIC MACHINES. FRANKLIN H. BENNE, Newark, N. J., assignor, by mesne assignments, to the Metropolitan Electric Light and Power Company of the United States, New York. Filed Jan. 11, 1882. (No model.)

Brief.—The armature is made open to admit of free ventilation.

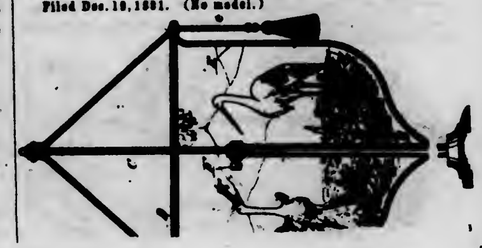
Claim.—1. An armature composed of channeled sections for the reception of the induction-wire, secured at their ends to end pieces and provided with transverse grooves, in combination with sections of iron wire wound in said transverse grooves, substantially as and for the purpose set forth.

2. In an armature of the Siemens type, radial ribs extending from the end pieces along the shaft thereof, in combination with the bobbins of insulated induction-wire, substantially as and for the purpose set forth.

3. In combination, the channeled sections *e e*, secured at their ends to end pieces and provided with the transverse grooves *g g*, the iron wire *j j*, and strip *k k* of heat-insulating material, substantially as and for the purpose set forth.

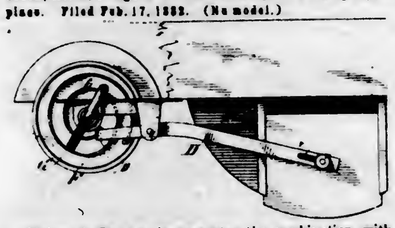
4. In combination, the shaft *a*, end pieces composed of hub *b*, flange *d*, end ribs, *e e'*, channeled sections *e e*, and bobbins *i i* of insulated wire, substantially as set forth.

5. In combination, the sections *e e*, formed substantially as shown, the iron wire *j j*, the end pieces, *b e e' d*, and shaft *a*, as set forth.



257,433. HEEL-PROTECTOR FOR BOOTS AND SHOES. SAMUEL BERGSTRESSER, Philadelphia, Pa., assignor of one-half to Jacob M. Kern, same place. Filed Mar. 27, 1882. (No model.)

Claim.—1. The combination of the heel-lifts having openings *g* with the bar or plate embedded in the heel, and having projections *h*, adapted to said openings *g*, as set forth.

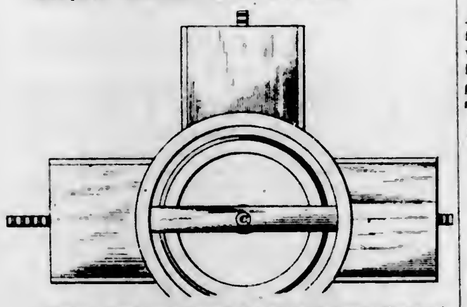


2. The combination, of the segmental bar *a*, having projections *h*, with the heel-lift *d*, having a segmental slot, *e*, and the lifts *f*, having openings *g*, as set forth.

257,434. LAMP-SHADE. ARTHUR C. BLATHEY, Riverside, Ill. Filed Dec. 10, 1881. (No model.)

Claim.—In the independent lamp-shade described, the combination, with the base having the tubular upright B, provided with the set-screw F, of the supporting-rod C, fitted to the tube, the cross-bar D, secured to the rod, and the shade E, attached at its upper end to the rod C, and adapted to depend below the top of the tube B, substantially as described.

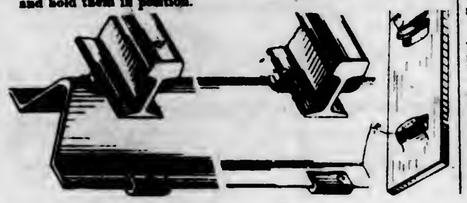
257,435. GRAIN-SEPARATOR. EDMUND D. BROWN, Battle Creek, Mich., assignor to Nichols Shepard & Company, same place. Filed Feb. 17, 1882. (No model.)



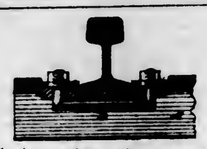
Claim.—1. In a grain-separator, the combination, with the adjustable doors of the fan-case, of adjusting-levers and a sliding transverse shaft provided with cams for actuating said doors, whereby they are adapted to be operated from either side of the machine.

2. The combination, with the adjustable doors of the fan-case and the adjusting-levers, of worm-wheels or their equivalent and a sliding transverse shaft, said wheels being mounted loosely on said shaft and adapted to be engaged therewith for operating said levers and doors, substantially as described.

3. The combination of the sliding shaft G, the worm-wheels F and F', or their equivalent, adapted to be engaged with said shaft, and the levers D and D' with the adjustable doors of the fan-case, substantially as described.



257,436. WOOD-PULP MACHINE. ROBINSON CARTWELL, Bellows Falls, Vt., assignor of one-fourth to Albert H. Fisher, same place. Filed Jan. 11, 1882. (No model.)

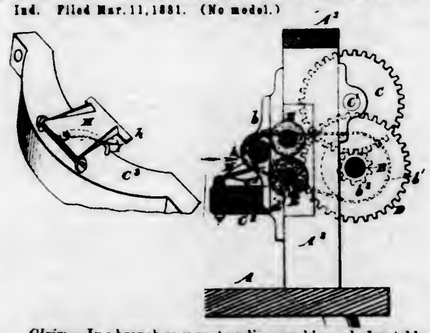


Claim.—As an improvement in machines for converting wood into paper-pulp, the cylindrical casing having radiating boxes or hoppers, provided with sliding covers and suitably operated followers, in combination with the grinding-wheel having a convex rim and suitable operating mechanism, as described, for the purpose set forth.

257,437. METALLIC RAILWAY-TIE AND FASTENING. H. DE SAVALA, Brooklyn, N. Y. Filed Mar. 13, 1882. (No model.)

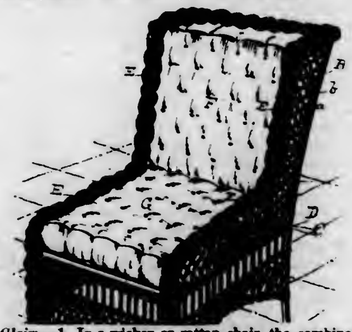
Brief.—A wrought-metal corrugated tie has flattened rail-seats connected at the sides with the body of the tie, and is formed by stamping or rolling. The rails are secured by double-headed screw-threaded bolts provided with washers and nuts. Clamping-plates having ears are connected to one or more ties, so as to space and hold them in position.

257,437.



Claim.—1. A wrought-metal corrugated tie having flattened rail-seats connected at the sides with the body of the tie and formed by stamping, rolling, or equivalent means, substantially as described.

2. In combination with a corrugated tie, such as described, the double-headed screw-threaded bolt provided with washers and nuts, all arranged so as to hold the rail in position in the seat, as set forth, or any equivalent means therefor.

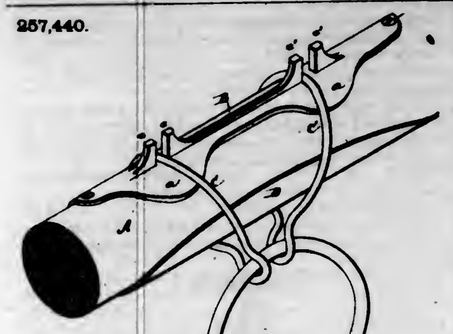


3. The clamping-plate C, having ears *a*, in combination with two or more ties, so as to space and hold in position the said ties, as described.

257,438. WILLOW-PEELER. GEORGE J. DUDLEY, St. Peter's, Ind. Filed Mar. 11, 1881. (No model.)

Claim.—In a branch or sprout peeling machine, a bed or table, A, and upright frame A' A² A³, having secured thereto the platform C⁵, cut away on its inner surface, as shown, in combination with the cutter H, having cutting-edge *h* and converging sides, all in one piece, spring I, fly-shaft B B', having pulley *b'* and pinion *b²*, gear D, pinion *d*, rollers E, and guide-roll J, as and for the purposes set forth.

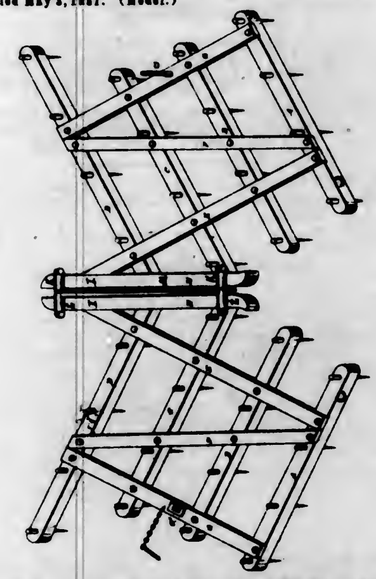
257,439. WICKER OR RATTAN CHAIR. GEORGE A. ELLIS, Gardner, Mass. Filed Jan. 9, 1882. (No model.)



Claim.—1. In a wicker or rattan chair, the combination of upholstered cushions F and G with the back A and seat D, having flanges of wicker-work B and C and a projecting edging, E, whereby the cushions are held in place, substantially as is shown and described.

2. In a wicker or rattan chair, the back and seat thereof provided with elastic flanges, in combination with removable upholstered cushions, substantially as and for the purpose described.

257,440. NECK-YOKE. JAMES E. FINLEY, Delphi, Ind., assignor to William F. Lytle and Isaac Druffel, same place. Filed Feb. 18, 1882. (No model.)



Claim.—1. The combination, with a neck-yoke and its rings, of the metal plate B, cast or formed with lugs adapted to receive and hold said rings, substantially as herein set forth.

257,440.

2. The metal plate B, having lugs *a c c' c'* and wings *a a*, in combination with rings C C and E and yoke A, all constructed and arranged substantially as and for the purpose described.

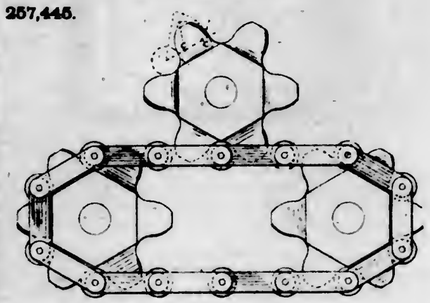
257,441. HARROW OR DRAG. JOHANN G. FRIEDEMANN, Waverly, assignor to August Friedemann, Bremer County, Iowa. Filed May 3, 1881. (Model.)

Claim.—In a sectional harrow, the combination, with the beams A B C D, of runner-beams H H, bearing eye-plates I, the coupling-bars K, hinged to said eye-plates on the outer edges of said beams H, and a locking device, substantially as described.

257,442. PROCESS OF TANNING HIDES. JOSEPH HEAD, Hornellsville, N. Y. Filed Dec. 8, 1881. (No specimens.)

Claim.—The process of tanning hides herein described, consisting of the following steps, which succeed each other in the order designated: first, placing the hides in a vat of water into which has been poured a mixture of one-half pound saltpeter, one pound oil of vitriol, one pound potash, and twenty pounds rock-salt; second, fleshing the hides after they have been soaked; third, soaking them in a vat of water into which has been poured a mixture of one bushel of quicklime and one and one-half pound of sal-soda after they have been fleshed; fourth, soaking the hides in a vat of water at a temperature of about 116° Fahrenheit after they have been limed; fifth, removing the hair and lime-shaving the hides; sixth, scouring the hides immediately after the hair is removed and they have been lime-shaved; seventh, coloring them; eighth, scouring the hides after they have been colored to remove all sediment and unnatural grain; ninth, the application of the tannin; tenth, laying the hides away in a pile after the tannin has been applied; eleventh, manuying them after they have been tanned; twelfth, scouring them on both sides; thirteenth, setting them out with a slicker and hanging them up to dry; fourteenth, stuffing them after they have become dry; fifteenth, packing them in a pile and covering them up after they have been stuffed; sixteenth, dipping them singly in a vat of water at a temperature of about 120° Fahrenheit after they have been taken from the pile; seventeenth, striking them out and drying them after they have been dipped; eighteenth, whitening, trimming, and boarding them after they have dried; nineteenth, blacking them with a composition of one pound of lamp-black, one and one-half pound of Babbitt's soap, boiled in three gallons of water; twentieth, smutting them off and applying gum-tragacanth and oil after they have been blacked; twenty-first, glassing them down and drying them; twenty-second, gumming them off with clear gum-tragacanth after they have dried.

257,443. BUCKLE. JOHN H. HUNTAMER, Janesville, Wis., assignor of two-thirds to Charles Dutton and Hiram Merrill, same place. Filed Nov. 25, 1881. (No model.)

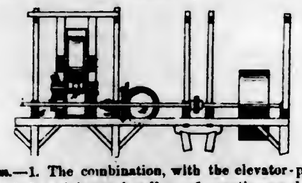


Claim.—In a buckle, the combination, with the buckle-frame and a bearing-plate consisting of the flat portion *d*, formed with a depression, *i*, a curved portion, *f*, provided with a groove, F, lugs or flanges C C, and opening *h*, of the tongue D, provided with the cross-bar E, the latter being secured within the groove F by means of the flanges or lugs C C, substantially as set forth.

257,444. TRACTION-ENGINE. HORATIO N. LAND and HOWARD CAMPBELL, Richmond, Ind., assignors to Gaar, Scott & Company, same place. Filed Jan. 16, 1882. (No model.)

Claim.—The combination, in a traction-engine, of the boiler A, supported upon traction-wheels, with the elevated horizontal tank-supporting bars G, bolted to the sides of the boiler at its front end above the front wheels and extending forward in advance of the front wheels, as shown, the elevated tank E, supported in position upon said bars in front of the smoke-stack and connected to the steam-dome by brace-rods *i*, and means for conducting and forcing the water from the tank into the boiler, substantially as described.

257,445.



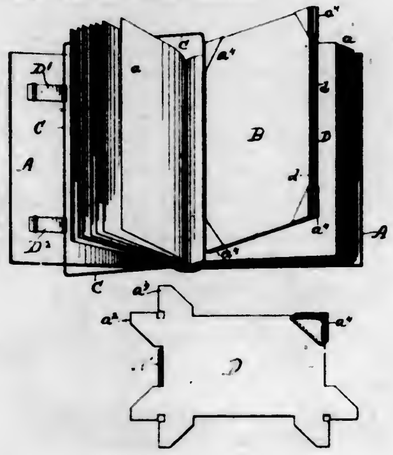
257,445. SPROCKET-WHEEL. FRANCIS H. LUCANNA, Columbus, Ohio, assignor to the Lochner Mining Machine Company, same place. Filed Jan. 3, 1882. (No model.)

Claim.—1. A sprocket-wheel the teeth of which have their engaging faces formed upon arcs of circles, substantially as set forth.

2. A sprocket-wheel having its teeth slotted to receive the intermediate bars of the chain-links, substantially as set forth.

257,446. GRAIN-ELEVATOR. WILLIAM H. LOTZ, Chicago, Ill., assignor of one-half to Edward Baumann, same place. Filed Nov. 19, 1881. (No model.)

Claim.—1. The combination, with the elevator-pulleys and paper wheels for driving such pulleys, of a continuous shaft-line for each line of elevators, such shaft-lines being driven from one end by a single pulley and by gear-wheels and a transverse shaft or shafts, and a wire-rope, chain, or rod passed through tubes in the grain-storing bins for raising and lowering the upper elevator-pulley, substantially as set forth.



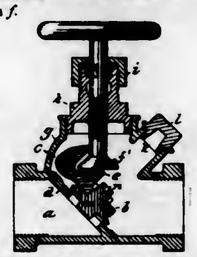
2. The combination, with a continuous line-shafting carrying gear-wheels, of an independent shaft for each paper-wheel, journaled in vertically-adjustable boxes and having a gear-wheel that meshes the gear-wheel on the line-shafting, and of the elevator-pulley riding upon such paper wheel, substantially as and for the purpose set forth.

3. In a grain-elevator, the elevator-pulley supported upon swinging beams that are raised and lowered by a wire rope passed through tubes in the grain-storing bins, so as to reach to and be operated from the lower floor of the building, all substantially as set forth.

257,447. PROCESS OF MANUFACTURING ILLUMINATING-GAS. ORASIO LUGO, New York, N. Y. Filed Apr. 7, 1882. (No specimens.)

Claim.—The process of manufacturing a fixed carbureted water-gas, which consists in carbureting the product of the decomposition of water by incandescent coal with hydrocarbons at their point of decomposition or dissociation, and then combining and fixing the mixture in a separate hot retort or bench, whereby a gas of constant photometric power is obtained free from light hydrocarbon vapor or condensable products, and whereby heavy as well as light hydrocarbons may be employed, substantially as described.

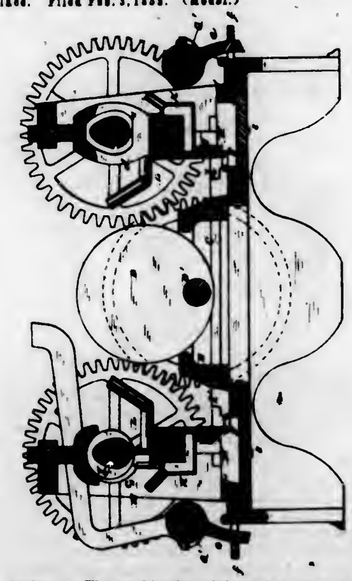
257,448. BLOTTING-PAD. JOHN E. PAYNESON, North Amherst, Ohio. Filed Oct. 28, 1881. (Model.)



Claim.—1. In a blotting-pad, the body D, having the tubular hinge-projection A' and provided with the projecting corners a^2 a^3, which are adapted to be folded over onto the body proper in opposite directions to form the pockets a^4, substantially as and for the purpose described.

2. The combination, with the blotting-pad B, consisting of the body D and the series of blotting-sheets *d*, of the wire bail C, the elastic bands D' D^2, and the book A, substantially as described.

257,449. STEAM-VALVE. RUFUS N. PRATT, Hartford, Conn., assignor to the Steam Boiler Appliance Company, same place. Filed Nov. 14, 1881. (No model.)



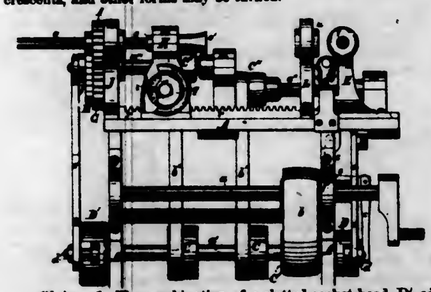
Brief.—The valve-case has two branches, *g* and *k*, and is provided with an inclined valve-seat and with a swinging flap operated by the stem *f*.

Claim.—1. In combination, in a fluid-cock, a barrel, *a*, having branches *g* and *k* and inclined valve-seat *d*, with a swinging flap, *b*, and operating-rod *f*, all substantially as described, and for the purpose set forth.

2. A fluid-cock having a barrel, *a*, inclined valve-seat *d*, branch *g*, and branch *k*, all substantially as described, and for the purpose set forth.

257,450. HORSESHOE-MACHINE. ZACHARIAH V. PURDY, Louisville, Ky., assignor of one-half to Albert G. Glover, same place. Filed Feb. 3, 1882. (Model.)

Claim.—1. The combination of the reciprocating carriage B, the bender A on this carriage, the spring-actuated jaws pivoted to the bender, having the shoulders a a', the feed-opening A' through the guide C', the hooked-spring dischargers, the collapsible die, and the curved extensions C^3, which compress the said jaws, substantially as described.



2. The spring-actuated collapsible dies H H', beveled and shouldered, as described, in combination with the opening-wedge *f* and means for actuating this wedge, substantially as described.

3. The vertically-reciprocating segment-shaped piercing-tool J, having beveled teeth and beveled gullets formed on it, means for bending rods into horseshoes, and the sprinkling-box K, all applied to a vertically-movable head, *d'*, substantially as described.

4. The combination, in a horseshoe-machine, of a right-line reciprocating carriage, a cam giving positive movements thereto, a concave bender secured to the carriage, bending-jaws pivoted to the concave bender, guides for the carriage and bending-jaws, spring discharging-hooks, bending-dies which are expansible, a nail-hole-piercing tool, and means for supplying air and water jets, substantially as described.

257,451. LATHE FOR TURNING FLUTED AND SIMILAR WORK. FREEMAN HANSON, Hollis, assignor, by mesne assignments, of four-fifths to the American Turning Company, Portland, Me. Filed Feb. 8, 1880.

Brief.—The stick to be turned is held at one end in a chuck, which may have a continuous or intermitting rotation. The intermittent rotation may be varied. The head-stock carrying a rotating cutter slides into cutting position at intervals, so that scallops, crescents, and other forms may be turned.

Claim.—1. The combination of a slotted socket-head, D', adjustable crank-rod *c'*, adjustable arm *j*, and pawl *m*, carried by said arm and engaging the teeth of a ratchet-wheel, H, all as hereinbefore shown and described.

2. The combination of the crank-rod *c'*, made adjustable at both ends, with an arm, *j*, and pawl *m* to act upon a system of gear-wheels and impart an intermittent rotation to the wood to be cut.

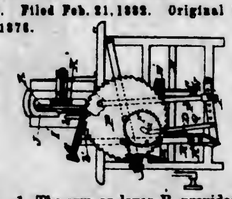
3. The combination of the chuck-shaft *e*, gear-wheels G and I, ratchet-wheels H, pawl *m*, and adjustable crank-rod *c'*, arranged to impart a definite intermittent rotation to the chuck-shaft, as hereinbefore described.

4. A sliding head-stock, E, and revolving arbor *i*, armed with any suitable cutting-tool, in combination with an intermittently-rotated chuck-shaft, *e*, as hereinbefore shown and described.

5. A sliding head-stock, E, and revolving and sliding arbor *i*, moved by adjustable crank-rods and slotted socket-heads, in combination with the chuck-shaft *e*, and gear-wheels G and I, arranged to impart alternately a constant or intermittent rotation to the lathe-chuck *e'*, as and for the purposes described.

REISSUES.

10,098. HORSE-COLLAR. CHRISTOPHER G. CALO, Albany, N. Y. Filed Mar. 2, 1882. Original No. 249,896, dated Nov. 22, 1881.



Claim.—1. As an improved article of manufacture, a hollow sectional horse-collar made of paper-pulp or papier-maché, as described.

2. The body of a hollow paper-pulp horse-collar, made in sections connected to admit opening and closing the collar, as described.

3. The combination, with the hollow sections A A', made of papier-maché, of the plugs *a a* and *a'* and the frame F, secured in the ends of the said sections, substantially as shown and described, whereby the ends of the said sections are re-enforced and provision is made for attaching the fastening devices, as set forth.

4. The combination, with the sections A A', hinged together at their lower ends, and the plate D, provided with one or more loops, *d*, and secured to the upper end of the section A, of the frame F, the plate D', having one or more slots, *d'*, the arms *f f'*, the plate *g*, the arm *h*, the spring *i*, the stop *i'*, and one or more catches, G, provided with a thumb-piece, *g'*, substantially as and for the purpose set forth.

10,099. SAW-SHARPENING MACHINE. MILO COVEL, Chicago, Ill. Filed Feb. 21, 1882. Original No. 150,115, dated July 28, 1876.

Claim.—1. The arm or lever R, provided on its upper end with a push-pawl or feeder and on its lower end with a guide or former, in combination with a vibrating lever connected to the sliding emery-wheel gate, substantially as and for the purposes specified.

2. The combination of the crank-shaft E, pitman Q, lever P', swivel-jointed connecting-arm P'', the vertically-sliding gate carrying the emery-wheel or sharpener, and the laterally-swinging gate-carrier, substantially as and for the purposes specified.

3. The angular slot *b'* in the gate-frame, in combination with the pin *b* on the vertically-sliding gate, substantially as and for the purposes specified.

4. The combination of the laterally-swinging gate-carrier or top piece, saddle L, brace M, pins *c c*, pulleys L L', the sharpening-wheel, and the driving-belts, all adapted for operation together, for the purposes set forth.

5. The guide or former R', pivoted to the feed-lever R, and having therein the slot *f*, in combination with the fastening-pin *f''* and the sharpener-actuating lever P', substantially as and for the purposes specified.

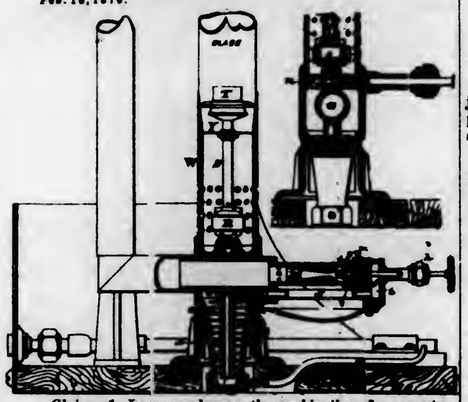
6. In combination, the beveled arm O, beveled removable and shouldered jacket T, removable bead-pieces U U, links or clasps V' V', and tighteners V'' V'', substantially as and for the purposes specified.

7. In a saw-sharpening machine, the combination, with the saw, of the pawl or feed-finger S, pivoted at one point, the loose end thereof being adapted to rise and fall in the line of the saw, but rigid laterally, substantially as described.

8. In a saw-sharpening machine, the combination, with the emery-wheel K and the arbor supporting the same, of the flanged pulley K', whereby the oil is prevented from reaching the cutting-surface of the emery-wheel, substantially as and for the purpose described.

10,100. PACKING-CASE. RALPH S. JENNINGS, Baltimore, Md., assignor to Joshua Levering, Baltimore, and George O. Manning, Baltimore County, Md., Trustees. Filed Mar. 11, 1882. Original No. 227,875, dated Feb. 15, 1881.

Claim.—1. A packing-case consisting of a pliable veneer body, to which the heads are united by textile fabric secured to the heads and to the body by stitches.



2. A packing-case whose head is united to the body by means of textile fabric, and having an open space between the edge of the head and the body, substantially as and for the purpose set forth.

3. The packing-case herein described, consisting of a body constructed of two or more layers of veneer cemented together, and having its head united to the body by a band of textile fabric stitched to the head and to the body, and united over the edge of the body, substantially as set forth.

4. A packing-case having strips of textile fabric secured to the outer edge of the body and to the rim of the head, and stitched together over the edge of the walls, forming a yielding rim for trundling and to receive blows or impacts, substantially as set forth.

5. In combination with a body of a packing-case having a textile-fabric flap secured thereto, a head having a similar flap secured near its edge, the said flaps being united and covering an annular space between the body and head, substantially as set forth.

10,101. APPARATUS FOR GENERATING GAS FOR HEAD-LIGHTS. NIRAM S. HAZIN, New York, N. Y., assignor, by mesne assignments, to F. A. Lyman and E. F. Taylor, Cleveland, Ohio. Filed Sept. 2, 1876. Original No. 99,937, dated Feb. 15, 1870.

Claim.—1. In a vapor-burner, the combination of a generator provided with a horizontal tube leading thereto, a jet-orifice controlled by a needle-valve and so placed with reference to the tube as to discharge vapor into the tube, and a pipe for the passage of gasoline to the jet-orifice, the latter provided with a drip-cup, whereby initial heat can be applied to the gasoline-pipe by igniting the contents of the drip-cup, substantially as set forth.

2. In a vapor-burner, a needle-valve operated by a screw-shaft threaded at or near its point, the screw-shaft suspended within a hollow tube, said tube provided with a stuffing-box at its outer extremity, substantially as and for the purposes shown.

3. The combination of the tank with the generating apparatus by means of a telescopic pipe, in the manner and for the purposes substantially as described.

4. The combination of the horizontal disks of wire-gauze or perforated sheet metal with the generator to prevent the disturbance or agitation of the fluid within it by the motion of the locomotive, substantially as described.

5. The combination of the small generator *c* with the burning-tube M and its contracted vent, and air-induction vents for vaporizing and burning the heavy oil from the bottom of the generator, in the manner substantially as described.

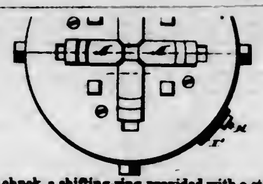
6. The combination of the sub-vaporizing apparatus with the heating-chamber, in the manner and for the purpose substantially as described.

7. The combination, with the chimney N, of the heating-chamber G, for the purpose of drawing in the heating-flame from the burning-tube M, substantially as described.

8. The combination of the tank with the generating apparatus by means of a telescopic pipe, in the manner and for the purpose substantially as described.

9. In a vapor-burner, devices, substantially as described, for heating the generator at top and cooling it at bottom, in the manner and for the purpose specified.

10. The combination, with the generator, of the pendent tube H, for removing the heavy oil from the gasoline fluid, in the manner and for the purpose set forth.



11. The combination, with the generator, of the devices, substantially as described, for separating the heavy or refuse portion of the gasoline fluid from the lighter and best portions of it, and vaporizing and burning the same to produce the heat for converting the lighter portion into an illuminating-gas, in the manner and for the purpose described.

12. The combination, with the air-tube W, perforated as described, of the burner T and wire-gauze disk Y, located below the burner, as and for the purpose described.

10,102. CHUCK. EDWARD S. PERROT and ELIZABETH C. BEHRMAN, (Administratrix of H. C. Behrman, deceased,) Philadelphia, Pa., assignors to National Manufacturing Company, New Haven, Conn. Filed Dec. 23, 1881. Original No. 167,018, dated Aug. 24, 1875.

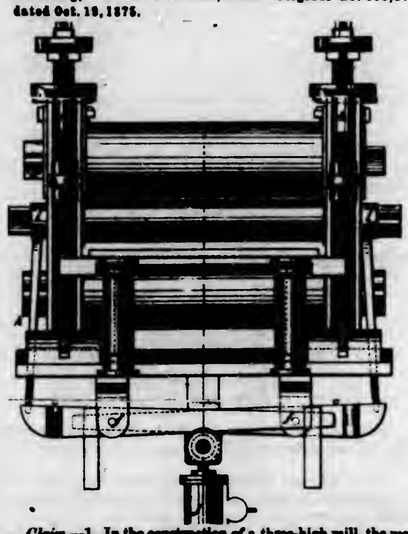
Claim.—1. In a chuck, a shifting-ring provided with a stud that extends through an elongated slot formed in the periphery of the shell of the chuck and inclined thereto.

10,102.

2. In a chuck, a shifting-ring provided with a stud which projects through a slot formed in the shell of the chuck and a plate perforated to receive said stud and provided on its inner face with a lug to fit within the slot.

3. In a chuck, a shifting-ring provided with a stud which projects through a slot formed in the shell of the chuck and a plate constructed to cover said slot, perforated to receive the said stud and provided on its inner face with a lug to fit within the slot.

4. The combination of the stop-lug l^2 with the stud H of the shifting-ring E and the slotted shell of the chuck.



10,103. SHUTTLE FOR SEWING-MACHINES. GEORGE RENNIE, Philadelphia, Pa., assignor to American Buttonhole, Overseaming and Sewing Machine Company, same place. Filed Mar. 13, 1881. Original No. 139,431, dated May 27, 1873.

Claim.—1. The combination, with a shuttle-case provided with a slit, *b*, for the reception and removal of the thread, of the hinged plate *m*, adapted to cover the side opening of the shuttle and retain the bobbin, and having a lip, *c*, extending over the outside of the case, and overlapping and partly closing the said slit *b* in the shuttle-case, as specified.

2. The combination of the shuttle-case A, a partition, *d*, extending across the interior of the case, and having an inclined slit, *a*, with a spring, D, and a screw having a nut, A, by adjusting which the spring can be made to force the thread with more or less pressure against the partition, substantially as described.

10,104. THREE-HIGH ROLLING-MILL. JOHN I. WILLIAMS, Pittsburg, Pa. Filed Nov. 21, 1878. Original No. 169,871, dated Oct. 19, 1875.

Claim.—1. In the construction of a three-high mill, the manner of combining the fluid-pressure cylinder and movable middle roll, substantially as and for the purposes set forth.

2. The combination, in a three-high mill, of the middle roll, C, the fire-plate or rest *e*, movable fire-plate *p*, guide *q*, movable with the roll and cylinder J, and interposed connections for conveying the power of the cylinder to the roll, substantially as set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

MATTHEWS *et al.* v. THE BOSTON MACHINE COMPANY *et al.*

Decided March 27, 1882.

1. REISSUE—EXPANDED CLAIM—LACHES.

Where the original patent shows upon its face that certain broad claims were not made, the patentees, if they are the inventors of such subject-matter, when apprised that it was not claimed in the patent, should use due diligence in surrendering the patent and having the mistake corrected. Fourteen years is too long a period of delay.

2. SAME—DIFFERENT INVENTION.

In this instance the reissue held to be not merely for a broader claim made many years after the original was granted, but for a different invention. By suppressing the description of certain parts of the device the reissued patent is made to cover by implication an invention described and claimed in a subsequent patent.

3. INFRINGEMENT—STATE OF THE ART.

When, in view of the state of the art, the patentee's claim must be construed to be for the specific arrangement of devices invented by him, the defendants do not infringe unless their devices are in the same specific form.

APPEAL from the Circuit Court of the United States for the District of Massachusetts.

Mr. Geo. L. Roberts and *Mr. Geo. Harding* for the appellants.

Mr. Causten Browne for the appellees.

Mr. Justice BRADLEY delivered the opinion of the Court.

This case comes before us on appeal from a decree of the Circuit Court for the District of Massachusetts, dismissing a bill in equity filed by the appellants, in which they prayed for an injunction and account of profits for an alleged infringement of two certain patents granted to Washburn Race and S. R. C. Matthews, one dated April 30, 1872, being a reissue of a patent granted January 26, 1858, and the other dated November 16, 1869. The defendants in answer denied that Race and Matthews were the first inventors of the thing patented, referring to several prior patents, and naming prior instances of knowledge and use of the alleged invention, and, among other things, setting up a patent issued to one Zebulon E. Coffin, dated July 21, 1868. They also denied that the reissued patent was for the same invention as the original, and denied infringement. The complainants filed a supplemental bill, alleging that since the filing of the original the defendants had procured a reissue of Coffin's patent, which contained substantially the same invention as that described in the plaintiffs' patent of 1869; but that Race and Matthews were the first and original inventors of the thing patented, and therefore they prayed that the Coffin patent might be declared void.

The Race and Matthews patents, on which this suit was brought, relate to casings or jackets around hydrants, and to the valves for letting on the water when wanted for use, and for draining it out of the hydrant when not in use. It is conceded that the objects of the casing are to prevent freezing in and around the hydrant by surrounding it with a volume of dead air, to keep it free from contact with the surrounding earth, and to enable the hydrant to be taken out of the ground without removing the surrounding earth. If the earth is in contact with the hydrant, it lifts the hydrant out of place by the action of the frost, and has to be dug away when repairs or other operations have to be performed below the surface. Many casings formerly used were fastened in different ways to the hydrant, and when lifted by the frost raised the latter also, causing breakage or leakage or other damage by the displacement, and also the hydrant could not be disconnected from the main and removed without removing the casing also. So far as the improvement in the casing is concerned the principal thing claimed to be effected by the patentees, Race and Matthews, is the placing of the case in position without attaching it to the hydrant or to the elbow of the main pipe below, so that the hydrant, while being protected from frost and the surrounding earth, may be lifted out separately, and so that the lifting of the case by the frost and surrounding earth will not disturb the hydrant. These objects are effected by two different devices: first, by causing the case to rest loosely on a flange projecting from the elbow of the main or otherwise, and allowing it to slide up the hydrant which it surrounds, and which is enlarged at that point for holding the valves; secondly, by allowing the upper end of the case to embrace the hydrant (enlarged at that point also) and to slide up and down upon it like a sleeve. Of course the case must fit the hydrant snugly enough to keep out the influx of cold air above and of dirt below, but not so tight as to prevent the hydrant from being lifted out or the case from slipping up and down upon it. This is the thing which the complainants contend that Race and Matthews invented.

As first patented in 1858, the invention did not accomplish the object. The bottom of the case, it is true, surrounded the hydrant like a sleeve and rested on a flange projecting from the elbow, which allowed the hydrant to be separately removed without removing the case; but the top of the case was inclosed in a flange projecting from the enlarged part of the hydrant above like the brim of a hat, but turned down over the top of the case, so that the latter, though unconnected

otherwise with the hydrant, yet if it were lifted by the frost it would press upward against the flange and raise the hydrant also. This difficulty was remedied by the invention of the improvement patented in 1869, by which the top of the case was made to surround and inclose the upper enlargement of the hydrant and to slide over it like a sleeve, as before stated. The reissued patent of 1872 substantially embraces both features of the improved case, namely, its disconnection with the hydrant both above and below, and places much stress on the dead-air chamber as a protection from frost, and on the protection of the hydrant below from the surrounding earth, although no claim is based on these last features. The defendants contend that this reissued patent is not for the same invention as that which is described and patented in and by the original patent of 1858; that the latter made no mention of the dead-air chamber formed by the casing, as a protection of the hydrant from the frost, and that it contained no indication that the case should fit closely to the hydrant, so as to prevent the passage of cold air into the chamber from without. But to these objections it is answered that the case invented by Race and Matthews in 1858 was a machine or apparatus having or being susceptible of various functions, some of which were well known and needed not to be mentioned or described. Among these known functions of the hydrant-casing were the formation of a dead-air chamber to prevent freezing and the protection of the hydrant from contact with the surrounding earth. The patent of Coffin, on which the defendants rely, states that prior to the date of his invention frost jackets or cases on hydrants were well known; that they surround the hydrant proper, an air-space existing between the two. It was not necessary for the patentees, Race and Matthews, to enumerate all the known functions of these frost-jackets in their original patent; and as no claim was based upon them it could not be hurtful to enumerate them in the reissued patent. But the complainants in their reissued patent have split up and divided the elements of their invention, and claimed them separately, and not as a combination. Of course this enlarges the scope of their patent. The separate claims embrace fewer elements in combination than were embraced in the claim of the original patent. No one could infringe the original patent unless he used all the elements of the combination. Any one will infringe the reissue who uses any of those elements which are now separately claimed.

The original patent had but a single claim in reference to the case, being a claim for a combination between the hydrant, the induction-pipe provided with a flange to sustain the jacket, and the jacket itself when arranged as described in the specification to effect the desired end, to wit: the ready removal of the hydrant. This in the reissued patent is divided into two claims, namely: first, the jacket surrounding the hydrant and forming a separate and removable part from the elbow, substantially as and for the purpose set forth; secondly, the independent jacket supported on the arm or elbow of the main at or near the junction of the hydrant, substantially as shown and described—that is to say, there is a claim of a jacket separate and removable from the elbow and of a jacket resting on the elbow. It cannot be denied that each of these separate claims is much broader than the claim in the original patent, and they are put forth in the reissue fourteen years after the original was granted. The latter showed on its face that these broad claims were not made, and if the patentees were really the inventors of an independent jacket standing loosely on the elbow of the main, when apprised that it was not claimed in the patent they ought to have used due diligence in surrendering it and having the mistake corrected. The case clearly comes within the ruling lately made in *Miller* v. *The Bridgeport Brass Company*.

There is still another objection to the claims in question. There is a wide departure from the original invention in this, that the subject of the latter was a jacket or casing whose top was inclosed in and covered by a flange projecting from the hydrant, which effectually prevented the removal of the jacket without removing the hydrant also, and which caused the hydrant to be raised when the jacket was lifted by the frost. In the reissued patent nothing is said of this arrangement of the top of the jacket, and the claims ignore it altogether, so that, as already intimated, the patent as it now stands would cover such a jacket as that described and claimed in the complainants' patent of 1869, which slides like a sleeve over the hydrant at top as well as bottom. The reissue is not only for a broader claim made many years after the original was granted, but is for a different invention. Therefore, so far as the jacket is concerned, we think it cannot be sustained.

But the patent of 1869 still remains. That was for an improvement by which it was proposed to liberate the top of the case from the flange which covered and inclosed it and make it surround the hydrant and slip over it like a sleeve. The claim is for "the detached case B, so combined and arranged with the hydrant A as to have an end play or vertical motion of several inches to compensate for the heaving by frost, the upper part of same passing outside of main stock of hydrant." Had this patent been confined to a hydrant-jacket closed at the bottom and resting on a flange of the main elbow, perhaps it might have been sustainable; but it is not so confined. It is only said that the lower end preferably shuts into a flange of the elbow. The specification, it is true, commences with a statement that the invention was a mere improvement upon that described by the patent of 1858, which was for a case closed at the bottom by standing on a flange; but before getting through there is an evident departure from that and an indication that the patentees had begun to entertain views of an expanded construction intended to be placed on the original patent, which afterward found expression in the reissue of 1872. The claim of the patent of 1869 as it stands covers any and every loose jacket having an end play to compensate for the heaving of the frost, and having the upper end passing around the hydrant. It covers the old New York wooden case or housing, which was in public use for many years before Race and Matthews gave their attention to the subject. We are of opinion, therefore, that this patent cannot be sustained.

As to the valve apparatus, the object of which is to let the water in the body of the hydrant escape when the main valve is closed and to prevent any escape of water when the main valve is open, since Race and Matthews were not the original inventors of this process, but only of a particular arrangement of valves to effect it, they can only properly claim the specific arrangement which they invented; and in view of the older valve in the St. Louis hydrants, which that of the defendants most nearly resembles, and of the fact that the valve used by the defendants is not in the specific form of that invented by Race and Matthews, we think that the defendants are correct in their position that they do not infringe the patent of Race and Matthews, as that patent must be construed in order to be sustained.

The decree of the circuit court must be affirmed.

U. S. Circuit Court—District of New Jersey.

GREEN v. FRENCH.

Decided March 28, 1882.

1. GREEN PATENT—PRIOR DECISIONS FOLLOWED.
In view of numerous decrees in other circuit courts sustaining the validity of the Green patent for driven wells, in only one of which appeal has been taken to the Supreme Court, the court declined to hear argument except as to new features of the particular case.

2. SAME—PRIOR INVENTION.
Evidence offered to show the existence of a driven well at Warsaw in the year 1859 discredited.

Mr. J. C. Clayton and *Mr. A. Q. Keasbey* for the complainant.

Mr. Wm. B. Maxson and *Mr. Jas. Buchanan* for the defendant.

NIXON, *J.*:

This is a suit in equity brought against the defendant for the infringement of Reissue Letters Patent No. 4,372, granted to Nelson W. Green, assignor of the complainant, on May 9, 1871, for an improvement in the methods of constructing Artesian wells. The original Patent No. 73,425 was issued to said Green, January 14, 1868, upon his application therefor, filed May 17, 1866. The patent is popularly known as the "Driven-well" patent, and the validity of the reissue has been the subject of controversy in the circuit courts of several districts almost without a parallel in the history of patent litigations.

It appears in this case that the contest began with the suit of *Andrews* v. *Carman* before his honor Judge Benedict in the eastern district of New York, was continued in the several cases of *Andrews* v. *Wright* before Judges Dillon and Nelson in the district of Minnesota, of *Hine* v. *Wahl* before Judge Gresham in the district of Indiana, of *Andrews* v. *Cross* before Judge Blatchford in the northern district of New York, and of *Andrews* v. *Cregan* before Judge Wheeler in the southern district of New York. All these cases resulted in sustaining the validity of the patent and in a decree in favor of the complainants. It does not appear that any except one of them have been taken up to the Supreme Court on appeal, but have been acquiesced in by the respective defendants. Under these circumstances it would seem that the time had arrived when controversy over determined questions should cease in the subordinate courts. When six learned judges in different districts have substantially agreed in the construction of a patent, another judge in a co-ordinate court, under the same state of facts, should accept their decision as final until the Supreme Court have had the opportunity of reviewing and reversing their judgment. Accordingly, when the case was called for hearing I stated to the counsel that I was unwilling to take the time of the court in listening to the discussion of issues which had been so often presented, discussed, and decided, and that unless my attention was called to features in the case which distinguished it from those elsewhere adjudicated I should be inclined to order a decree for the complainant on the authority of the suits in other districts. The counsel of the respective parties agreed that all the testimony in the present case in regard to the existence of a driven well in the premises of Timothy H. Buxton, at Warsaw, in the State of New York, as early as the spring of 1858, was new, and had never been introduced or considered in any of the other cases. The argument, therefore, at the hearing, after the suggestion of the court, was mainly directed to the question whether in fact any well was there at that date which in its process, construction, and mode of operation anticipated the alleged invention of Green.

I have given the evidence careful consideration, and find it is so contradictory that I am quite perplexed in reaching a decisive judgment. Having no reason to suppose that any of the witnesses mean to distort the truth, it is clear that some of them are mistaken, and it is hard to reconcile the many conflicting statements in regard to the facts of the case.

The principal witness in favor of the existence of a driven well in Warsaw as early as the spring of 1858 is Mr. Timothy H. Buxton, its alleged inventor, and the owner of the premises where it was put down. He describes how it was done:

"In the first place," he says, "I took a piece of gas-pipe * * * of the length I wanted and drilled in one end small holes sufficient to let water in, and then had a plug turned to put in the bottom end of the pipe with a shoulder, so that the plug would not drive up into the pipe, one end being small enough to go up into the pipe, say four inches." This plug, about ten inches in length from the shoulder and tapering to a point, was put in the bottom of the pipe. He then took a common crowbar, made a hole in the ground as far as he could with it, and then put the pipe in the hole and drove it down the depth that he supposed he could find water; then took a bar of round iron and put it in the pipe and punched out the wooden plug in the bottom; then screwed a cast-iron pump to the top of the pipe, began to pump, and got water He further states that Mr. Hiram Adams turned the block which was used for a plug at the lower end of the pipe and drilled the holes in the pipe; that the pump as thus constructed was in constant use for smith purposes in the blacksmith-shop for several years; that it was taken up when the ground was built over where it stood, and was afterward put down again in the new shop between the forges in the same manner as above described when it was first made.

It is well to remember in this connection and in view of the testimony of John West, to which reference will be made hereafter, that Mr. Buxton stated at a subsequent stage of his examination that West was present during the whole time of putting down the second driven well in the new shop and dictated about it. He is strongly supported by the testimony of Hiram E. Adams, who carefully and minutely describes a pump that he saw put down on Buxton's premises on the west side of the blacksmith-shop, north of the door, and about two feet from the wall. He says that in the spring of

1858 he formed a partnership with one Silas J. Fargo for carrying on the business of turning, sawing, and planing; that it continued for one year to the spring of 1859; that they occupied a shop belonging to C. & T. Buxton, and were to do their turning and sawing in their wagon business in consideration of their furnishing the shop; that when they took possession there was only one well on the Buxton premises; that during the year 1858 a pump was put down; that at the request of T. H. Buxton he turned a hickory plug for the end of an iron pipe, and helped drill holes in the side of the pipe and fitted the plug to the end. The pipe was about an inch and a half in diameter and from ten to fourteen feet in length. The witness recollects seeing workmen sinking the tube in the ground and attaching a pump to the upper end, which was about two and a half feet above the ground; that water was obtained by pumping and used in the work of the blacksmith-shop for probably two or three years afterward; that he used the water from the pump for his own work on the premises, and that he was in a line of persons to furnish water from it to extinguish the first fire of Hurd & Gates's planing-mills, which occurred in the year 1859.

Eli Dibble testifies that he was a carriage-maker in the employ of the Messrs. Buxton for upward of twenty years, and left them in the month of September, 1861. He remembers the well north of the door on the west side of the blacksmith-shop, and that water was pumped from it until it was drained at the fire of Hurd's planing-mills in 1859. He states that the well was an iron pipe stuck up out of the ground and a common cast-iron pump on top of it.

F. L. Hain says he was a master builder, and did much carpenter work for the Buxtons; that in the year 1859 he shingled the roof of a small house, which stood on their premises about three rods to the east of the blacksmith-shop. While engaged in this work he was in the habit of passing around the west end of the shop half a dozen times a day to go to the planing-mill for lumber. He recollects the iron pipe sticking out of the ground with a pump on the top, just north of the door, on the west side of the shop, and pumped water out of it a good many times.

There is more corroborating testimony of the same sort, and it all points to and describes the well which is covered and claimed by the Green patent, and if true as to the date of construction his invention is clearly anticipated.

The patent being *prima facie* good, the burden of proof on a question of anticipation is upon the defendant. Does the rebutting evidence of the complainant suggest a reasonable doubt of its truth? He has summoned a number of witnesses, but it is sufficient for the purposes of this case to refer to the salient points of the testimony of a few of the more important. In the first place, these witnesses were all old residents of Warsaw, and they agree in the statement that the first driven well they ever heard of in that town was put down in the street in front of the barn of the brick hotel property in the summer or fall of 1865, and that it attracted much attention at the time, and was discussed by the citizens generally as a new invention.

In view of the number of witnesses who now testify to their knowledge that Buxton invented and sunk another driven well of the same construction as early as the year 1858 or 1859, it seems rather singular that no one then remembered or adverted to the fact of its previous existence and use in the town.

In the next place, Elihu R. Benson, Charles P. Williams, and Calvin W. Bisby were in the employ of the Buxtons in their manufacturing establishment for a number of years, including the years 1858 and 1859. They were on the premises daily and give intelligent accounts of the sources whence they procured water for carrying on the work of the manufactory. They severally testify that no driven well existed there to their knowledge, and they do not understand how it could have been there without coming under their observation.

Chester P. Hurd and Ira N. Hurd were in the lumber trade in connection with the firm of Hurd & Gates, whose place of business was immediately in the rear of C. & T. Buxton. Their mode of access was along a fifteen-feet lane or alley over the Buxton premises. They were thus obliged to pass and repass to and from their work and meals every day. Their occupation also made it necessary for them to visit the shops of Buxton daily. They distinctly remember the dug well—an ordinary stoned well, near one corner of the blacksmith-shop—but they never heard of a driven well in Warsaw before the year 1865. If there had been one on Buxton's property they think that they should have known and remembered it.

The testimony of John West renders it still more incredible that a driven well existed in Warsaw in the year 1859. He states that he has lived in Warsaw for twenty-eight years past; that he never heard of a driven well there until the summer of 1865, when two or three men came from Bath or Penn Yan and put down one on the brick hotel property; that it excited great attention as a novelty, a hundred men or more being present; that he obtained the right to drive these wells in Warsaw shortly afterward, and put down in the town from seventy-five to one hundred; that Mr. Buxton employed him to sink three in different places on his property, one of which was in his blacksmith-shop; that he paid him the usual royalty for the patent right; and that all this occurred in the early part of the year 1867. The circumstances attending the sinking of the well in the blacksmith-shop are so inconsistent with any theory that Buxton had previously invented and used a few feet distant for several years a driven well that I quote his statement of what took place. The witness says:

> He [Buxton] took me into the shop and showed me where he wanted the well; asked me if I thought I could make a drive-well there. I told him I thought I could. He said he had a good well, a dug well, just outside of the shop, plenty of water, but it got dirty, and thought if he had a drive-well inside it would be better for his boys.

Such evidence greatly impairs the force and value of the testimony offered to prove the prior invention and use of the driven well. Green's invention was in the year 1861. Buxton says that a few years elapsed—how many he could not say—between the time of his sinking the first driven well and the date when West put down the second, and he is unable to indicate the year when the latter took place. Nor does he attempt to explain why he paid another a royalty for the privilege of using his own invention. A memory so defective as to allow its possessor to forget in a few years that he has made one of the most remarkable inventions of the century cannot be depended on for accuracy in the statement of transactions which took place twenty years ago.

The complainant is entitled to a decree.

It will be observed that I have made no reference to the evidence and argument on the question of the validity of the reissue. I have purposely refrained from expressing any opinion (1) because it has been fully considered and adjudicated in the other cases and (2) because in the unsettled condition of the law arising from some recent decisions of the Supreme Court I prefer to leave that tribunal to determine it in the case now pending on appeal from the Circuit Court of Indiana.

DESIGNS.

12,920.—CIGAR CUTTER.—*Napoleon Du Brul*, Cincinnati, Ohio. Application filed June —, 1881. Term of patent 14 years.

12,921.—CIGAR-CUTTER.—*Napoleon Du Brul*, Cincinnati, Ohio. Application filed May 26, 1881. Term of patent 14 years.

12,922.—ADVERTISING OR ORNAMENTAL BLANK OR EASEL.—*Ethan L. Meodie*, New York, N. Y., assignor of one-half to *Charles H. Gillespie*, same place. Application filed February 27, 1882. Term of patent 3½ years.

12,923.—GRAVE-COVER.—*Robert H. Sipes*, Union City, Ind. Application filed February 7, 1882. Term of patent 14 years.

12,924.—CARPET.—*Horatio Smith*, Kidderminster, England, assignor to *William Mansell Daintrey*, New York. Application filed March 14, 1882. Term of patent 3½ years. Registered in England August 29, 1881.

12,925.—COOKING-RANGE.—*William A. Spicer*, Providence, R. I. Application filed March 20, 1882. Term of patent 7 years.

12,926.—WATCH-MOVEMENT.—*Henry Onesime Steagfer*, Ponts Martel, Switzerland. Application filed March 27, 1882. Term of patent 7 years.

12,927.—EMBLEM FOR THE ANCIENT ORDER OF HIBERNIANS.—*Christopher P. Sweetman* and *Charles M. Picard*, Dayton, Ohio. Application filed January 3, 1882. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,339.—NATURAL MINERAL WATER.—*The Bethesda Mineral Spring Company*, Waukesha, Wis. Application filed April 6, 1882.
"The word 'BETHESDA.'"

9,340.—CHAMPAGNE-WINES.—*Chandon & Co.*, Epernay, France. Application filed March 20, 1882.
"The word 'GREEN' and the two stars."

9,341.—CHAMPAGNE-WINES.—*Chandon & Co.*, Epernay, France. Application filed April 10, 1882.
"The word 'GOLD' and the two stars."

9,342.—CHAMPAGNE-WINES.—*Chandon & Co.*, Epernay, France. Application filed March 20, 1882.
"The word 'WHITE' and the two stars."

9,343.—ARTIFICIAL WATERS.—*Henry Sugden Evans*, Montreal, Quebec, Canada, and Rouse's Point, N. Y. Application filed September 17, 1881.
"The word 'PHOSPOZONE.'"

9,344.—CERTAIN PROPRIETARY MEDICINES.—*Peter Fahrney*, Chicago, Ill. Application filed March 17, 1882.
"The arbitrarily-selected letters 'P' and 'B.'"

9,345.—KNIT AND WOVEN GLOVES AND UNDERWEAR.—*Bruno Falke*, Chemnitz, Saxony, Germany. Application filed April 10, 1882.
"The representation of a falcon."

9,346.—LAGER-BEER.—*Joseph Gahm*, Boston, Mass. Application filed April 14, 1882.
"The symbol of the mug with the handle and the letters 'J. G.' on the body of the said mug."

9,347.—LINIMENT.—*B. J. Kendall & Co.*, Enosburg Falls, Vt. Application filed March 13, 1882.
"The figure or vignette of a horse's head."

9,348.—CANNED MEATS AND FISH.—*J. G. Meyer & Co.*, Brookfield, Wash. Ter. Application filed April 8, 1882.
"The representation of the stag's head with antlers."

9,349.—CANNED MEATS AND FISH.—*J. G. Meyer & Co.*, Brookfield, Wash. Ter. Application filed April 8, 1882.
"The representation of the dragon, horse, and rider."

9,350.—LEATHER-DRESSING.—*Restorff & Bettmann*, New York, N. Y. Application filed February 20, 1882.
"The arbitrarily-selected word-symbol 'SARATOGA.'"

9,351.—CANNED FRUITS, VEGETABLES, JELLIES, JAMS, PRESERVES, AND MEATS.—*San Jose Fruit Packing Company*, San José, Cal. Application filed April 13, 1882.
"The group consisting of the eagle, the can or package, and the two grizzly bears."

9,352.—SHAMPOO.—*Madame Lazelle Vaunt*, Philadelphia, Pa. Application filed April 1, 1882.
"Three nude female forms with long flowing hair bathing."

9,353.—CORDIAL DESIGNATED "SCHNAPPS."—*Joel B. Wolfe*, New York, N. Y. Application filed May 25, 1881.
"The fac-similes of the signatures of Udolpho Wolfe and Joel B. Wolfe."

LABELS.

2,676.—Title: "ARNICA SHAVING SOAP."—*C. H. Strong*, Chicago, Ill. Application filed April 15, 1882.

2,677.—Title: "DR. BIGELOW'S POSITIVE CURE."—*Charles H. Thorning*, Chicago, Ill. Application filed January 28, 1882.

2,678.—Title: "DR. HOFFMAN'S RED DROPS."—*Frank Traudt*, St. Louis, Mo. Application filed April 5, 1882.

2,679.—Title: "WHITING'S DECORATIVE INDELIBLE OUTLINE INK." *Frederic A. Whiting*, Wellesley Hills, Mass. Application filed April 17, 1882.

DISCLAIMERS.

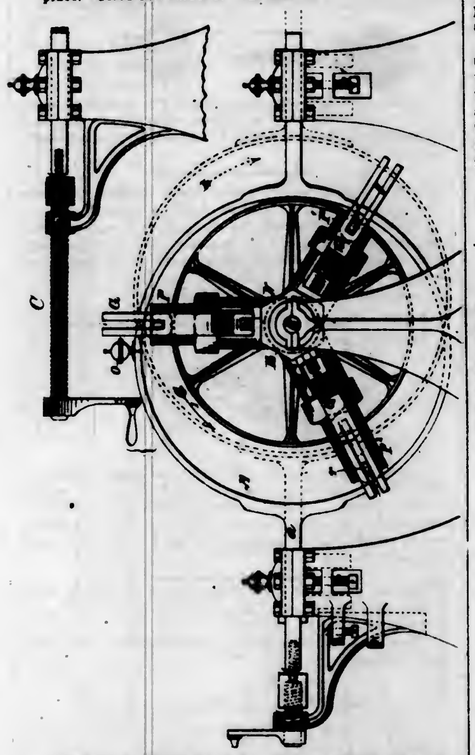
9,842, (Reissue.)—*Tennis V. Le Roy*, assignor to *The Le Roy Journal Bearing Company*, New York, N. Y., dated August 16, 1881. IMPROVEMENT IN CAR-AXLE BOXES. Disclaimer filed April 28, 1882, by *The Le Roy Journal Bearing Company*.

Enters its disclaimer "to that part of the said specification which begins on line 70 of the printed copy, and which appears in the following words, to wit: 'Which readily yields to pressure, and is sufficiently flexible to permit the journal of the axle to adjust itself therein.'"

No. 9,028, (Reissue.)—*John Matthews*, New York, N. Y., patent dated January 6, 1880. IMPROVEMENT IN SODA-WATER APPARATUS. Disclaimer filed May 2, 1882.

Enters his disclaimer "to the fifth claim of said letters patent, which is in the following words, to wit:

"'5. In a dispensing apparatus, the ice-chamber *c*, made to extend downward behind the tumbler-recess, substantially as herein shown and described.'"



And "to the seventh claim, which is in the following words, to wit:

"'7. An apparatus having its front portion to contain an overhanging recess or chamber, *g*, containing the sirup valves and faucets, which are operated through the cover of the chamber and discharged into a recess, *h*, within which the drinking-tumblers are placed to receive the sirups or beverage.'"

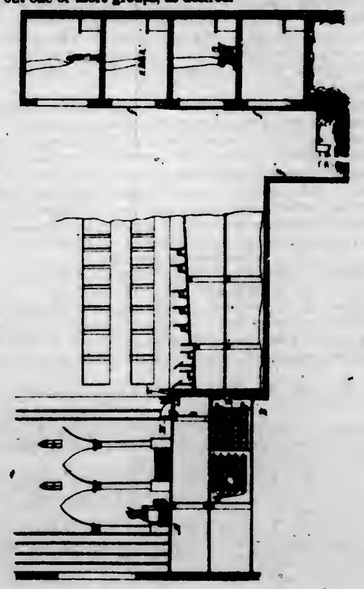
PATENTS

GRANTED MAY 9, 1882.

257,452. STEAM, AIR, OR WATER ENGINE. JAS. A. ADAMS, Austin, Tex., assignor of one-half to Peter E. Roberts, same place. Filed Oct. 14, 1881. (No model.)

Claim.—1. The horizontally and vertically adjustable ring A, the shaft S, the cylinder E, pistons P P' P², and means to convey steam to and exhaust it from the cylinders of the pistons, all combined substantially as and for the purposes described.

2. The combination, with the shaft S and the cylinder E, rigidly mounted on the shaft, of the steam-chest F, loosely mounted on said shaft, and an adjustable gland or nut, whereby the steam-chest in any required position around the shaft may be tightened up to the port-face of the cylinder to compensate for the wear, substantially as described.



3. The combination, with the adjustable ring A, the shaft S, and the cylinder E, of the steam-chest F, adjustable around the shaft, whereby the admission and exhaust of steam may be adjusted to correspond with the adjustment of the ring, substantially as and for the purposes described.

4. The combination, with the adjustable ring A, the shaft S, and the cylinder E, having pistons P P' P² and steam-ports *d d' d²*, of the adjustable steam-chest F, having live and exhaust steam passages *f f'* and ports F' F², combined and operating substantially as and for the purposes described.

5. In a steam-engine of the class described, the method of subjecting the entire surface of the plane of resistance to equal wear by adjusting the same both horizontally and vertically relatively to the axis of rotation of the forces acting upon said plane, and correspondingly adjusting the admission and the exhaust of the power impelling said forces, whereby the position of the working-surface of the plane of resistance is shifted relatively to the forces acting thereon, substantially as described.

257,453. TELEPHONIC TRANSMISSION OF SOUND FROM THEATERS. CLEMENT ADER, Paris, France. Filed Jan. 13, 1882. (No model.) Patented in France Aug. 9, 1881, in Germany Aug. 20, 1881, in Belgium Aug. 20, 1881, in England Sept. 1, 1881, and in Italy Sept. 13, 1881.

Brief.—Transmitters are placed on or below the stage of a theater, near the foot-lights, a transmitter at the right-hand side and one at the left-hand side being connected with receivers for the right and left ears of each subscriber by lines leading to the subscribers' houses. The transmitters are protected from the jar of the stage by being hung from elastic supports, or are mounted on a base of lead. The transmitter-batteries are arranged in groups, with the necessary switches and circuits for throwing in and cutting out one or more groups, as desired.

Claim.—1. The described auro-stereoscopic arrangement of telephones for theaters and the like, consisting of two telephonic transmitters at the theater, one arranged on one side of the stage and the other on the other side, with two receiving-telephones at the subscriber's house, one designed to be placed by the auditor at each ear, with a telephonic circuit connecting the transmitter at the right of the stage with the receiver for the auditor's right ear and another circuit connecting the transmitter at the left of the stage with the receiver for the auditor's left ear, combined substantially as and for the purposes set forth.

2. The combination of the stage A of a theater with a series of transmitting-telephones, T T, arranged adjacent to the foot-lights in substantially the manner set forth and shown, with circuits extending from said transmitters to the residences of the respective subscribers and there terminating each in a receiving-telephone, substantially as set forth.

3. The combination, with the stage A of a theater, of a transmitting-telephone, T, and an interposed elastic cushion or suspender, substantially as set forth.

4. The combination of the stage A of a theater, having a sound-opening in the floor thereof, and one or more transmitting-telephones, T T, arranged beneath the floor in connection with said opening, substantially as set forth.

5. The combination of the stage A of a theater, having a sound-opening, S, through the floor thereof, a box, K, hung from the floor under said sound-opening by elastic suspenders, and a series of transmitting-telephones, T T, disposed in said box, substantially as set forth.

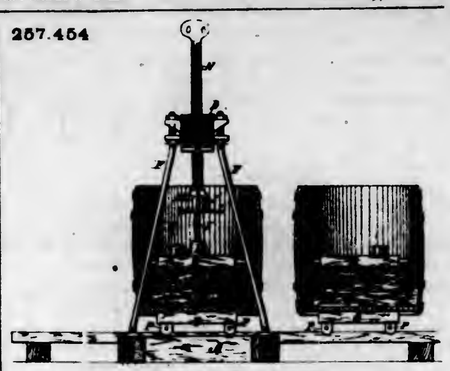
6. The combination of a series of transmitting-telephones, an equal series of inductoriums, a series of local circuits, each including one transmitter and one inductorium, and each divided into two or more branches, two or more series of batteries, one battery included in each such branch, a circuit-breaking commutator in each such branch, all the commutators of each separate series of batteries being arranged in a separate row or group, and means, substantially as described, for simultaneously operating all the commutators of either series, as and for the purposes set forth.

7. A series or gang of circuit-breaking commutators, consisting of a number of pairs of springs or strips arranged in a row, the opposite strips of each pair tending to fly together and close the circuits, with an insulating-bar arranged between the rows of strips and adapted to be moved between the contacting portions of the strips of all the pairs simultaneously, thereby separating them and breaking the circuits, combined and operating substantially as set forth.

8. A series of local transmitter-battery circuits, each including the primary of a separate inductorium, a series of line-circuits, each including a receiving-telephone and the secondary of one of the inductoriums, means, substantially as described, for changing the batteries in the local circuits, and a series of short-circuiting or circuit-breaking interruptors, each interposed in one of the line-circuits, with means for simultaneously operating all of said interruptors, all combined and adapted to operate substantially as set forth.

9. The combination of a transmitter arranged in a theater or the like, local battery-circuit connecting the same with an induction-coil, a line-circuit leading from said coil to the subscriber's residence, and there terminating in a receiving-telephone, a silencing-box, M, through which at least one wire of said circuit passes, a spring, *d*, and bracket *e*, interposed in said circuit and inclosed in said box, and a projection, *i*, on the lid L, adapted, when the lid is closed, to depress said spring, and thereby cut off the current from the receiving-telephone, substantially as set forth.

257,454. TOBACCO-PRESS. ROBERT L. ALEXANDER, New Liberty, Ky. Filed Mar. 22, 1882. (No model.)



Claim.—1. In presses, a supplementary follow-board adapted, substantially as herein shown, to expand and bind against the opposing sides of a tub, hogshead, barrel, or similar receptacle, for holding the compressed contents of said receptacle, as herein set forth.

2. In presses, the adjustable follow-board, composed of the frame R S S', having the grooves E', arbor T, rack and pawl T', and pinion, or their equivalent, in combination with the U-shaped pieces U, having hinged thereto the rack-bars V, all operating substantially as and for the purpose set forth.

3. In presses, a supplementary expanding and adjustable follow-board, as shown, in combination with a press, substantially as herein set forth.

4. In presses, the combination of the screw N, having at the lower end a cross-head, M, provided at each end with the gains J', and the independently-adjustable follow-block I, having the guide-arms J, provided with holes K and pins L, substantially as and for the purpose herein shown.

257,454

257,455. CASKET TRIMMING OR ORNAMENT. DEXTER AVERY, Westfield, Mass., assignor to the Textile Manufacturing Company, same place. Filed Aug. 17, 1881. (No model.)

Claim.—An improved casket trimming or ornament, consisting of a rigid mold having its surface corrugated or roughened and platted or covered with thread or textile fabric, substantially as set forth.

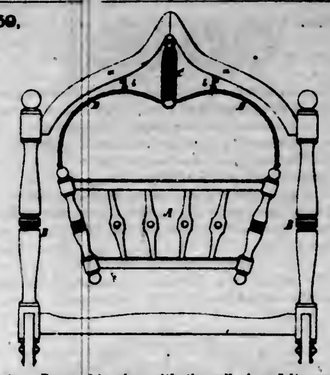
257,456. LIQUID WATER-PROOF STOVE-POLISH. WILLIAM AYLING, Chicago, Ill. Filed Dec. 5, 1881. (Specimens.)

Claim.—The herein-described composition of matter for polishing stoves, consisting of crude gum-turpentine, aqua-ammonia, water, alcohol, and plumbago, substantially in the proportions specified.

257,457. PICTURE-HOOK. FRANKLIN P. BAKER, Boston, Mass. Filed Sept. 8, 1881. (No model.)

Claim.—An improved picture-hook, composed of two parts pivotally united, the upper portion provided with a hook adapted to grasp the upper edge of the molding and the lower portion provided with a hook to receive the cord, and an upwardly-projecting nose to pass behind the lower edge of the molding, all substantially as set forth.

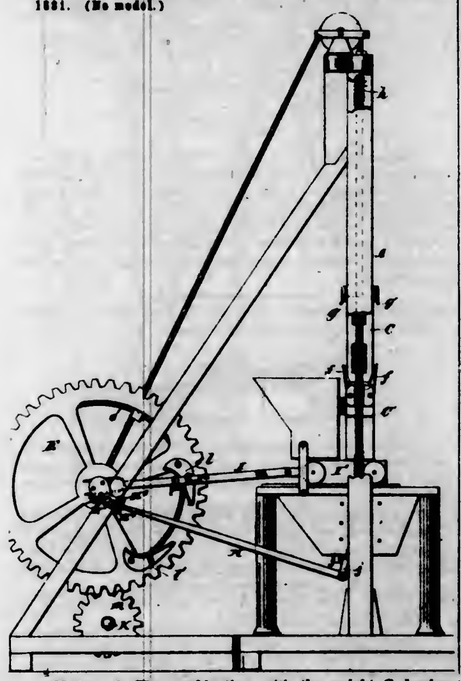
257,458. WHISTLING RETURN-BALL. CHARLES E. BALDWIN, Albany, assignor to Albert J. Bayless, New York, N. Y. Filed Feb. 15, 1882. (No model.)



Brief.—Improvement on the device described in Letters Patent No. 149,908.

Claim.—1. An improved musical toy constructed substantially as herein shown and described, consisting of a perforated hollow ball, A, elastic diaphragm D, whistle C, cord F, and elastic G, all arranged and operated as set forth.

2. In a hollow perforated return-ball, the combination, with the fixed elastic diaphragm D, of the cord F and loop forming elastic G, substantially as herein shown and described, and for the purpose set forth.

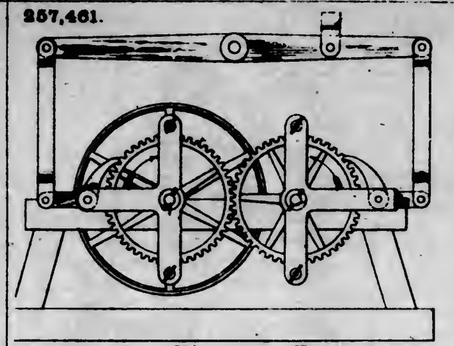


257,459. CRADLE. FRANK W. BARKER, Belmont, N. H. Filed Mar. 20, 1882. (No model.)

257,459.

Claim.—In combination with the crib A and its supporting-stand B, the spring C and the hooks *c c* and the two levers D D, provided with eyes *b b*, all being applied and arranged substantially in manner and to operate as set forth.

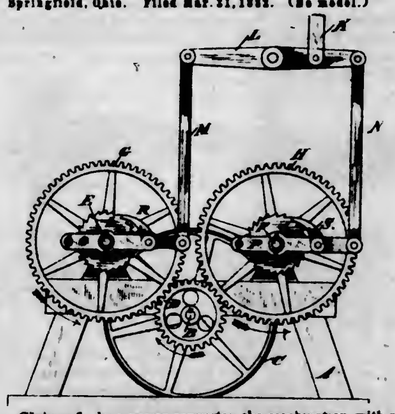
257,460. BRICK-MACHINE. HENRY C. BARNES, Sedalia, assignor to Edward Hurley, Pettis County, Mo. Filed Oct. 8, 1881. (No model.)



Claim.—1. The combination, with the weight C, having notches, and the intercepting latches or bars F, fixed to the uprights A, of the die C', having the spring-catches *f*, substantially as and for the purpose set forth.

2. In a brick-machine, the combination, with the wheel-shaft E and the crank-shaft *f*, carrying the cams *h*, acting upon the mold-chamber plungers *i* and the cranks *j*, of the pitmen H, having a slot at its point of connection with said shaft, substantially as and for the purpose set forth.

3. In a brick-machine, the combination, with the plunger I and pitman I, sliding upon the shaft of the wheel E, of the wheel K, having the oppositely-facing cams *l l'*, substantially as and for the purpose set forth.



257,461. POWER-CONVERTER. FRANCIS M. ROCKWALTER, Springfield, Ohio. Filed Mar. 21, 1882. (No model.)

257,461.

Claim.—In a power-converter, the combination, with a vibrating beam actuated by a reciprocating prime mover and a driving-wheel, of two meshing gear-wheels, the one of which is secured upon the shaft of the driving-wheel and the other upon an independent journal, and dogs with connecting mechanism actuated alternately by the vibrating beam and engaging with said meshing gear-wheels, whereby the driving-wheel is caused to revolve continuously in one direction, substantially as described.

257,462. POWER-CONVERTER. FRANCIS M. ROCKWALTER, Springfield, Ohio. Filed Mar. 21, 1882. (No model.)

Claim.—1. In a power-converter, the combination, with a vibrating beam actuated by a reciprocating prime mover and a driving-wheel whose shaft is provided with a pinion or gear-wheel, of intermediate gear-wheels meshing with the aforesaid pinion on the driving-shaft, and connecting mechanism uniting the aforesaid gear-wheels with the opposite ends, respectively, of the vibrating beam, whereby said gear-wheels become alternately acting and idle-wheels, and so cause the continuous revolution of the driving-wheel, substantially as described.

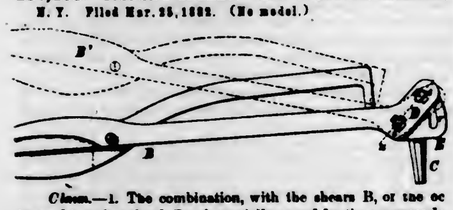
2. In a power-converter, the combination of the driving-pinion D, gear-wheels G and H, ratchets I and J, dogs R and S, links M and N, vibrating beam L, and reciprocating rod K, the parts being constructed and united substantially as and for the purpose specified.

257,463. LADDER. WILLIAM A. BOYE, Strathroy, Ontario, Canada, assignor of one-half to Hiram Edgar Ketchum, same place. Filed Feb. 16, 1881. (No model.) Patented in Canada Mar. 26, 1881.

Brief.—An extensible step-ladder consisting of two lower sections, each provided with a windlass and a cross-bar supporting a pulley on its rear side, and an upper section sliding within the lower section and operated by a rope on the windlass.

Claim.—An extensible step-ladder consisting of the two lower sections, each provided with a windlass and a cross-bar supporting a pulley-wheel on its rear side, and an upper section sliding within the said lower section and adapted to be operated by the windlass thereon through a rope attached to its lower end, substantially as set forth.

257,463.



257,464. DEVICE FOR MAKING BUTTON-MAKING MOLDS. ALONZO R. BOYNTON and WILLIAM C. LOCKE, Auburn, N. Y., assignors to Driggs, Mosher & Co., same place. Filed Aug. 18, 1880. (No model.)

Claim.—1. As a means to facilitate and improve the making of molds for buttons, a transfer-plate provided with dowel-pins *a* and a series of holes, *a*, of a size equal to or larger than the buttons to be molded, in combination with a hollow guide-plug, D, made to fit within the holes *a*, and a drill, E, in said guide-plug, substantially as and for the purpose described.

2. The combination of the yielding spindle F, having its outer end flat and turned at *f* to the desired size, and the cutter-head G, having grooves in its under face, with the interchangeable cutters *i'* and *j'*, substantially as and for the purposes set forth.

257,465. TINNER'S SHEARS. JOHN F. BRAYER, Rochester, N. Y. Filed Mar. 25, 1882. (No model.)

Claim.—1. The combination, with the shears B, of the octagonal tapering shank C, substantially as and for the purposes described.

2. The combination, with the shears B, of the slotted plate E, bolts *e e'*, and shank C, for attaching the slotted plate to the bench, substantially as and for the purposes described.

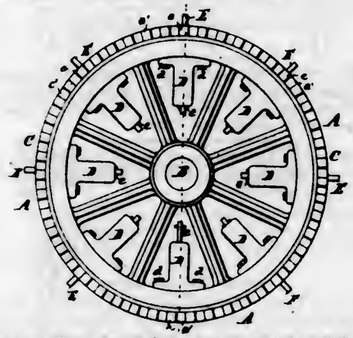
3. The combination, with the shears B, of the slotted plate E, provided with the octagonal shank C, and means for adjusting the inclination of the shears, substantially as and for the purposes set forth.

4. The combination, with the shears B, of the beveled plate E and bolts *e e'*, substantially as and for the purposes set forth.

257,466. ORNAMENTAL CHAIN. WARREN W. BRIGGS, Providence, R. I., assignor to S. & E. Lederer, same place. Filed Mar. 13, 1882. (No model.)

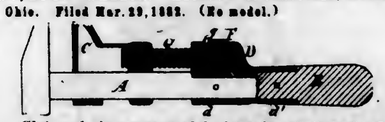
Brief.—The rings inclose and retain the blanks.

257,466.



Claim.—1. An ornamental chain provided with blanks secured at intervals by passing the connecting link or links around the blank, as described, as a new article of manufacture.

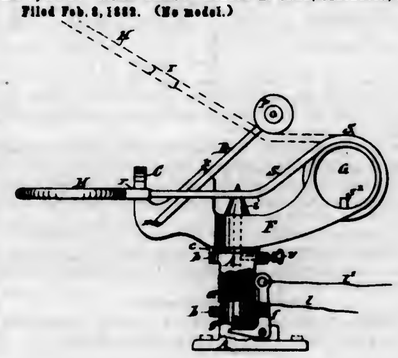
2. In an ornamental chain, the combination, with the links *a a* and *b b*, of the blanks *c c*, constructed so that the link passing around the blank will firmly hold the same, as described.



3. In an ornamental chain, the combination, with the links, of blanks or ornamental designs provided with the recesses *d d*, constructed to be secured by entering the links into the recesses, as described.

257,467. TRACTION-WHEEL. CHARLES D. BUSCOMB, St. Jacob's, Ill. Filed Feb. 17, 1882. (No model.)

Claim.—The improved traction-wheel consisting of the combination of the wheel A, the periphery or tread of which has cogs *c* and the open spaces *c'*, the series of housings D, each having flanges *d d*, internal hollow, *d'*, the shoulder at *d²*, and each of said housings containing a sliding lug or tooth, E, forming part of a stem, E', having shoulder at *f*, and the spring F, all said parts arranged and operating substantially in the manner and for the purposes set forth.



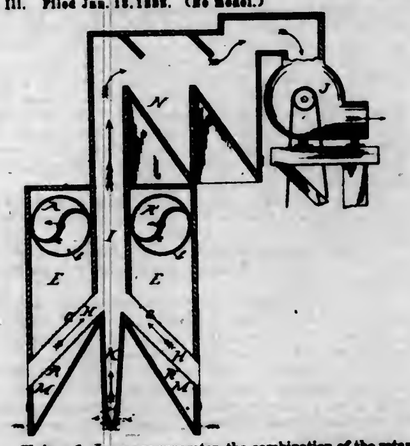
257,468. WRENCH. MATTHEW E. CAMPFIELD, Cleveland, Ohio. Filed Mar. 29, 1882. (No model.)

Claim.—1. In a wrench of the kind described, the head *g*, secured to the end of the screw G, in combination with the projection F, having the two slots *f* and *f'*, as and for the purpose specified.

2. The improved ferrule D, having the sockets *d* and *d'*, and the projection F, and having the slots *f* and *f'* for the head *g* of the adjusting-screw G to revolve in, in combination with the shank A, handle E, and screw G of a wrench, substantially as described.

257,469. BALL-TRAP. MILTON E. CARR, Canandaigua, N. Y. Filed Feb. 6, 1882. (No model.)

Claim.—1. The combination of the frame F, provided with the stationary laterally-disposed hook C, and the spring-arm S, having the ball-holder H, provided on the side of its socket *r* with a horizontal shoulder beveled on its under side, the tripping-rod h, extended vertically through the center of the spindle *a*, and provided with the cone *i*, and the lever *f*, extended under the base of the spindle, substantially as shown and set forth.



2. The spindle *a*, having the inclined face *g* at its lower end, in combination with the tripping-rod *h*, extended vertically through said spindle, and the tripping-lever *f*, extended under the base of the spindle, substantially as and for the purpose set forth.

3. The combination of the frame F, provided with the arresting-arm D, and with the open cylinder G, the latter having a notch, *o*, in its free edge, and the spring-arm S, wound around said cylinder and terminating with a hook, *s'*, turned toward the axis of the cylinder and engaging the notch *o*, said spring-arm being maintained in its connection on the cylinder by the arresting-arm depriving the spring-arm of sufficient play to effect its disengagement from the notch *o*, as specified and shown.

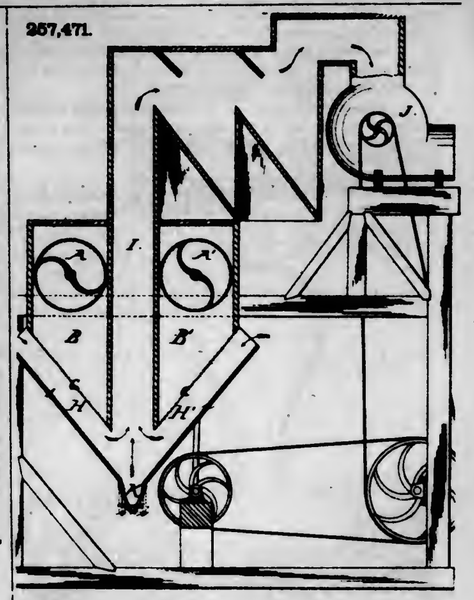
4. The frame F, provided with the groove *b* and holes *m*, and the arresting-arm D, lying in said groove, and having its lower extremity bent at a right angle and passing through one of the holes *m*, and provided with the clamping-nut *n*, substantially as described and shown.

5. In combination with the spring-arm S, the ball-holder consisting of the ring H, having integral with it the socket *r*, and provided on the side of said socket with a horizontal shoulder beveled on its under side, substantially as described and shown, for the purpose specified.

257,470. ORE-SEPARATOR. DELOS CAR-SHADER, Chicago, Ill. Filed Jan. 16, 1882. (No model.)

Claim.—1. In an ore-separator, the combination of the rotary sifter A, shaft *a*, cam-wheels *g*, rollers A, and rocker-arms D, substantially as and for the purpose set forth.

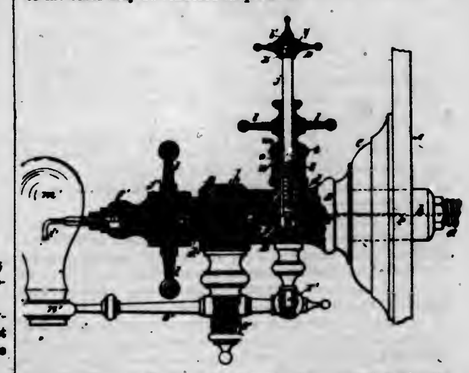
2. In an ore-separator, the chambers E, screens G, the receiving-hoppers M, screens R, oppositely-inclined air-ducts H, air-duct I, and the exhaust-fan J, all substantially as and for the purpose set forth.



3. In an ore-separator, the chambers E, screens G and R, receiving-hoppers M, and intermediate inclined air-passages, H, in combination with the vertical air-duct K, having an adjustable air-inlet, *i*, an air-duct, I, and exhaust-fan J, all constructed and arranged substantially as and for the purpose set forth.

4. In an ore-separator, the combination of the chambers E, sifters A A', and screens G and R, intermediate air-duct, I, exhaust-fan J, the receiving-hoppers M, having valves *m*, the two opposite inclined air-ducts H, and the vertical intermediate air-duct, K, the whole being constructed and arranged substantially as and for the purpose set forth.

257,471. ORE-SEPARATOR. DELOS CAR-SHADER, Chicago, Ill. Filed Jan. 16, 1882. (No model.)



Claim.—In an ore-separator, the chambers B B', sifters A A', wire screens G, intermediate air-duct, I, and exhaust-fan J, in combination with the downwardly-inclined air-channels H H', and the opening K, having wing-valves *i*, the whole being constructed and arranged substantially as and for the purpose described and shown.

257,471.

257,472. DRAFT-TUBE FOR SODA-WATER AND OTHER BEVERAGES. WILLIAM P. CLARK, Medford, Mass. Filed Nov. 4, 1881. (No model.)

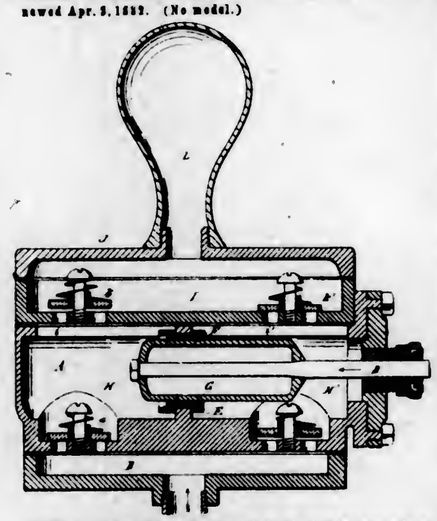
Brief.—Conduit *c* is controlled by valve *i*, and the outlet-passages *f g*, which are connected with the valve-chamber, may by the mechanism described both be rendered inoperative, or either one or the other may be rendered inoperative.

Claim.—1. The combination of valve-stem *f*, its head *i*, threaded thereon and arranged to interlock in wall *d*, the rigid collar *m* on said stem, the loose metallic collar *n*, and elastic packing *o*, arranged between said collars, substantially as specified.

2. The combination of valve-stem *f*, its interthreaded head *i*, collars *m n*, packing *o*, and cap *s*, with its packing *t*, arranged to seat upon both said collar *m* and the rim of the inclosing-wall *d*, substantially as specified.

3. The combination of valve *i*, the inlet-conduit *c*, arranged to be closed and opened by said valve, and the outlet-passages *f g*, connecting with the valve-chamber and provided with mechanism whereby either of said passages may be rendered operative and the other inoperative, or both be rendered inoperative, substantially as specified.

4. The combination of valve *i*, conduit *c*, conduits *f g*, and rotary valve *v*, having a longitudinal passage arranged to be brought into coincidence with either of said conduits *f g*, substantially as specified.



5. The rigid packing-holder *h*, formed with a recess or seat extending outside the circumferential line of the packing-passage

therein, and the packing n, formed with a corresponding projection, f', to interlock in such seat in the holder, substantially as specified.

6. The combination of glass m', its supporting-rod o', with its ring n', and studs p' r', depending from body B and connected with and sustaining said rod, substantially as specified.

7. In combination with rotary valve r and coacting conduits f g, the valve i, arranged to close the supply-passage e and to regulate the force of the jet through passage g as desired, substantially as specified.

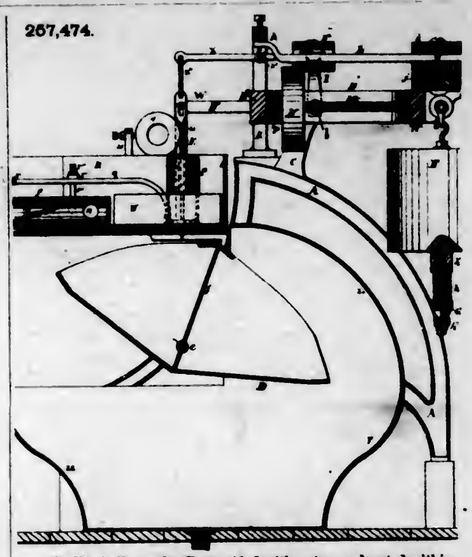
257,473. LIFTING AND FORCE PUMP. WILLIAM H. CLOUD, Detroit, Mich., assignor, by mesne assignments, of one-half to William H. Jackson, same place. Filed Apr. 21, 1881. Renewed Apr. 5, 1882. (No model.)

Claim.—1. In a pump, the barrel A, divided into two chambers, H H', by a diaphragm, E, through which the piston reciprocates, in combination with a removable top closing the upper openings of the chambers H H', whereby access can be had to the inlet-valves in each of said chambers without removing either head of the barrel, substantially as described.

2. In a pump, the barrel A, provided with a diaphragm, E, forming two chambers, H H', in combination with a removable top closing the upper openings of said chambers, a stuffing-box secured in the diaphragm E, and the piston G, substantially as and for the purpose specified.

3. In a pump, the combination of the pump-barrel, diaphragm, and piston, constructed, substantially as described, with the separable exit-valve chamber or box I and separable cap J, surmounted with the air-chamber L, whereby access can be had either to the exit-valves, the barrel, or the inlet-valves without removing either head of the barrel, substantially as specified.

4. The pump-barrel A, divided into separate chambers H H' by a diaphragm, E, in combination with the separable exit-valve chamber I, closing the upper openings of the chambers H H', the separable cap J, closing the valve-chamber I, and bolts s s, pivoted between lugs o o of the barrel A, and engaging with lugs o o of the cap for detachably securing the barrel A, chamber I, and cap J together, substantially as and for the purpose described.



257,474. AUTOMATIC LIQUID-WEIGHING MACHINE. EDWIN CRAWLEY, Newport, Ky., assignor to Simpson & Gault, Cincinnati, Ohio. Filed Jan. 11, 1881. (Model.)

Brief.—An oscillating pan suspended from a scale-beam receives the liquid to be measured. The movement of the beam operates the inlet-valves, and the pan in its descent is automatically discharged.

Claim.—1. The hollow valve P, provided with the spider o and the guiding device o', the lower edge of the valve constituting its face, and the face of the seat inclosing the exit-orifice, and being without a surrounding ridge, substantially as and for the purpose set forth.

2. The hollow valve P, provided with a stem, u, located within the valve and engaging a guideway, v', located in the orifice of the valve-seat, substantially as and for the purposes set forth.

257,474.

3. The hollow valve P, provided with a stem, u, located within the valve and engaging a guideway located in the orifice of the valve-seat, the lower edge of the valve constituting its face, the face of the seat inclosing the exit-orifice, and being without a surrounding ridge, substantially as and for the purposes set forth.

4. The hollow valve P, provided with a stem, u, located within the valve and engaging a guideway located in the orifice of the valve-seat, the lower edge of the valve being flush with the floor of the receiving-vessel and constituting its face, the face of the seat inclosing the exit-orifice, and being without a surrounding ridge, substantially as and for the purposes specified.

5. The combination of the weighted balance-beam B and the valves P, supported from the forward end of said beam, substantially as and for the purposes specified.

6. The combination of the valve P and weighted lever X, fulcrumed at X' from arch or support K, substantially as and for the purposes specified.

7. The combination of the weighted balance-beam B and the valves P and weighted lever X, fulcrumed at X', and supporting at its forward end the valves P and connecting and operating mechanism, substantially as and for the purposes specified.

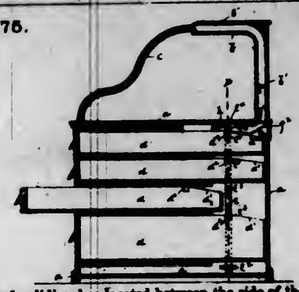
8. The combination of the weighted balance-beam B and the valves and weighted lever X, fulcrumed at X', and supporting the valves P and devices for continuing the descent of the pan after the valves have reached their seats, substantially as and for the purposes specified.

9. The combination of the weighted balance-beam B, bar W, valves P, links Z, beam X, device 3 4 5, and connecting devices, substantially as and for the purposes specified.

10. The combination of the valves P, the slotted links Z, and bar W, substantially as and for the purposes specified.

11. The combination of the valves P, the slotted links Z, bar W, stirrup 6, and device 3 4 5, substantially as and for the purposes specified.

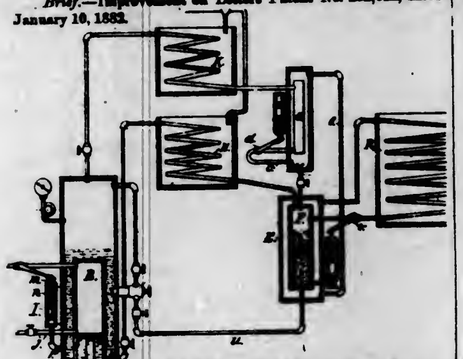
12. The combination of the balance-beam B and the lever L, pivoted to and oscillating within said beam, one end of said lever being provided with weights j and k, supported above the end of the balance-beam in such a manner as to enable the balance-beam to receive their weight successively, substantially as and for the purposes specified.



13. The combination of the weighted balance-beam B, receiving-vessel R, supply-pipe S, valve T, valve P, weighted lever X, device for continuing the descent of the pan D when the valves reach their seats, and devices for enabling the descent of the pan to allow the latter to discharge its contents, and connecting and operating mechanism, substantially as and for the purposes specified.

257,475. AUTOMATIC LOCKING MECHANISM FOR THE DRAWERS OF DESKS, &c. ANNA OUTLER, Buffalo, N. Y. Filed Nov. 4, 1881. (No model.)

Claim.—1. An automatic locking mechanism for desks, consisting of a sliding bar located between the side of the drawer and the contiguous side of the desk, and provided with inwardly-projecting pins, drawers having their sides inclined on their inner ends and having notches therein for the reception of the pins upon the sliding bar, a pivoted lever for raising the sliding bar, and the sliding cover of the desk for operating said lever, substantially as shown and described.



2. An automatic locking mechanism for the drawers of desks, consisting of the sliding bar c, provided with pins c' c' c', the lever f, spring h, the notches d', and inclines d' in the drawers d, and the sliding cover e, all combined and operating substantially as shown and described.

257,475.

257,476. ICE-MACHINE AND REFRIGERATING APPARATUS. THOMAS DAVIS and CHARLES E. DAVIS, Indianapolis, Ind. Filed Feb. 8, 1882. (No model.)

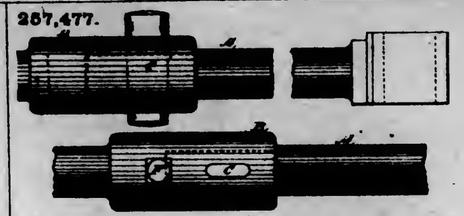
Brief.—Improvement on Letters Patent No. 252,621, dated January 10, 1882.

Claim.—1. In an ammonia refrigerating apparatus, the combination, with boiler A, heater B, and steam-supply pipe i, of an automatic valve-regulator, substantially as described, and for the purpose set forth.

2. In combination with a boiler, retort, or vessel containing ammonia and a pressure-gage, the use of petroleum or fluid of like properties in the presence of ammonia, substantially in the manner and for the purpose set forth.

3. In an ammonia refrigerating apparatus, the combination of vessels a and b, substantially in the manner described, and for the purpose set forth.

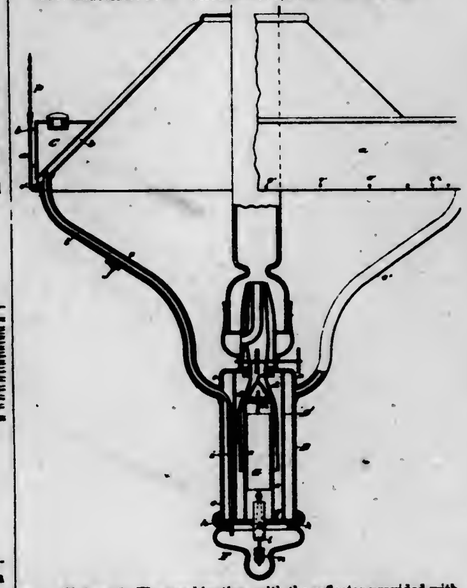
4. In an ammonia refrigerating apparatus, the combination, with a valve controlling the flow of liquid ammonia to the expanding-chamber, of a governor operated by the expanding gaseous ammonia, substantially in the manner described.



5. In an ammonia refrigerating apparatus, the absorber F and surrounding vessel E, containing ammonia-gas on its way to the refrigerator, combined substantially in the manner and for the purpose set forth.

6. In an ammonia refrigerating apparatus, the combination, with the absorber F and the refrigerator, of a valve, o, automatically regulated and controlled by the pressure in the absorber, substantially as shown and described, and for the purpose set forth.

7. The combination, in an ammonia refrigerating apparatus, of the expansion-chamber b, absorber F, and pipe c, for the purpose set forth.



257,477. VALVE ROD AND STEM FOR STEAM-ENGINES. WALTER DAWSON, Scranton, Pa. Filed Feb. 18, 1882. (No model.)

257,477.

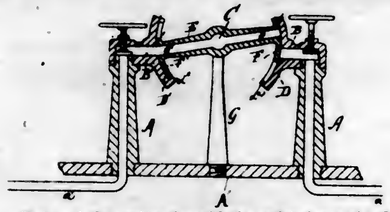
Claim.—The hole in the valve-rod B, as shown at D, Figs. 1 and 2, and at F, Fig. 3, and the hole in the valve-stem A, as shown at G, Fig. 4, of any suitable shape and form that will admit a wedge or bolt, pin or key, or an equivalent, for the purpose of disconnecting or separating the valve-stem A from the socket of the valve-rod B.

257,478. LAMP AND CHANDELIER. ABRAHAM F. DE VOURNEY, Montclair, N. J. Filed Sept. 30, 1881. (No model.)

Claim.—1. The combination, with the reflector provided with a flange, a, having perforations a', of the annular reservoir mounted on the reflector, as shown, and insulated therefrom by suitable interposed ribs or projections, as set forth.

2. The combination of the elongated valve-seat, the elongated plug-valve arranged to fit the same, the adjustable weights n, the perforated or apertured guide o for the float, and the float G, linked loosely to the valve and arranged to be guided in its vertical movement, substantially as set forth.

3. The combination of the reflector, the reservoir, the arms o o', the oil-pipe i, arranged in the arm c, the cock j, oil-well D', jacket D, and receiving-chamber F, the jacket D being screwed into said chamber F, and all arranged substantially as shown.



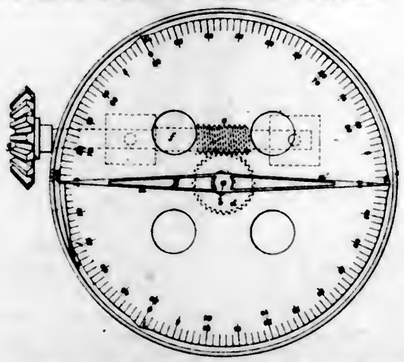
4. The combination of the oil-well, the perforated jacket, the burner, the oil-receiver secured removably to the jacket, the elongated valve and seat, the float, and the foraminous float guide and guard arranged within the well, all arranged substantially as set forth.

5. The combination of the reflector, the annular reservoir mounted on and insulated therefrom, the arms or supports o o', the oil-pipe i, the burner, the oil-well, the perforated jacket, the oil-receiver and float, the float guide and guard, and the elongated valve-seat and valve, all arranged to operate substantially as set forth.

257,479. CHEMICAL FIRE-ENGINE. JOHN A. DUGGAN, Quincy, Mass. Filed Oct. 8, 1881. (No model.)

Brief.—The device contemplates the alternate emptying of two tanks into a common eduction-pipe for the continuous dis-

charge of the fluid. For this purpose a central standard supports a discharge-pipe capable of axial rotation, having fixed upon it a tube, E, which, partaking of this motion, brings the pipe into communication with either of two pipes, *a a'*, (contained by hollow standards A A',) leading from the tanks.

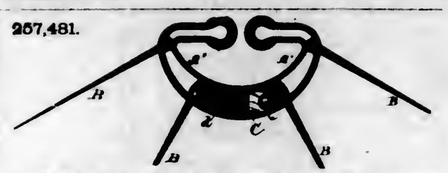


Claim.—1. In combination with the outlet-pipes *a a'* and the pipes or castings B B', the discharge-pipe C, provided with a lateral supply-tube, E, and adapted to be turned on its axis, so as to put said tube E into communication with one of said pipes or castings B or B' and out of communication with the other, substantially as set forth.

2. In combination with hollow standards A A and solid standards G, the outlet-pipes *a a'*, extending up through said standards, the pipes or castings B B', secured to the tops of said standards and communicating with pipes *a a'*, the discharge-pipe C, movable on its axis, and the supply-tube E, which may be thrown into connection with the passage in either casting by the same motion which throws it out of connection with the passage in the other casting.

3. In combination with supply-pipes, an axially-movable discharge-pipe, C, a supply-tube, E, connected thereto, lips F F', attached to the ends of said tube E, pipes or castings B B', and guideways D D', whereby the rocking of tube E in either direction cuts off the supply from one pipe or casting B or B' and admits a supply through the other, substantially as set forth.

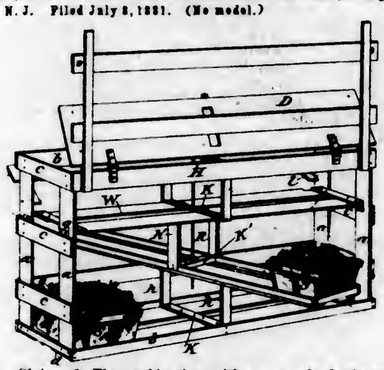
257,480. SPEED INDICATOR AND RECORDER. WILLIAM O. DUNBAR, Altoona, Pa. Filed Nov. 7, 1881. (No model.)



Claim.—1. The combination, with the time-piece provided with the hand, as described, of the rotary dial and mechanism for effecting the stopping and starting of the said hand, as explained, while such dial may be in revolution, as specified.

2. The combination of the marking device or spring S with the time-piece and with the rotary dial and mechanism for effecting the stopping and starting of the time-piece hand, as explained, while such dial may be in revolution, as specified.

257,481. CALF-WEANER. JOHN C. DUPER, Decatur, Ill. Filed Mar. 12, 1881. (No model.)



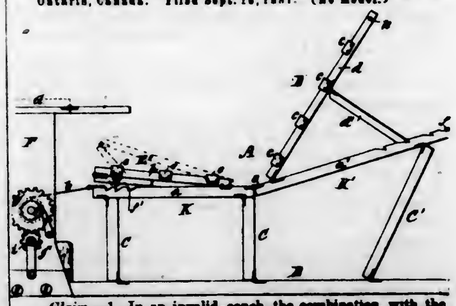
Claim.—1. A calf-weaner consisting of the parts A' and A², the part A' having a circular portion, and central hole within said circular portion, the part A² having a stem, *a²*, adapted to fit within the central hole, *a'*, of the part A', in combination with the spring-catch C, secured to the stem *a²* by a rivet, or otherwise, and adapted to pass into the central hole, *a'*, and hook onto the rear edge of said circular portion, substantially as and for the purpose specified.

257,481.

2. A calf-weaner formed, substantially as shown, with an open skeleton frame, having webs at intervals formed across the openings, the webs being provided with holes *a²*, by means of which the prongs B B are united with the body, substantially as shown.

257,482. CRATE FOR FRUIT. ELIAS W. DURAND, Irvington, N. J. Filed July 8, 1881. (No model.)

Claim.—1. The combination, with a crate, of a horizontally-revolving platform pivoted therein, the arrangement being such that on revolving the platform it projects outside of the crate, for the purpose set forth.



2. In a crate or carrier for fruit, the combination, together with a revolving platform, of the rod R, upper permanent cross-bars H and K, and lower permanent cross-bar, K, substantially in the manner and for the purpose described.

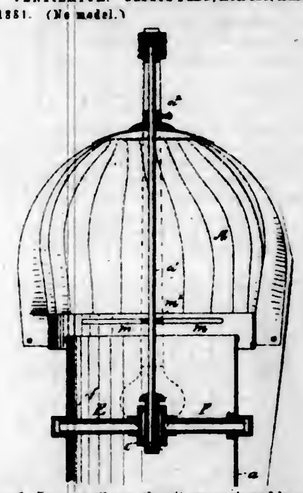
3. In a crate or carrier for fruit, the combination of the door having the cleats *f f* with the corner-posts *a a*, having the chamfered ends, for the purpose described.

4. The combination of two crates together, each having a horizontally-revolving platform pivoted therein, and means for securing them together, substantially in the manner and for the purpose described.

5. The combination of the single lid D', of double width, to cover two crates combined together, with the crates, each having a horizontally-revolving platform pivoted therein, substantially in the manner and for the purpose described.

257,483. INVALID-BEDSTEAD. ANNIN S. EVANS, Kingston, Ontario, Canada. Filed Sept. 16, 1881. (No model.)

Claim.—1. In an invalid-couch, the combination, with the base B and the side bars of the hinged sections K K', of the knees C C', hinged to the said side bars and base, substantially as and for the purpose set forth.



2. In an invalid-couch, the combination, with the base B, the winding-drum E, and the cord or strap *b*, of the hinged sections K K' and the knees C C', hinged to the side bars of the said sections and to the base, substantially as and for the purpose set forth.

3. In an invalid-couch, the combination, with the side bars, *a a'*, of the hinged sections K, provided with notches *f'*, of the hinged foot-rest E' and the braces A', hinged to the end of the side bars of the said foot-rest, substantially as and for the purpose set forth.

4. In an invalid-couch, the combination, with the base B and the hinged section K', of the knees C', hinged to the base and provided with the adjustable sliding bar H, hinged to the said section, substantially as and for the purpose set forth.

5. In an invalid-couch, the combination, with the base B and the hinged section K', of the knee C', provided with the slot *c'*, and the spring-dog N, and the notched bar H, provided with the headed studs *n*, substantially as and for the purpose set forth.

257,484. VENTILATOR. GEORGE FERD, Melrose, Mass. Filed Aug. 8, 1881. (No model.)

Claim.—1. In a ventilator, the oil-reservoir and bearing, and means for supporting it, consisting of the gas or steam cross *c*, the pipes E F, the spindle-bearing within the cross, and means for closing the ends of the pipes and for fastening them to the casing of the ventilator, all substantially as and for the purposes specified.

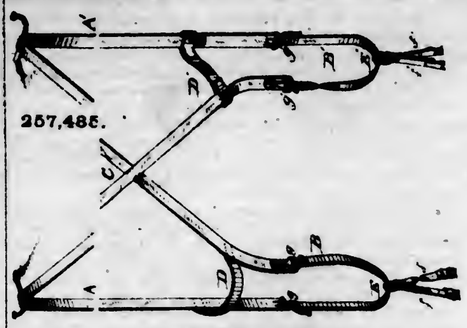
2. In a ventilator, the combination of a gas or steam cross, containing a spindle-bearing, and the spindle, all substantially as and for the purposes described.

3. As a spindle-bearing for a ventilator, the steam or gas cross, having the hole or recess *c* and the sleeve *c²*, all substantially as and for the purposes described.

4. As a means of supporting a spindle-bearing in a ventilator, the steam or gas cross *c* and the lateral pipes E F, fastened to the casing of the ventilator, all substantially as described.

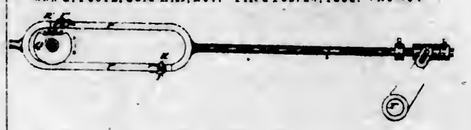
5. As an upper bearing for a ventilator-spindle, the sleeve *h'*, supported within the recess *h'* in the block H, substantially as described, and surrounded by a packing of yielding material, all substantially as and for the purposes specified.

6. In a ventilator, the combination of the spindle *a'*, the head A, and the metallic braces *m*, cast in one piece, all substantially as and for the purposes described.



7. In a ventilator, an oil-cup consisting of the joint, cross, or other suitable casing, and the sleeve *c²* within the cup, extending to the bottom thereof, and one or more small escapes or passages connecting the chamber without the sleeve with the bearing within, all substantially as and for the purposes specified.

257,485. STOCKING-SUPPORTER. CATHARINE G. FOOTE, New York, N. Y. Filed Mar. 30, 1882. (No model.)



Claim.—1. The shoulder-straps A A', combined with the straps B B', to the ends of which they are united, forming practically an endless strap, and with the rings E E', supporting the straps to be fastened to the stockings.

2. The combination of the shoulder-straps A A' and straps B B', forming practically an endless strap, adjustable in length by fastening devices *g g*, sliding rings E E', and straps *f f'*, connected therewith, substantially as described.

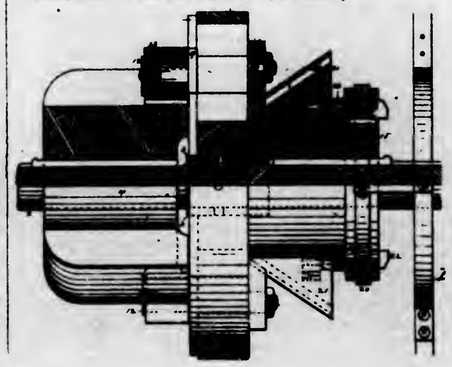
3. The shoulder-straps A A', in combination with the straps B B', forming practically an endless strap, connecting-straps D D', sliding rings E E', and straps *f f'*, substantially as and for the purpose described.

257,486. GOVERNOR FOR DIRECT-ACTING ENGINES. HYRON G. FOOTE, Gold Hill, Nev. Filed Feb. 20, 1882. (No model.)

Claim.—1. The shaft C, connected by worm or other gearing to the throttle-valve stem, combined with the gear D, which turns the shaft C by means of the ratchet E and pawl F, also combined with the loop H, having the internal racks, K and K', said loop to be given its motion by the cross-head or other reciprocating part of the engine, substantially as described, and for the purpose set forth.

2. The combination of the shaft C with the gear Q and the loop P, having the pawls R and R', said loop to be given its motion by the rock-shaft of the engine, substantially as described, and for the purpose set forth.

257,487. STETHOSCOPE. WILLIAM F. FORD, New York, N. Y. Filed Apr. 4, 1881. (No model.)

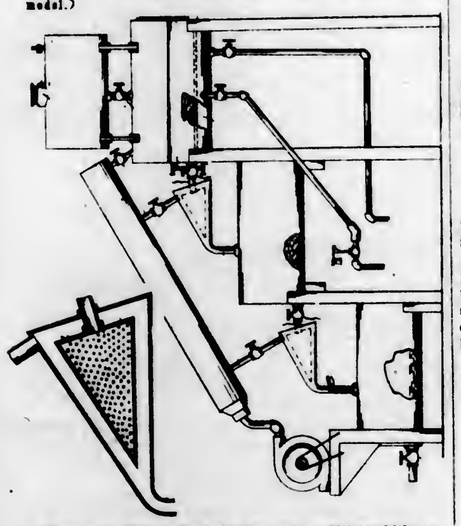


Brief.—A concealed spring automatically operates upon the arms.

Claim.—1. The combination, with a stethoscope, of a concealed noiseless spring inclosed in a casing made in two parts and connected with the tubes of the instrument, substantially as and for the purpose herein described.

2. The combination, with the tubes B B, of the arms C C, the boxes D D, having shoulders *l m*, post *e*, and stud *f*, and the coiled spring G, substantially as and for the purpose herein described.

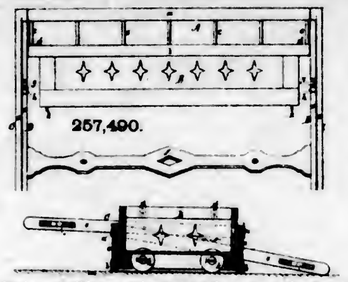
257,488. CLUTCH FOR SHAFTING. JAMES GIBBINS, Springfield, Mass. Filed Oct. 18, 1881. (No model.)



Claim.—1. The combination, in a clutch for coupling and uncoupling shafting, of a tail-block provided with radial projections and adapted to be keyed fast to one end of a line of shafting, a head-block adapted to be keyed fast to the adjacent end of separate shafting in the same line, a plate made upon or secured to said head-block at right angles to its axis and provided with radial openings, a sliding pin secured in each said opening, and mechanism to slide the said pins to and fro, each in its respective opening, to cause the pins to engage with the lugs on said tail-block in a lateral direction, or to disengage them from said lugs, substantially as described.

2. The combination, in a clutch for coupling and uncoupling shafting, of a tail-block provided with radial projections and adapted to be secured fast to one end of a line of shafting, a stationary head-block adapted to be keyed fast to the adjacent end of separate shafting in the same line, a plate made upon or secured to said head-block at right angles to its axis and provided with radial openings, a sliding pin provided with a gnide secured in each said opening, and sliding wedges having a movement in and independent of the stationary head-block and parallel with the shaft to operate the sliding pins, substantially as described.

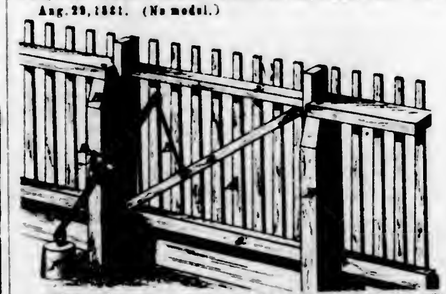
3. In a clutch for coupling and uncoupling two separate and independent shafts, the combination of the sliding wedges, the recessed spring locking-pins located therein, and an operating-collar provided with inclined studs to engage with said pins, whereby said pins are first moved outward and the wedges unlocked, and the wedges moved to operate the sliding pins of the clutch by a single movement of said collar, substantially as described.



257,489. PROCESS OF AGING AND PURIFYING WHISKY. GEORGE GORWAY, Philadelphia, Pa., assignor of one-half to William W. Thomason, same place. Filed May 5, 1881. (No model.)

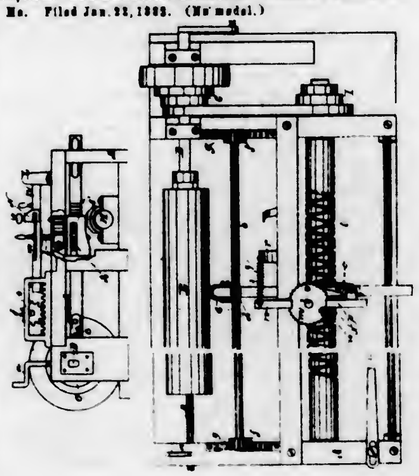
Claim.—1. The method of aging and purifying whisky or other spirituous liquors by heating the same to a temperature not exceeding 183° Fahrenheit, applying pressure thereto to produce atomization of said liquor, and commingling said atoms with atmospheric air, said liquor and air being then successively atomized and brought into contact with new or fresh supplies of atmospheric air and repeatedly spread over cooling-surfaces between each such atomization, until it is sufficiently cooled, whereupon it is conducted to a retaining vessel or barrel in such manner as to permit of the escape of its commingled air, substantially as described.

2. In an apparatus for aging and purifying whisky or other spirituous liquors, the combination of the following instrumentalities: a heating-vessel, a successive series of temperature-reducing vessels, the latter being provided with atomizers, and means for supplying said atomizers with continuous supplies of atmospheric air, said parts being arranged substantially as shown and described.



257,490. FENCE. WILLIS D. HATCH, Bath, Me. Filed Jan. 23, 1882. (No model.)

Claim.—1. The combination of the rectangular fence and the two leg-frames arranged therewith, pivoted thereto, and provided with catch-hooks and studs, all substantially and to operate as set forth.



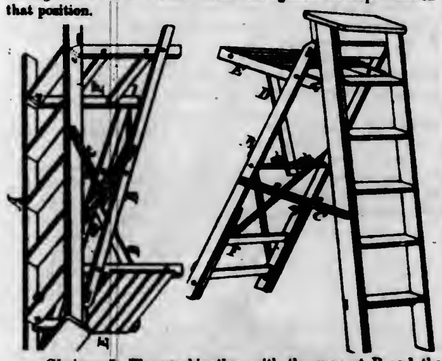
2. The combination of the bedding-holder, provided with ears and arranged and movable, as described, within the rectangular fence, with such fence and the two leg-frames applied thereto, and provided with catch-hooks and studs, all being essentially and to operate as set forth.

257,491. GATE-CLOSER. HENRY GROSS, Tiffin, Ohio. Filed Aug. 29, 1881. (No model.)

Claim.—In an automatic gate-closing device, the bearing D, fixed to the gate-post in an inclined position, and the lever C, having a journal, c, pivoted on said inclined bearing in a vertically-inclined plane, whereby the lever is caused to swing in a defined path and in such movement to move around the gate-post and extend beyond the line of the fence when the gate is opened, as described, in combination with a weight, F, connected with one end of the lever, and the link or chain connecting the other end of the lever with the gate, all substantially as described.

257,492. LOG-DRESSING MACHINE. WILLIS D. HATCH, Bath, Me. Filed Jan. 23, 1882. (No model.)

257,490. FOLDING CRIB. HERBERT GREENWOOD, East Templeton, assignor to himself and Michael Keating, Boston, Mass. Filed Mar. 30, 1882. (No model.)

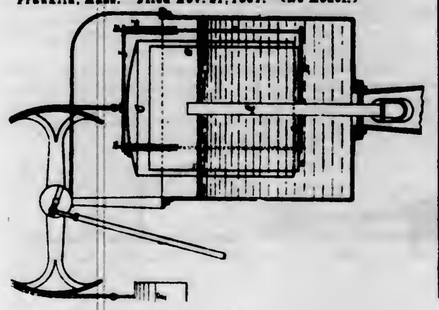


Claim.—1. The combination for feeding the cutter to the log, it consisting of the sliding tool-rack, its supporting-carriage, mechanism for reciprocating such carriage, and mechanism for intermittently advancing the tool-rack, all being substantially and to operate as set forth, the mechanism for reciprocating the carriage being the duplex spirally-grooved shaft H, the spanner *d'*, and the mechanism for intermittently advancing the tool-rack being the pinion *h*, arbor *i*, ratchet-wheel *m*, pawl *o*, spiral spring *q'*, post *r*, stop *s*, and the abutments L M, all being constructed and arranged as shown and described.

2. The combination of the sliding tool-rack, provided with mechanism for reciprocating it, and mechanism for intermittently advancing it, as described, with the auxiliary mechanism for sustaining the tool-rack, such auxiliary mechanism consisting of the hanger *d*, shaft *e*, gears *f*, racks *g*, guides *h*, and roller *i*, all constructed, arranged, and adapted to the tool-rack and the frame A, substantially as set forth.

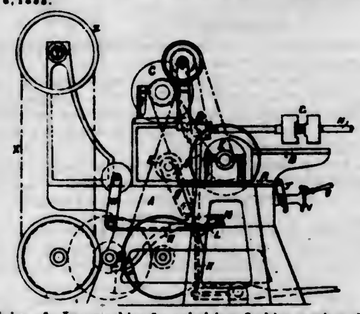
3. The combination of the log-supporting arbor and center, the sliding tool-rack and its sustaining-carriage, the mechanism for reciprocating such carriage, as set forth, the mechanism for intermittently feeding the tool-racks, and the mechanism, as described, for supporting the said racks, this latter mechanism consisting of the hanger *d*, shaft *e*, gears *f*, racks *g*, guides *h*, and roller *i*, all being arranged in the frame and to operate substantially as explained.

257,493. COMBINED STEP-LADDER AND WASH-BENCH. CORNELIUS HOOD, Cleveland, Ohio. Filed Oct. 28, 1881. (No model.)



Brief.—A sliding brace which moves in a mortise in the oscillating cross-bar between the brace-legs supports the hinged shelf. When converted into a wash-bench the shelf becomes the support at one end, and a frame pivoted at the lower end of the brace-legs becomes the support at the other end, both the shelf and the frame having notches or shoulders which bear against the steps when in that position.

Claim.—1. The combination, with the support B and the hinged shelf B, of the sliding brace D, attached to the cross-bar *d*, journaled in the arms of the shelf and playing in a mortise in the oscillating cross-bar *d'*, and provided with the spring *d''*, all as shown and described.

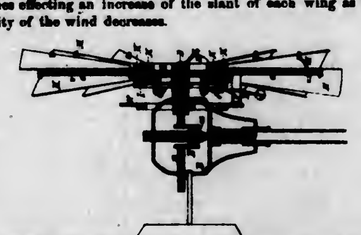


2. The combination, with the step-ladder and its support B, of the frames E and F, having the notches or shoulders *e e* in their upper ends, which engage with the edges of the steps, as and for the purpose set forth.

257,494. GAS-EXHAUST REGULATOR. REUBEN K. HUDSON, Franklin, Mass. Filed Nov. 21, 1881. (No model.)

Claim.—The inverted auxiliary bell and its elastic connection or connections, combined with the main bell and the tank of the gas-exhaust regulator, and arranged and adapted substantially in manner and to operate therewith as set forth.

257,495. MACHINE FOR TREATING HIDES AND SKINS. JOHN WILLIAM JARMAN, London, County of Middlesex, England. Filed Nov. 22, 1881. (No model.) Patented in England Sept. 23, 1881, in Belgium Nov. 15, 1881, in France Dec. 7, 1881, in Italy Dec. 21, 1881, in Austria-Hungary Jan. 2, 1882, in Queensland Jan. 26, 1882, and in New South Wales Feb. 6, 1882.



Claim.—1. In a machine for unhairing, fleshing, paring, shaving, and setting hides, skins, or pelts, the knife-cylinder E and roller F, in combination with the knife-cylinder C and roller D, arranged to operate substantially as and for the purposes set forth.

2. In combination with the cylinders C and E, the adjustable rollers D and F and clips G, as set forth.

2. The combination, with the tubes B B, of the arms C C, the boxes D D, having shoulders *l m*, post *e*, and stud *f*, and the coiled spring G, substantially as and for the purpose herein described.

257,496. WINDMILL. SAMUEL U. KING, Cottage City, Mass. Filed Jan. 3, 1882. (No model.)

Brief.—As the speed of revolution of the windmill increases the arms L L will be so moved by centrifugal force as to turn the main gear on the shaft D and cause it to simultaneously turn all the pinions K in manner to reduce the slant of the wings to the direction of the wind, the reactive power of the springs M of the vanes effecting an increase of the slant of each wing as the velocity of the wind decreases.

Claim.—1. The combination of the main and auxiliary gears I K, (applied to the wheel-shaft and wings as set forth,) the springs M, (of the wings and radial arms,) and the weighted arms L and their fulcra *d*, adapted to the wheel-hub and main gear, all being essentially as set forth, and for governing the slant of the wings of the wind-wheel.

2. The combination of the annulus N and means for advancing and retracting it, as explained, with the rotary frame B, its supporting-standard A, the curved finger P, projecting from one of the wings H, and with said wings and their supporting-arms *c*, and main and auxiliary gears I K, all being to operate substantially as specified.

257,497. DRESS-SHIELD. ISAAC N. KLEINERT, New York, N. Y. Filed Jan. 19, 1882. (No model.)

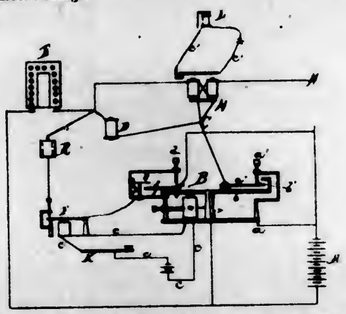
Claim.—1. A dress-shield having a saddle-strip secured over the seam connecting the two flaps by parallel seams located at the opposite edges of the saddle-strip, and uniting the latter to the flaps and forming an open space between their concave edges, substantially as set forth.

2. A dress-shield provided with a saddle-strip over the seam that joins the two flaps of the shield, said strip extending beyond

257,497.

the ends of the shield to form attachments for sewing to the dress-seams, substantially as set forth.

3. A dress-shield provided with a saddle-strip for imparting the desired form to the juncture of the two flaps, and for constituting attachments to be sewed to the dress, and with side bands secured to the saddle-strip and flaps, and extending below the latter, substantially as set forth.



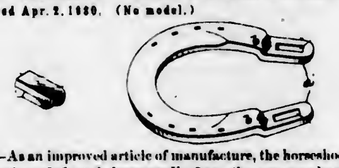
4. In a dress-shield, the combination, with the water-proof flaps provided with a saddle-strip, as described, of a supplemental shield of absorbent material, substantially as set forth.

257,498. MANUFACTURE OF COLORING-MATTER. HORACE KOECHLIN, Leerrank, Baden, Germany. Filed Apr. 6, 1882. (No specimens.) Patented in France Nov. 5, 1881, in Belgium Nov. 9, 1881, and in England Nov. 9, 1881.

Claim.—The production of the matters described—that is to say, the lenco bases and lenco products or reduction products of the bodies obtained by the action of nitroso derivatives upon tannin or equivalent reaction, said lenco bases or reduction products being obtained by the reaction of said bodies or directly, substantially as described.

257,499. MULTIPLE TELEGRAPHY. JOSEPH W. LARIMER, Buffalo, N. Y., assignor of six-tenths to James W. Tillinghast and Frank Kitton, both of same place. Filed Jan. 20, 1882. (No model.)

Brief.—A device for overcoming troubles in duplex telegraphy due to static charge and discharge and extra currents. An electro-magnetic shunt is provided around the artificial-line coil for avoiding the statical difficulties, and the battery is momentarily connected through the home relay at the instant its connection with the main line is broken for preventing false signals due to extra-current charge.



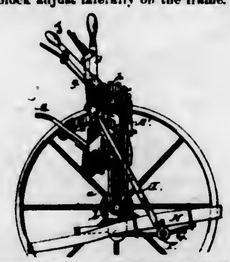
Claim.—1. The combination of the battery A, transmitter B, differential relay M, electro-magnetic shunt D, rheostats E and R, repeating-sounder F, circuit-breaker K, and the local circuits *c* and *c'*, and the metallic conductor (wire or otherwise) connecting battery A with metallic arm *f* of transmitter B, the metallic conductor connecting adjustable screw *p* with armature of repeating-sounder F, metallic conductor connecting repeating-sounder F with artificial line through adjustable resistance R, all arranged and operating substantially in the manner and for the purpose specified.

2. The combination of elements or parts in a system of multiple telegraphy, consisting of a metallic connection between battery A and point *f* on transmitter B, a like connection between set-screw *p* on transmitter and armature on repeating-sounder F, a like connection between set-screw of frame of repeating-sounder, F, through resistance R, to artificial line between rheostat E, and differential relay M, a like connection from rheostat E or any point between it and differential relay M, through electro-magnetic shunt D, to point of division C, all combined and operating as described, and in combination with the local circuit *c c c*, with circuit-breaker K, whereby repeating-sounder F is worked in same circuit with transmitter B, as specified.

3. An improved transmitter, B, one part constructed, substantially as those in common use, with continuity-preserving points, a lever with fulcrum in the center, said lever operated by an electro-magnet, and in combination with circuit-breaking or contact points at the opposite end to the continuity-preserving points, consisting of a metallic arm, *f*, extending from lever *b* and insulated from it at *f'*, an adjustable screw, *p*, insulated from frame *b* at *p'*, and a metal spring, *s*, insulated from *b* at *s'*, all arranged and operating in this system of multiple telegraphy substantially as described.

257,500. HORSESHOE. PATRICK J. LATHAM, Providence, R. I. Filed Apr. 2, 1880. (No model.)

Claim.—As an improved article of manufacture, the horseshoe with heel portions deflected downwardly from the upper or hoof surface, and provided each with a dovetail slot and an elastic cushion constructed with a dovetail projection fitted in the slot, thus forming the means to retain such cushions in place, substantially as shown and described.

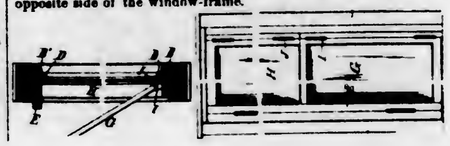


257,501. COMPOSITION FOR ROOFING AND PAVING. ARCHIBALD K. LEE, Galveston, Tex. Filed Feb. 20, 1882. (Specimens.)

Claim.—1. A compound consisting of natural asphaltum, pine-tar, and oxide of iron, in about the proportions specified, and for the purposes set forth.

2. A new article of manufacture consisting of canvas or other textile felted or fibrous fabric saturated or coated, or both, with a compound of natural asphaltum, pine-tar, and oxide of iron.

257,502. SULKY-PLOW. IVER LODGE, Russell, Iowa. Filed Dec. 13, 1881. (No model.)



Brief.—The two arched bars forming the frame converge at the sides and form parallel ways or slides in which the wheel-spindle adjusts by a cogged lever. The plow-beam, tongue, and lever with its ratchet-block adjust laterally on the frame.

Claim.—The combination, with the frame A A' B, of the sector-plate K, elbow-lever J, hooked and forked connecting-rod I, beam-clamp or saddle G, having eyes *e*, and plow-bail F, substantially as shown and described.

257,503. WINDOW FRAME AND SASH. MICHAEL W. MAHAR, Dayton, assignor of one-half to Stephen Crane, Hamilton, Ohio. Filed Jan. 21, 1882. (No model.)

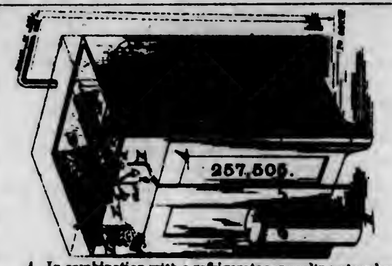
Brief.—The window-sash is hinged to a strip T-shaped in cross-section, which slides in a corresponding groove in a vertical side strip secured in the window-frame. A strip to retain the opposite side of the sash in place is hinged to a vertical strip on the opposite side of the window-frame.

Claim.—1. In a window-frame, the strip secured within the frame as shown, provided with dovetail or T grooves C, to coincide with the position of the sash, in combination with the strip B', having hinged to its inner edge the sash-retaining strip E, substantially as herein shown.

2. In a window-sash, the strips F, secured to the strip B by means of dovetail or T tongues working in similarly-formed grooves, and having the window-sash G H hinged thereto, substantially as and for the purpose herein set forth.

3. In a window-sash and frame, the frame having the strip provided with dovetail or T grooves C, and the strips B', provided with the hinged retaining-strip E, in combination with the strips F, provided with tongues operating in grooves C, having hinged thereto the sash G H, substantially as and for the purpose herein shown.

257,504. PRINTER'S GALLEY. WILLIAM J. S. MCANDREW, Hamilton, Ontario, Canada, assignor of two-thirds to John Eastwood and Reginald Kennedy, same place. Filed Dec. 9, 1881. (Model.)



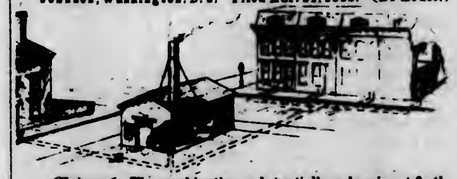
Claim.—In a printer's galley having a side-stick provided with wedge-shaped projections, the strip 2, constructed with the straight bearings 11 and 13 and the inclined bearings 12 and 14, and provided with the transverse elongated slot 16, in combination with the adjusting-wedges provided with projecting studs 18 and heads 19, substantially as and for the purpose described.

257,505. REFRIGERATING BUILDINGS, CARS, VESSELS, AND OTHER STRUCTURES. FRANCIS H. MCMILLAN and HENRY C. JOHNSON, Washington, D. C. Filed Mar. 8, 1882. (No model.)

Claim.—1. The herein-described apparatus for refrigeration, consisting of a liquefied-gas receiver and an expansion coil or chamber in communication therewith, and also in communication with the atmosphere, whereby the gas after expansion is permitted to freely escape.

2. The herein-described plant or apparatus for general refrigeration, consisting of a general or main compressing apparatus at one point, one or more expansion coils or chambers at another point or points communicating with the atmosphere, and one or more portable receivers adapted to be put into communication with such coils or chambers, as and for the purpose set forth.

3. The herein-described method of general refrigeration or cooling, consisting in compressing a gas or fluid in quantities at a main or general supply-point, placing the liquefied gas in portable receivers, transporting said receivers thus charged to structures containing the chambers to be refrigerated, there placing the receivers in communication with an expansion chamber or coil, and causing the gas after expansion to freely escape from the apparatus, as set forth.



4. In combination with a refrigerator or cooling-chamber containing a coil or expansion-chamber provided with an escape-passage, a compressed-gas receiver or vessel communicating with said coil or expansion-chamber, as set forth.

5. A refrigerator provided with tank C, coil B, and gas-receiver G, communicating with the tank, as set forth.

6. In combination with the tank C and coil B, the spiral vane arranged within barrel D, wheel F, and jet or nozzle K, connected with a vessel, G, containing compressed gas or fluid, as and for the purpose set forth.

7. In combination with a domestic refrigerator or cooling-chamber provided with a brine-tank, and a gas receiver or vessel communicating with said tank, a water-service pipe coiled in or carried through said tank and provided with a faucet, whereby the water is cooled as it is drawn.

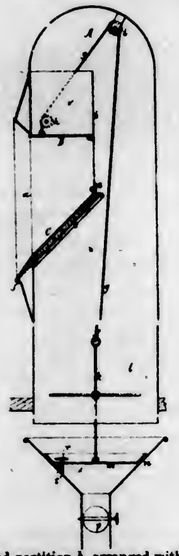
257,506. SYSTEM OF REFRIGERATION FOR COOLING CARS, SHIPS, BUILDINGS, &c. FRANCIS H. MCMILLAN and HENRY C. JOHNSON, Washington, D. C. Filed Mar. 31, 1882. (No model.)

Claim.—1. The combination, substantially as herein set forth, of a gas-compressing apparatus at one point, a structure or structures removed and distinct therefrom, and a pipe or pipes extending from the compressing apparatus to a receiver or an expansion-chamber in said structure or structures communicating with the atmosphere, said pipe being adapted and arranged to convey the compressed gas thereto.

2. The method herein set forth of cooling chambers of buildings, cars, vessels, or other structures, which consists in compressing the gas or fluid at a general supply establishment, conducting the compressed gas through a pipe or pipes to a receiver adapted to be put in communication with an expansion-chamber and located in the same structure therewith, and establishing communication between the receiver and expansion-chamber and between the expansion-chamber and the atmosphere, whereby the gas is permitted to flow from the receiver to the expansion-chamber to expand therein and to freely escape after expansion.

3. In combination with a structure containing a gas-receiver and an expansion-chamber communicating with the atmosphere, a gas-compressing apparatus provided with a pipe whereby it may be placed in communication with said receiver, the structure and the compressing apparatus being, one or both, adapted to travel in relation to the other, substantially as set forth.

4. In combination with a structure containing a gas-receiver, a large distributing-receiver, either portable or stationary, charged with a compressed gas or fluid and adapted to be put into communication with the gas-receiver of said structure, whereby the latter receiver may be supplied with gas for cooling purposes without requiring the compressing apparatus to be brought into immediate connection therewith.



257,507. VENTILATOR FOR SHIPS. PATRICK HINAN, Chelsea, Mass. Filed Jan. 23, 1882. (No model.)

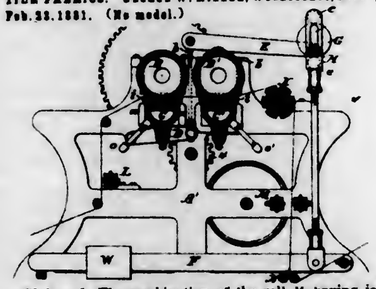
Claim.—1. The ventilator-hood provided with the single mouth *a*, and with partition *b*, deflector C, adapted and arranged and to operate therewith, substantially as set forth.

2. The ventilator-hood provided with the single mouth *a*, and with partition *b*, and the two deflectors B and C, adapted and arranged and to operate therewith, substantially as set forth.

3. The hood provided with the inclined gutters *e*, and with

257,507.

the deflector C, and partition *b*, arranged with the mouth *a* of the said hood, substantially as set forth.



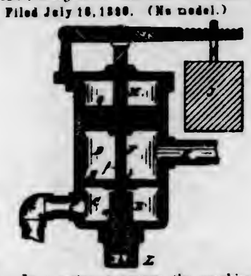
4. The deflector C, provided with the rear lip or flange, *c*, in combination, and arranged as described, with the hood and its mouth and partition *b*, disposed as shown.

5. The deflector C, provided with the side lips, *d*, in combination, and arranged as described, with the hood and its mouth *a*, partition *b*, and gutters *c*, disposed as represented.

6. The deflector C, provided with the front lip, *f*, in combination, and arranged as described, with the hood and its mouth *a* and partition *b*, disposed as represented.

7. The combination of the water-intercepting pan *m*, provided with the discharge-valve, as described, with the tunnel *n*, and with a ventilator-hood provided with a mouth, *a*, partition *b*, and the two deflectors B and C, all being adapted and arranged to operate in manner and for the purposes substantially as set forth.

257,508. MACHINE FOR PRESSING AND FINISHING TEXTILE FABRICS. GEORGE W. MILLER, Woonsocket, R. I. Filed Feb. 23, 1881. (No model.)



Claim.—1. The combination of the roll B, having journals turning in fixed bearings, the roll B', with journals turning in sliding boxes, the movable bed C and fixed bed C', levers D, bearing on the bed C, levers E, bearing on the sliding boxes of the roll B' and connected to the levers D, and appliances for depressing and elevating the outer ends of the levers E, substantially as set forth.

2. The combination, in a pressing-machine, of levers E, weighted levers F, rods *d*, connecting the levers E and F, appliances whereby the connection between the levers E and rods may by one movement be loosened without disconnecting them, and by another movement may be tightened to bring the weight of the levers F upon the levers E, substantially as set forth.

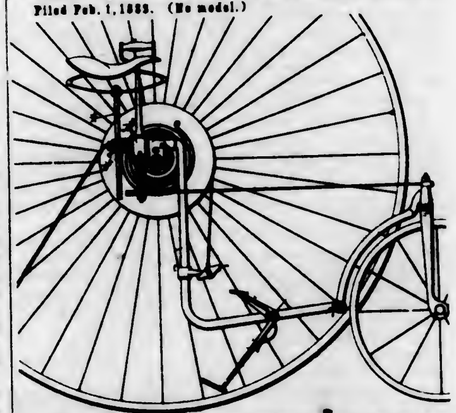
3. The combination of the levers E and F, slotted rods *d*, carrying rollers or bearings *e*, the shaft H, extending through both rods, and eccentrics G, arranged on the shaft between the rollers *e*, for the purpose set forth.

257,509. WATER-GOVERNOR. HARRISON S. MILLER, Indianapolis, Ind., assignor of one-half to William H. Marts, same place. Filed July 16, 1880. (No model.)

Claim.—In a water-governor, the combination of the two chambers C D, divided by the partition B, which also forms the valve-seat, and connected by the opening *b* through said partition, the weighted stem H F, the plunger G, chamber-nut L, stuffing-box *a*, and valve E, the latter being of equal size throughout and extending through into the third chamber, K, and provided with the orifice *e f*, leading from said third chamber through into the upper or discharging chamber, D, all constructed, arranged, and operated substantially as shown and described, and for the purpose specified.

257,510. COMPOSITION FOR PAINTS. WILLIAM R. MORRIS, Fort Ann, N. Y. Filed Jan. 20, 1881. (Specimens.)

Claim.—A composition for paints, consisting of oil and its substitutes and pulverized Hudson River shale or slate, said slate having as its ingredients silica, lime, alumina, carbonic acid, and water, substantially as set forth.



257,511. WATCH-REGULATOR. RICHARD OLIVER, Brooklyn, N. Y. Filed Dec. 30, 1881. (No model.)

Claim.—1. The combination of the slotted regulator-lever A, quadrant-rack B, provided with pin D, operating in the slot F, and pinion-wheel E, substantially as described.

2. The combination, with the regulator-lever, of a toothed quadrant, over which said lever extends, a bearing for the lever upon the quadrant near the pivot of the latter, and a pinion gearing with the quadrant, substantially as set forth.

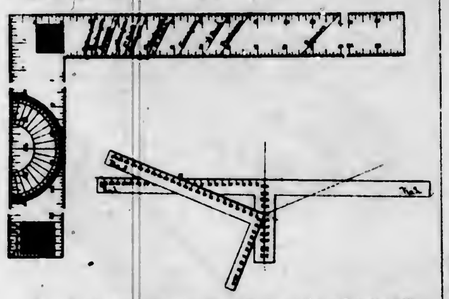
257,512. VELOCIPEDE. ALBERT E. OVERMAN, Hartford, Conn., assignor to the Overman Wheel Company, same place. Filed Feb. 1, 1883. (No model.)

Claim.—1. In a tricycle, the combination, with the driving-wheels mounted on separate spindles, and driving-disks mounted on

the spindles and engaging the hubs of the driving-wheels, of the main supporting-frame extending downwardly in front of the driving-wheel spindles and then forwardly, and supporting the guide-wheel, and foot-pedals pivoted to brackets sleeved on the vertical portions of the side frame-pieces, and straps or bands connecting the foot-pedals and driving-disks, substantially as set forth.

2. In a tricycle, the combination, with the driving-wheels mounted on separate spindles, driving-disks mounted on said spindles, and foot-pedals for actuating the driving-disks, of a cross-bar located in rear of the spindles and supporting a seat, and side frame-pieces extending downwardly in front of the spindles and forwardly, and supporting the guide-wheel, substantially as set forth.

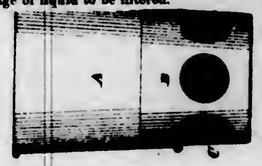
257,513. PREPARATION FOR CLEARING COFFEE. PERRIS S. PAINE, Boston, Mass. Filed Dec. 19, 1881. (No specimens.)



Claim.—The herein-described product for use in clearing coffee, the same consisting of fish-skin coated with white of eggs or like albuminous matter.

257,514. FIFTH-WHEEL FOR VEHICLES. GILBERT A. PARRISH, Fremont, Ohio. Filed Sept. 19, 1881. (No model.)

Claim.—The fifth-wheel of a wagon in which the upper half is composed of a full circle, solid in front of the head-block and open behind, secured to the head-block, provided on the rear side with an extension-piece forged thereto and secured to the reach, in combination with the lower half composed of an open half-circle secured to the axle-bed, the two halves constituting the fifth-wheel being held together by means of the bolt secured to the upper half and to the end of the reach below, substantially as and for the purpose herein set forth.

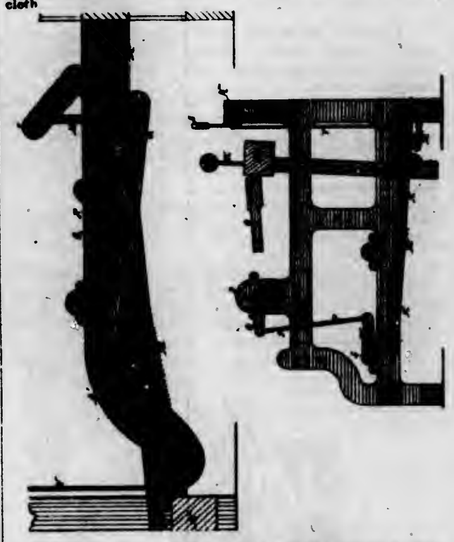


257,515. CARPENTER'S SQUARE. BYRUS PERU, Nebraville Nebr., assignor of one-half to W. H. B. Stout, same place. Filed Jan. 17, 1882. (No model.)

Claim.—A square bearing upon its face side and tongue lines coincident with those of a protractor centrally located on its blade, and indicating-marks designating the geometrical figure of which each line forms a unit or side, and also marks indicating the internal and external angles of said figures, substantially as shown and described.

257,516. FILTER. HENRY C. RICE, Louisiana, Mo. Filed Oct. 25, 1881. (No model.)

Brief.—A sheet of filtering material, C, is pressed between two frusto-conical tubes, which fit one within the other, the inner tube projecting below the outer and having perforations to allow the passage of liquid to be filtered.



Claim.—1. The filter herein described, consisting of outer upper tube, A, inner lower tube, B, and filtering material C, the outer tube forming the upper half of the receptacle and supporting the filter and the inner tube forming the lower half of the receptacle and projecting beneath the outer tube, as shown and described.

2. The filter consisting of inner and outer frusto-conical tubes, A and B, and filtering material C, the inner tube being pressed into the outer tube to hold the cloth between the two tubes and the outer tube forming the support to the filter, as set forth.

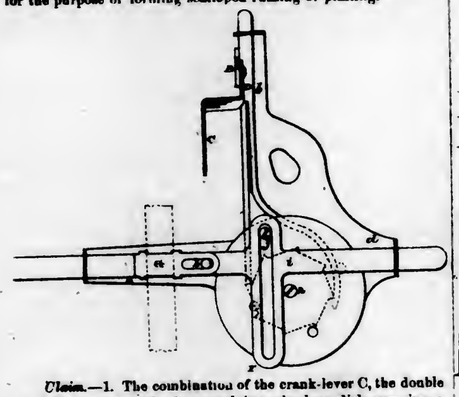
257,517. LOOM FOR WEAVING PILE FABRICS. JOHN ROTHWELL and CHARLES ROTHWELL, Philadelphia, Pa. Filed July 22, 1881. (No model.)

Brief.—The crank-shaft is mounted in eccentric-bearings, which may be turned to shift the shaft slightly backward and cause the lay to beat partially up, or moved to shift the shaft forward again and cause the lay to beat up fully. The loops or pile are thus formed upon the fabric by partially beating up several picks of weft and then giving the lay a full beat, which slides such picks forward upon the body-warp and causes the lighter-weighted terry-warps to rise up in loops in front of these picks. The connections between the rock-shaft, by which the eccentric-bearings are operated and the lever by which such shaft is turned, are made adjustable to permit the length of loop to be varied. By means of a hand-controlled locking-bar the parts for shifting the eccentric-bearings may be held out of action during the formation of plain cloth.

Claim.—1. In a loom for weaving looped or terry and plain fabrics, the combination, with the eccentric-journals B', having the arms O secured thereto, the rods P, arms N, shaft L, and operating mechanism for said shaft, of the crank-shaft C, pitmen Q, and the lay and reed E E', as shown and described.

2. The combination of cam F, lever G, rod H, arm I, shaft L, arm J, lock-bar K, springs M, eccentric-bearing B', and connecting mechanism N P O, substantially as shown and described.

3. The combination of cam F, shaft L, eccentric-bearing B', connecting mechanism N P O, adjustable mechanism G H I, and abutment or stop *e*, whereby the length of the loops or grade of the fabric may be varied, substantially as shown and described.



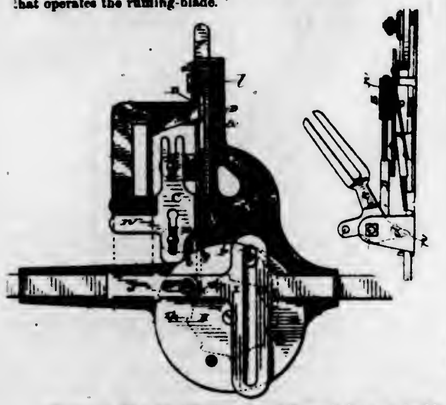
4. The combination of terry-lever S, lock-bar K, mechanism connecting said terry-lever and lock-bar, as shown, arm J, and shaft L, substantially as shown and described.

5. The combination of terry-lever S, bell-crank lever T, and rods V with the lock-bar K, formed of the parts *x y* and adjustable in the direction of its length, and having the notch *a*, the springs M, adjustable mechanism G J H I, shaft L, and cam F, substantially as shown and described.

6. The eccentric-bearings B' and rigidly-attached arm O, boxes B, rods P, arms N, and shaft L, in combination with arms J I, rod H, adjustable lock-bar K, lever G, cam F, having pin F', stop *e*, the shaft E, and means for operating said shaft, substantially as shown and described.

257,518. RUFFLING ATTACHMENT FOR SEWING-MACHINES. JOSEPH S. SACKETT, Plattsburg, N. Y. Filed Aug. 24, 1881. (Model.)

Brief.—The guide which carries the ruffling-strip is slowly reciprocated in a plane perpendicular to the direction of the feed for the purpose of forming scalloped ruffling or plaiting.



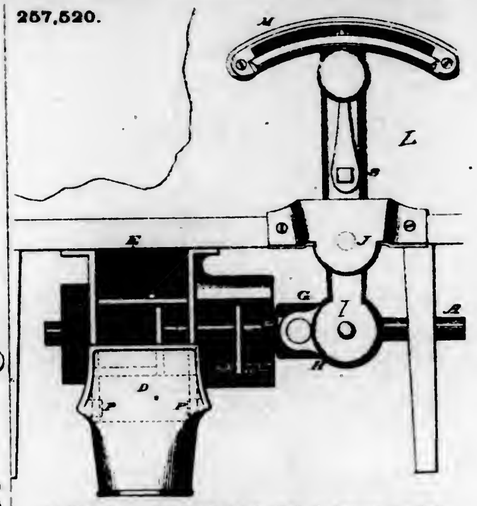
Claim.—1. The combination of the crank-lever C, the double pawl D, a ratchet-wheel, a revolving wheel or disk carrying a crank-pin, and a reciprocating cross-head carrying a guide, G, substantially as shown.

2. The combination, with the crank-lever C and the double pawl D, of the guide G and intermediate mechanism, substantially as described, for operating said guide from said pawl, as set forth.

3. The reciprocating guide G, slotted so as to be adjustable, in combination with the cross-head and its operating mechanism, substantially as set forth.

257,519. RUFFLING OR PLAITING ATTACHMENT FOR SEWING-MACHINES. JOSEPH S. SACKETT, Plattsburg, N. Y. Filed Aug. 26, 1881. (Model.)

Brief.—The guide which carries the ruffling-strip, and which is slowly reciprocated in a plane perpendicular to the direction of the feed for the purpose of forming scalloped plaiting or ruffling, is operated by mechanism connected with the same bell-crank lever that operates the ruffling-blade.



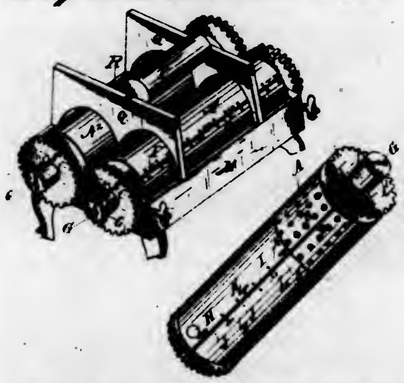
Claim.—1. The combination of a bell-crank lever, a double pawl, ratchet and crank wheel, a reciprocating head carrying a guide, and a ruffling device which is also operated by the bell-crank lever, substantially as shown.

2. The combination, with the slide C and the ruffling-blade, of the lever B, a rod for operating the said slide, arm *p*, double pawl F, ratchet-wheel H, crank-disk G, cross-head I, and guide J, substantially as described.

257,520. GRAIN-DRILL. CHARLES SCHULZ, Dayton, Ohio. Filed Apr. 18, 1881. (Model.)

Claim.—1. The pivotal binding-bar L, with set-screw S, in combination with the adjusting-arm I and indicator-plate M, substantially as and for the purpose specified.

257,520.



2. The sleeve G, supported on shaft A, between washers pinned to said shaft, and adjusting-arm I, connected by link H, in combination with the feeding mechanism of a grain-drill, substantially as and for the purpose specified.

3. The solidly-cast swinging conveyer D, with interior flattened projections, P, in combination with the seed-case E, having external cavities, as set forth, substantially as and for the purpose specified.

4. The washer C, composed of two plates embracing the shaft, the inner being a cut-off and the outer an end wall, and connected by plate *o*, substantially as set forth.

257,521. STENCIL-PRINTING MACHINE. ALBERT G. SHANNON, Santa Rosa, Cal. Filed Nov. 18, 1881. (No model.)

Claim.—1. In a stencil-printing machine, the cylinders A and A^1, having ink-receiving holes H, which are closed by screw-stoppers, said cylinders containing cylinders A', which are also provided with ink-receiving holes h, so arranged that the holes H and h can be placed in a direct line by means of the rod *d*, having the handle G, which is designed to be turned, when desired, on the scale C, the latter indicating the relative position of the holes H and h, the perforations B *b* in the cylinders being so arranged as to be closed when H and h are opened, all substantially as described, and for the purposes set forth.

2. The cylinders A^1 A', having perforations B *b*, the former cloth-covered and provided with groove l, springs K, and knife R, in combination with cylinders A A', similarly perforated, covered, grooved, and provided with springs, the groove in cylinder A being adapted for the working of the knife R, and said cylinders A A^1 geared together and adjustably mounted on frame M, in the manner and for the purposes set forth.

257,522. BOX OR BUCKET FOR BERRIES, &c. SETH H. SMITH, Delta, Ohio, assignor to the Smith Manufacturing Company, same place. Filed Mar. 23, 1882. (No model.)

Claim.—1. The combination, with a bent wooden box constructed substantially as described, of a lining folded from a single uncut sheet and secured in position by means of the hooked ends of the wire bail or handle, as set forth.

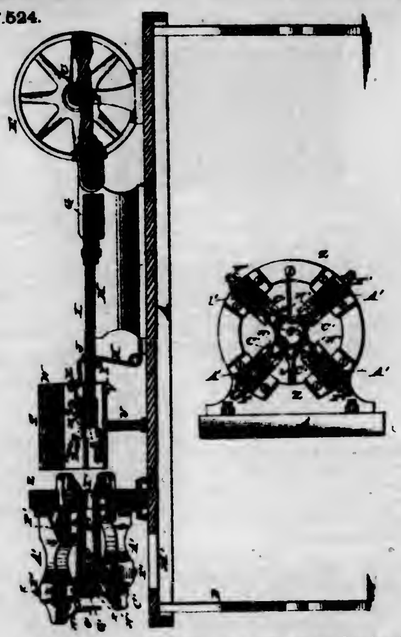
2. The herein-described improved box or bucket, having sides G, ends E, and flaps I, in combination with the lining folded from a single uncut sheet and having flaps K, and the wire bail or handle having hooked ends M, passing through the ends and flaps of the box and lining, which are thereby secured together, as set forth.

257,523. WHEEL. JOHN F. SNYDER and GEORGE J. BLIESNER, Blakeslee, Ohio. Filed Feb. 9, 1882. (Model.)

Claim.—1. The combination, with the rim of a wheel having a socket formed therein, of a spur projecting from and working in the socket, a boxing or cap having closed sides and top formed in one piece and fitting over the socket, and a spring or cushion fitting between the spur and boxing and bearing against both, the several parts being adapted to operate as described, and one cap to be removed without affecting the others, as set forth.

2. The combination, with the rim of a wheel having a shouldered socket, E, formed therein, of a spur, D, having a detachable plate, *d*, secured to its shank and adapted to fit within the socket in the wheel, a hollow boxing, G, having closed sides and top formed in one piece and fitting over the socket E, and a spring-cushion, F, fitting between the boxing and spur, substantially as and for the purpose set forth.

257,524. MACHINE FOR CUTTING GREEN CORN OFF THE COB. DARIUS E. SPERR, Blue Grass, Iowa. Filed Feb. 28, 1882. (Model.)



Claim.—1. The combination, with the plunger-rod I, having notch S, of the plunger-head L, consisting of a sleeve having cup-shaped rear end and provided with notch or opening R, lever-latch O, having tooth Q and spring P, and mechanism for operating said lever-latch, as set forth.

2. In a machine for cutting green corn off the cob, the combination of the trough T, having hinged flanged wings V, with mechanism, substantially as described, for automatically opening and closing the said wings, as set forth.

3. The combination of the trough T, the flanged wings V, connected to said trough by spring-hinges, the spring-bracket K, having eye J, the toggle-joints X, connecting said spring-bracket with the wings V, the plunger-rod I, having cross-pin Y, and mechanism for reciprocating the said plunger-rod, substantially as set forth.

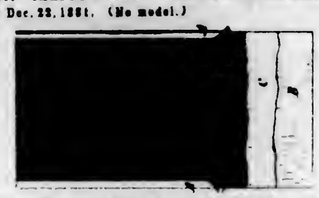
4. In a machine for cutting green corn off the cob, the combination of the frame Z, having arms A', the shanks C', and rods I', mounted in sockets radially in said arms, springs for forcing the said shanks and rods in an inward direction, nuts for limiting their movement, and the guards H', hinged, as described, to the said shanks C' and rods I', as set forth.

257,524.

5. The combination, with the shanks C', arranged as herein described, and having knives or cutters G', of the guards H', hinged to said shanks and to the rods I', arranged as herein shown, so that the front and rear ends of said guards shall be forced independently in an inward direction, as set forth.

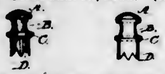
6. As an improvement in machines for cutting green corn off the cob, the combination of the bed-plate or table, the trough or hopper having hinged flanged wings, the plunger-rod having plunger-head connected thereto by suitable latch mechanism and provided with a cross-pin, Y, the spring-bracket K, having eye J, and connected by toggle-joints to the hinged flanged wings of the trough or hopper, the frame Z, having arm or bracket P', and arms carrying the knives or cutters and guards or guides and the crescent-shaped scrapers, and suitable operating mechanism, all arranged and operating substantially as and for the purpose set forth.

257,525. SAP-SPOUT. IRWIN H. SPELMAN, Cortland, Ohio. Filed Oct. 8, 1881. (No model.)



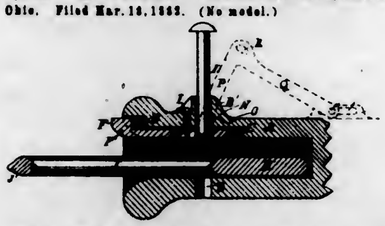
Claim.—The combination, with the sap-spout A, constructed as described, of the spur B, constructed of a flat piece of metal, and having a shoulder, *b'*, to engage with the notch *b²* on the end of the spout A, as herein described, and for the purpose set forth.

257,526. MAKING OF MOSAICS OF GLASS, PORCELAIN, OR STONE. GEORGE STANLEY, Boston, Mass. Filed Mar. 24, 1882. (No specimens.)



Claim.—The mode, substantially as described, of making a mosaic of glass or other mineral substance, such consisting in arranging the pieces, in manner as described, on an argillaceous and arenaceous bed, next coating the upper surfaces of the said pieces with clay or other material suitable to resist adhesion of the joining metal to such surface, next drying the whole and heating it to the temperature of the joining metal when in a molten state, and while such bed and pieces may be at such temperature pouring upon the pieces of glass and into the narrow spaces or channels between and around them lead or a joining metal in a molten state, the whole being subsequently cooled and finished by removal of the surplus metal, as set forth.

257,527. CARPET-LINING. HENRY A. SYMMES, Lincoln, R. I. Filed Dec. 22, 1881. (No model.)



Claim.—The carpet-lining herein described, consisting of the sheet of paper A, wider than the breadth of lining, the fibrous pad B, and the woven fabric D, to form dust-receptacles, having a sheet of paper, C, between such woven fabric and the fibrous material, and the edges of paper sheet A being folded over so as to inclose the edges of the whole, as herein set forth.

257,528. LACING STUD OR BUTTON. EDWARD D. STARLE, Waterbury, Conn. Filed Jan. 10, 1882. (No model.)

Claim.—As an improved article of manufacture, the herein-described lacing-stud, formed from a hollow post or eyelet having a central flange or shoulder, C, all of a single piece of sheet metal, the said flange or shoulder dividing the stud into a lower tubular shank, D, and an upper rounded neck, B, having a spread head or rim to receive the circular disk or cap A, substantially as and for the purpose specified.

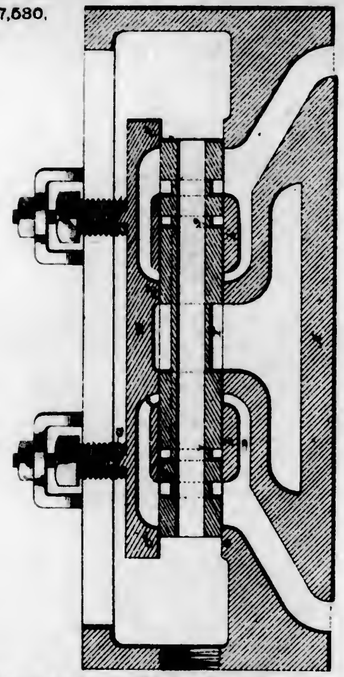
257,529. CAR-COUPLING. WILLIAM G. STRUBBE, Cincinnati, Ohio. Filed Mar. 16, 1882. (No model.)

Claim.—1. In car-couplers, the draw-head provided with an enlarged cavity, A', to the rear of the pin, having in the upper wall a dovetail groove, C, in combination with the tripping device E, placed in the said slot, having the head F, central elongated slot, G, and the sloping cavity H, substantially as and for the purpose herein shown.

2. In car-couplers, the draw-head provided with the rear enlarged cavity, A', having in the upper wall the dovetail slot C and cavity D, with the tripping device E in said slot having the head F, elongated slot G, sloping cavity H with the securing-pin I and coupling-pin L, substantially as herein shown.

257,530. STEAM SLIDE-VALVE. BENJAMIN F. STURTEVANT, Boston, Mass. Filed Feb. 25, 1882. (No model.)

Claim.—1. A valve constructed with a series of admission-ports which communicate with the cylinder-ports at each end, and adapted to have its ends open and close the exhaust-ports at each stroke, substantially as set forth.



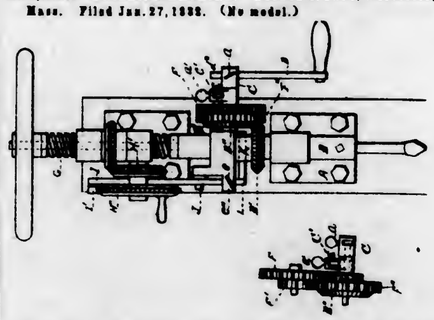
2. A valve having a steam-chamber in each end and provided with a series of admission-ports which communicate with the cylinder-ports at each end, and adapted to have its ends open and close its exhaust-ports at each stroke, substantially as set forth.

3. The combination, with the cylinder-ports and the valve cap or cover, of a double-faced valve provided with steam-chambers and with a series of admission-ports which communicate with the cylinder-ports, the ends of the valve being constructed and arranged to open and close the exhaust at each stroke, substantially as set forth.

4. The combination, with the main and supplemental ports for supplying steam to the ends of the cylinder, of a valve provided with a port adapted to open a supplemental port at each stroke, and with two or more independent ports at each end for supplying steam to the cylinder, substantially as set forth.

5. The combination, with the cylinder-ports and valve cap or cover, of a valve provided with a series of ports at each end, and

257,530.



with a steam-passage to allow the steam to flow from a port in the valve through a passage in the cap and down through the valve to the cylinder-port, substantially as set forth.

257,531. BUTTON-FASTENER. PARKER H. SWEET, Jr., Washington, D. C., assignor to the Heaton Button Fastener Company, Providence, R. I. Filed Mar. 15, 1882. (No model.)

Claim.—As an improved article of manufacture, the herein-described button-fastener, consisting of the plate *b*, provided with the two front prongs, *a*, and with the central prong bent in a reverse direction and over the said plate *b*, whereby the plate protects the fabric from abrasion, substantially as and for the purpose specified.

257,532. DRILLING-MACHINE. GUSTAVE C. TAPY, Worcester, Mass. Filed Jan. 27, 1882. (No model.)

Claim.—1. The combination, with the drill-shaft B, bevel-gears B' and B'', sleeve C, and its attached crank-hub, of the loose pinion C', with its mortised projection E upon the side of its hub, the fixed intermediate gears, F F', gear F'', and interchangeable crank-bar *d*, all arranged and constructed as described, and for the purposes set forth.

2. The combination of the spring *c*, lug *c'*, vibrating bent lever I, pawl I', ratchet-wheel H'', and eccentric K on the drill-spindle, as described, and for the purposes set forth.

3. The combination of the vibrating bent lever I, pawl I', ratchet-wheel H'', eccentric K on the drill-spindle, adjusting-screw *e*, and lug *c'*, as shown, and for the purposes specified.

4. The drill-shaft B and the connected feed-screw G, in combination with the ratchet-wheel H'', vibrating lever I, pawl I', and eccentric K on the drill-spindle, as shown, and for the purposes set forth.

257,533. WARDROBE-HOOK. FREDERICK TAYLOR, Lowell, Mass. Filed Jan. 26, 1882. (No model.)

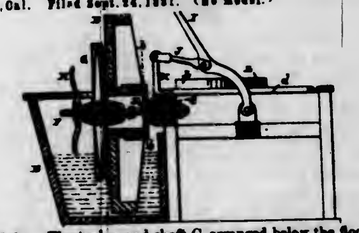
Claim.—1. A wardrobe-hook made of wire B, doubled as herein described, and having its ends bent into eyes A A' at opposite sides of said hook, as and for the purpose specified.

2. A wardrobe-hook made of wire B, doubled as herein described, and having the ends of said wire bent into eyes A A' at opposite sides of said hook, and having the strands of a branch of said hook twisted together, as and for the purpose specified.

257,534. HAY BINDER, UNLOADER, AND STACKER. A. L. THORNTON, Dover, Iowa. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination of the poles A B and the connecting series of ropes *b* with the hay-rack G, for the purpose specified.

2. The combination of the poles A B, the series of connecting-ropes *b*, the hooks *c c*, made fast to the poles A B, the anchor and draw ropes *c c*, with their crotch-ropes *h* and rings *d d*, and the anchor-stake *f*, substantially as described, for the purpose specified.



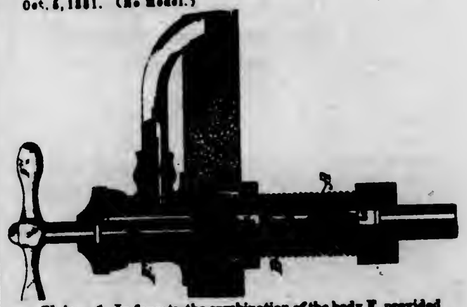
3. In a hay binding, unloading, and stacking machine, the combination of the poles A B, with the series of connecting-ropes *b*, the anchor and draw ropes *c c*, and the anchor-stake *f*, with the hay-rack G, for the purpose of rolling loads of hay from a wagon or along the ground or up the inclined side of a stack.

4. The hooks *h h*, attached to the hay-rack, substantially as shown, for the purpose specified.

257,535. COMPOSITION FOR CLEANING AND PROTECTING METAL SURFACES. CHARLES W. TRICKEY, Belmont, Mass. Filed Jan. 31, 1881. (Specimens.)

Claim.—The within-described compound for cleaning and protecting metal surfaces, consisting of marrow-oil, paraffine-oil, oleine, tincture of gum-guaiacum and oil-mirbane, in about the proportions specified.

257,536. DEVICE FOR COOLING TIRES. ISAAC L. UNDERHILL, Ione, Cal. Filed Sept. 24, 1881. (No model.)



Claim.—The tank *a* and shaft C, arranged below the floor A, the latter carrying the revolving supporting-wheel E, the lever K, the lever I, and connecting-link J, and the slot *d*, the whole constructed to act in combination in the manner set forth, whereby the wheel and tire and the operating-handle of lever I, when in a horizontal position, may rest immediately upon the floor, for the purpose described.

257,537. DEVICE FOR MAKING BUTTON-MAKING MOLDS. FREDERICK VAN PATTEN, Auburn, N. Y., assignor to Driggs, Meaker & Co., same place. Filed Aug. 18, 1882. (No model.)

Claim.—The templet F, in combination with its rod F', secured to the back of the templet, and the mortised support and guide F'', adapted to slide upon said rod and against the edge of a rectangular plate, substantially as and for the purpose described.

257,538. FAUCET. CHARLES WHITTAKER, Chicago, Ill. Filed Oct. 5, 1881. (No model.)

Claim.—1. In faucets, the combination of the body F, provided with the spout at or near the supporting-flange, valve-rod E', extending from the handle to the sliding sleeve D, sliding sleeve D, stirrup H, connecting-rod E, valve G, coupling-stem B, and valve-seat A, all substantially as set forth.

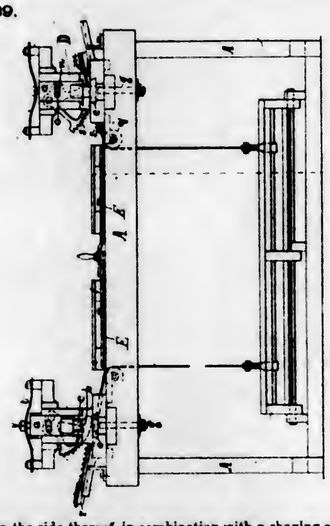
2. The combination of handle F', valve-rod E', sleeve D, stirrup H, said valve-rod being connected to said sleeve by a screw, by which said sleeve and stirrup are moved upward and downward as said handle is turned toward the right and left, rod E, valve G, and valve-seats A, substantially as set forth.

3. In faucets, the combination of the stopper or valve G, adapted to be closed with instead of against the pressure of water, and the screw-cut valve-rod E, said stopper and screw being connected together by sleeve D, stirrup H, and connecting-rod E, whereby the said valve is gradually opened and closed by the action of the screw, all substantially as set forth.

257,539. MACHINE FOR CUTTING HOOP-LOCKS. HENRY WILDE, Newark, N. J. Filed Dec. 10, 1881. (No model.)

Brief.—The hoop-blank is clamped on the table, and the hoop is notched and beveled at one end and mortised and beveled at the other end by the cutters, which reciprocate in perpendicular and diagonal lines.

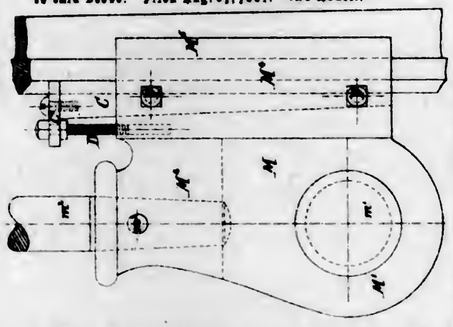
Claim.—1. The combination, in a machine for cutting a tongue-and-mortise lock in barrel-hoops, of a bed provided at one end with a reciprocating tool for cutting and a diagonally-moving tool for bevaling the mortise of the lock in the manner described, corresponding mechanism at the other end for cutting and beveling the tongue of the lock in similar manner, suitable gages for setting the hoop properly under the two tools, and mechanism adapted to operate the said tools, substantially as and for the purpose set forth.



2. In combination with the top of bed A and the two sets of cutting-tools, one or both being adjustably secured thereto, the gage *h*, for setting the hoops endwise, substantially as described.

3. In combination with the dies for the mortise and tongue of the hoop, the gages *d'*, for centering the hoop beneath the punches, substantially as set forth.

4. In combination with the dies *c* and gages *d'*, the levers E, arranged and operated substantially as described, and provided with the bent ends *f'*, for pressing the hoop against the gage and die-bed, substantially as set forth.



5. A punching-cutter operating as described, and having a

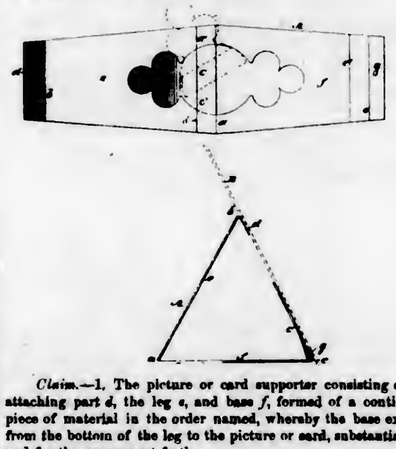
257,539.

recess in the side thereof, in combination with a shaving or beveling cutter moving at an angle and entering said recess at the close of its stroke, as set forth.

257,540. CROSS-HEAD FOR STEAM-ENGINES. DANIEL C. WILCOX and GEORGE H. BEEBE, Marshalltown, Iowa, assignors to said Beebe. Filed Aug. 31, 1881. (No model.)

Claim.—The combination of the slide B, projecting on either side of the framing, to which it is attached, and provided with a raised center on its outer surface, with the cross-head M, having the jaws M^2 M' M^2, and the wedge C, fitting over the outer face of the slide and provided with the adjusting means D P, substantially as set forth.

257,541. DEVICE FOR SECURING, &c., THE CLOTH OF BILLIARD-TABLES. J. FREDERICK BABCOCK, Bangor, Me., assignor of one-half to Charles P. Wiggin and William H. Bradford, both of same place. Filed Feb. 25, 1882. (No model.)



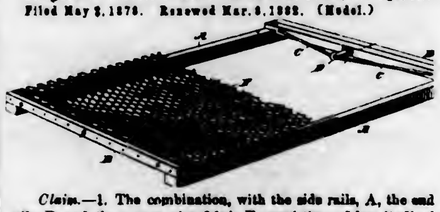
Claim.—1. In combination with a billiard-table, a cloth, *b*, covering the same and provided with a strengthening or stiffening material around its edges, substantially as herein set forth.

2. In a billiard-table, the cloth *b*, strengthened at its edges, in combination with devices whereby said cloth may be stretched or drawn over the bed with a substantially equal strain in all directions, substantially as herein set forth.

3. In a billiard-table, the cloth *b*, strengthened or stiffened at its edges, in combination with cords *d e*, passing through or under the frame of said table, and devices whereby said cords and attached cloth shall be stretched with a substantially equal strain in all directions, substantially as and for the purposes set forth.

4. In a billiard-table, the cloth *b*, strengthened or stiffened at its edges, in combination with cords *d e*, attached to said edges, passing through or under the frame of said table below the bed, shafts *f h*, gears *i g*, and crank or its equivalent attached to said shaft *f*, whereby said cords and attached cloth are stretched and drawn over said bed with a substantially equal strain in all directions, as herein set forth and described.

257,542. PICTURE AND CARD SUPPORTER. CHARLES BECK, Philadelphia, Pa. Filed Mar. 16, 1882. (No model.)



Claim.—1. The picture or card supporter consisting of the attaching part *d*, the leg *e*, and base *f*, formed of a continuous piece of material in the order named, whereby the base extends from the bottom of the leg to the picture or card, substantially as and for the purpose set forth.

2. The supporter formed of the attaching part *d*, leg *e*, and base *f*, having a tongue, *g*, in combination with the tongue C of the card or plate, substantially as and for the purpose set forth.

3. The supporter A, formed with the additional score folding lines *a' a'*, substantially as and for the purpose set forth.

4. The tongue C, adapted to be secured to the card or plate and formed with the score-line *c''*, substantially as and for the purpose set forth.

257,543. BED-BOTTOM. WILLIAM J. HOPE, Columbus, Ohio, assignor to Charles L. Ames and Abel H. Frost, Chicago, Ill. Filed May 3, 1878. Renewed Mar. 8, 1882. (Model.)

Claim.—1. The combination, with the side rails, A, the end rails, B, and the woven-wire fabric F, consisting of longitudinal spring-wire coils secured permanently to the end rails, B, of the rod C and extensible strut D, whereby the central portions or coils of the fabric F may be elongated or given increased tension without equally elongating or increasing the tension of the marginal coils, substantially as described, and for the purposes set forth.

2. In combination with the frame A B and contractile fabric F, secured at the upper surface of the end rails, the truss-rod C, having its ends attached to the inner face of the end rail, B, below the plane of the fabric, and the strut D, provided with the nut or shoulder *d*, bearing against the end rail in the plane of the rod C, and having its end extended and housed within a close-fitting recess, *b*, in the end rail, substantially as shown, and for the purposes stated.

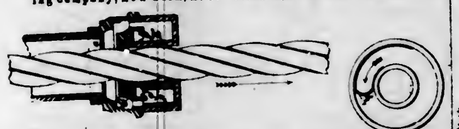
257,544. COMPOUND FOR ROOFING. JOHN BOWMAN and GRAHAM KLINCK, Princeville, Ill. Filed Mar. 11, 1882. (No specimens.)

Claim.—1. The herein-described composition of matter to be used for roofs, &c., consisting of the following proportions, to wit: brimstone, five pounds; rosin, ten pounds; coal-tar, sixty-five pounds; flour-paste made with alum-water, twenty pounds, mixed and prepared as set forth.

2. A roofing-cover consisting of brimstone, rosin, flour and alum-water paste, coal-tar, hair, and plaster-of-paris, combined and applied as set forth.

257,545. PROCESS OF MANUFACTURING WATER-GAS. WM. H. BRADLEY, New York, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—The improvement in the process of making the gas known as "water-gas" herein described, which consists in introducing steam together with air at the bottom of a cupola or generator containing carbonaceous fuel, for the purpose of raising the fuel to incandescence, desulphurizing it, and preventing the formation of clinker and disintegrating it if formed, and in introducing steam into the generator at or near the top thereof and causing it to pass in a downward direction through the incandescent carbon, substantially as described.



257,546. SHAFT-TUG. WILLIAM B. BROOKS, West Dennis, Mass. Filed Mar. 18, 1882. (Model.)

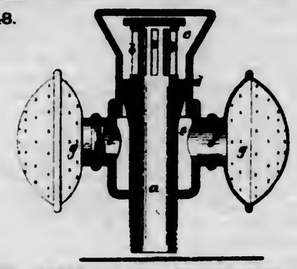
Claim.—1. A shaft-tug consisting of the leather strap A, provided with buckle *a* and the friction-roller *c*, connected to a suitable plate secured between the folds of said strap, substantially as and for the purpose set forth.

2. In a shaft-tug, the combination, with the strap A, of the plate B, having ears *e*, and *d*, and rollers *c*, connected to the strap, substantially as and for the purpose set forth.

257,547. EXTENSION-CHANDELIER. JAMES E. BROWN, Brooklyn, assignor to the Archer and Pancoast Manufacturing Company, New York, N. Y. Filed Apr. 8, 1882. (No model.)

Claim.—1. The friction-spring bent as explained, and bearing against the walls of the annular chamber formed in the clutch-casing, said spring being moved by the turning block as the sliding pipe or rod descends, substantially as and for the purposes set forth.

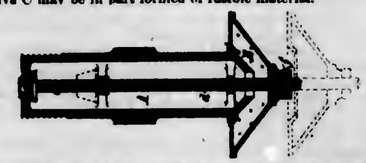
2. The spiral pipe or rod, the bent friction-spring located and movable in an annular chamber formed in the clutch-casing, and the turning-block having a serrated flange, the teeth of which engage with the fold of the spring, the several parts being combined and arranged substantially as shown and described.



3. The combination of the spiral pipe or rod, the clutch-casing having an annular chamber formed in the lower part, the bent spring bearing against the walls of said chamber, the turning-block having the serrated flange made to engage with the spring during any downward tendency of the slide, and to release the spring when the slide is elevated, and the removable cap, substantially as and for the purposes set forth.

257,548. AUTOMATIC FIRE-EXTINGUISHER. JOSEPH R. BROWN, Providence, R. I. Filed June 13, 1881. (No model.)

Claim.—1. In an automatic fire-extinguisher, the combination, with a distributer, of an inlet-pipe closed at the end and provided with narrow ports through which the water passes, the sleeve *c*, and a seal made of a solder fusible at a low temperature, as and for the purpose set forth.

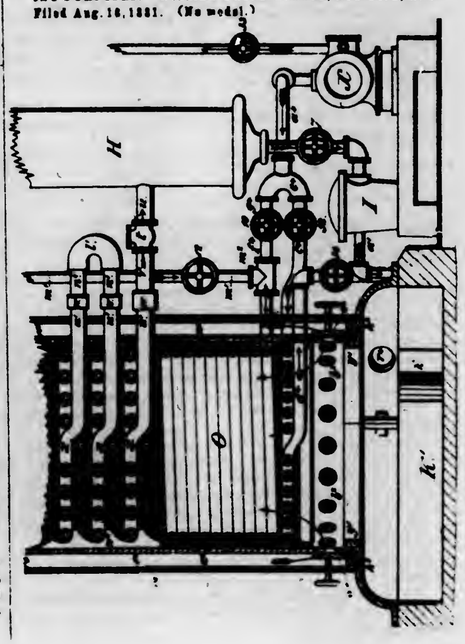


2. The combination, with the pipe *a*, provided with the enlargement at *d*, of the sleeve *c*, secured to the enlargement by a solder fusible at a low temperature, and the chamber *e*, provided with outlets, to which distributers are secured, the whole constructed to form an automatic fire-extinguisher, as described.

257,548.

257,549. AUTOMATIC FIRE-EXTINGUISHER. JOSEPH R. BROWN, Providence, R. I. Filed Nov. 11, 1881. (No model.)

Brief.—The distributer E may or may not be perforated. The valve C may be in part formed of fusible material.



Claim.—1. In an automatic fire-extinguisher, the combination, with the pipe A, provided with a contracted outlet and an annular soldering-surface, of the valve C, constructed to exclude the water from the distributer, and a conical distributer secured by solder, as described.

2. The combination, with the pipe A and a conical distributer secured by solder, as described, of the valve C and stem *d*, provided with a screw-thread engagement with the distributer, constructed to allow the valve to be forced to its seat, as described.

3. The combination, with the pipe A, provided with a valve-seat at its upper end, and a distributer secured by fusible solder around the discharge-opening, of a valve the stem of which is secured in the distributer, and the body of which is made in part of a fusible material, as described.

257,550. PROCESS OF AND APPARATUS FOR GENERATING GASES FOR MOTIVE POWER, HEATING, AND ILLUMINATING PURPOSES. WILLIAM FRANK BROWNE, New York, N. Y. Filed Aug. 16, 1881. (No model.)

Claim.—1. A generating coil or conduit having the projecting ends thereof extending through the wall of the furnace tangentially to the inner and outer turns of the coil and the inner end of the coil, and its projection bent down and extending below the bends of the coil and furnishing a support therefor.

2. A series of flat contiguous coils or conduits having suitable end connections uniting all the coils with each other, in combination with the shell of the furnace for the circulation of liquid throughout the series.

3. A series of spiral coils having the outer bends thereof connected by external return-bends and couplings, and also the inner bends thereof connected by return-bends and couplings to form a continuously-connected conduit, whereby a continuous circulation of liquid is secured throughout the series.

4. A series of coils having their ends projecting through the wall of the furnace substantially parallel to each other, and having all their return fittings and couplings outside of the wall of the furnace.

5. In combination with the coils, the hollow supporting pipes or bars passing through the furnace and having suitable end connections, as and for the purpose described.

6. In combination with the supporting hollow bars, the means for causing a circulation of liquid therein, which consists in the stand-pipe H, containing water under pressure, pipe m^3, having valve 17, pipe a^3, having valve 18, pipe p^3, having valve 20, and steam-dome M, operating as described.

7. The furnace containing the generating-coils, constructed with a double shell extending from the base to the bonnet, the outer shell having apertures at the top and the inner shell having apertures at the bottom opening into the ash-pit, in combination with the circular damper s^4, for the purpose of utilizing the heat and heating the air supplied to the fuel.

8. The shell of the furnace, having in combination therewith a door or doors extending from the base to the bonnet and nearly one-half of the circumference of the shell, for the purpose of removing and inserting the generating-coils and other internal parts, as described.

9. The double shell of the furnace, in combination with the double shell of the door, in which the inner furnace-shell overlaps the hinge-joint for preventing leakage, as described.

10. In combination with the engine operated by gas or vapors of liquid combustibles, the exhaust-pipe g', having valve 10, and the superheating-coil O, as and for the purpose described.

11. In combination with the superheating-coils, the stand-pipe H, pipe y, having valve 16, pipe x^3, pipe g, having plug-cock 14, pipe w', and the dome M, as and for the purpose described.

12. The means for returning the liquids which are trapped off from the generator to the pump, and thence forcing them again into said generator, which consists of a pipe, a', connected with the generator, the trap I, chamber C', pump E', return-pipe o, and the necessary connections and valves, as described.

13. The water-supply pipe c', the oil-supply pipe k, and the pump E', in combination with a conducting-pipe, o, and a gas-generating apparatus.

14. The process of generating gas which consists in forcing products of combustion from the furnace and carbonaceous material by a combined jet of steam and carbonaceous vapor under pressure through a heated coil or conduit.

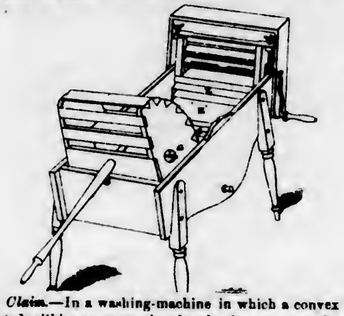
15. The process of generating gas which consists in forcing products of combustion and pulverized solid carbonaceous matter by a jet of steam through a heated conduit.

16. The process of generating gas by first converting liquid hydrocarbon and water into vapor or gas, and by a jet of the combined vapor forcing the products of combustion into a heated conduit and converting the mixture into a fixed gas.

17. The pipe Q, connected with the stack, the receptacle T, connecting-pipe V, pipe g^3, and the injecting device, in combination with a coil or conduit located in the furnace.

18. The counterbalanced valve i^3, provided with a guide-stem, w^3, in combination with its seat h^3 within the stack, as and for the purpose described.

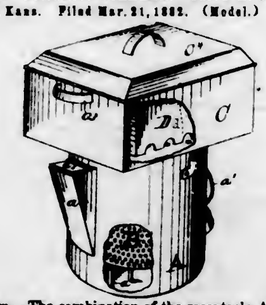
19. The stack having a counterbalanced valve and seat therefor, as described, in combination with the outlet-pipe Q.



20. The pipe Q, connecting with the stack, the pipe g^3, for steam and oil vapor, and the injecting device, in combination with the heating-coils located in the shell.

21. The pipe g^3, for steam and oil vapor, the injecting device, the receptacle T, for pulverized carbonaceous matter, and a connecting-pipe, in combination with a coil or conduit located in the furnace.

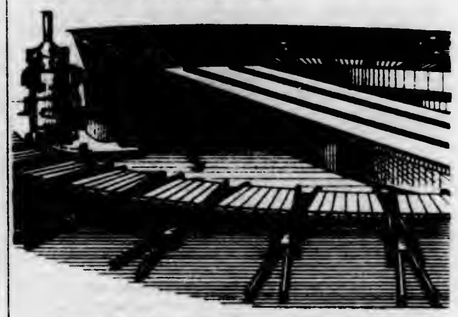
22. The engine and a pipe connected with its exhaust-ports, in combination with the hollow perforated grate d^3, located in the base of the generator.



23. In a high-pressure gas-generating apparatus, the hollow perforated grate, in combination with the gas-generating conduits within said high-pressure gas-generating apparatus, for the purpose specified.

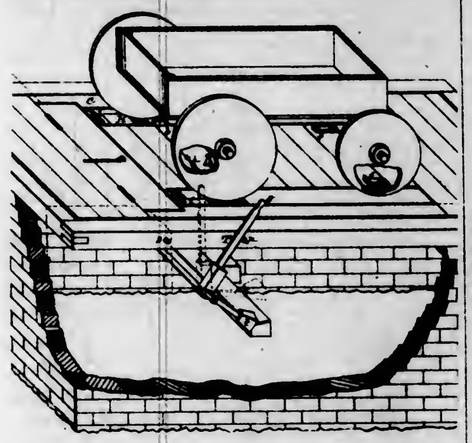
257,551. WASHING-MACHINE. ANTHONY W. BURKE, Stayner, Ontario, Canada. Filed Aug. 29, 1881. (No model.) Patented in Canada May 13, 1881.

Claim.—In a washing-machine in which a convex rubber is pivoted within an open chamber having a concaved corrugated bottom, the combination of dash-boards E, located at each end of the chamber, and inclined boards E', separating the dash-boards from the corrugations, and having their upper surfaces extending from the lower edges of the end corrugations to the under rear edges of the dash-boards E, substantially as and for the purpose specified.



257,552. DOMESTIC STEAMER. OLIVE M. CASSEY, Leavenworth, Kans. Filed Mar. 21, 1882. (Model.)

Claim.—The combination of the receptacle A, boiler B, oven C, and pans D, the said oven being provided with a flange, c, and perforations c', and the pans having depending flanges d^3 on three sides thereof, substantially as shown and described.



257,553. RAILROAD TURN-TABLE. JNO. B. COLLIS, Altoona, Pa. Filed June 27, 1881. (No model.)

Brief.—The table is rotated through a connected lever-arm, to the outer end of which is a locomotive.

Claim.—In combination with a turn-table, a locomotive, substantially as desired, and a lever-arm adapted for attachment to the turn-table, substantially as described.

257,554. DUMPING-PLATFORM. GEORGE H. CORMACK, Rockford, Ill. Filed Jan. 25, 1882. (No model.)

Claim.—1. A three-part dumping-platform consisting of a central portion and track side beams having a central pivot-support, the side beams and central portions capable of a pivotal dumping movement in unison or independent, substantially as and for the purpose hereinbefore set forth.

2. A three-part dumping-platform consisting of a central portion and side-track beams having a central pivotal support, the side beams and central portions capable of a pivotal dumping movement in unison or independent, and the central portion provided with lateral arms projecting in rear of the track side beams, to receive the wheels of the wagon, substantially as and for the purpose hereinbefore set forth.

3. The combination, with a three-part dumping-platform consisting of a central portion and track side beams having a common central pivot-support, the side beams and central portion capable of a pivotal dumping movement in unison or independent, of a pawl and detent connected with their respective parts and adapted to engage each other, substantially in the manner and for the purpose hereinbefore set forth.

4. The combination, with a three-part dumping-platform consisting of a central portion and track side beams having a common central pivot-support, the side beams and central portion capable of a pivotal dumping movement in unison or independent, of turn-buttons or other equivalent locking mechanism to limit the three-part platform to a unison of movement, substantially as and for the purpose hereinbefore set forth.

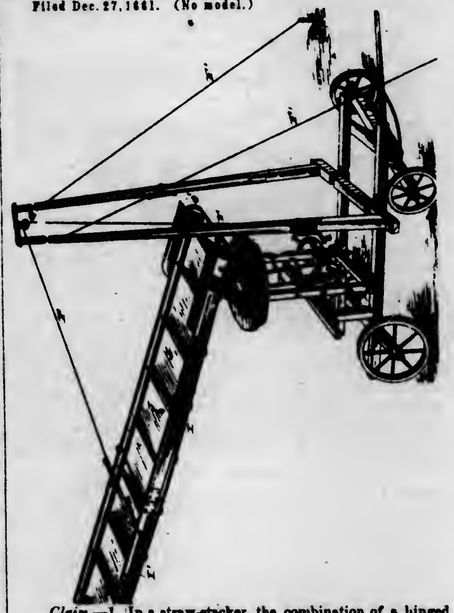
5. The combination, with a scale-platform, of a central three-part dumping-platform consisting of a central portion and track side beams having a common central pivotal support in the scale-platform and capable of a pivotal movement in unison or independent, substantially as and for the purpose hereinbefore set forth.

6. The combination, with the three-part dumping-platform, of pivoted standard-supports having their segment peripheral surface engage the rear ends of the central and side portions of the dumping-platform and capable of an oscillatory movement, substantially as and for the purpose hereinbefore set forth.

7. The combination, with the pivoted standard-supports of the dumping-platform, of a hand-lever for disengaging the supports from the platform and a weight operating to return the support to engage the platform and hold it in contact therewith, substantially as and for the purpose hereinbefore set forth.

8. The combination, with the three-part dumping-platform, of the hinged beam capable of its changed positions to limit the inclination of the dumping-platform to adapt it for use in connection with a wagon or sled, substantially as and for the purpose hereinbefore set forth.

257,555. SAFETY ATTACHMENT TO HARVESTERS. WILLIAM F. CORNELL and WESLEY SMITH, Adrian, Mich. Filed Mar. 21, 1882. (No model.)



Claim.—1. The combination of the rock-shaft F, having forked arm G, the sliding rod H, having forked arm I, flange K, and washer L, the spring M, interposed between said arm and washer, and mechanism for manipulating the rock-shaft by the raising and lowering of the driver's seat, as set forth.

257,556.

2. The combination of the seat-bar O, having plate P, provided with socket Q and opening R, the seat S, having stud T, the coiled spring U, placed in socket Q, encircling the stud T, the pin B', adjustable in transverse perforations in the socket and stud, the connecting-rod X, rock-shaft F, and mechanism operated by said rock-shaft for throwing the machine into or out of gear, as set forth.

257,556. STRAW-STACKER. HENRY CORTELYOU, Fairland, Ind., assignor of one-half to Frank Chapman, same place. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a straw-stacker, the combination of a hinged foldable derrick, the uprights thereof being made in two pieces, a carrier, a winding-drum, a pulley, and a rope, substantially as and for the purpose set forth.

2. In a straw-stacker mounted upon and in combination with a hinged foldable frame, a turn-table, as described.

3. The combination, in a straw-stacker, of a hinged foldable frame, a turn-table, and the running-gear, substantially as shown and described.

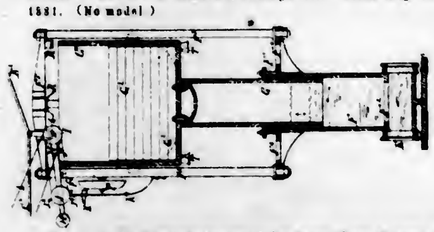
4. The combination, in a straw-stacker, of a carrier, a turn-table, a foldable supporting-frame, and the running-gear, substantially as shown and described.

5. The combination, in a straw-stacker, of a foldable frame, the running-gear, and two circular disks, one of which is movable about the other, substantially as shown and described.

6. A turn-table for straw-stackers, comprising a foldable frame and disks, as described, in combination with two pulley-shafts, one of said pulley-shafts passing through the foldable frame and the other being secured to one of the disks, as shown and described.

7. The combination, in a straw-stacker, of a pulley-shaft, X, the foldable frame, and suitable means whereby said shaft and the pulleys connected therewith are adjustably mounted in said frame, substantially as and for the purpose described.

8. The combination, in a straw-stacker, of a turn-table and a carrier made in two pieces, supported by and moving with the turn-



table, as described, a foldable derrick, pulleys, rope-drum, and rope, whereby the outer piece of the carrier may be raised and lowered by said rope, substantially as set forth.

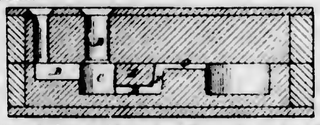
9. In a straw-stacker, the combination of the turn-table provided with two disks, and the driving-shaft, the running-gear, the carrier made in two pieces, I I', a rope, F, a pulley, drum, and the derrick, substantially as and for the purpose described.

10. In a portable straw-stacker, the combination of a folding derrick made in two parts, a folding frame, a turn-table, the running-gear, and a carrier made in two parts, the lower end of the derrick, when not raised, being adapted to fall back and rest on a support on the running-gear, the upper end falling forward and resting on the carrier, the outer end of the carrier falling forward on the inner end, and the table and frame folding forward on the running-gear, substantially as and for the purpose set forth.

11. In a portable straw-stacker, the combination of a folding derrick and turn-table, provided with a movable disk, with a carrier made in two parts and provided with an endless belt or apron and actuating-shaft, a driving-belt, and a pulley-shaft, L, secured to the movable disk of the turn-table, substantially as and for the purpose set forth.

257,557. PRESSURE-REGULATOR FOR WATER-SUPPLY MAINS. DEWITT C. CREGIER, Chicago, Ill. Filed Aug. 12, 1881. (No model.)

Claim.—1. In a system for supplying water from a pump or analogous forcing means, the plunger G, made air-tight at the top and sides and sealed with water at the bottom, in combination with means for depressing it with a yielding force, and with the case F, stuffing-box F', and pipe E, as herein specified.



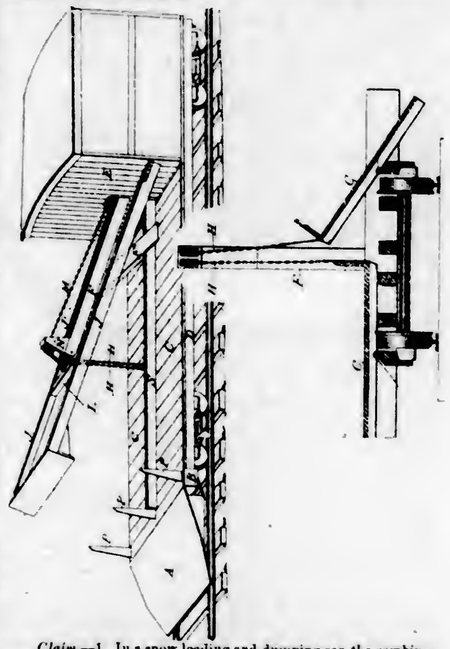
2. The carriage G', open at top, and plunger G, open at bottom, in combination with each other and with the removable weights G², guides F", pipe E, and pump D, as herein specified.

3. In combination with a pipe, E, and means for forcing water therethrough, the loaded hollow plunger G, bell P, hammer K, and means J', actuated by the engine for operating the hammer, and actuating devices H, for automatically bringing the operating means into and out of action as the plunger G rises and sinks, as herein specified.

4. In combination with the engine C, pump D, pipe E, and loaded hollow plunger G, the lever or movable piece H, operating the rods B² C², to control the speed of the pump, substantially as herein specified.

5. In combination with a lever, H, actuated by the rising and sinking of the hollow plunger G, the pulley I, and actuating-belt I', the pulley J and actuating-belt J', and pins J², hammer K, and bell P, arranged for joint operation, as herein specified.

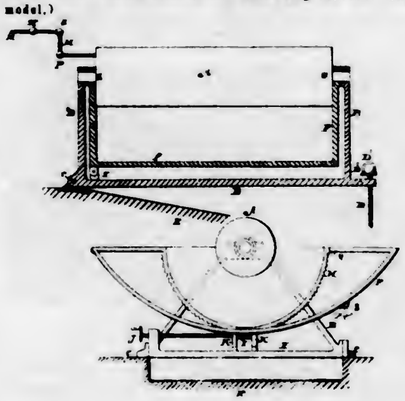
257,558. DEVICE FOR CASTING METALS. RICHARD CROSS and JAMES GABRIEL, Cleveland, Ohio. Filed Feb. 15, 1882. (No model.)



Claim.—1. In a mold prepared for casting metals, the circular chamber C, having the inlet B and outlet E in tangential directions and at different levels, and the vertical opening D, substantially as described.

2. In a mold prepared for casting metals, the combination of the inlet B, the circular chamber C, the opening D, the channel E, and the vertical channel F, substantially as described.

257,559. SNOW LOADER AND DUMPER. JAMES DAVIES, Mitchell, Dak., assignor of one half to John M. Washburn and Edward C. Currey, same place. Filed Dec. 31, 1881. (No model.)



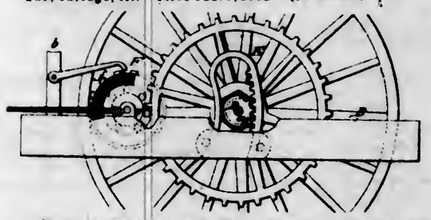
Brief.—A car is provided at one end with an inclosing shield and at the other with a plow and cutters. Pivoted platforms are adapted to be raised and lowered by chains secured to cross-beams of the platform and passing through rigid brace-pieces. A breaker consisting of beams hinged to the shield and joined at their forward end by a knife is arranged to be raised and lowered, to separate the mass from the drift.

Claim.—1. In a snow loading and dumping car, the combination, with a pivoted platform, C, raised and lowered by chains H, secured to the center of the cross-beams of the platform and passing through the rigid brace-piece F, of a breaker consisting of the beams J J', hinged to the shield E and actuated by a chain, M, passing over a roller supported on the rigid brace-piece F, substantially as described, and for the purpose set forth.

2. In a snow-car, as described, the combination of the pivoted platform-pieces C, the breaker-frame J J', pivoted to the shield E, and moving on each side of the brace F, said brace provided with pulleys for the passage of chains H M, actuating the platform and breaker-frame, and the plow A, cutters P, and inclosing-shield E, substantially as shown and described, and for the purpose set forth.

257,560. APPARATUS FOR UTILIZING SOLAR HEAT. GEO. W. DRIVSLER, San Francisco, Cal. Filed Aug. 12, 1881. (No model.)

Claim.—1. The combination of a reflector of the described shape with a heat-receiver of substantially cylindrical form, and mounted and adjusted upon the focal line of the reflector.



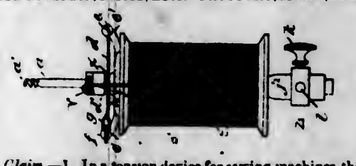
2. The combination of the parallel and cylindrical reflector F and heat-receiver A with the regulating devices composed of the screws D' D", crank D², hinges c, frame B, trunnion G, gear H, screw I, crank J, base E, orienting-bracket Q S, or other equivalent.

3. The combination of the jacket T, made of non-conducting material, with the heat-receiver A and reflector F.

4. The improved apparatus for concentrating and applying the heat-rays of the sun, consisting of a mirror straight in longitudinal direction, and of parabolic or equivalent curve in cross-section, adapted to concentrate the heat of the sun-rays on a focal line, in combination with the heat-receiver mounted on the axis of the mirror.

257,561. WITHDRAWN.

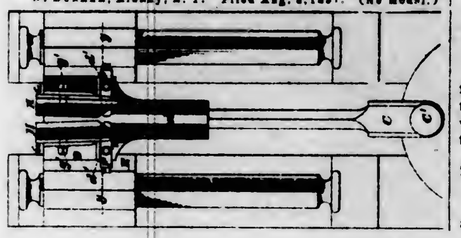
257,562. HARVESTER. ROBERT H. DIXON and JOHN F. STEWARD, Chicago, Ill. Filed Jan. 9, 1882. (No model.)



Claim.—1. In a harvester, the frame-work supported upon the drive-wheel by means of the segments E E', and the axle provided with pinions that roll therein, the gear C, for giving the pinions rotation, in combination with means for operating said gear located concentric with the segments, substantially as described.

2. The combination of the segments and the axle-pinions rolling therein with the gear C and pinion F, their radii being equal to the radius of the segment, and the axis of said pinion being coincident with the center of said segment, substantially as described.

3. The segments, the axle provided with pinions, the gear C, and the pinion F, located concentric with the segments, in combination with means for actuating them, substantially as described.



257,563. TENSION DEVICE FOR SEWING-MACHINES. WILLIAM DUCHEMIN, Boston, Mass. Filed Feb. 9, 1882. (No model.)

Claim.—1. In a tension device for sewing-machines, the transverse tension-spring d, adjusting-screw f, and groove x, arranged and located as and for the purpose described.

2. In combination, the revolving shaft a, having a central spiral-formed exit, a', the cross-bar b b, having the central boss, d', provided with the groove x, and arms c c, having the loops w r, the tubular shaft j, having the shoulder-plate h, with the lugs e' e', the set-screw e, adjusting-screw f, transverse tension-spring d, and block j', provided with the thumb-screw k and rod l, all arranged and located as and for the purpose set forth.

257,564. MACHINE FOR BEVELING CLOTH-BOARDS. JOHN W. DUNHAM, Albany, N. Y. Filed Aug. 8, 1881. (No model.)

Claim.—In a machine for scarfing or beveling cloth-boards, the combination of the reciprocating knife-stock D, having a perpendicular groove, d, horizontally-adjustable gages F, and the diverging and inclined knives H, as and for the purposes described.

257,565. WIRE STAPLE. PATRICK DUNN and THOMAS HARRIS, Côte Saint Paul, Quebec, Canada. Filed Dec. 13, 1881. (No model.)

Claim.—1. As an improved article of manufacture, a wire staple having the crown or head depressed or indented, as set forth, for the purpose described.

2. A wire staple having the crown or head depressed or notched, as described, and the points of the legs beveled on the outside, as shown, for the purpose set forth.

3. A wire staple having the crown or head depressed or notched and the extremity of the legs beveled downwardly from the outer to the inner side to form a point and prevent the legs spreading when driving.

4. A wire staple having the head or crown depressed or notched, one point cut beveling on the outside and the other cut parallel thereto and turned inwardly, as set forth, for the purpose described.

257,566. COMMUTATOR FOR MAGNETO-ELECTRIC MACHINES. ARTHUR H. RODY, Hartford, Conn. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a commutator, the combination of the several insulated strips and the recessed head, into which they are forced and by which they are held together, substantially as described, and for the purpose specified.

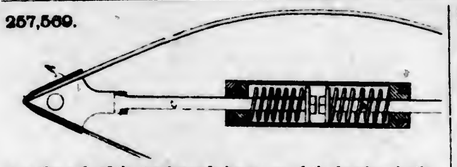
2. In a commutator, the combination of the recessed head, the several strips having the shoulder b, the bolt F, and shaft D, substantially as described, and for the purpose specified.

3. In a commutator-strip, the body E and wearing-plate a, having their confronting sides made flat, as shown, and having the head of the deeply-slotted screw d sunk into the strip a nearly to the flat side of said strip, substantially as described, and for the purpose specified.

257,567. METHOD OF REMOVING IRON FROM FERRUGINOUS SALINE SOLUTIONS. CONSTANTIN FAHLBERG and CONRAD SEMPER, Philadelphia, Pa., assignors to John Harrison, Geo. L. Harrison, Jr., and Thomas S. Harrison, all of same place. Filed Nov. 23, 1881. (No specimens.)

Claim.—1. The method of removing iron from a ferruginous solution of the salt of a metal, alkali, or alkaline earth, which consists in treating said ferruginous solution with plumbic dioxide, either by adding said plumbic dioxide to said solution or by converting a neutral monobasic or polybasic salt of lead or an oxide of lead into plumbic dioxide in said solution.

2. The method of manufacturing sulphate of alumina or aluminous cake free, or almost free, from iron, which consists in treating ferruginous aluminous solutions with plumbic dioxide in the manner set forth.



257,568. RECOVERY OF PLUMBIC DIOXIDE FROM FERRUGINOUS SOLUTIONS. CONSTANTIN FAHLBERG and CONRAD SEMPER, Philadelphia, Pa., assignors to John Harrison, Geo. L. Harrison, Jr., and Thomas S. Harrison, all of same place. Filed Nov. 23, 1881. (No specimens.)

Claim.—The process of purifying waste plumbic dioxide and ferric plumbate produced in the process of precipitating iron from ferruginous solutions, which consists in treating said waste mass with nitric or other acid or acid-salt, for the removal of the iron therefrom, as specified.

257,569. ELLIPTIC SPRING. HIRAM GARDINER, New York, N. Y. Filed Jan. 7, 1882. (No model.)

Claim.—1. The V-shaped sockets constructed and operating, as set forth, to conform to and hold the elliptical plates, and to se-

257,569.

cure the ends of the tension-rods by means of the bearings in the apex of the socket, and the bearing having the tapered opening across the base of the socket.

2. The V-shaped socket having an opening in its apex and a conical opening or seat in its base, in combination with a tension-rod having an upset or conical head adapted to be passed through the opening in the apex, and seated in the base, substantially as described.

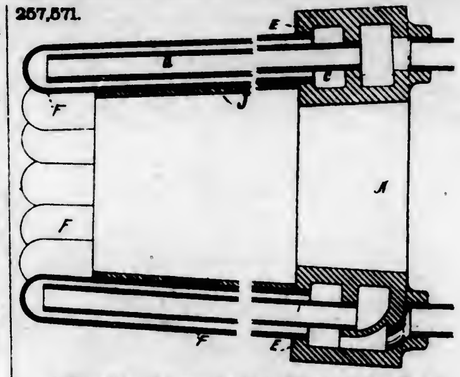
3. The cylinder constructed in two parts, as described, with bosses cast on each end to receive thread and nuts to hold the two halves of the cylinder together, in combination with spiral spring E, truss-rods C, and knuckle A, all for the purposes set forth.

257,570. CHURN. JOHN GIFFORD, Watertown, N. Y. Filed Dec. 22, 1881. (No model.)

Claim.—1. The intermittingly-revolving vessel B, mounted upon anti-friction rollers, and having an intermittent movement imparted to it by the wheels F, F', and F², whereby the cream is dashed from side to side of the vessel when the movement takes place, substantially in the manner and for the purpose set forth.

2. The combination of the rectangular intermittingly-rotating vessel B and the wheels F F' F², dogs or ratchets F³ and F⁴, springs F⁵ and F⁶, pinion G, and connecting-rod F', for giving to the vessel B an intermittent rotative movement, substantially as and for the purpose set forth.

3. The combination of the automatically-operative and intermittingly-opening valve C, bent arm C', spring C², slotted plate C³, strip C⁴, projection C⁵, and the set-screw C⁶, the arrangement of the parts being substantially such as described, whereby they are made to ventilate the vessel B during the operation of churning, as set forth.

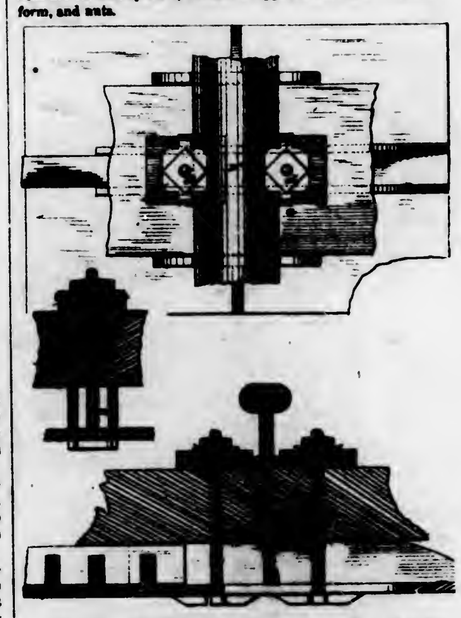


4. The combination of the vessel B, the hollow journal B', the pipe D, the eccentric D², and sliding valve D³, the parts being arranged for joint operation substantially as and for the purpose set forth.

5. The combination of the vessel B, the pipe D, the wire E', and bell E, the parts being arranged substantially as and for the purpose set forth.

257,571. TUYERE. PHIN. W. GORDON, Pittsburg, Pa. Filed Feb. 23, 1882. (No model.)

Claim.—1. The casting A, having two annular passages, B and C, each with an external connection, the closed pipes F, and the internal pipes, G, combined substantially as set forth.

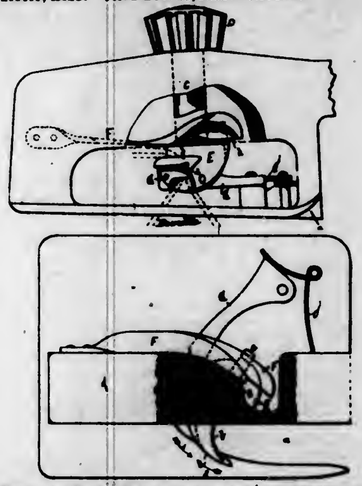


257,571.

2. The casting A, convergent pipes F, internal pipes, G, and inner shell, J, combined substantially as set forth.

257,572. RAILROAD CHAIR AND TIE. LEVI HAAS, Chester, Pa. Filed Feb. 15, 1882. (No model.)

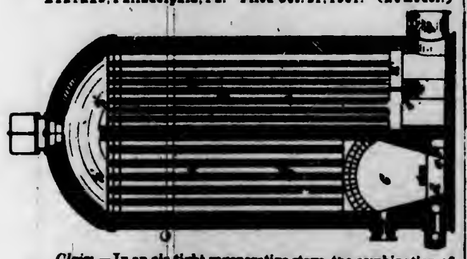
Brief.—A bed-plate is provided with a rail-supporting seat consisting of right-angled crossing web and oblong socket and upright side pieces, the whole being constructed of one piece of metal. A notched tie rod or bar connects the chair-plates together. The rails are secured by bolts, washers of approximate concave-convex form, and nuts.



Claim.—1. The bed-plate having the right-angled crossing web and socket and the side pieces, in combination with the block, the track-rail, and means of fastening for connecting the whole together, substantially as and for the purpose set forth.

2. In a railroad structure, the bed-plate and the rail-support seat, consisting of right-angled crossing-web *a*, having oblong socket *a'*, with spaced-apart pieces *a²* and upright side pieces, *a³*, all combined and constructed of one piece of cast-iron, substantially as and for the purpose specified.

3. The combination of the base-plate having the right-angled crossing web and oblong socket provided with cross-pieces, and the side pieces, the base-block, the slotted or notched tie rod or bar, the chair-plates, the washers, concave-convex in shape, and having flanges, the headed and nutted bolts, and the rail, substantially as and for the purpose set forth.

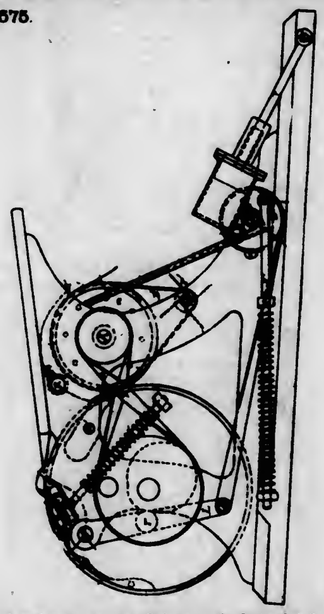


257,573. KNOT-TYER FOR GRAIN-BINDERS. PAUL HANSON, Rochester, Minn. Filed Nov. 25, 1881. (Model.)

Claim.—1. The knotter consisting of the head E, having the fixed barbed jaw *b* and the pivoted jaw *c*, in combination with the spring F, having the cam-surface *i* and a flat portion, *h*, adapted to act upon the jaw *c* to open it when the knotter is revolved in one direction and to close it when the knotter is reversed, substantially as set forth.

2. The knotter consisting of the head E, having the fixed barbed jaw *b* and the pivoted jaw *c*, in combination with the spring F, having the cam-surface *i* and a flat portion, *h*, adapted to act upon the jaw *c* to open it when the knotter is revolved in one direction and to close it when the knotter is reversed, and a spring-dog, G, for casting off the loop from the hooks, substantially as set forth.

257,574. REGENERATIVE STOVE FOR HEATING AIR. J. M. HARTMAN, Philadelphia, Pa. Filed Oct. 21, 1881. (No model.)



Claim.—In an air-tight regenerative stove, the combination of the combustion-chamber C at the bottom of the stove, the separate regenerator A above the combustion-chamber, the separate regenerator B, both constructed with vertical passages, and the division-wall *f*, projecting above the said regenerators, substantially as described.

257,575. SHEET-DELIVERY APPARATUS FOR PRINTING-PRESSES. JOHN T. HAWKINS, Taunton, Mass. Filed Nov. 26, 1880. (No model.)

Claim.—1. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of frictional-surfaced sheet-driving wheels suitably spaced upon a common axis, and curved sheet-guides in contact with and conformed to the peripheries of said wheels and rigidly mounted upon a shaft above the same, all arranged and operating substantially as and for the purpose set forth.

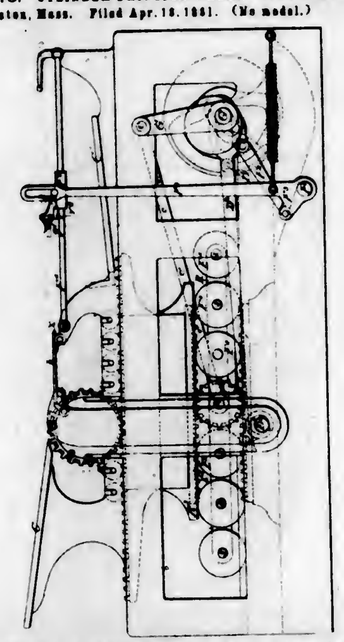
2. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of frictional-surfaced sheet-driving wheels suitably spaced upon a common axis, and curved sheet-guides in contact with and conformed to the peripheries of said wheels and rigidly mounted upon a shaft above the same, a revolving fan, a fly or delivery-frame consisting of an oscillating or vibrating hollow shaft having secured thereto hollow perforated bars or fingers, and provided with means, substantially as described, for forcing a current of air through perforations in said fingers, substantially as and for the purpose set forth.

257,575.

scribed, to force a current of air upon the last-printed side of each sheet of paper when discharged from between said wheels and guides, substantially as and for the purpose set forth.

3. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of frictional-surfaced sheet-driving wheels suitably spaced upon a common axis, curved sheet-guides in contact with and conformed to the peripheries of said wheels and rigidly mounted upon a shaft above the same, a revolving fan, and an oscillating fly, all arranged and operating substantially as and for the purpose set forth.

4. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, a fly or delivery-frame consisting of an oscillating or vibrating hollow shaft having secured thereto hollow perforated bars or fingers, and provided with means, substantially as described, for forcing a current of air through perforations in said fingers, substantially as and for the purpose set forth.



5. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, in combination with a revolving fan, a fly or delivery-frame consisting of an oscillating or vibrating hollow shaft having secured thereto hollow perforated bars or fingers, and provided with means, substantially as described, for forcing a current of air through perforations in said fingers, substantially as and for the purpose set forth.

6. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, in combination with a hollow fly-shaft having hollow perforated fingers, an air-pump connected thereto, whereby a current of air is forced through the perforations in said fingers during the forward or delivery oscillation of the fly, substantially as and for the purpose set forth.

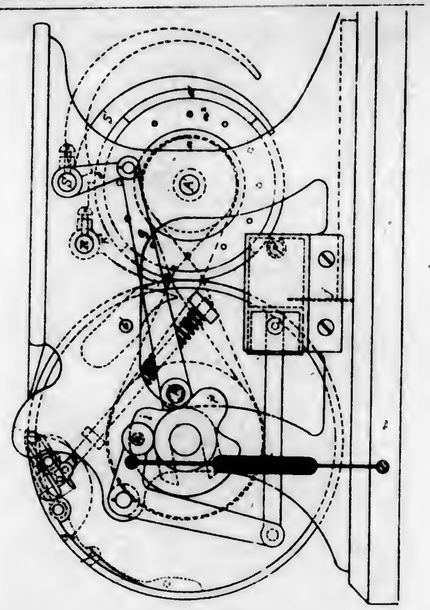
7. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of frictional-surfaced sheet-driving wheels suitably spaced upon a common axis, curved sheet-guides in contact with and conformed to the peripheries of said wheels and rigidly mounted upon a shaft above the same, an oscillating hollow fly-shaft provided with hollow perforated fingers, and an air-pump, all arranged and operating substantially as and for the purpose set forth.

8. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of frictional-surfaced sheet-driving wheels suitably spaced upon a common axis, curved sheet-guides in contact with and conformed to the peripheries of said wheels and rigidly mounted upon a shaft above the same, a revolving fan, a hollow fly shaft provided with perforated fingers, and an air-pump, all arranged and operating substantially as and for the purposes set forth.

257,576. CYLINDER PRINTING-PRESS. JOHN T. HAWKINS, Taunton, Mass. Filed Apr. 18, 1881. (No model.)

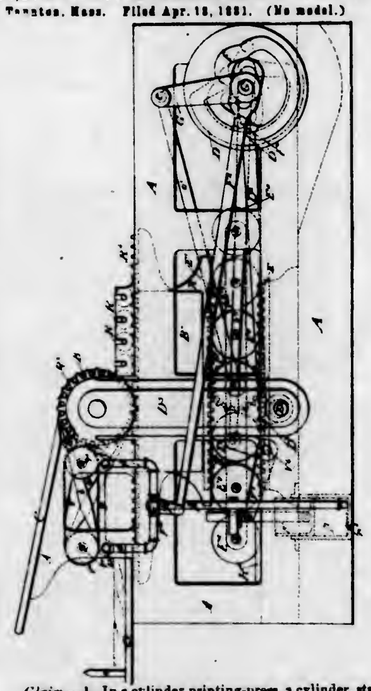
Claim.—1. A printing-machine having an impression-cylinder geared directly and continuously to a reciprocating bed and alternately rotated thereby an equal distance in each direction, in combination with means, substantially as described, for taking a printed sheet head first from the top of the impression-cylinder and discharging said sheet partly during said cylinder's direct or printing rotation and partly during its retrograde or non-printing rotation, substantially as and for the purposes set forth.

2. In a cylinder printing-press, in combination with a reciprocating bed and an impression-cylinder geared thereto, so as to make a greater rotation than one complete revolution in each direction to a single stroke of the bed, a series of stripper-fingers and a series of traveling sheet-grippers, whereby the sheets are first partially delivered to and upon said fingers by said cylinder during a part of its forward rotation, and then during its retrograde motion removed by said grippers from said cylinder and fingers and completely delivered upon the fly-board, substantially as set forth.



257,577. SHEET-DELIVERY APPARATUS FOR PRINTING-PRESSES. JOHN T. HAWKINS, Taunton, Mass. Filed Nov. 26, 1880. (No model.)

Claim.—1. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of sheet-driving wheels, stationary sheet-guides, and movable sheet-guides, arranged and operating substantially as and for the purposes set forth.



2. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, sheet-driving wheels, and stationary and movable sheet-guides, in combination with means, substantially as described, to force a current or jets of air over or upon the sheets as delivered, substantially as and for the purposes set forth.

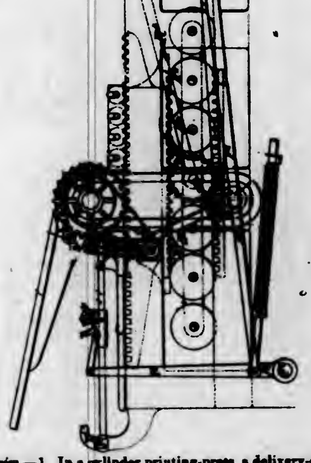
3. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of sheet-driving wheels, stationary and movable sheet-guides, and an air-pump provided with a perforated discharge-pipe, all arranged and operating substantially as and for the purposes set forth.

4. In a cylinder printing-press or other machine requiring a similar disposition or delivery of sheets of paper therefrom, the combination of sheet-driving wheels, stationary and movable sheet-guides, a fly-board provided with sheet-stops, and means, substantially as described, to force a current of air over or upon the sheets in course of delivery, all arranged and operating substantially as and for the purposes set forth.

257,578. CYLINDER PRINTING-PRESS. JOHN T. HAWKINS, Taunton, Mass. Filed Apr. 18, 1881. (No model.)

Claim.—1. In a cylinder printing-press, a cylinder, stationary sheet-guides, frictional-surfaced sheet-driving wheels, and means for forcing two series of jets of air under the sheets of paper in the course of delivery, in combination with means for transmitting motion to said parts, as described, each movement being so timed in relation to the others that one series of air-jets is first forced against the surface of the cylinder under the tail edge of each sheet, and then the sheet is delivered tail first from the top of the cylinder to and between said sheet-guides and frictional-surfaced driving-wheels, and finally discharged upon another series of air-jets to the fly-board, all substantially as set forth.

2. In a cylinder printing-press, in combination with a reciprocating bed and an impression-cylinder provided with sheet-supporting fingers, and geared to said bed so as to make a greater rotation than one complete revolution of the cylinder to a single stroke of the bed in each direction, a series of stationary sheet-guides, sheet-driving wheels and jet-pipes, and means, substantially as described, for forcing air through said pipes, substantially as and for the purposes set forth.



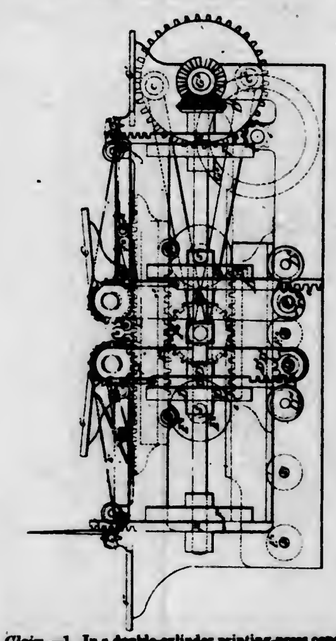
3. In a cylinder printing-press, the combination, with the cylinder, of means, substantially as described, for alternately forcing jets of air first under the delivery edge of the sheet to raise it from the cylinder, and then under the body of the sheet to float it in horizontal projection to the delivery-board, whereby the use of tapes, cords, and fly is entirely eliminated from the delivery mechanism, substantially as and for the purposes set forth.

4. In a cylinder printing-press, in combination with the cylinder and secured thereto, a series of stationary but adjustable sheet-supporting fingers, whereby the margin of the sheet is supported out of contact with the surface of the cylinder, thereby facilitating the delivery of the sheet, substantially as set forth.

5. In a cylinder printing-press, the combination, with the cylinder provided with a series of stationary but adjustable sheet-supporting fingers, of means for forcing jets of air against the surface of the cylinder between said fingers and under the sheet to be delivered, substantially as and for the purposes set forth.

6. In a cylinder printing-press, the combination, with a series of two or more jet-pipes, of means, substantially as described, for alternately forcing air-jets through said pipes, whereby the edge of the sheet to be delivered is first elevated by one series of jets preparatory to its delivery and the delivery completed by the support given to the sheet by another series of jets, substantially as and for the purposes set forth.

257,579. CYLINDER PRINTING-PRESS. JOHN T. HAWKINS, Taunton, Mass. Filed Apr. 18, 1881. (No model.)



Claim.—1. In a cylinder printing-press, a delivery-cylinder, a series of oscillating stripper-fingers provided with rotary brushes and reciprocating or traveling sheet-grippers, in combination with means, substantially as described, for transmitting motion to said parts, each movement being so timed in relation to the others that each sheet is delivered tail first from the back and top of the cylinder upon said stripper-fingers, and thence seized and the delivery of the sheet completed by said grippers, substantially as and for the purposes set forth.

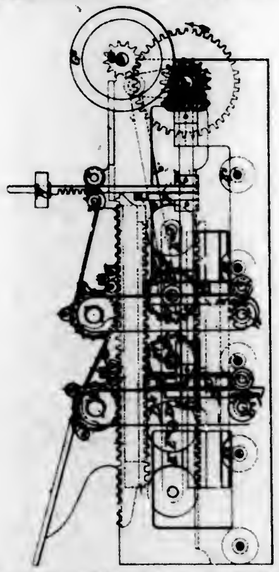
2. In a cylinder printing-press, in combination with a reciprocating bed and an impression-cylinder and geared to said bed, so as to make a greater rotation than one complete revolution of the cylinder to one stroke of the bed in each direction, a series of oscillating stripper-fingers provided with rotary brushes, and reciprocating or traveling sheet-grippers situated at the back of the cylinder, substantially as and for the purposes set forth.

3. In a cylinder printing-press, in combination with its cylinder, a series of oscillating or vibrating sheet stripper-fingers, a series of rotary brushes, and means, substantially as described, for imparting motion to said parts, whereby the edge of each sheet is elevated and stripped from the cylinder, substantially as set forth.

257,580. DOUBLE-CYLINDER PRINTING-PRESS. JOHN T. HAWKINS, Taunton, Mass. Filed Apr. 18, 1881. (No model.)

Claim.—1. In a double-cylinder printing-press constructed to print one side of a sheet for each single stroke of a reciprocating type-bed, two impression-cylinders geared continuously to and alternately rotated in the same direction by said bed, in combination with means, substantially as described, for delivering the sheets from each cylinder, whereby each sheet is delivered from its respective cylinder tail first as the cylinder retrogrades, and without contact of its last-printed side with any part of the delivery mechanism, substantially as and for the purposes set forth.

2. In a printing-press provided with a reciprocating type-bed, the combination, with said bed, of a reciprocating counter-balance or counter-weights and means, substantially as described, for causing said counter-balance to move in opposition to said bed and attached parts, said counter-balance being thus caused to equilibrate the momentum of the type-bed and other reciprocating parts of the machine, all substantially as set forth.



3. In a printing-press provided with a reciprocating type-bed, the combination, with said bed, of a reciprocating counter-balance provided with a pocket or pockets for holding an additional weight or weights, and means, substantially as described, for causing said counter-balance to move in opposition to said bed, whereby the momentum of the bed is equilibrated and the inertia and momentum of the counter-balance varied at will, substantially as and for the purposes set forth.

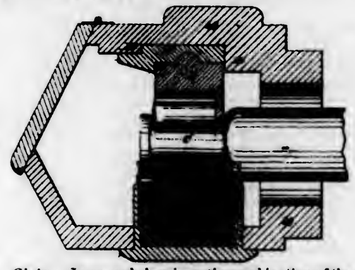
4. In a double-cylinder printing-press constructed to print one side of a sheet for each single stroke of a reciprocating type-bed, two impression-cylinders geared to and alternately rotated in the same direction by said bed, and a reciprocating counter-balance, in combination with pinions rolling between fixed racks, and

racks upon the bed and counter-balance, and connected to opposite cranks for actuating said pinions, bed, and counter-balance, whereby a higher speed of press is obtained than in presses otherwise constructed, as hereinbefore described, all substantially as and for the purposes set forth.

5. In a cylinder printing-press, an impression-cylinder provided with a flexible or yielding sheet-supporting blade and bearing-surfaces, as described, in combination with a type-bed provided with a pair of bearers corresponding to but wider than said bearing-surfaces on the cylinder, and engaging said sheet-supporting blade at the moment the cylinder makes the impression at that point, thereby bringing the blade in close contact with the cylinder, whereby said blade is caused to support the tail of the sheet and keep it raised from the surface of the cylinder for purposes of delivery, except at the point of contact indicated, when the blade is pressed close to the cylinder, clear of the type-surface and chase or furniture of the bed, substantially as set forth.

257,581. PERFECTING PRINTING-PRESS. JNO. T. HAWKINS, Taunton, Mass. Filed Apr. 16, 1881. (No model.)

Claim.—1. In a perfecting printing-press, in combination with one reciprocating type-bed carrying two forms, two impression-cylinders geared to and continuously rotated in opposite directions by said bed, and arranged, substantially as described, so that one cylinder takes the sheet at or near its top when practically at rest for printing the first side of the sheet, and the other cylinder takes the sheet at or near its bottom when practically at rest, as delivered from the top of the first cylinder, for printing the second side of the sheet, substantially as and for the purposes set forth.

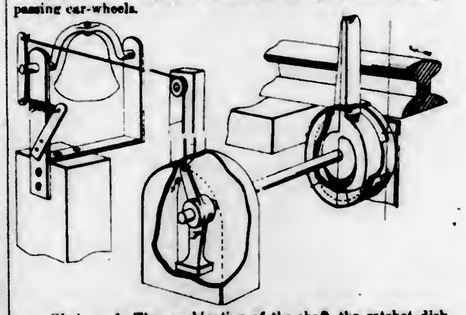


2. In a perfecting printing-press, in combination with one reciprocating type-bed carrying two forms, two impression-cylinders and two sets or series of fingers or strippers, all arranged and operating, substantially as described, so that one cylinder delivers each sheet head first from its upper side to and upon one set of said fingers or strippers inclined to the lower side of the other or second cylinder, whence the sheet is taken by the second cylinder and delivered tail first upon the second set of fingers or strippers, substantially as and for the purposes set forth.

3. In a perfecting printing-press, in combination with one reciprocating type-bed carrying two forms, one or more reciprocating weights provided with a rack or racks, and one or more gear-wheels running upon a stationary stud or studs and geared intermediately to said rack, and a rack or racks attached to the type-bed, said weights being so proportioned as to equilibrate the moments of the reciprocating bed and attached parts, substantially as set forth.

4. In a perfecting printing-press constructed to print from two forms upon a reciprocating type-bed, in combination with two impression-cylinders continuously geared to and rotated by said bed, an automatic feeding and sheet-cutting apparatus, consisting of sheet-cutting cylinders d^{11} and d^{12}, the pressure or feeding roller j^2, the strippers or fingers d^{14}, the tape-rollers j^7 and j^8, their tapes k^3, and the lifting pressure or feed rollers j^9, whereby paper in the roll is automatically fed in the machine, cut into sheets, and said sheets fed by the first-impression cylinder, substantially as set forth.

5. In a cylinder printing-press, in combination with cylinder-grippers provided with cam-shaped hubs, sheet-lifter fingers consisting of thin slotted blades resting upon said hubs, whereby the sheet is gripped between the upper face of the sheet-lifter fingers and the lower face of the grippers and the edge of the sheet lifted from the cylinder's surface by the operation of the grippers, substantially as and for the purposes set forth.



257,582. CAR-AXLE BOX. MARSHALL HAYDEN, New Milford, Pa. Filed Dec. 24, 1881. (Model.)

Claim.—In car-axle bearings, the combination of the saddle I, provided with separate cells for the anti-friction rollers, and having a projecting head on top, with the plate F, provided with a hollow to correspond with the projections on saddle I and the recess in the axle-box A, substantially as and for the purpose described.

257,583. SIGNALING APPARATUS FOR RAILROAD-CROSSINGS. JAMES H. HAYES, Corro Gordo, Ill. Filed Oct. 17, 1881. (No model.)

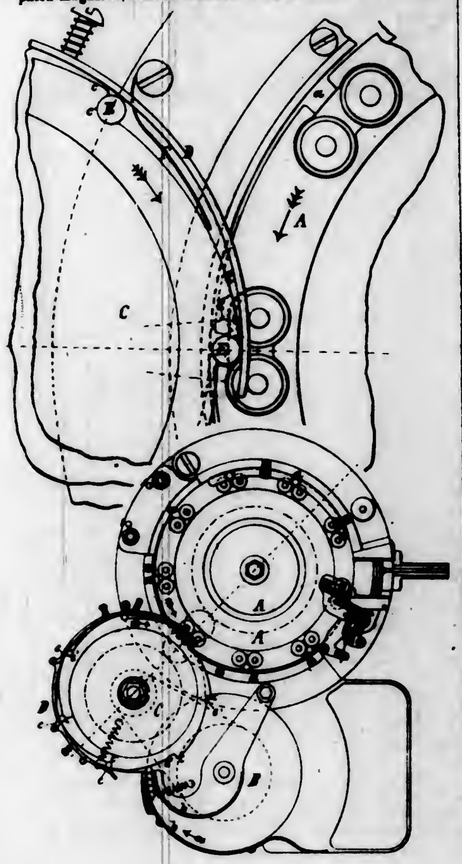
Brief.—A signal is operated through connection with a counterweighted shaft carrying a ratchet, which is engaged by a weighted operating-lever, which is disengaged from said ratchet after a partial revolution, and is automatically returned to a vertical position to re-engage the ratchet when again acted upon by passing car-wheels.

Claim.—1. The combination of the shaft, the ratchet-disk thereon, the vibratory operating-lever co-operating with the ratchet-disk, and weighted to bring it back to normal position, and a stop for disengaging the lever from the ratchet-disk at the proper time, substantially as described.

2. The combination of the shaft, the ratchet-disk thereon, and the vibratory operating-lever co-operating with the ratchet-disk, and weighted to bring it back to normal position, with a stop for automatically disengaging the lever from the disk, and means for automatically resetting the shaft and its disk after they have been released from the operating-arm, substantially as described.

3. The combination of the shaft, the ratchet-disk thereon, and the vibratory operating-lever co-operating with the ratchet-disk, and weighted to bring it back to normal position, with a stop for disengaging the lever from the disk, means for resetting the shaft and disk, and a signaling device operated by the rocking of the shaft, substantially as described.

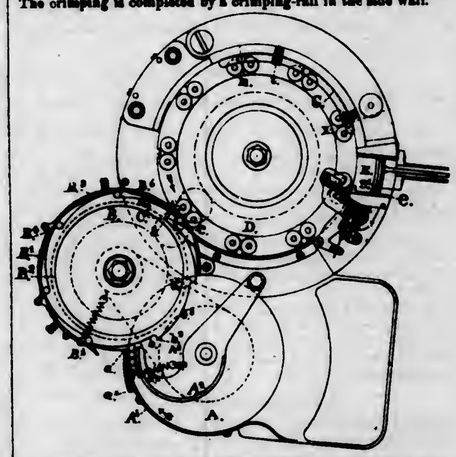
4. The combination of the shaft, the ratchet disk, thereon, the vibratory operating-lever co-operating with the ratchet-disk, as described, and weighted to bring it back to normal position, and a stop for disengaging the lever, with the weighted resetting-lever and a signaling device connected to the resetting-lever, substantially as set forth.



5. The combination of the shaft, the ratchet-disk thereon, the vibratory operating-lever co-operating with the disk, as described, a stop for disengaging the lever, the weighted resetting-lever for bringing the shaft back to normal position, the bell, and the connecting-cord and spring, substantially as set forth.

6. The combination of the shaft, a series of ratchet-disks mounted thereon, and a series of operating-levers co-operating with said disks, as described, with means for disengaging said levers from said disks, means for resetting the shaft after each partial rotation, and a signaling device operated from the shaft, whereby the operating of any one of the operating-levers will cause the shaft to be rocked and the signal to be made without the disturbance of any of the other levers, substantially as described.

7. The combination, with the racket-disk, the lever, and the casing, of the guard moving with the lever for preventing the entrance of dirt, water, &c., into the casing, substantially as described.



257,584. BULLET-PATCHING MACHINE. ALFRED C. HOBBS, Bridgeport, Conn., assignor to the Union Metallic Cartridge Company, same place. Filed Feb. 18, 1882. (No model.)

Brief.—An ordinary feed-disk carries the bullets against a toothed wheel, by which they are carried around in a plane overlapping another disk, denominated a "patcher-disk," which rotates in the opposite direction, and has recesses in its periphery which register with the teeth of the first disk, so that the bullets pass into said recesses during the continuous movement of the two disks. Two cylinders or drums having independent rotative movement on their own axes are arranged in each recess of the patcher-disk, by which the bullet is caused to rotate on its axis as it passes the patch-magazine, which is located in the guard-wall of the machine.

257,585. BULLET-PATCHING MACHINE. ALFRED C. HOBBS, THEODORE V. BOWERS, and CHARLES R. RICHARDS, Bridgeport, Conn., assignors to the Union Metallic Cartridge Company, same place. Filed Feb. 9, 1882. (No model.)

Brief.—An ordinary feed-disk supplies the bullets to a carrier, by which they are carried around into recesses in the periphery of a continuously-rotating disk, which carries them past a magazine of patches in the side wall of the machine. In the said recesses are friction-rollers, which have independent rotation upon their own axes, by which the bullets are rotated as they pass the magazine. After the patch is wound upon the bullet a projecting bar partially crimps in the part which projects beyond the base. The crimping is completed by a crimping-rail in the side wall.

Claim.—1. In a bullet-patching machine substantially such as described, a horizontally-rotating disk provided with recesses in its periphery, in combination with a table or other support for a bullet in proximity to the periphery of the rotating disk, and a suitably-moving carrier or pusher for imparting to the bullet a sidewise bodily movement in a path bisecting the circle described by the periphery of the rotating disk for the purpose of depositing the bullet in one of the said recesses without arresting or interfering with the continuous rotation of the disk.

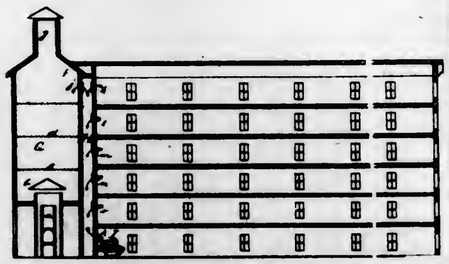
2. The patching-machine disk D, provided with the recesses *d* in its periphery, in combination with the hooked or ratchet-toothed wheel B and the stationary cam *e*, arranged and operating substantially as and for the purpose set forth.

3. The patching-machine disk D, provided with the recesses *d* in its periphery, in combination with the friction feed-dial A, for arranging and presenting a series of bullets in column, and a suitably-moving carrier or pusher for moving the bullets from the end of each column and carrying them along the face of a stationary guide, by which they are forced sidewise into the recesses *d* while the disk D is continuing its rotation.

4. The continuously-rotating transfer-wheel B, provided with the teeth *b*, and with the circumferential groove C, in combination with the stationary tangential cam *e*, and the continuously-rotat-

ing patching-machine disk D, provided with the recesses *d*, substantially as and for the purpose set forth.

5. The yielding end section, *a*, of the outer guide-wall of the friction-dial A, in combination with a suitably-moving carrier or pusher for moving aside successively the end bullets of the column fed forward by the friction-dial, substantially as shown and described.

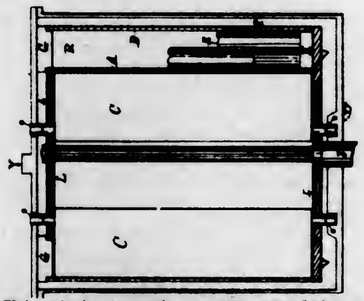


6. A magazine for holding a package of paper slips or bullet-patches, in combination with a rotating disk adapted to roll a bullet across the face of the magazine, and an agitator for transversely rubbing back and forth the edges of the paper slips for the purpose of preventing the adhesion of the superposed slips to each other.

7. The finger *e'*, arranged to bear lightly upon the outer stratum of paper slips or patches contained in the magazine, and connected with the spring-bar *e*, the end *e²* of which projects partially across the path of the bullets as they are successively rolled along by the rotating disk D, as and for the purpose set forth.

8. In combination with bullet-patching mechanism substantially such as described, the tucker F, operated by means of the cam F', for tucking or folding part of the downwardly-projecting patch under the base of the bullet, and thus preparing the lower part of the patch for the action of the eccentric crimping-rail, by which the remainder of the downwardly-projecting patch is crimped upon the base of the bullet.

9. In combination with the rotating patcher-disk D, the magazine E, provided with the follower E', and with the inclined side wall, E², for bearing with elastic pressure upon the tail ends of the mass of slips contained in the magazine.

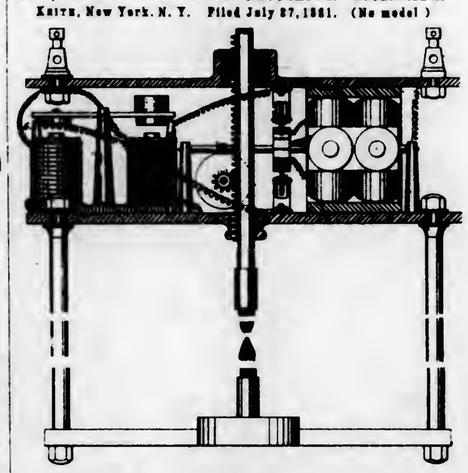


257,586. MALT-HOUSE. LOUIS C. HUCK, Chicago, Ill. Filed Mar. 20, 1882. (No model.)

Claim.—1. The malt-kiln house G, having ventilator-stack *g*, with damper *h*, in combination with flue H, exhaust-fan I, and vent *j*, all arranged substantially in the manner and for the purpose set forth.

2. In malting establishments, the vertical flue H, connected with a suction-fan and communicating through vents with the several compartments above the malt-kiln floors, and with all the growing-floors of the malt-house, all substantially as and for the purpose set forth.

257,587. ROTARY ENGINE. SALMON D. JONES, Raritan, N. J. Filed July 7, 1881. (Model.)



Claim.—1. A rotary engine or pump composed of two cylinders placed concentrically one within the other, and secured at one end the same end to a disk or head, and having between them a single continuous annular chamber for pressure, said cylinders being constructed to revolve simultaneously and together, the outside cylinder revolving around the abutment in said annular chamber and the periphery of the inside cylinder against the abutment substantially as and for the purposes described.

2. A rotary engine or pump composed of the two cylinders A and B, placed concentrically one within the other, having between them the single continuous annular chamber R, and both cylinders being secured at one and the same end to a single head, V, and constructed to revolve, as described, around an abutment, the inside cylinder, A, being provided with the sliding wings C, having the studs I and rollers O, and the wings being operated by means of the cams D, placed as described, and for the purposes set forth.

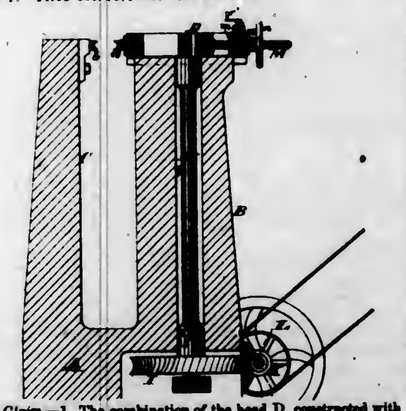
3. In a rotary engine or pump, a roller-abutment constructed to be attached, in the manner described, to the packing-ring G or to the stationary head T, and composed of two or more rollers, and of the frame-work, substantially as and for the purposes described.

4. A rotary engine or pump composed of the two cylinders A and B, placed concentrically one within the other, and secured at one and the same end to the single head V, and having at the other end the stationary head T, provided with the ports F and S, which is secured to the packing-ring G, attached to an abutment, the single continuous annular chamber R, the cams D, situated as described, and the wings C, provided with studs and rollers, substantially as described.

257,588. ELECTRIC-LIGHT REGULATOR. NATHANIEL S. KEITH, New York, N. Y. Filed July 27, 1881. (No model.)

Claim.—1. The combination of a carbon-carrier, an electric motor gearing with said carrier, so as to control its movement in both directions, said motor being placed in a derived or branch circuit, devices, substantially as described, for reversing the direction of movement of that portion of the motor-train which engages with the carrier, and two regulating or controlling electro-magnets operating said reversing devices, one of said magnets being placed in a derived circuit to the carbons and the other in the main or principal circuit with said carbons.

2. The combination of a carbon-carrier, an electric motor geared thereto and placed in a derived or branch circuit, circuit-closing devices for reversing the movement of the electric motor, and two regulating or controlling electro-magnets for operating said circuit-closing devices, one of said magnets being placed in a derived circuit to the carbons and the other in the main or principal circuit with the carbons.



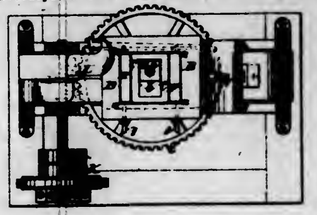
3. The combination, substantially as described, of a carbon-carrier, an electro-magnetic motor gearing with the carrier and provided with two commutator wheels or brushes bearing upon its commutator-cylinder in the manner set forth, said motor being placed in a derived or branch circuit, and devices, substantially as described, which close the circuit to one or the other of the commutator-brushes, so as to reverse the direction of rotation of the motor.

4. The combination, substantially as described, of a carbon-carrier, an electro-magnetic motor in a branch or derived circuit, geared to said carrier, a two-point circuit-closer controlled by a regulating electro-magnet, and circuit-connections, as described from said circuit-closer to independent commutator wheels or collectors upon the motor, whereby the direction of rotation of the motor may be reversed.

5. The combination of a carbon-carrier, a propelling electro-magnetic motor in a branch or derived circuit, provided with a commutator-cylinder, and independent commutator wheels or collectors, applied in the manner described to said commutator-cylinder, so that the motor may be made to revolve in either direction by closing the circuit through one or the other of said collectors, a circuit-closer joined to the collectors, opposing electro-magnets in the main or principal circuit and in a derived circuit to the arc, substantially as described.

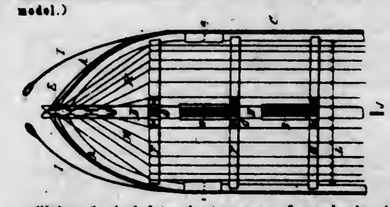
6. The combination, substantially as described, of a carbon-carrier, an electro-magnetic motor in a derived circuit, provided with independent commutator brushes or collectors, and a pivoted armature-lever, main and derived circuit electro-magnets acting upon said lever, and circuit-connections, as described, the whole so arranged that when the attraction of the main-circuit magnet preponderates the circuit of the motor is closed through one of the collectors and the motor revolves in one direction, while, vice versa, when the attraction of the derived-circuit magnet preponderates the circuit is closed through the other collector and the motor revolves in the opposite direction.

257,589. RIVETING-MACHINE. ROBERT KENT, Brooklyn, N. Y. Filed Oct. 18, 1881. (No model.)



Claim.—1. The combination of the head D, constructed with the opening *a*, the block E, having the opening *d* and the threaded stem M and placed in the opening *c*, the crank-block G, placed in the opening *d* of the block E, the crank F, working through a suitable socket or bearing in the crank-block G, the nut N, working in the bearing provided to the head D, the punch *a*, attached to the head D, and the die *b*, coincident with the punch *a*, the said parts being constructed and arranged for joint use and operation substantially in the manner herein described, for the purpose specified.

2. The combination of the tightening-screw *r*, the flanged collar N, the block E, having the threaded stem M, the crank-block G, crank F, and head D, carrying the punch *a*, the said parts being constructed and arranged substantially in the manner herein described, for the purpose specified.



3. The reciprocating head D, having the punch *a*, constructed with the plate R, marked to the gage S, the index U, and the die *b*, placed axially coincident with the punch *a*, all substantially as and for the purpose herein set forth.

257,590. CUTTING AND PUNCHING MACHINE. ROBERT KENT, Brooklyn, N. Y. Filed Oct. 19, 1881. (No model.)

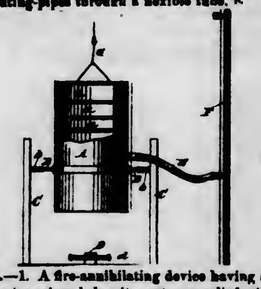
Claim.—1. The combination of the head B, constructed with the opening *a*, the block C, placed within the opening *a* of the head B, the crank-block D, placed within the opening *b* of the block C, the crank *c*, working through a suitable bearing in the block D, and the bars F, pivoted, as described, to the head B at opposite sides of the block C, the whole constructed and arranged for joint use and operation, substantially as and for the purpose herein set forth.

257,591. SECTIONAL BOAT-FRAME. CHARLES L. KING and CHARLES W. KING, Kalamazoo, Mich. Filed Sept. 28, 1881. (No model.)

Claim.—1. A skeleton boat or canoe frame having its keel and gunwale made in sections adapted to be detachably fitted together and to the ribs, in combination with a cord strained under the keel in the direction of its length and detachably secured at both ends of the same, and a cord strained around the gunwale at each side of the boat and having its ends detachably secured to the bow and stern of said boat, as and for the purpose specified.

2. In combination with a boat or canoe frame having its gunwale and keel made in sections detachable from each other and from the ribs and straining-cords for holding the whole together, as described, a series of cords, H, passing around said frame, and the fastenings *b*, for securing said cords for the purpose of providing a support for a canvas or other covering, substantially as described.

3. In combination with a boat-gunwale made in sections detachably secured together and to a sectional keel and ribs, the cord I, passing entirely around said gunwale and tightly strained around the same in a groove in its outer surface or in its fastening-clips by means substantially as described, as and for the purpose specified.



4. In a boat made in sections, the sectional keel B, detachably connected to the ribs and gunwale, in combination with the cord J, strained around the under surface of said keel in the direction of its length, and a suitable fastening device for securing its ends, substantially as described.

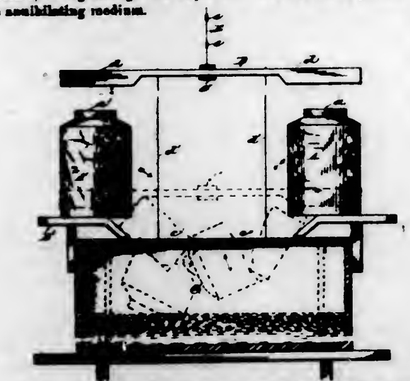
5. In a boat made in sections adapted to be detachably fitted together and secured by cords, as described, and in combination with the meeting ends of said sections, the clips *a*, fitting on said meeting ends and having grooved or recessed outer surfaces for the purpose of holding the fastening-cords, substantially as described.

6. In a boat-frame made in sections adapted to be detachably secured together, and in combination with the cords I J, grooved clips *a*, and the hook-plates E, for fastening the sections in place, the notched ribs G, and the cords H, fitting in the notches in said rib, substantially as and for the purpose specified.

257,592. FIRE-ANNIHILATOR. ISIDOR KITSEE, Cincinnati, Ohio. Filed Jan. 17, 1882. (No model.)

Brief.—The generator A is hung below its center and held in an upright position by wire having fusible points, which, when released, permits the generator to be agitated, and the gas passes to the distributing-pipes through a flexible tube, F.

Claim.—1. A fire-annihilating device having a swinging vessel hung on trunnions below its center, supplied with chemicals in separation, and having a flexible eduction-pipe, substantially as described.



2. In a fire-annihilating device operated by melting of fusible connections, a swinging generator, A, having flexible eduction-pipe E, said generator being provided below its center with trunnions B B, mounted on standards C C, and adapted to automatically invert and swing to and fro by action of springs *b b*, surrounding said trunnions, in combination with the spring *d*, substantially as described.

3. In a fire-annihilating device, the combination of a swinging generator, hung below its center, supplied with chemicals in separation, and having a flexible eduction-pipe, with a distributing-pipe provided with eduction-openings, substantially as described.

4. The combination, in a fire-annihilating device, of the swinging generating-vessel A, with fusible connections G, eduction-pipe E, distributing-pipe F, and post D, having spring *d*, substantially as described.

257,593. FIRE-ANNIHILATOR. ISIDOR KITSEE, Cincinnati, Ohio. Filed Nov. 25, 1881. (No model.)

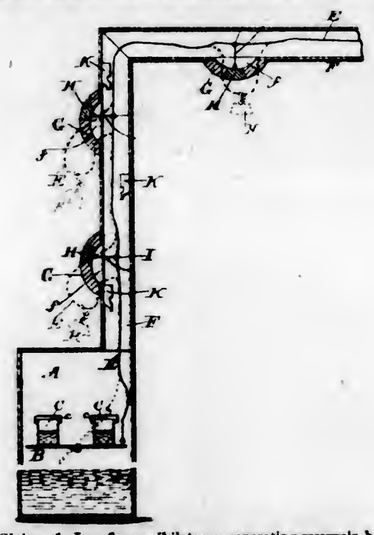
Brief.—When the temperature of the apartment in which the device is kept is raised by the incipient fire the fusible solder is melted, and the bar D, having weighted ends *d*, descends on the rods *d'* and fractures by contact the friable vessels A, containing the chemicals necessary to generate the extinguishing-gas, whose contents, falling through the trap *c'* into the reservoir *c*, produce the annihilating medium.

Claim.—1. In an automatic fire-extinguisher, friable vessels supplied with chemicals which, when commingled, form a fire-extinguishing gas or vapor, and a generating-reservoir to receive the contents of said friable vessels, in combination with weights held suspended by fusible connections, substantially as described.

2. In an automatic fire-extinguisher, the friable vessels A A', the receiving-generator C, having traps *c' c'*, in combination with depending rods *d' d'*, and the bar D, having weighted ends *d d*, held suspended by means of fusible connections, the melting of which is adapted to cause the weighted arm to fall, thereby breaking the friable vessels A A' and emptying their contents into the generating-reservoir, substantially as described.

257,594. FIRE-ANNIHILATOR. ISIDOR KITSEE, Cincinnati, Ohio. Filed Dec. 12, 1881. (No model.)

Brief.—Heat affecting the fusible cord B will cause the loosely-covered vessels C, containing the chemical reagents, to be tilted into the reservoir A, where their contents unite to form a fire-extinguishing gas, which escapes through the opening A'.



Claim.—1. In an automatic fire-annihilator, a generating-reservoir supplied with a chemical reagent, having eduction-openings and provided with an interior weighted tilting device sustained horizontally by fusible connections, said device being provided with loosely-covered independent vessels holding chemical reagents in separation, substantially as described.

2. In an automatic fire-extinguisher, the generating-reservoir A, having eduction-openings A', in combination with the fusible wire B and independent loosely-covered vessels C, supplied with chemical reagents, substantially as described.

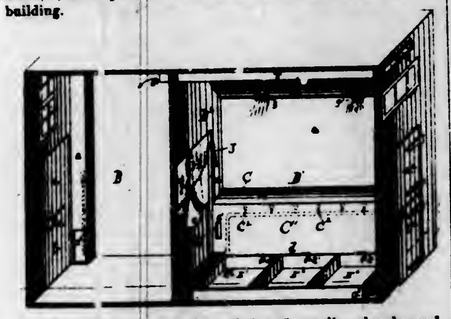
257,595. FIRE-ANNIHILATOR. ISIDOR KITSEE, Cincinnati, Ohio. Filed Dec. 31, 1881. (No model.)

Brief.—By the heat melting the retaining material G the weight H drops, and by pulling on cord E tilts the platform B, upon which are covered receptacles C, containing chemical reagents, which, mixing in tank A, generate the fire-extinguishing gas, which rushes up pipe F, sounding the alarm-whistles K in its passage, and out the opening *f* to extinguish the fire.

Claim.—1. In a fire-annihilator, a generating-reservoir having a tilting shelf held in position by a retaining-cord provided with independent branch cords, said branch cords having end weights embedded within fusible substance, substantially as described.

2. In a fire-annihilator, a generating-reservoir having a tilting shelf supplied with vessels containing chemical reagents in separation, suspended by a cord having independent sliding branch cords, each of said branch cords having a terminal weight embedded within fusible substance, substantially as described.

3. In a fire-annihilating device, a conduit-pipe connected with and opening into a generator having openings sealed with fusible caps, as and for the purpose specified, substantially as described.



4. In a fire-annihilator, a conduit-pipe opening into and connected with a generating-reservoir, said conduit-pipe provided with interior sounding-whistles, substantially as described.

5. In a fire-annihilating device, a conduit-pipe connected with and opening into a generating-reservoir having openings sealed with fusible caps, said fusible caps retaining weights connected to a cord within said pipe, as and for the purpose intended, substantially as described.

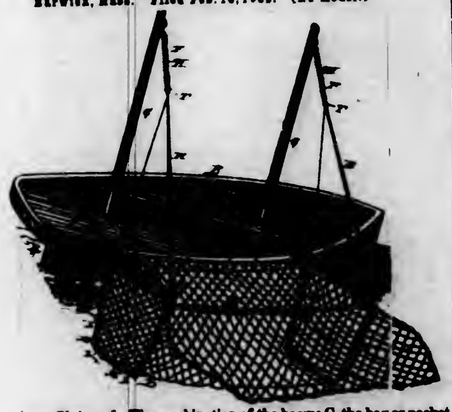
6. The combination, in a fire-annihilating device, of a generating-reservoir, A, provided with a tilting shelf, B, and vessels C, supplied with separate chemicals, adapted, when brought into contact, to generate a fire-extinguishing gas, with a conduit-pipe, F, having openings *f*, closed with fusible seals G, which seals retain in position weights H, said pipe F being further provided with internal sounding alarm-whistles, K, cord E, and branch cords *e*, as and for the purpose intended, substantially as described.

257,596. STOCK-BATH. JAMES H. LEA HERN, New York, N. Y. Filed Jan. 21, 1882. (No model.)

Brief.—The bathing and cooling chambers B' B are adapted for the use of stock. In the former they can receive either hot-air, vapor, or cold-water baths. The boilers D D' D² D³, heated by gas-jets C³, supply the warmth, and reservoir G, having the sprinklers *g g'*, the water. The curtained half doors allow the animal to have his head outside when so desired, and the sectional tube E' E² E³ allow giving the animal foot or hip baths. Ventilators *e, e'*, and F permit free circulation of air to the interior of the building.

Claim.—1. A stock-bath consisting of a cooling-chamber and bathing-chamber, the bathing-chamber constructed with double walls, having gas-jets and boilers arranged between the walls, and double doors provided with drop cloth or cloths on their upper part, and having suitable ventilators, substantially as and for the purpose specified.

2. The combination of the bathing-chamber constructed with double doors, having its lower part or floor made into sectional tube, the water-supply pipe provided with faucets, and the waste-pipe, substantially as and for the purpose set forth.

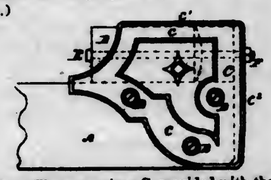


3. The double doors *a b*, the top section, *a*, having a projection, *c'*, and the bottom section, *b*, a corresponding recess, *c*, in combination with drop-cloths H and cord and pulley J, substantially as and for the purpose set forth.

4. A stock-bath consisting of a bathing-chamber provided with double doors, having drop cloth or cloths, with a water-tank provided with a suitable supply-pipe, and having rose-sprinklers, substantially as and for the purpose set forth.

5. In a stock-bath, the combination of the cooling-chamber and bathing-chamber, the bathing-chamber being constructed with double walls, having gas-jets arranged between the walls, double doors provided with drop cloth or cloths on their upper part, having suitable ventilating-shafts, with the sectional tube in its lower part provided with supply and waste pipes, and the water-tank provided with shower and spray sprinklers, substantially as and for the purpose set forth.

6. The ventilator extending entirely across the upper part of the bathing-chamber, having one end in the cooling-chamber and the other end entirely outside of the bathing-chamber, and provided with suitable discharge trap-doors for regulating the temperature in the bathing-chamber, substantially as and for the purpose set forth.



257,597. FISHING APPARATUS. SAMUEL H. LOSS, West Harwich, Mass. Filed Feb. 10, 1882. (No model.)

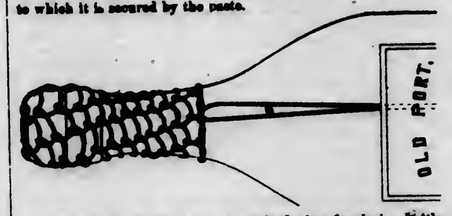
Claim.—1. The combination of the booms C, the bag or pocket D, the blocks I T U, ropes H, and coiled springs F, all arranged and operating substantially as and for the purpose set forth.

2. The combination, with the vessel A, of the booms C, the bag or pocket D, attached to said booms and to the side of the vessel, and having rings or eyes M, and the ropes L, attached to the outer ends of the booms, reeved through the eyes M, and having their inner ends secured adjustably to the deck of the vessel, as set forth.

257,598. DEVICE FOR STRETCHING RED-BOTTOMS. IMMANUEL LORENZEN, Hartford, Conn., assignor to the Peerless Wire Mattress Company, same place. Filed Apr. 10, 1882. (No model.)

Claim.—The corner-iron C, provided with the flange C' above and parallel to the top of the side bar, A, and the flange C² at right angles to said side bar, in combination with the side bar, A, the sliding end bar, B, and the bolt and nut E F, substantially as described.

257,599. IRON FENCE-POST. ANDREW H. LUCAS, St. Louis, Mo., assignor of one-half to L. F. Prince, same place. Filed Nov. 25, 1881. (No model.)



Claim.—1. As an improvement in fence-posts, a solid metallic rod, A, pointed at its lower end, at B, and provided at the base-line with a circumferential series of pointed prongs or barbs, C, integral with said post, and projecting permanently diagonally downward and outward, as herein described, for the purpose set forth.

2. The combination, with a fence-post having T-shaped recesses for the reception of the fence-wires, of a key or fastener consisting of a wedge-shaped plate having an outward-bent flange at its lower side, partly separated from said wedge-plate by a slot extending from the narrow toward the wide end, substantially as set forth.

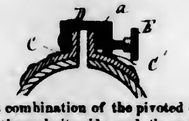
257,600. DEVICE FOR SECURING CORKS IN BOTTLES. GERHARD LUTTJES and HENRY E. G. LUTTJES, New York, N. Y. Filed Mar. 7, 1882. (No model.)

Brief.—The neck of the bottle and the head of the stopper are covered with paste. An elastic casing of knit twine is then drawn over the neck of the bottle, about which it contracts, and to which it is secured by the paste.

Claim.—1. As an improvement in devices for closing bottles, the combination, with a cork provided with an enlarged head, of an elastic tubular casing inclosing said head and entire neck of the bottle, substantially as herein shown and described.

2. The herein-described means for closing bottles, which consists of a cork with an enlarged head, having its upper surface convex, with an elastic tubular casing inclosing the head of the cork and neck of the bottle and permanently connected thereto, substantially as specified.

3. The combination, with a bottle and its cork, of a netted or twisted tubular casing elastically fitting over the exposed surface of the cork and neck of the bottle and entirely inclosing the same, and provided with one or more ends for attachment to the body of the bottle, substantially as set forth.

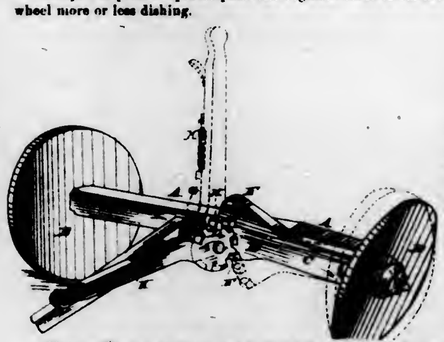


4. The herein-described device for securing corks in bottles, which consists of a tubular casing formed of netted or woven twine, which elastically envelops the cork and neck of the bottle, and is permanently secured to every part of its inclosed surface by cement, substantially in the manner and for the purpose set forth.

5. The combination of the bottle *a*, cork *b*, with enlarged head *c*, and elastic covering or casing *d*, all constructed in the manner and for the purpose set forth.

257,601. ADHESIVE CEMENT. S. CARY MURRAY, Lockport, N. Y. Filed Mar. 27, 1882. (No specimens.)

Claim.—The hereinbefore-described composition of matter or cement to be used and applied to the surface of wood, brick, stone, glass, or any metallic surface, for the purpose of resisting the passage of water and the action of the atmosphere upon such substance, consisting of the flour of lime-rock, water-washed sand, Portland cement, dry white French zinc, and boiled linseed-oil, in the proportions specified.



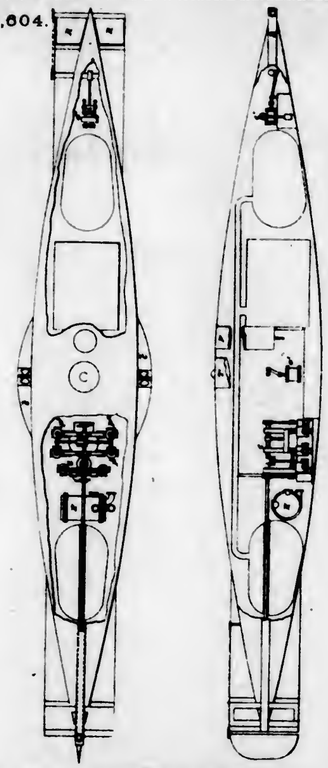
257,602. DEVICE FOR REPAIRING RUPTURES IN WATER-HOSE. LAWRENCE MERRIHEW, Rochester, N. Y., assignor of one-half to John R. Strauchon, same place. Filed Oct. 3, 1881. (No model.)

Claim.—The combination of the pivoted clasp D, having the screw E passing through its side, and the metallic flanges C C', to one of which the clasp is pivoted, the other being provided with a rib, *a*, beneath which the screw rests, as shown and described, and for the purpose specified.

257,603. SULKY-PLOW. JACOB MICKWOOD, Warsaw, Ind. Filed Mar. 6, 1882. (No model.)

Brief.—A pivoted spindle-plate and segment-lever to set the wheel more or less dishing.

Claim.—The combination of the axle A, the pivoted stub-axle C, provided near its inner end, which is flattened at E, with teeth or cogs F, the bracket G, having recess H and segmental series of teeth I, and the lever J, having segmental head provided with teeth L, and spring-catch K, all arranged and operating substantially as set forth.

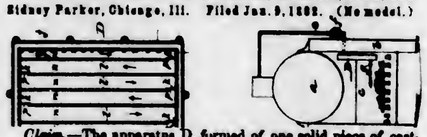


257,604. SUBMARINE VESSEL. THORSTEN NORDENFELT, London, England. Filed Sept. 9, 1881. (No model.) Patented in England Feb. 17, 1881, in France Aug. 11, 1881, in Belgium Aug. 23, 1881, and in Italy Sept. 12, 1881.

Brief.—The horizontal position of the vessel is preserved by means of longitudinal stability-rudders operated by means of a hydraulic engine. The valves of the engine are controlled by a swinging pendulum. The vessel is caused to ascend or descend in the water by the revolution of screw-propellers mounted on vertical axes at its sides.

Claim.—1. The combination, with the vessel, of the screws at its sides rotating about vertical axes, and means for actuating said screws, substantially as and for the purpose hereinbefore set forth.

2. The combination of the rudders R R, the controlling-cylinder, its piston connected with the cranked axis of the rudders, the valve V, and the weight attached to the arm of the valve-spindle, substantially as and for the purpose set forth.



257,604.

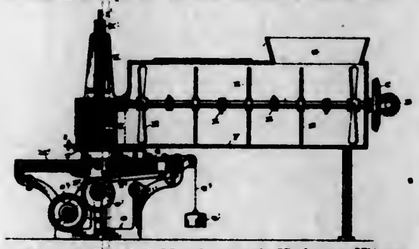
257,605. ELECTROPLATED YELLOW-METAL. ANDREW O'NEILL, New Haven, Conn. Filed July 29, 1879.

Claim.—As a new article of manufacture, the within-described composite sheet metal, consisting of sheet yellow-metal electroplated on one side with nickel and on its other side with copper, substantially as specified, for the purposes set forth.

257,606. SMOKE-CONSUMING APPARATUS. SIDNEY PARKER and JAMES D. BENNETT, Chicago, Ill., assignors, by direct and mesne assignments, to George H. Watson, Ackley, Iowa, Abner W. Merrill and Fred S. Merrill, Waterloo, Iowa, and Sidney Parker, Chicago, Ill. Filed Jan. 9, 1882. (No model.)

Claim.—The apparatus D, formed of one solid piece of cast-iron, and provided with partition-walls *i*, dividing it into chambers *n*, having openings *p* at alternate ends of said chambers, provided with screens, channel *i*, and inlet *f*, in combination with cover *h*, provided with bead *j*, and T-shaped exhaust provided with slot *m*, substantially as specified.

257,607. TREATMENT OF CELLULOSE AND THE MANUFACTURE OF ARTICLES THEREFROM. ALEXANDER PARKES, Sutton Coldfield, Birmingham, County of Warwick, England. Filed Aug. 19, 1881. (No specimens.) Patented in England Mar. 8, 1881, in France Aug. 5, 1881, and in Belgium Aug. 8, 1881.

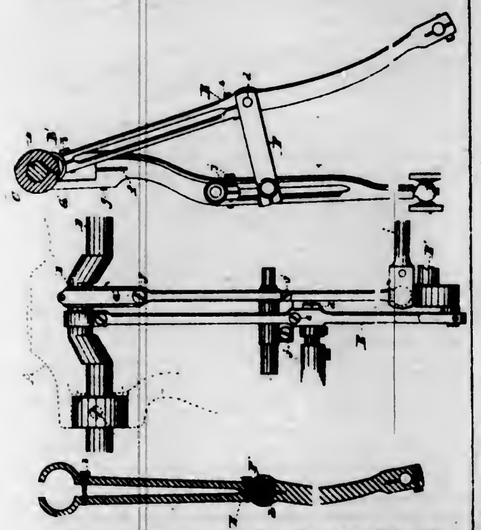


Claim.—1. As an improvement in the process of making articles in whole or part of cellulose, the treatment with a solvent consisting of a solution of iodide of zinc or its specified equivalent, substantially as described.

2. As an improvement in the process of making articles in whole or in part of cellulose, the treatment of the dissolved cellulose with the alcoholic or described equivalent solution to remove the solvent.

3. The process hereinbefore described of making articles of cellulose and of coating articles therewith, consisting in first dissolving cellulose in a solution of iodide of zinc or its specified equivalent, then molding the dissolved cellulose to the form of article required, or spreading it over the surface of the article to be coated, then removing the solvent by washing, and finally rolling, pressing, or calendering the article or coated article.

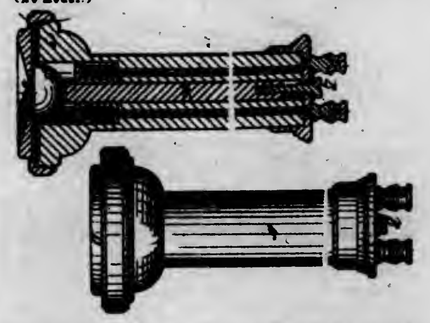
4. The process hereinbefore described of making articles of cellulose or partly of cellulose, consisting in first dissolving cellulose, as above set forth, in iodide of zinc or its specified equivalent, then washing out the solvent from the cellulose, and then molding the cellulose to the form required by subjecting it to pressure in molds or otherwise, or by rolling or spreading machinery.



257,608. BRICK-MAKING MACHINE. STEPHEN J. PLANT, Yorkville, Ontario, Canada, assignor of one-half to Harriet Worwood, same place. Filed Nov. 25, 1881. (No model.)

Claim.—1. The shaft M and eccentric N, the arm N', cross-bar N², and set-screw N³, combined with the table M', and adapted to serve as set forth.

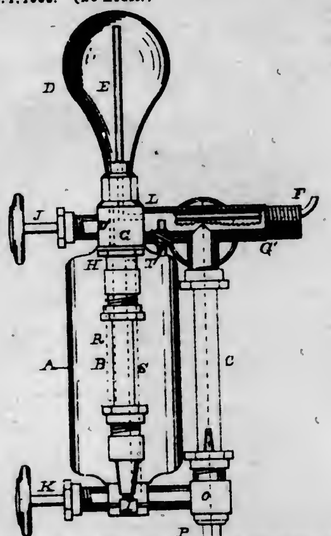
2. The combination of the adjustable table M' and the adjusting means N N' N² N³ with the shaft M, the wheel O', gear O², arms or levers P' P², and weighted sliding carriage Q, as and for the purposes specified.



257,609. DEVICE FOR CONVERTING MOTION IN SEWING-MACHINES. D'ARCY PENTON, Cleveland, Ohio. Filed Jan. 24, 1882. (No model.)

Claim.—1. In a sewing-machine, the combination, with a crank-shaft and an oscillating lever, of a pitman constructed with two yielding arms made integral therewith, the outer ends formed as bearings to fit upon the crank, and a set-screw inserted through the yielding arms to take up for wear, a split bushing inserted in a circular bearing formed between the yielding arms, and a radius-bar connected at one end to the oscillating lever, and at the other end mounted on a bearing supported in said split bushing, substantially as set forth.

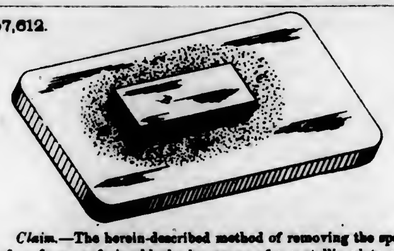
2. In a sewing-machine, the combination, with the crank B' and pitman E, said pitman being split, substantially as shown, of the radius-bar F, said radius-bar being connected to the pitman by means of a screw, *d*, passing through a split ball-bushing, F', substantially as and for the purpose shown and described.



257,610. ELECTRIC TELEPHONE. THEAT T. PROSSER and JAMES P. FREEMAN, Chicago, Ill.; said Freeman assignor to the Home Telephone Company, of Illinois. Filed July 21, 1881. (No model.)

Claim.—1. A telephonic instrument constructed with a diaphragm the unsupported vibratory area of which is composed of a flat annulus and a central hemispherical depression, substantially as before set forth.

2. The combination, substantially as before set forth, of the helix, the permanent magnet, and the diaphragm whose unsupported vibratory area is composed of a flat annulus and a hemispherical depression.



257,611. LUBRICATING OIL-CUP. WILLIAM W. RAMSEY, Dayton, Ohio, assignor of one-half to August Tegeler, same place. Filed Nov. 1, 1880. (No model.)

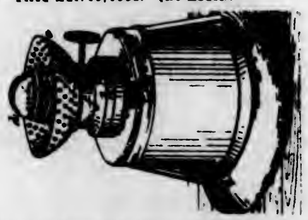
Claim.—The herein-described steam-actuated lubricator, consisting of the metal oil-receptacle A and steam-condensing chamber D, from which steam-pipe connection E F extends, the glass indicator-tubes B and C, arranged at the side of the oil-receptacle, with which they are connected, the pipes R, S, O, and G', having connecting-ducts, as specified, and the valves J K M, located as shown, the whole being constructed and arranged to operate substantially in the manner set forth.

257,612. METHOD OF REVIVIFYING ABRADING-SURFACES. JOSEPH RENSHAW, Hartford, Conn. Filed Aug. 22, 1881. (No model.)

257,612.

Claim.—The herein-described method of removing the spent surface from surfacing-blocks by means of a metallic plate and grains of cutting material rolling on said plate, substantially as set forth.

257,613. PAVEMENT. WILLIAM D. RICHARDSON, Springfield, Ill. Filed Mar. 20, 1882. (No model.)



Claim.—1. A pavement for streets and roadways, comprising brick and asphalt or similar material in alternate courses, laid in the form of an arch, with the ends resting on the curbstones, substantially as described.

2. A pavement consisting of a bottom layer of asphalt, cement, or similar material, a course of brick, a second layer of asphalt or cement, and a top course of brick, the whole forming an arch of which the curbstones are the abutments, substantially as described.

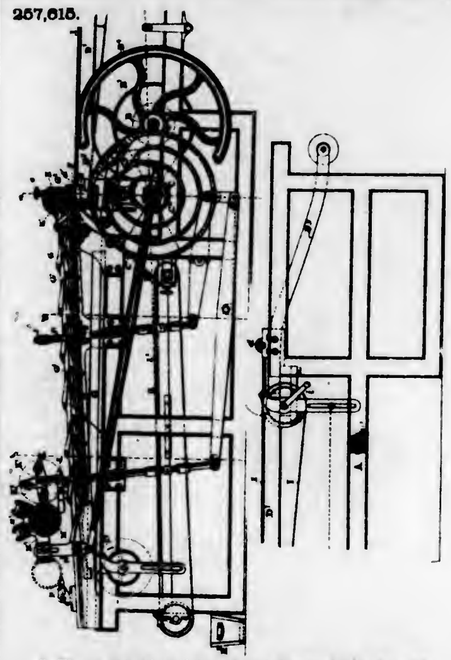
3. In a pavement, the combination of the bottom layer of asphalt, cement, or similar material, the intermediate course of brick, laid flatwise and with tight joints, the second layer of asphalt, cement, or similar material, and the top course of brick, laid sidewise, as explained, and also with tight joints, the whole forming an arch, resting on the curbstones, substantially as described.

4. As a foundation for a pavement for streets and roadways, an arched course of brick laid close together and inclosed between two layers of asphalt, cement, or similar material, substantially as described.

257,614. LAMP-BURNER. CHARLES C. RICHMOND, Boston, Mass. Filed Mar. 13, 1882. (No model.)

Claim.—An inverted perforated bell-shaped casing, *c*, in combination with and located outside of a perforated cap, *d*, the base of said cap being secured directly to the bottom of said casing, as and for the purpose described.

257,615. LOZENGE-MACHINE. THOMAS ROBERTSON, Toronto, Ontario, Canada. Filed Oct. 26, 1880. (No model.) Patented in England Apr. 19, 1880.



Claim.—1. The pivoted frame D', carrying the cutter-block D and provided with rollers for carrying the apron I, in combination with the cutter-block D, apron I, stationary cutter-head E, cutters F, and means, substantially as described, for giving the pivoted frame a vertical movement at its outer end, as and for the purpose specified.

2. In combination with the tubular cutters F and the slotted shanks thereof, the hooks G', passing through said slotted shanks and connected to the reciprocating conveyor-bars, substantially as and for the purpose specified.

3. In a lozenge-machine, the conveyor-table G, provided with a series of ridges, G', in combination with the reciprocating finger-bars G', substantially as and for the purpose specified.

4. The combination of the channeled cam-wheels, the pivoted paste-frame, with cutter-block and intermittently-moving apron mounted thereon, and a stationary cutter-head, substantially as shown and described.

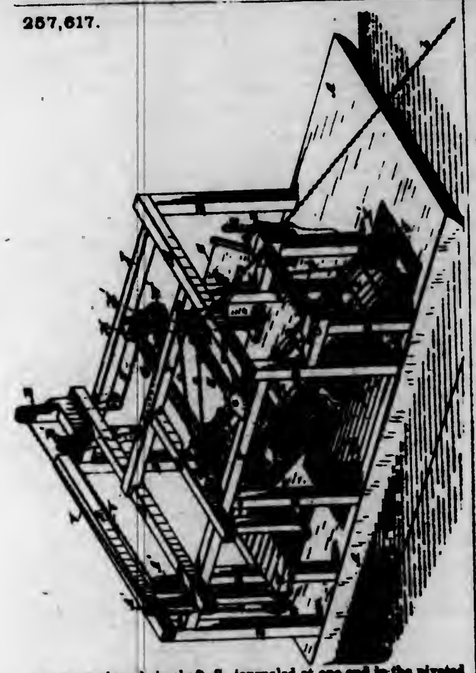
257,615.

5. The combination of the channeled cam-wheels, the reciprocating frame carrying the cutter-block and intermittently-moving apron, the cutter-head, the embossing and printing heads, and mechanism, substantially as described, for connecting and operating said parts, and the lozenge-conveying mechanism and receiving-trays, arranged and operating substantially as shown and described.

257,616. METALLIC JOINT FOR FLEXIBLE ROOFING. FRANK E. SACHENDORPH, Cincinnati, Ohio. - Filed Jan. 25, 1882. (No model.)

Brief.—A sheet-metal strip having its lower edge bent under to form a rounded edge is interposed within the fold of the upper sheet, and a fastening passes through the strip and edges of the sheet and is covered by the outer fold of the upper sheet.

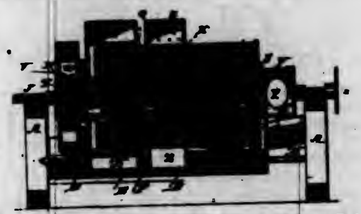
Claim.—The herein-described joint for flexible roofing, consisting of the combination of a lower sheet, an upper sheet whose underturned lower edge is applied to register with the upper edge of the lower sheet, a strip of sheet metal having its lower edge bent or doubled under so as to form a smooth rounded lower edge, and interposed within the fold of the upper sheet, and suitable fastenings passing through the said sheets, underneath, and covered by the outer fold of the upper sheet, as set forth.



257,617. DREDGING-MACHINE. JEREMIAH SAYDER, Sunbury, Pa. Filed Feb. 2, 1882. (No model.)

Brief.—The bucket-chain is driven by a horizontal shaft from which the propelling chain-shaft is operated. From a vertical shaft which operates the horizontal drive-shaft is driven an endless chain which operates the carrier-apron.

Claim.—1. In a dredging-machine, the combination, with the endless chain of buckets and the delivery-apron U, of the horizontal drive-shaft G, upright shaft L, gearing therewith and provided with pulley W', posts A' and B', provided with sheaves, and endless chain V, passing over said sheaves and over pulleys W' W on the shaft L and shaft of apron U, respectively, substantially as and for the purposes set forth.



2. In a dredging-machine, the combination of a chain of elevating-buckets, a delivery-apron at the end of the chain of buck-

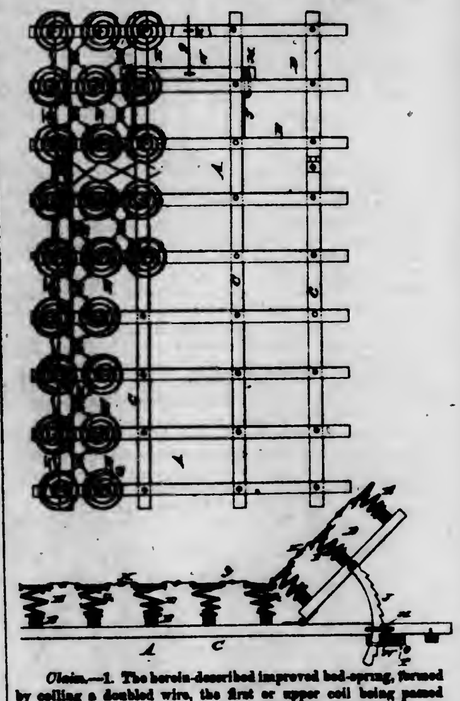
257,617.

ets, an anchor-chain shaft, S, journaled at one end in the pivoted lever T, a horizontal shaft, G, connected to shaft S by chain *o* and to the chain of elevating-buckets, and upright shaft L, connected to a shaft of the delivery-apron by an endless chain and to shaft G, and operating the said several parts, substantially as set forth.

257,618. APPARATUS FOR AMALGAMATING AND WASHING ORES. JAMES SCOTT, Denver, Colo., assignor of five-eighths to Lewis Packer, Charles Quentin, and John Henry Anderson, all of same place. Filed Apr. 26, 1881. (Model.)

Claim.—1. In an amalgamator, the concentrating-pan B, having compartments C E G, formed by the partitions D F, the latter of which is perforated, substantially as described.

2. In an amalgamator, the herein-described cylinder, having the centrally-located partly-perforated tapering tube M, surrounded by the imperforate tube Q, located within and communicating with a third or discharge tube, K, substantially as and for the purpose set forth.



3. The cylinder I, having tapering tube M, the central portion of which is perforated and separated by flanges N from the imperforate ends, the front end of which forms a mercury-chamber, as herein described, for the purpose set forth.

4. The cylinder I, having tapering tube M, constructed and arranged as herein described, and provided with parallel-sided projecting ends R S, the former of which has partition T, chutes U, and openings V, in combination with the lifting-buckets W X, arranged as described, and discharging through the openings V into said tube M, as herein described, for the purpose set forth.

5. The tube M, having central perforated part, flanges N, and projecting end S, provided with openings V, in combination with the concentrating-pan B, having chute H, substantially as and for the purpose set forth.

6. As an improvement in amalgamators, the combination, with the pan B, having compartments C E G and chute H, of the cylinder consisting of the casing J, chuting tubes K M O, lifting-buckets W X, discharging into tube M, the perforated tailings-buckets Z, and suitable operating mechanism, all constructed and arranged substantially as herein described, for the purpose shown and specified.

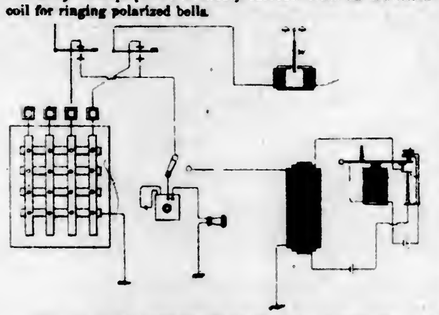
257,619. SPRING BED-BOTTOM. MARVIN C. SILVER, Monroe, Wis. Filed Mar. 20, 1882. (No model.)

Claim.—1. The herein-described improved bed-spring, formed by coiling a doubled wire, the first or upper coil being passed through and secured by the loop formed by doubling the wire, as set forth.

2. In a bed-bottom, the combination, with the springs, of the joint or tie, formed by interlooping two pieces of wire which have been bent or doubled, as herein described, for the purpose set forth.

3. As an improvement in bed-bottoms, the combination of the frame A, having rails C, provided with recesses L and staples M, the hinged frame D, having flanged ratchet-bars J, the bar N, springs P, and the bed-springs secured upon said frames, as described, for the purpose set forth.

257,620. BUTTON-FASTENING. FRANKLIN A. SMITH, Jr., Providence, R. I., assignor to George W. Prentice, same place. Filed Mar. 6, 1882. (No model.)

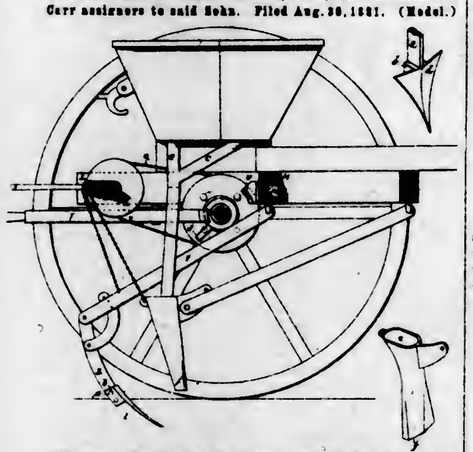


Claim.—1. As an improved article of manufacture, the herein-described button-fastener, consisting of the disk or plate B, provided with one or more depending attaching projections, *a b*, formed from the central portion thereof, and having a prong, C, to receive the shank of a button and to penetrate the material to which the button is secured, all substantially as and for the purpose specified.

2. The herein-described blank for button-fasteners, consisting of the disk or plate B, provided with one or more attaching projections, *a b*, formed from the central portion thereof, and with an integral laterally-projecting prong, C, substantially as specified.

257,621. SIGNALING APPARATUS FOR TELEPHONE-LINES. JAMES G. SMITH, Hackensack, N. J., and CHARLES E. BUELL, New Haven, Conn., assignors of one-third to George W. Coy, Milford, Conn. Filed Mar. 3, 1882. (No model.)

Brief.—Employs the secondary currents from an induction-coil for ringing polarized bells.



Claim.—1. The combination, substantially as described, with the central-office apparatus of a telephone-exchange system for placing any two subscribers' lines in connection with one another, of circuit-shifting apparatus for connecting any line to the secondary of an induction-coil, and in the primary circuit of the induction-coil a constantly-operating circuit-controller, whereby the current for the primary coil is suitably varied, reversed, or controlled in such a way as to produce reversed currents in the secondary coil and the connected subscriber's line.

2. The combination, substantially as described, of the telephone-exchange switch, circuit-shifters in the line-circuits, a wire or connection common to said circuit-shifters, an induction-coil whose secondary forms a portion of said common wire or connection, and a constantly-operating circuit-controller for the primary circuit of the induction-coil.

3. The combination, substantially as described, of the telephone-exchange switch, circuit-shifters for connecting any line to the secondary of an induction-coil, and in the primary circuit of the induction-coil a constantly-operating pole-changer.

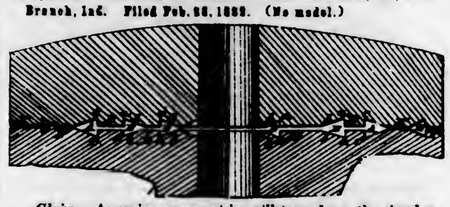
257,622. SEEDING-MACHINE. JNO. W. SOHN, CHAS. O. RICHTER, and ROBT. S. CARR, Hamilton, Ohio; said Richter and Carr assignors to said Sohn. Filed Aug. 30, 1881. (Model.)

Claim.—1. In a seed-drill of the class specified, the distributing-tubes E, having a broadened and flattened issue end, F, with beveled front surfaces, substantially as shown and described.

2. The combination of distributers having broadened ends arranged to scrape the surface of the soil, seed-conduits and fertilizer-conduits, both set to issue into said distributers, and covering-shovels arranged behind and between said distributers to produce unfertilized trenches between the seed-rows, substantially as shown and described.

3. In a seed-drill of the class specified, the combination, with seed-distributing tubes having broadened, flattened, and beveled issue end, of following covering-shovels in the form of an acute triangle with straight side edges and beveled crowning faces, substantially as set forth.

4. The combination, with a shovel-shank having its end perforated, of a shovel cast thereon and having rear flanges clasping said shank, and united by the metal in said perforations, substantially as set forth.



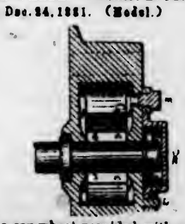
5. The combination of shovel-shank *a* with shovel L, cast thereon, having flanges *b* in contact with the shank, the shovel and flanges contacting with three sides only of the shank, substantially as and for the purpose set forth.

6. The combination with a deep-set seeder-shovel, a highly-set seed-distributer, an elevating winch-bar of flattened section, and a chain from said shovel to said winch, of a chain from said distributer attached to said winch-bar at a point nearer its axis than the point of attachment of said shovel-chain, substantially as set forth.

7. The combination of a main axle, a winch-bar parallel thereto, a series of drag-bars suspended from the winch-bar and arranged to be lifted by the rotation of the same, a means for transmitting rotary motion from the axle to the winch-bar, a sliding clutch and fixed incline or equivalent device for arresting such transmission, a lever projecting from the winch-bar, a hook to engage said lever and retain it when motion is arrested, and a lever for starting the transmission, substantially as set forth.

8. The combination, with a seeder-axle, a rotary winch-bar, a winch-bar lever, and its retaining-hook, of a tight pulley, a loose pulley, a means of transmission between them, a sliding clutch adapted to engage with said loose pulley, a hand-lever to slide said clutch, and a fixed incline to release said clutch, substantially as set forth.

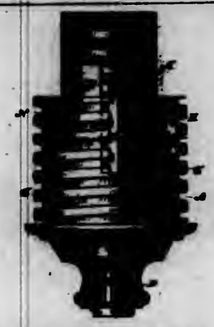
257,623. MILLSTONE-DRESS. JOHN M. SPERR, Jr., Fort Branch, Ind. Filed Feb. 28, 1882. (No model.)



Claim.—As an improvement in millstone-dress, the circular furrow A, the tangential furrows B, increasing in depth toward the eye of the stone and meeting or running into each other near the eye, the level lands D, dressed low, the furrows E, of less draft than the furrows B, and the lands F, dressed high, substantially as set forth.

257,624. CARPET-FASTENER. SETH J. SPIVLEY, Greenville, Mich. Filed Mar. 16, 1882. (No model.)

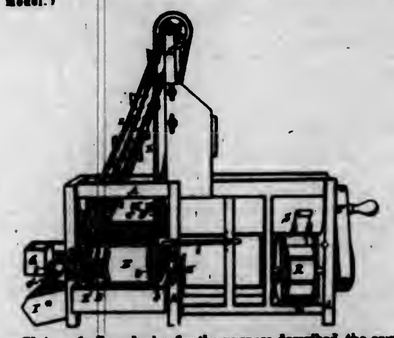
Claim.—A device for securing or laying carpets, consisting of a supplemental molding, C, provided with studs E and hooks D, the latter of which engage with the carpet, while the former engage with loops upon the base-board, substantially in the manner and for the purposes specified.



257,625. CAR-WHEEL. FRANCIS H. TANNEHILL, Barnesville, Ohio. Filed Dec. 24, 1881. (Model.)

Claim.—In a car-wheel provided with a recessed oil-box, the combination of the bars *f* on the inside of said oil-box, a hub having wedge-shaped openings *d* for the passage of the oil to the axle, the solid ends *e* sloping back from the ends of the oil-openings, and a removable cap, K, hermetically secured to the outer end of the oil-box, substantially as shown and described, and for the purpose set forth.

257,626. REMOVABLE PERMUTATION-LOCK. ROBERT W. THURMAN, Lynchburg, Va. Filed Mar. 18, 1882. (No model.)



257,626.

Claim.—1. The locks N O, and cylindrical case A A', formed with screw-thread G thereon and slot F therein, in combination with pawl C and spring H, arranged to operate as and for the purpose specified.

2. A removable lock consisting of slotted screw-threaded case A A', pawl C, and spring H, in combination with locks N O, spindles B b, disks D S, and indented notched tumblers b, arranged to engage with the coincident screw-thread and groove of sleeve E, as shown and described.

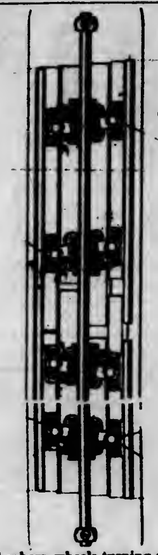
257,627. MORTAR-MIXING MACHINE. RANDALL T. VAN VALKENBURG, Manchester, Mich. Filed Mar. 15, 1882. (No model.)

Claim.—1. In a device for the purpose described, the combination, within the frame A, of the rotating screen C, the cylinder E, and the screen *c*, with the chambered box B, substantially as specified.

2. In a mortar-mixing device, and in combination, the rotating screen C, cylinder E, subdivided box B, provided with openings *l*, and the subdivided screen I, adapted to deliver the contents to elevators, substantially as and for the purposes described.

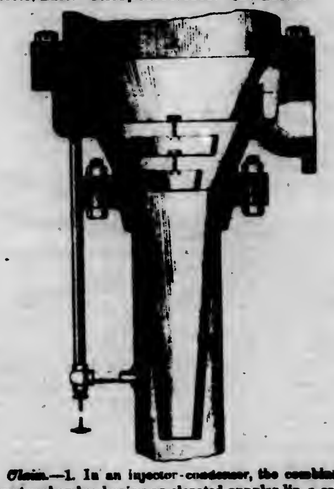
3. In a mortar-mixing machine provided with devices for screening the sand, sifting the lime, and elevating the same to the hoppers J and J', the cylinders K, constructed and operating substantially as and for the purposes set forth.

4. In a mortar-mixing machine, the cylinder E, provided with a hollow and perforated shaft, in combination with the rigidly-secured water-supply pipes *c*, each hollow shaft rotating within the head of said pipe and secured in its rotation so as to form a water-tight joint by pressure upon the opposite end of each shaft, substantially as and for the purposes set forth.



5. In a mortar-mixing machine, substantially as described, and in combination, the rotating screen C, cylinder E, box B, screen I, and elevators K, the latter being adapted to take the contents of the screen I and deliver them into the hoppers J and J', substantially as set forth.

6. The combination, in a mortar-mixing machine inclosed within the screen supporting-frame and driven from a single main shaft, of the sand-screen, lime-sifting cylinder, receiving-box, elevating devices, hoppers, graduated cut-offs, and mixing-chamber, the parts constructed, arranged, and operating substantially as and for the purposes described.



257,628. CLOTH-STRETCHING MACHINE. GEO. W. VOELKER, Woonsocket, R. I. Filed Oct. 18, 1881. (No model.)

Claim.—A cloth-stretcher cylinder consisting of the stationary shaft, inclined arbors, wheels turning on said arbors and having slotted peripheral flanges, and headed pins extending from the slots into the slots, substantially as set forth.

257,629.

257,629. INJECTOR-CONDENSER. JOSEPH WHEELOCK, Worcester, Mass. Filed Jan. 28, 1882. (No model.)

Claim.—1. In an injector-condenser, the combination, with the water-chamber having an elevated annular lip, a cone projecting downward within said lip, of a conical shell extending below said cone and water-chamber, and a discharge-pipe connected to the lower and small end of said conical shell, substantially as described.

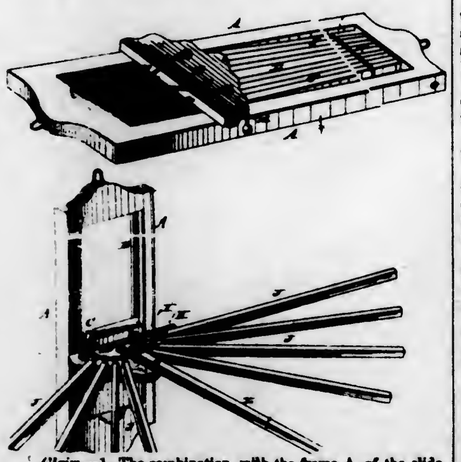
2. The combination, with the water-chamber in an injector-condenser, of a sediment-trap and a flush-pipe, substantially as described.

3. The combination, with the conical main shell in an injector-condenser and a discharge-pipe connected to the lower end of said shell, of a tapered nozzle extending downwardly within said discharge-pipe, and in communication at its upper end with the interior of the conical shell, substantially as described.

257,630. ALPHABET-BLOCKS. ADELINE D. T. WHITNEY, Hilton, Mass. Filed Dec. 6, 1881. (Model.)

Claim.—1. A set of blocks representing the various proportional subdivisions of a given straight line and proportional area

257,630.



of a circle whose diameter bears a fixed ratio to the given line and capable by means of interchangeable combinations of representing the letters of the Roman alphabet and other printed characters, substantially as described.

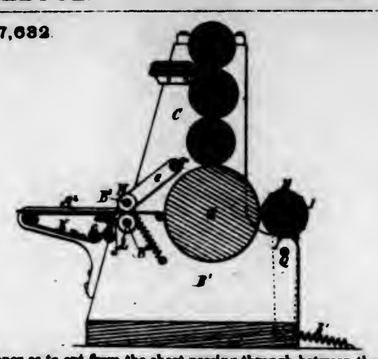
2. A set of alphabet or toy blocks composed of blocks representing different proportional subdivisions of a given straight line and circle, each in definite relative proportion to the others and capable of representing by combination the various characters commonly used in print in regular proportion and on a uniform scale, substantially as described.

3. The blocks A, B, C, D, E, and F, having the shapes and relative proportions and capable of being used in combination, in the manner and for the purposes herein set forth.

257,631. CLOTHES-DRIER. ALBIAN L. ADSIT, North Springfield, Pa. Filed Mar. 12, 1882. (Model.)

Claim.—1. The combination, with the frame A, of the slide C, the hinged plate D, the tapering clothes-bars, hinged, as shown, to said plate, and the ring N for holding them together, so that they may be folded between the sides of frame A, as set forth.

2. The combination of the frame A, slide C, having hinged bracket D, provided with rigid central bar, L, and hinged tapering arms J, and the ring N, as and for the purpose set forth.



3. As an improvement in clothes racks or driers, the combination of the frame A, slide C, hinged bracket D, brace E, loop H, arms or bars J L, and the hook M, all arranged and operating substantially as set forth.

257,632. RUBBER-CUTTING MACHINE. CHARLES ADAMS, Brooklyn, N. Y. Filed Oct. 29, 1881. (No model.)

Claim.—1. In machinery for cutting sheets of rubber or other analogous elastic tenacious material into boot-uppers or other objects, the combination, with suitable feed-rolls, of two sets of revolving knives, operating one to cut the major portions of the said uppers or other objects and leave them connected by slight strips, and the other to subsequently sever such strips, leaving the uppers or other objects complete, substantially as explained.

2. In machinery for cutting a sheet of rubber or other analogous elastic tenacious material into boot-uppers or various other objects, the combination, with a shifting bearing or cutting cylinder or bed, of a revolving cylinder armed upon its periphery with a series of cutters of such form and operating with said bed in such

257,632.

manner as to cut from the sheet passing through between them a series of boot-uppers or other objects which are connected by frail strips, by which strips said uppers, after being cut, are fed along together from the knives and bed, substantially as described.

3. In machinery for cutting a sheet of rubber or other analogous elastic tenacious material into boot-uppers or various other objects, the combination, with a suitable cutting-bed, of a series of cutters mounted upon a rotary cylinder, and of a shape to cut a boot or shoe upper entire from a sheet of rubber or other analogous material, with the exception of frail strips which connect said uppers, substantially as stated.

4. The drum G, operating with the cutter I as a shifting bed to such cutters, and as a means of feeding the sheet of material along, substantially when such cutters are of a form to cut from said strip a continuous line of uppers or other objects connected by slight strips, substantially as described.

5. The cutter I, of a shape to cut from a sheet of rubber or other material a series of boot-uppers or other objects united by frail connections, substantially as and for the purposes stated.

6. The endless apron K, in combination with the drum G, cutter I, and knives or cutters *d d'*, substantially as described.

7. In combination with the rotary drum G, the cutter-cylinder or roll H, connected adjustably to the machine-frame with respect to the said drum to automatically adapt itself to varying thickness of material passing between said drum and cylinder, substantially as stated.

8. In combination with the drum G and the cutters I I, the knives or cutters *d d'*, suitably supported, and operating to sever the strips connecting the uppers or other objects cut by the said cutter I, substantially as and for the purposes set forth.

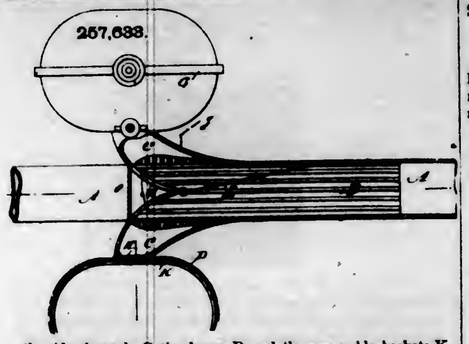
9. The combination, with the cutter I, the drum G, and the knife-stocks L, of the rotary rolls or hubs N, as connected adjustably with said stocks to constitute shifting cutter-beds for the latter, substantially as set forth.

10. In combination with the cutters I, drum G, and knives *d d'*, the endless aprons K, having openings to permit of escape of the scraps cut from the material by the said knives *d d'*, substantially as herein set forth.

11. The general physical structure of the machine as composed of the housings B B', rolls D E F, drum G, cylinder or roll H, with its cutters I, and adjustable automatically with respect to the drum G, the knives *d d'*, mounted upon rotary cylinders and operating with the rotary beds or hubs N, and the endless apron, with its openings, substantially as described.

257,633. ATTACHMENT FOR DREDGING-PUMPS. ROBERT H. ADAM, Charleston, S. C. Filed Aug. 27, 1881. (No model.)

Brief.—To prevent large stones from entering the pump, a grated cage is located in a bend or knee of the pump-tube, whereby such stones are directed into a receptacle at either side of the tube by an adjustable switch tongue or wing.



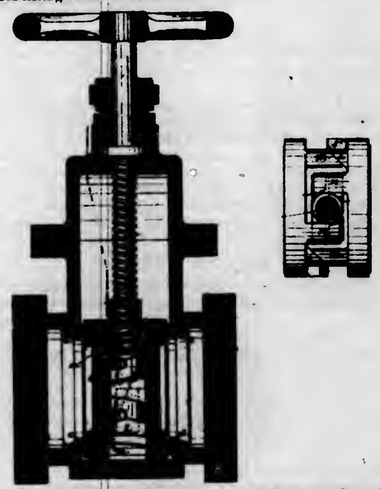
Claim.—1. The combination, with the pump-tube A, of the sleeve or grating B, arranged in the bottom of the said tube at a knee or elbow of the same, substantially as shown and described, whereby large pieces of rock are prevented from entering and injuring the pump, as set forth.

2. The combination, with the pump-tube A of the grating B, the side channels, C, above the grating B, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the pump-tube A, of the grating B, the side channels, C, and the drums D, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the pump-tube A, of the grating B,

257,633.



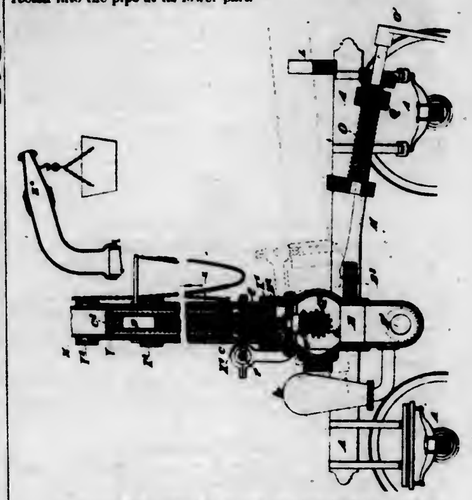
the side channels, C, the drums D, and the removable baskets K, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the pump-tube A, of the grating B, the side channels, C, the drums D, and the pivoted or swinging switch-plate L, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with the pump-tube A, of the grating B, the side channels, C, the drums D, the pivoted switch-plate L, and the gates H, substantially as herein shown and described, and for the purpose set forth.

257,634. STRAIGHT-WAY VALVE. JAMES ARTHUR, Jersey City, assignor of one-half to William S. Carr, Paterson, N. J. Filed Nov. 25, 1881. (No model.)

Brief.—Two similar valves, each having interlocking cylindrical hubs and inclines, whereby both are retained in proper relative position, but may be turned one against the other, combined with a wedge-shaped lifter operated by a screw-stem, which lifter, when raised, turns the valves so as to relieve the pressure on their seats before lifting them off their seats.



Claim.—1. The combination, in a straight-way valve, of two disks, interlocking flanges on their backs, segmental inclines, a wedge-shaped lifter, a screw to operate the same, and the projections and stops *a b*, substantially as set forth.

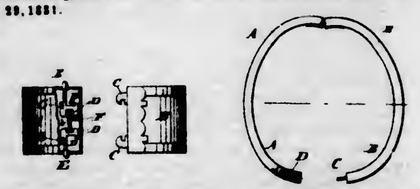
2. In combination with the disks placed back to back in a straight-way valve, a wedge-shaped lifter introduced between the disks, and mechanism for operating the same so as to give a partial rotation to the valve-disks in commencing to lift the same, substantially as set forth.

3. In a straight-way valve, two disks, each having similar segmental inclines upon the back, a projection by which it is lifted, and a projection by which its downward movement is arrested, in combination with the screw and lifter and a case having the projections *b*, substantially as set forth.

257,635. EXTENSION-PIPE FOR FIRE APPARATUS. JOHN ASHWORTH and CHARLES S. PATRIN, Chicago, Ill. Filed Feb. 4, 1882. (No model.)

Brief.—The extension-pipes X Y Z are carried on truck A, lying longitudinally. When intended to be used the pipes are raised by screws and water-supply from one or more sources directed into the pipe at its lower part.

Claim.—1. The screw C, having the longitudinal groove *c*, and the threaded sleeve D, having the feather *d*, in combination with the pipes X Y Z, substantially as herein specified.

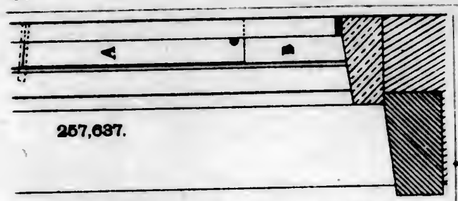


2. The pipes X Y Z, in combination with the socket-piece B, central screw, C, and concentric sleeve D, and provided with passages *x y z* and stuffing-boxes X' Y', adapted to serve as herein specified.

3. The socket-piece B, supported on the carriage A, with liberty to turn in a vertical plane, in combination with the pipe X and its connections, socketed in one end, with one or more hose-couplings, B', on the opposite end, and the operating-shaft G, mounted in the line of axis of motion, arranged for joint operation as herein specified.

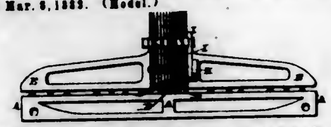
4. The elevating-screw O and its operating means O', in combination with the nut Q, links M, arm B', and socket-piece B and its connections, arranged to serve as herein specified.

5. In a series of telescopic pipes, the head C' on the screw-threaded sleeve D, in combination with the pipes Y Z, arranged to prevent the elevating of the pipes beyond the proper limit, as herein specified.



257,636. FASTENING FOR BRACELETS AND SCARF-RINGS. ELIJAH ATKINS, Birmingham, County of Warwick, England. Filed Aug. 26, 1881. (No model.) Patented in England Jan. 29, 1881.

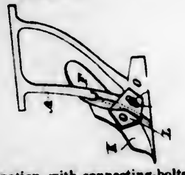
Claim.—In a bracelet, the combination, with the rigid notched catches C of the part B, of the catches D, consisting of an angle bar or plate provided with plains *a a'* on the outer end of its shorter arm, and with the lug *b* at its angle, and the spring F, interposed between and connected to the said catches between the lugs *a' b*, arranged in the hollow end of the section A, substantially as herein shown and described.



257,637. WINDOW-FRAME POCKET. ALGERNON S. BAKER, Augusta, Me. Filed Jan. 12, 1882. (No model.)

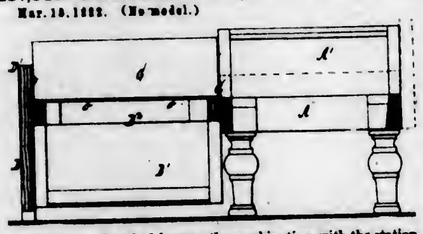
Brief.—The pocket-piece is grooved at one end to fit over a dowel-pin in the edge of the pocket-opening.

Claim.—The combination, in a window-frame pocket, of the cover A, having grooved end D and the dowel D', secured to the window-frame, as set forth.



257,638. MOP-HOLDER. HENRY BAUGHMAN, Columbus, Ohio. Filed Mar. 6, 1882. (Model.)

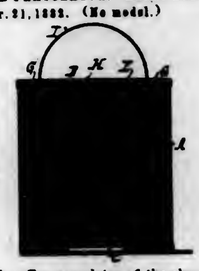
Claim.—In a mop-holder, the combination of the lower jaw, A, having the stem B and guides D formed upon the center of its top edge, with the upper jaw, E, screw-socket L, provided with ratchet O, and the dog I, pivoted in the flange H, substantially as described.



2. The combination of the jaw A, having the screw-stem formed upon its center, the upper jaw provided with a flange and a dog, and the screw-socket having a ratchet formed upon its lower edge, substantially as set forth.

257,639. PLOW. MATTHEW M. BEARD, Holmes County, Miss. Filed Sept. 24, 1881. (No model.)

Claim.—The combination, with connecting-bolts, of the front shank, A, having the plain slot C, the notched slot D, and the rabbet E, the share F, having apertures G H and flange J, the curved plate K, having the transversely-slotted angle-iron L, and the land-side having aperture N, as described.



257,640. BED-LOUNGE. MAX BECKER, New York, N. Y. Filed Mar. 18, 1882. (No model.)

Claim.—1. In a bed-lounge, the combination, with the stationary main frame A, of the seat-frame B, hinged to the front edge thereof, and provided with an attached back, D, having a longitudinal rail, D', projecting downward below the under side of the seat-frame substantially the entire length thereof, and normally resting behind the main frame, but constituting a vertical bedstead-rail when the hinged seat-frame is opened, substantially as described.

2. In a bed-lounge, the combination of the stationary main frame A, the hinged seat-frame B, provided with a cross-piece, B², and an attached back, D, having a longitudinal rail, D', projecting downward below the under side of the seat-frame, and normally resting behind the main frame, but constituting a vertical bedstead-rail when the hinged frame is opened, and the head-rest G, hinged at its lower edge to the cross-piece of the seat-frame, and when in an open position supported by the head-piece of the main frame, substantially as described.

257,641. COFFEE-PERCOLATOR. HENRY BERRY, Jersey City, N. J. Filed Mar. 21, 1882. (No model.)

Claim.—1. A coffee-percolator of the character described, combining in its structure the percolating-vessel provided at its upper end with an inwardly-projecting flange, E, having a notch, F, a removable and replaceable lid or cover, D, and a handle, I, having its ends extended through the lid or cover into the form of catches G, which project from the edges of the latter, substantially as described.

2. A coffee-percolator combining in its structure the percolating-vessel provided at its upper edge with an inwardly-projecting flange, E, having the notch F, and downwardly-projecting stop H, a removable and replaceable lid or cover, D, and a handle, I, having its ends extended through the lid or cover in the form of catches G, which project from the edges of the latter, substantially as described.

257,642. BOTTLE-WRAPPER. HENRY BELL, Baltimore, Md. Filed Mar. 10, 1882. (No model.)

Claim.—1. A bottle-wrapper made of lengths of vegetable fiber, which are secured together at their centers and adapted to be bent up from the bottom to the neck of a bottle, substantially as shown and described.

2. A bottle-wrapper made of lengths of vegetable fiber, which are secured together at their centers between pieces of pasteboard or felting, substantially as shown and described.

3. A bottle-wrapper composed of suitable pieces of material, which are secured together at the center and bent up around the bottle and confined by a band, and having a number of the strips made longer than the rest and bent back over the said band and confined by another band inclosing the wrapper, substantially as shown and described.

257,643. DECORATING GLASSWARE. BENJAMIN BUDAS and JOSEF PLOGEL, Brooklyn, N. Y. Filed Oct. 6, 1881. (Model.)

Claim.—1. A composition for decorating the surface of glassware, consisting of red lead, granulated quartz, boric acid, potash, and bismuth, substantially as described.

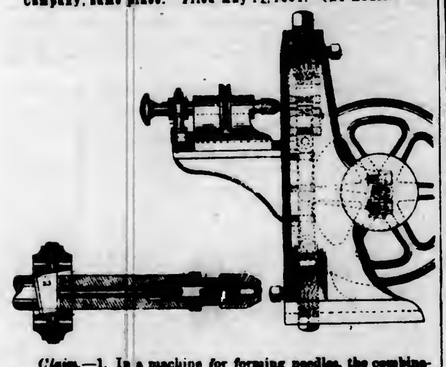
2. The method herein described of decorating the surface of glassware, consisting of the application with a suitable flux of a layer of composition of red lead, granulated quartz, boric acid, potash, and bismuth, then placing it in a muffle and exposing it to the heat of a furnace until the fusion of the composition takes place, substantially as described.

3. The process herein described of decorating the surface of glassware, consisting of first frosting a portion of it with a colored composition of red lead, granulated quartz, boric acid, potash, and bismuth, and, second, of painting the unfrosted portions of it with

a part of like composition ground to an impalpable powder and colored with metallic oxide, and then exposing to the heat of a decorating-furnace until the fusion of the composition takes place, substantially as described.

4. As an article of manufacture, glassware having portions of its surface frosted with composition, as herein described, and unfrosted portions painted with like composition ground and colored with metallic oxide, substantially as described.

257,644. CUFF-BUTTON, &c. SANGUINET H. BENOIST, St. Louis, Mo. Filed Mar. 23, 1882. (Model.)



Claim.—1. In a removable button or stud for cuffs, &c., the combination of the head A and shoe-piece B B' *b*, sliding in the inner face of the head to and from the end thereof, substantially as and for the purpose set forth.

2. In a removable button or stud for cuffs, &c., the combination of head A, with grooves *a'* and orifice *b*², and the sliding shoe-piece B B' *b*, with spring-catch *b'*, constructed and operating substantially as set forth.

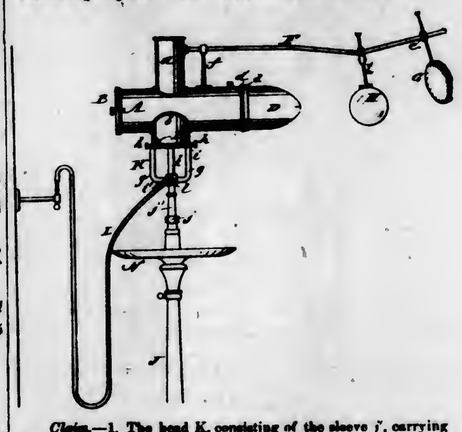
3. The shoe-piece B B' *b b'* for cuff-buttons, formed of a single plate of metal folded together substantially as shown and described.

257,645. MACHINE FOR SWAGING NEEDLE-BLANKS. JOHN BURRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed May 11, 1881. (No model.)

Claim.—1. In a machine for forming needles, the combination of two forming-dies, one stationary and the other made movable and loose in a reciprocating plunger, and an adjustable stop for arresting the downward movement of said loosely-fitted die, two knuckle-jointed bars connected with a pitman and crank for actuating said plunger, and two adjusting-screws for adjusting said forming-dies in either direction in the line of movement of said plunger, substantially as described.

2. In a machine for forming needles, the combination of two forming-dies, one stationary and the other made movable and loose in a reciprocating plunger, two knuckle-jointed bars connected with a pitman and crank for actuating said plunger and die, two adjusting-screws for adjusting said forming-dies in either direction in the line of movement of said plunger, and a revolving clamp for holding the needle-blanks while being formed, substantially as described.

3. In a machine for forming needles, the combination of two forming-dies, one stationary and the other made movable and loose in a reciprocating plunger, two knuckle-jointed bars connected with a pitman and crank for actuating said plunger and die, an adjustable arm extending into a cavity in the plug beneath the movable die and secured in any desired position in the guideway of the plunger, for limiting the movement of the movable die, and two adjusting-screws for adjusting the forming-dies in either direction in the line of movement of the plunger, substantially as described.



4. In a machine for forming needles, a revolving clamp for holding the needles while being formed, consisting of a tubular spindle provided with a slot having its rear edge beveled on both sides, and containing a key correspondingly beveled on its rear edge for preventing said key from being accidentally jarred loose, an annular grooved sleeve having a movement along said spindle, and provided with a slot having inclined parallel ends to actuate said key, sliding jaws moving within said spindle and operated by the said key, in combination with dies for forming the needles, substantially as described.

5. In a machine for forming needles, the combination of a fixed die, a reciprocating plunger, a movable forming-die actuated by said plunger, fixed guide-plates for guiding said plunger, a revolvable plug inserted into one of said plates, provided at the end with an eccentric-pin projecting into a cavity in the plunger beneath said movable forming-die, and adapted at its outer end to be adjusted and secured in any desired position, whereby the throw or length of movement of the movable die in the plunger is regulated or controlled, substantially as described.

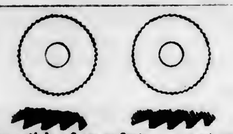
6. In a machine for compressing needles, the combination of two forming-dies, one stationary and the other movable between two guide-plates, two knuckle-jointed bars to actuate said movable die, and connected with a pitman and crank, and a revolving clamp for holding the needles while being compressed, substantially as set forth.

257,646. LARYNGOSCOPE. CARL BEEBLER, New York, N. Y. Filed Dec. 16, 1881. (Model.)

Brief.—In the front end of the lens-tube is a shade with its outer end cut at about an angle of forty-five degrees, and turning freely. The mirror-arm is bent so that it may throw the mirror's center to right or left at will. The mirrors are attached to the arm through adjustable shafts and double ball and sockets.

Claim.—1. The head K, consisting of the sleeve *j'*, carrying the lateral screw *j*, tube *l*, enlargement *l'*, arms *g g*, the flanged rim I *i*, and the tube *h*, said head being adapted to connect by screws *h* with an extension, *h*, on cylinder A, and to be turned, raised, or lowered in the socket of a stand, as described.

2. The combination, with the cylinder A, having the upward extension *a* and a post, *f*, with a guide-aperture at the top, of the rod F, end-threaded to screw into a threaded perforation on said extension *a*, passing through the guide-aperture of post, and provided with a bend or elbow, whereby the mirrors may be held in their true relative position to the cylinder, whether the dentist works on the right or left of the instrument, as described.

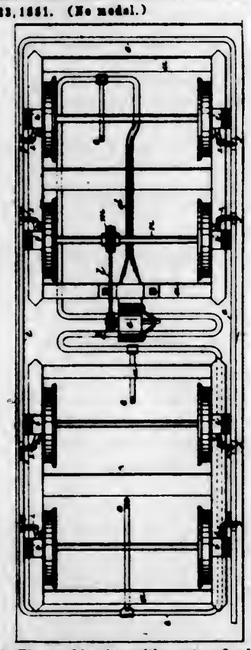


3. The combination, with the cylinder A, of the shade D, swiveled on the end thereof and cut at an angle of about forty-five degrees, whereby it may be held by friction in any desired position to protect the eyes of the operator from the light which comes from the lens, as described.

4. The combination, with the rod F and mirrors connected therewith by arms *h'*, of the sleeves *h*², having threaded branch tubes *h*², clamp-screws *h*¹, side tubes *h*², with clamp-screws *h*⁴, and the ball-and-socket joint *h'* *h*² *h*², whereby the mirrors G H may be adjusted with great nicety to each other and to the cylinder, as described.

257,647. GRINDING-ROLL AND METHOD OF MANUFACTURING THE SAME. RICHARD BIRKHOLZ, Milwaukee, Wis. Filed Feb. 16, 1882. (No model.)

Claim.—1. As an improvement in the art of manufacturing grinding-rolls, the method consisting in first casting the roll in a chill with teeth or ribs thereon, and subsequently grinding away the points or edges of the teeth to complete the roll.



257,647.

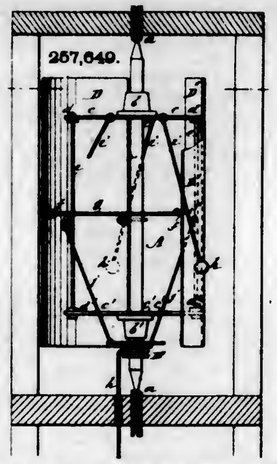
2. As a new article of manufacture, a cast-metal grinding-roll having thereon chilled ribs or teeth, portions of the edges of which are of softer metal than the remainder, as described and shown.

3. As a new article of manufacture, the cast-metal roll having thereon and integral therewith the chilled teeth or ribs with ground points or extremities.

257,648. CAR-AXLE BOX. HENRY BOUCHARD, St. Elmo, Ala. Filed Nov. 23, 1881. (No model.)

Claim.—1. The combination, with a rotary fan-blower driven by a belt connected with the shaft of the blower and a car-axle, of the main air-pipe *e* and branch air-pipes *g*, each hinged to the air-pipe and leading to an axle-box, and ventilating-pipes *o*, leading from the main air-pipe *e* through the floor of the car into its interior, whereby the car-axle boxes are kept cool and the car ventilated at the same time, substantially as described.

2. The combination, with the axle-box *q*, provided with the adjusting-screws *t*, of the axle-box *p*, adapted to be inserted therein, and provided with the steps *v v* and springs *v u*, secured to the under face, substantially as described, and for the purpose set forth.



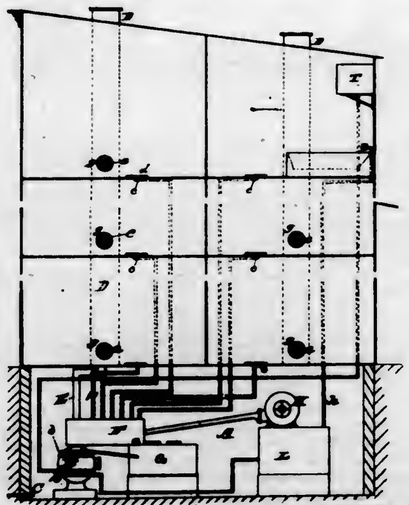
257,649. WINDMILL. BENJAMIN J. BRAGDON, Beloit, Kans. Filed Jan. 4, 1881. (Model.)

Brief.—The wind, striking the vanes D D′ D″, causes them to revolve and operate the mill. If the velocity is too great, the weighted rods *i* are thrown outwardly and partially close the vanes, thus automatically regulating the movement of the mill. The rods *g*, connecting the edges of the vanes together, cause the opening and closing movement to be uniform.

Claim.—1. The curved vanes or wings D D′ D″, centrally hinged to the arms *c c′* and connected together by the rods *g*, substantially in the manner and for the purposes set forth.

2. The arms *c* and *c′*, formed with the curved arms *d* and *d′*, in combination with the wings or vanes D D′ D″, hinged to the arms *c* and *c′*, substantially as described.

3. The combination, with the centrally hinged and joined wings or vanes D D′ D″, provided with the eyes *f′* on their leeward edges, and the fixed upper collar, *b*, of the shaft A, of the

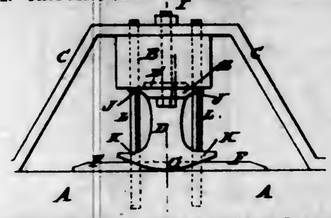


257,649.

governors *h i*, hinged at their upper ends to the said collar and passing through the eyes of the vanes, substantially as and for the purpose set forth.

4. The combination, with the arms *c*, provided with the curved arms *d* and the vanes D D′ D″, hinged to the said arms, of the sliding collar E, the connecting-rods *j*, and the operating-rod *k*, substantially as shown and described, whereby the said wings will be drawn in against the curved arms, as and for the purpose set forth.

5. The curved vanes or wings D D′ D″, centrally hinged upon the tie-rods *e*, in combination with the rods *g g g* and the curved arms *d*, the rods connecting the windward edges of the wings with opposite leeward edges thereof, substantially as described.

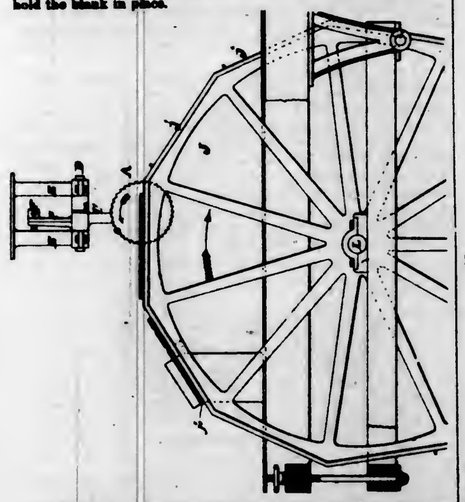


257,650. APPARATUS FOR HEATING AIR AND WATER FOR BUILDINGS. ALVIA K. BROWN, Newton, Iowa. Filed Mar. 11, 1882. (No model.)

Claim.—1. The air and water heating apparatus for buildings and apartments, consisting of the air-tight furnace-chamber A, furnace B, drum F, water-chamber G, fan K, water-tanks L T, and coiled heating-pipes *b* A, substantially as specified.

2. The air-heating and ventilating apparatus for buildings and apartments, consisting of the air-tight furnace-chamber A, furnace B, water-chamber G, coiled heating-pipe *b*, drum F, fan K, cold-air flue C, hot-air pipes H, and cold-air outlets *o* in chimneys D, substantially as specified.

257,651. SLEIGH-KNEE. BENJAMIN F. BROWN, Houghton, Mich. Filed Jan. 30, 1882. (No model.)



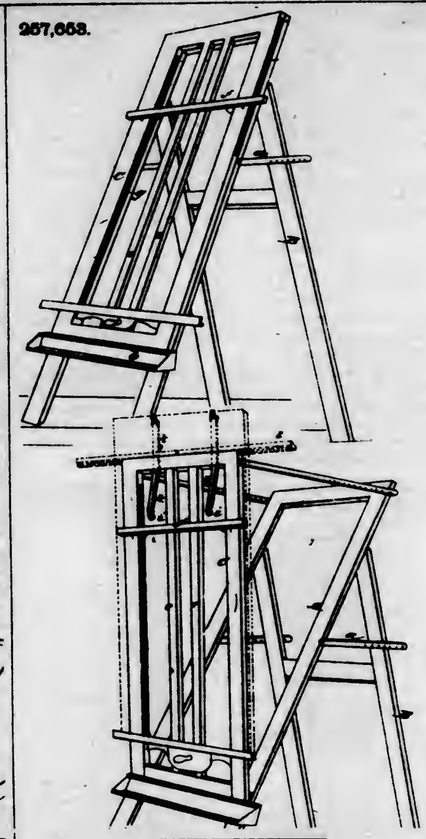
Claim.—1. The herein-described sleigh-knee D, provided with the horizontal flange E around its upper part, a little below its upper end, D′, having perforations H in its sides to receive the fastening-bolts and recesses J in its front and rear to receive the strengthening-pins, and having its lower end flared at the front and rear and provided with perforations K and flanges, substantially as set forth.

2. The combination, with the runners A, the beam B, having its lower side recessed, and the brace C, perforated and having its ends secured to the runners, of the knee D, provided with the perforated and recessed flange E around its upper part, a little below the upper end, D′, and downwardly-projecting flanges G on the sides of its flaring lower part, the fastening-bolts I, and the strengthening-pins J, substantially as and for the purpose set forth.

257,652. STAVE-JOINTING MACHINE. WILLIAM BROWN, St. Louis, Mo. Filed Nov. 26, 1881. (No model.)

Brief.—An adjustable feed-wheel with tangential sides carries the blank without clamping to inclined saws, the sides of which hold the blank in place.

Claim.—1. The combination of a feed-wheel, J, having tangential beds *j*, each provided with a single stud, *j′*, and the inclined saws A A, the wheel being adapted to deliver the blanks after being cut, and the inclined saws, mounted one on each side of the wheel and adapted to hold the blank down in its place on the bed while sawing the sides in jointing, as set forth.



2. In combination with inclined saws, a feed-wheel beneath, having straight beds *j*, said wheel being adjustable toward and away from the saws and adapted to deliver the blanks lengthwise to the saws, as set forth.

257,653. HASSEL. WILLIAM H. BROWNELL, Brooklyn, N. Y. Filed Mar. 17, 1882. (No model.)

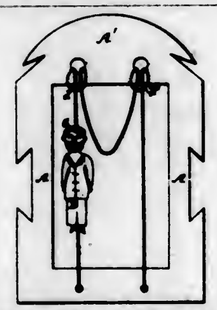
Claim.—1. The combination, with the main frame, of an auxiliary frame, C, carrying the work-slides and hinged at its lower end to the front of the main frame, whereby the frame C may be adjusted with respect to the main frame to hold the work in varying positions, as described.

2. The clasps *i* and bands *k*, in combination with the easel-frame C, substantially as and for the purpose described.

257,653.

257,654. FIRE-EXTINGUISHER. ALBERT H. BURRITT, Waterbury, Conn., assignor to the A. Burritt Hardware Company, same place. Filed Feb. 1, 1882. (No model.)

Claim.—1. The distributer consisting of the cup-shaped disk attached to the nozzle and arranged in a plane at substantially right angles to the discharge and a short distance therefrom, the rim of the said cup perforated, substantially as described.

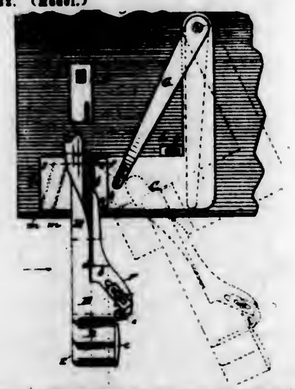


2. The distributer consisting of the cup-shaped disk attached to the nozzle and arranged in a plane at substantially right angles to the discharge and a short distance therefrom, the rim of the said cup perforated, with a conical plug to close the nozzle, secured by a fusible connection, the spindle of the plug extending through the bottom of the distributer substantially as and for the purpose described.

3. The distributer consisting of the cup-shaped disk attached to the nozzle and arranged in a plane at substantially right angles to the discharge and a short distance therefrom, the rim of the said cup perforated, with a plug to close the nozzle, its spindle extending through the distributer and secured by a fusible connection between the spindle and the distributer, substantially as described.

257,655. TOY OR PUZZLE. ABRAHAM D. CAMPBELL, Hackensack, N. J., assignor of one-half to William Cronkright, same place. Filed Mar. 20, 1882. (No model.)

Claim.—1. As a new article of manufacture, a puzzle or toy consisting of a frame or gallows, A, and a suspended body, B, the



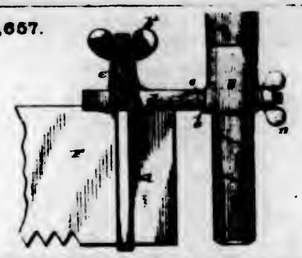
267,655.

head C and trunk of which are formed in separate parts and suspended on a looped cord or line arranged and supported substantially as shown and described.

2. As a new article of manufacture, a puzzle or toy consisting of a frame or gallows, A, and a suspended body, B, the head C and trunk of which are formed in separate parts and suspended on a looped cord or line so arranged that the head may be removed from one section of the line and placed upon another without removing the head from the line, substantially as set forth.

267,656. REVERSE-SEAMING GUIDE FOR SEWING-MACHINES. JAMES W. CHAMBERS, Baltimore, Md. Filed Feb. 20, 1882. (Model.)

Claim.—1. The devices for forming the reversed seam, consisting of the combination of a middle plate, the upper and lower tongue spring-guides, bent at their ends to form tapering throats, and the upper and lower curved folding-lips, connected to the middle plate and diverging from its plane from a point, *d*, near the middle line of the throats, and curved over and inclosing the tongue spring-guides, substantially as and for the purpose described.



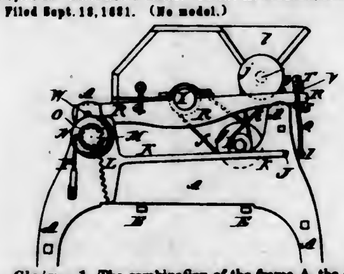
2. The combination, with the machine-table having slots *j*, with inclined bottoms, of the right-angular spring base-plate C, having pins *b* and guide-ribs *m*, and connected to the machine-table by a pivot-screw, *a*, substantially as and for the purpose described.

3. The combination, with the machine-table and the right-angular base-plate C, of the bearing-spring G and pivot-screw *a*, connecting both the said spring and the base-plate to the machine-table, as and for the purpose set forth.

4. The combination, with the pivoted right-angular plate C, bearing the seam-folding devices, of the adjustable gage A, as and for the purpose described.

5. The combination, with the middle plate, D, the upper and lower curved lips, D' and D², and the upper and lower spring-tongues, E and E', of the adjustable gage F, substantially as and for the purpose described.

267,657. SAW-HANDLE. WILLIAM CLEMSON, Middletown, N. Y., assignor to the Wheeler, Madden & Clemson Manufacturing Company, same place. Filed Feb. 11, 1882. (No model.)



Claim.—1. The combination, with a handle and an eye or socket secured thereto, the latter being provided with an angular opening or recess on one side and an opening on the opposite side for the passage of the end of the shank, of a shank having means for securing the saw-blade thereto, and provided with an angular shoulder of the same size as the angular recess before referred to, and with a screw-threaded portion adapted to pass through the handle and through the opening on the opposite side of the eye or socket, and means for securing the said shank in position, substantially as set forth.

2. The combination, with a handle and an eye or socket secured thereto, the latter being provided with an angular recess on one side and provided on the opposite side with an opening for the passage of the end of the shank, of a shank consisting of a body portion and a screw-threaded end portion, the body portion being provided with a longitudinal groove for the saw to rest in, and an angular shoulder adapted to fit in the angular opening in the said eye or socket, as described, and means for securing the saw-blade to the said shank, substantially as set forth.

3. The combination, with the saw-handle provided with a socket having an angular opening or recess on one side and an opening on its opposite side, of a shank constructed to extend through the socket and provided with an angular portion that fits within the angular recess in the socket and with a groove to receive the edge of the saw-blade, and a clamping-bolt and thumb-nut for securing the saw-blade to said shank, substantially as set forth.

4. The combination, with the saw-handle provided with a downward extension, an eye or socket, B, provided with an angular opening or recess on one side and an opening on its opposite side, of a screw-threaded shank inserted through the socket and secured by a thumb-nut, and constructed with an angular portion that fits in the angular opening of the socket, said shank being provided with a groove, *g*, and a projection, *c'*, and the clamping-bolt G and thumb-nut *b'*, substantially as set forth.

267,658. GRINDING-MILL. JAMES H. COLLINS, Gadsden, Ala. Filed Sept. 19, 1881. (No model.)

Claim.—1. The combination of the frame A, the stationary concave stone B, the cylindrical runner C, and the hinged supporting-racks D E, as set forth.

2. In a grinding-mill, the combination, with frame A and the stationary stone B, of the hinged rack D, the connecting-rods G, the cross-bars I, the rock-shaft J, and mechanism for turning said shaft, substantially as herein shown and described, whereby the said stone can be adjusted by turning the said shaft, as set forth.

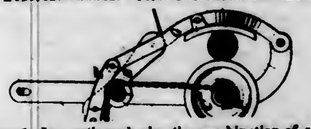
3. In a grinding-mill, the combination, with the frame A and the cylindrical runner C, of the hinged rack E, the connecting-rods Q, the cross-bars I, and the rock-shaft J, and mechanism for turning said shaft, substantially as herein shown and described, whereby the said runner can be adjusted by turning the said shaft, as set forth.

4. In a grinding-mill, the combination, with the frame A and the racks D E, that carry the grinding-stones, of the connecting-rods G and Q, the cross-bars I, and the rock-shaft J, and mechanism for turning said shaft, substantially as herein shown and described, whereby both stones can be adjusted by one operation, as set forth.

5. In a grinding-mill, the combination, with the rack D, carrying the stationary stone B, and the connecting-rods G, of the hook-nuts H, substantially as herein shown and described, whereby the said connecting-rods can be readily detached from the said rack, as set forth.

6. In a grinding-mill, the combination, with the rock-shaft J, carrying the cross-bars I, connecting-rods G Q, and the racks D E, of the lever K, rack-segment L, gear-wheel M, and ratchet and pawl O P, substantially as herein shown and described, whereby the said shaft can be readily turned to adjust the stones and will be securely held when adjusted, as set forth.

257,659. CAR-COUPLING. GEORGE O. S. CONWAY, Stonefield, assignor of one-half to James Cooper and Frederick Fairman, both of Montreal, Canada. Filed Nov. 26, 1881. (No model.)

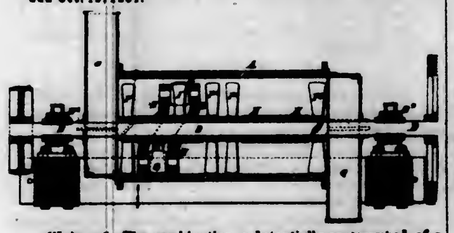


Claim.—1. A car-coupler having an oval internal chamber, in which is contained a ball dropping automatically into place on the entry of the link, so as to hold it in position, substantially as specified.

2. The combination, with the chamber A' and ball C, contained therein, and adapted to lodge in and retain the link, of recess G, as and for the purposes set forth.

3. The combination, with the ball C, contained in chamber A', provided with recess G, of arm E, mounted on pivot-spindle D, all constructed and operating substantially as and for the purposes set forth.

257,660. CAR-BRAKE. GEORGE O. S. CONWAY, Stonefield, assignor of one-half to James Cooper and Frederick Fairman, both of Montreal Canada. Filed Dec. 24, 1881. (No model.)

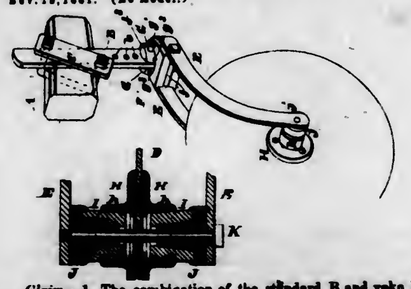


Claim.—1. In a railway-brake, the combination of a swinging oscillating frame and lever pivoted thereto operated to grip the axle, when so desired, between them, and thereby wind up the brake-chains and put on the brakes, all substantially as herein set forth.

2. The combination, in a railway-brake, of a swinging frame, a curved lever carrying a shoe, a drum and spindle carried in frame, and a lever pivoted in the upper part of the swinging frame, worked by means of a cord passing through it, but unattached thereto, and operating to close the lever and frame on the axle, and thereby put on the brakes, all substantially as herein described.

3. The combination, with a rod, either vertical or horizontal, operating when rotated to cant the lever E, to which it is connected, and thereby apply the brake mechanism herein described, of a cross-head mounted on end of said shaft and moved in either direction by a continuous cord passing through same, all as herein set forth.

257,661. MACHINE FOR REDUCING COAL, CORN, &c. RICHARD COOK, Sheffield, England. Filed Mar. 8, 1882. (No model.) Patented in England Oct. 18, 1880, in Germany Mar. 14, 1881, in France Mar. 18, 1881, in Belgium Mar. 16, 1881, and in Canada Oct. 18, 1881.



Claim.—1. The combination, substantially as described, of a case or cylinder, A, a shaft, D, curved drivers or carriers H, secured to the shaft, and rollers G, arranged respectively on the ends of the drivers or carriers to rotate in different vertical planes, essentially in the manner and for the purposes set forth.

2. The combination, with the case or cylinder A, having feed and discharge tubes at its ends, respectively, the horizontal shaft D, and the traveling grinding or crushing rollers G, of the double-armed fans P, P', and P², arranged respectively at the feed and discharge ends of the case or cylinder and at the side of the traveling grinding or crushing rollers for cooling the material being operated on, feeding it along, and discharging the same at one end of the case or cylinder, substantially as described.

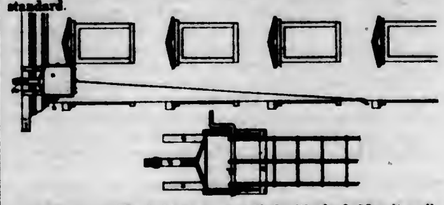
3. The combination of the case or cylinder A, the tube or shaft O, and the chute or pipe Q with the shaft D, curved drivers or arms H, the rollers G, and the blades or fans I, substantially as above described, and for the purpose specified.

257,662. ROTARY COLTER. OSCAR J. CORNOYER, St. Louis, Mo., assignor of one-half to Joseph H. Barr, same place. Filed Nov. 15, 1881. (No model.)

Claim.—1. The combination of the standard B and yoke E with the box F, secured to the yoke, and the bearing-blocks G, adjustably secured to the standard, for the purpose set forth.

2. The combination, with a yoke, E, and flanged box F, of the standard B, having orifices *b*, and the bearing-blocks G G, having pin *g'*, the said blocks being adjustable on the standard, as and for the purpose set forth.

3. The combination of standard B, adjustable bearing-blocks G, with flanges *g*, pin *g'*, box F, having grooves *f f²*, bolt *f'*, and the yoke E of a rotary colter, all made substantially as set forth.



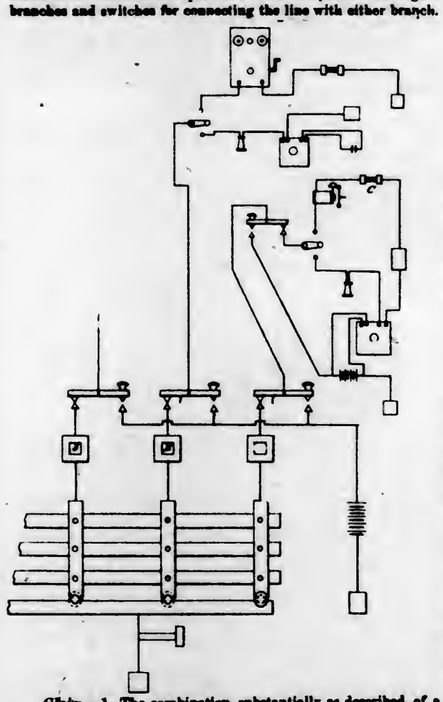
4. In combination with the standard B, yoke E, and box F, the adjustable bearing-blocks G, having the teats *g²* secured thereto, as and for the purpose set forth.

5. The blocks G G, formed with teats *g²* *g²*, and provided with the pin *g'*, in combination with the box F, having stop *f³*, and the standard B, having orifices *b*, as set forth.

6. The combination of the cutter D, disks H H, having hubs *h h*, concentrically-ribbed arbors J J, yoke E, bolt K, and the concentrically-grooved housings I I intermediate of the arbors and hubs, as set forth.

257,663. FIRE-ESCAPE. PATRICK H. COSTELLO, Boston, Mass. Filed Mar. 6, 1882. (No model.)

Brief.—The shaft upon which the ladder is wound is inclosed in a case which is provided with guides and a central sustaining-standard.



Claim.—1. The ladder-case provided with the ladder, its coiling-shaft, and the central standard and its wheel, and the guides, arranged substantially as set forth.

2. The guide-rail arranged with the building, as described, in combination with the coiling-ladder, and with its case and coiling-shaft, and with the sustaining-standard and its wheel and guides, arranged with each case, as shown and described.

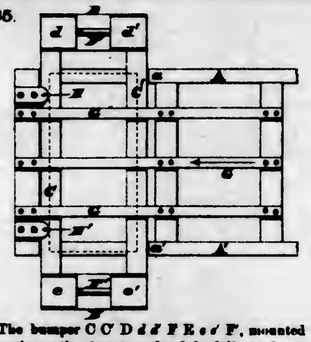
257,664. TELEPHONE-EXCHANGE SYSTEM. GEORGE W. COY, Milford, Conn., assignor, by mesne assignments, to the United States Telephone Manufacturing Company, New York, N. Y. Filed Dec. 31, 1880. (No model.)

Brief.—The lines are normally grounded through a listening-telephone located in a common earth-connection at the central office. High resistances at the subscribers' stations prevent the diversion of currents from the central-office ground. Annunciators are placed in the lines and a battery in the branch, and keys are provided whereby the lines may be connected either with annunciators and telephone to ground or with the battery branch. Subscribers' stations are provided with telephone and signal branches and switches for connecting the line with either branch.

Claim.—1. The combination, substantially as described, of a series of telephone-lines centering in a single office, switch apparatus for connecting any two of said lines for telephonic communication, an annunciator in each normal line-circuit and in direct connection with said circuit, and circuit-shifting apparatus for connecting any line at pleasure to a wire leading to an electric generator for signaling to a subscriber's station.

2. The combination, substantially as described, of a series of telephone-lines, a common switch apparatus for connecting any two lines for telephonic communication, an annunciator at the central office placed directly in each normal line-circuit, an electric generator in a branch line for signaling purposes, and circuit-shifting apparatus for disconnecting any line from the portion of its normal circuit running to the annunciator and ground and connecting said line to the wire leading to the generator.

3. In a station telephone apparatus, a battery in a local circuit, in combination with a switch in the line having connections to the station apparatus and the local battery, and acting to disconnect the line from the station apparatus and connect it with the local battery, substantially as and for the purpose described.



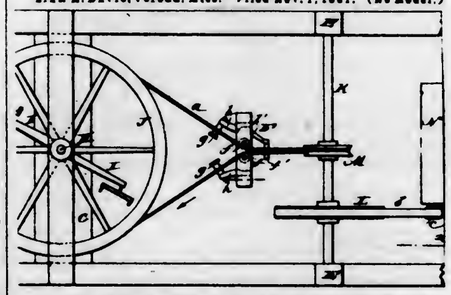
257,665. BRICK-MACHINE. JONATHAN CARADER, Cincinnati, Ohio, assignor of one-half to Wilhelm Pieper, same place. Filed Feb. 24, 1882. (No model.)

Claim.—1. A bumping apparatus reciprocating transversely of the delivery-frame of a brick-machine, and adapted to alternately strike the opposite ends of the charged molds, in combination with suitable stops for arresting said molds in a proper position, substantially as described.

2. The combination, in a brick-machine, of delivery-frame A *a* A' *a'*, reciprocating bumper C C' D E, bearing-bars G, and stops H H', substantially as described.

3. A brick-machine bumper consisting of the beams C C', ends D E, blocks *d d' e e'*, and handles F F', as and for the purpose specified.

257,666.



4. The bumper C C D *d d* F E *e e* F, mounted on rollers *j j*, and reciprocating transversely of the delivery-frame of a brick-machine, substantially as herein described.

257,666. COTTON-SCRAPER. CHARLES C. DAVIS and WILLIAM H. MERCER, Hayden, S. C. Filed Feb. 23, 1882. (Model.)

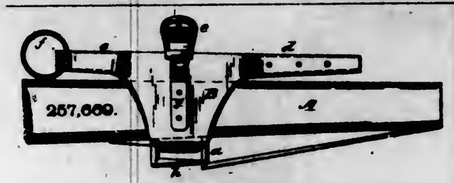
Claim.—In a cotton-scraper, the combination of the two beams A, each made in a single piece with the standards, and having the handles D secured between their rear ends, the shaft B, having the two cutting-wheels G secured thereto, and the scrapers C, which cut close to the outsides of the wheels, substantially as shown and described.

257,667. DRIVING MACHINERY FOR COTTON-GINS. WILLIAM H. DAVIS, Verona, Miss. Filed Nov. 1, 1881. (No model.)

Claim.—1. The adjustable arms A A, provided with the rollers *g g*, and the adjustable arms A' A', provided with the rollers *f' f'*, in combination with the vertical guide-rollers *f f*, substantially as and for the purposes set forth.

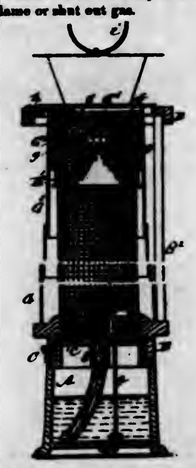
2. In combination with the vertical king-post H, provided with the levers I I, and carrying the main drive-wheel J, and the horizontal shaft K, provided with the pulleys L and M, the intermediate frame, F, provided with the adjustable arms A A, having the rollers *g g*, and the arms A' A', provided with the rollers *f' f'*, substantially as and for the purposes set forth.

257,668. VACCINATOR. JOHN H. DICKSON, New Castle, Pa. Filed Feb. 8, 1882. (No model.)



Brief.—A quill-point carries the virus, and is also adapted to serve as a scarifier.

Claim.—A combined scarifier and vaccine-carrier, consisting of a quill clarified, hardened, and sharpened, and bearing the virus, substantially as described.



257,669. HARNESS ATTACHMENT FOR VEHICLE-SHAFTS. JOHN H. DIEFFENBACHER, Edwardsburg, Mich. Filed Mar. 6, 1882. (No model.)

Claim.—The shaft A, having connected to it the spring-catch *c* and confining-arm A, in combination with the girdle B, having buckle *e*, straps *d g*, and strap *c*, with ring *f*, substantially as and for the purpose set forth.

257,670. SAFETY-LAMP FOR MINERS' USE. JOHN M. DOLBY, Wilcoxboro, Pa., assignor to himself, William H. Thomas and James J. Kerwin, same place. Filed Mar. 6, 1882. (No model.)

Brief.—A telescopic extinguishing-case exterior to the gauze cage of the lamp is raised when the lamp is in use and lowered to extinguish the flame or shut out gas.

Claim.—1. The telescoping tubular sections G G', the section G², provided with openings *g*, the section G³, having bar S, and the covering-section G⁴, in combination with the cage E E', and the frame-bars F', as shown and described.

2. The combination, in a lantern, of a cage-body, E, wire-gauze E', and supporting-frame *f*, as shown and described.

3. The externally-threaded cap D and the bowl having internally-threaded neck *c*, in combination with the burner *b*, having perforated collar *d* and washer-plate *d'*, whereby the burner may be made fast to the bowl, the trimming and raising wire may be readily manipulated, and the oil may be prevented from escaping on the cage or wire-gauze, as described.

257,671. MAP AND CHART EXHIBITOR. ALEXANDER DOM, Mount Healthy, Ohio. Filed Oct. 18, 1881. (No model.)

Claim.—1. In combination with a series of display-sheets, a frame or support to which one end of said sheets is attached, said frame being retained on an appropriate support and capable of being turned horizontally thereon, substantially as and for the purpose specified.

2. The roller C, having attached thereto a series of display-sheets, E, and supported by a frame, said frame being retained on an appropriate support and capable of being turned horizontally thereon, substantially as and for the purpose specified.

3. The standard A, provided at the top with hole *b'*, and frame A', consisting of the horizontal rail B and arms E', the frame being provided with pin *b* and capable of being turned horizontally on the standard, in combination with the roller C, having attached thereto at intervals around its face a series of display-sheets, E, substantially as and for the purpose specified.

4. The standard A and frame A', capable of being turned horizontally on the top of the standard, said frame being further provided with notches *d*, in combination with the roller C, having attached thereto a series of display-sheets, substantially as described.

5. The rail C, retained on an appropriate support and capable of being turned horizontally on such support, and a series of display-sheets attached to said rail by means of a connecting-strip, X, substantially as and for the purposes specified.

257,672. SURCINGLE. MARSHALL E. DOWLIN, North Adams, Mass. Filed Dec. 12, 1881. (No model.)

Claim.—1. A surcingle formed with two distinct inflexible bearing-pads, separated so as to freely admit the ridge of the backbone between them, and adapted to bear on the fleshy parts of the back, on either side of the ridge, with a flexible connection between said pads, adapted to span the backbone without bearing seriously thereon, together with a buckling-strap for fastening the same around the blanketed body of the horse, substantially as herein shown and described.

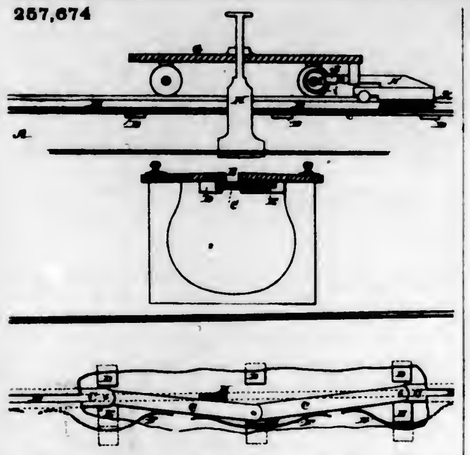
2. A surcingle constructed with bearing-pads formed of wooden blocks joined by a flexible connection or hinge, substantially as and for the purpose set forth.

3. The combination, in a surcingle with inflexible bearing-pads and their connection, of the buckling-strap *d*, fastened to the middle of the said connections and free in both directions therefrom, but passing loosely over the pads, substantially as and for the purpose set forth.

4. The combination, in a surcingle, with inflexible bearing-pads and their connector, of the buckling-strap *d*, fastened to the middle of the connector, with loops *b b* near the outer ends of the pads, through which the strap is loosely passed, substantially as herein shown and described.

257,673. ART OR PROCESS OF REFINING SUGAR. GEORGE A. DRUMMOND, Montreal, Quebec, Canada. Filed Feb. 4, 1882. (No specimens.)

Claim.—1. The art or process of clarifying syrup or solution of sugar by forcing it up through a suitable medium contained in a vessel, which, at the desired point of the operation, is inverted, so that the syrup remaining therein filtrates downward, but in the original direction and to the original outlet, all substantially as herein described, and for the purposes set forth.



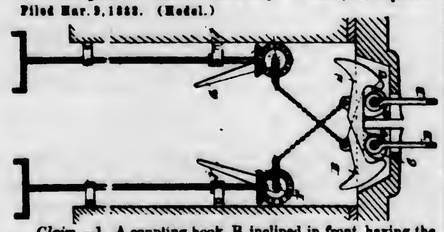
2. The art or process of clarifying any liquid and cleansing the clarifying medium by a liquid of less density by forcing the liquid to be purified up through the medium, reversing, when desired, the vessel containing same, allowing the remainder of the liquid to filtrate downward, and simultaneously letting in the cleansing-fluid on top, all as herein described, and for the purposes set forth.

257,674. CABLE RAILWAY. THEODORE DUPPY, San Francisco, Cal. Filed Feb. 11, 1882. (No model.)

Brief.—The slot of the tunnel is closed and protected by jointed sections confined in suitable guides, and opened by the passing grip-shank and returned to position by means of springs. A cleaner traveling in the slot is attached to a dummy and is operated by an eccentric upon the forward axle of the dummy.

Claim.—1. In a cable railway having an underground tunnel or tube in which the cable travels and a grip-slot through which the shank of the grip passes, the jointed sections or strips C C under the grip-slot, and confined in suitable guides to close said slot, and to be moved to one side by the passing grip-shank and to return to position by means of springs F, substantially as described.

257,674



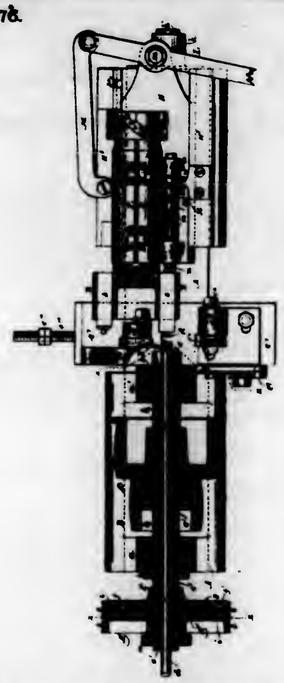
2. In a cable railway having an underground tunnel or tube and a grip-slot through which the shank of the grip passes, the combination and arrangement of the jointed strips C C, guides D E, and springs F, substantially as described.

3. In a cable railway having an underground tunnel or tube and a grip-slot, the jointed strips C C, closing the said slot underneath and opening as the grip-shank passes, in combination with a cleaning attachment upon the dummy, said cleaner traveling in the grip-slot in advance of the grip-shank, substantially as and for the purpose herein described.

4. In a cable railway having a tunnel or tube and a grip-slot, the jointed strips C C, arranged, as shown, to close or open the slot around the passing grip-shank, in combination with the cleaning device attached to the dummy, consisting of a cleaner, K, operating within the grip-slot, and the cleaners *l l* on top, and attached to a frame, N, secured to the throw-rod J, operated by an eccentric, I, upon the forward axle of the dummy, substantially as and for the purpose herein described.

5. In a cable railway, as shown, a cleaning device attached to the dummy in front, consisting of the cleaners K, traveling in the grip-slot, and cleaners *l l*, passing on top of the road, said cleaners having a forward and return motion in addition to the progress of the dummy by means of the frame N, rod J, strap *i*, and eccentric I upon the forward axle of the dummy, substantially as herein described.

257,675. CAR-COUPLING. DAVID B. DUNCAN, New Richmond, Ohio, assignor to himself and HARRY F. MOORE, same place. Filed Mar. 9, 1882. (Model.)



Claim.—1. A coupling-hook, B, inclined in front, having the lateral cam C and a recessed heel, and pivoted on a bolt, *c*, in combination with a notched draw-head and an iron rod bent in the middle to form a link, D, said rod being provided with an eye at each end, as and for the purpose specified.

2. The combination, with two hooks, B B, on pivots *c*, of the cams C C, each arranged on the heel of a hook to be out of the way of the opposite hook when its own is in a vertical position, but when the same is in a horizontal position to permit the point of the opposite hook to ride over it and engage, as described.

257,676. METAL-WORKING LATHE. FREDERIC ECAUSERY, New York, N. Y. Filed Jan. 13, 1881. (No model.)

Claim.—1. The combination, with the revolving tubular mandrel, of a tubular chuck within the mandrel, a wheel with an internal screw screwing upon the rear part of the tubular mandrel, mechanism, substantially as specified, for detaining the wheel and causing the screw to give end motion to the clamping-chuck, and means for revolving the screw-wheel more rapidly than the mandrel to screw the wheel in the other direction and liberate the article clamped by the chuck without stopping the rotation of the mandrel, substantially as specified.

257,676.

2. The combination, with the hollow mandrel and the chuck, of the wheels *f* and *g*, disk *e*, pinions *i*, internal and external gears, and friction-bands 5 and 6, substantially as set forth, whereby the chuck is operated during the revolution of the mandrel, substantially as set forth.

3. The combination, with the mandrel, chuck-wheels *f* and *g*, and bands 5 and 6, of the cylinder A and lever *h*, substantially as set forth.

4. The combination, with the tubular mandrel and chuck, of the wheels *f* and *g*, intermediate gearing, straps 5 and 6, cylinder A, and friction-pad acting against the wheel *f*, for the purposes and substantially as set forth.

5. The friction-pad 16, swinging strap *n*, and pin 18, in combination with the cylinder A, straps 5 and 6, wheels *f* and *g*, mandrel, and chuck, substantially as set forth.

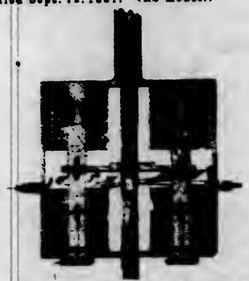
6. The cylindrical tool-holder having parallel holes, a circular range of parallel tool-stocks, and the arbor F, in combination with the stock G, bed H, zigzag cam N, stud 24, and mechanism for moving the bed back and forth, substantially as set forth.

7. The bolt *u*, pin 35, slotted sleeve *v*, and stud 33, in combination with the tool-holding cylinder E and mechanism for reciprocating the same and revolving it progressively, substantially as set forth.

8. In a lathe having a reciprocating tool-holding cylinder, a head having a hub that projects toward the central recessed portion of the tool-holding cylinder, and a tool supported upon such hub, in combination with mechanism for moving the hub and tool transversely of the lathe, as and for the purposes set forth.

9. The combination, in a lathe, of a revolving mandrel, a holding-chuck, a tool-holding cylinder having parallel holes for the tool-stocks, the mechanism for turning the cylinder progressively and holding it, an external shaping-cutter, a separating-cutter, and a transverse sliding bed with heads for holding such cutters, and mechanism for moving and stopping the bed, substantially as specified.

257,677. TELEPHONE. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 17, 1881. (No model.) Patented in England June 15, 1878.



Claim.—1. A tension-regulating device, a support for the same, a diaphragm resting against the tension-regulator, and a spring-presser acting to retain the diaphragm in place, substantially as specified.

2. In a telephone, a diaphragm the whole of which is free to vibrate under the action of sound, a tension-regulating device at one side of the diaphragm, a mouth-piece, and a spring acting to press the diaphragm toward the tension-regulator, substantially as set forth.

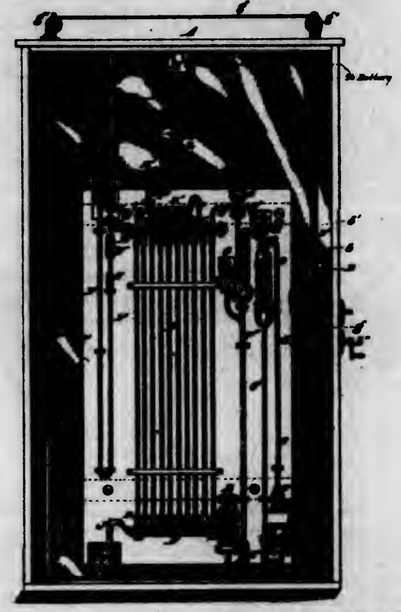
3. In a telephone-instrument, a diaphragm that is corrugated or ribbed at or near its edges, substantially as set forth.

4. In a telephone, the combination, with the diaphragm, of a yielding tension-regulator at one side and a yielding presser acting against the other side.

257,678. ELECTRIC LIGHT. EDGAR A. EDWARDS, Cincinnati, Ohio. Filed Sept. 12, 1881. (No model.)

Claim.—1. The combination, in an electric lamp, of the channeled carbon-holder with the knife-edged friction-clutch arranged to work in the channel of the carbon-holder and connected to a vibratory yoke, the yoke rigidly connecting the axial cores of the magnets, and adapted to raise said vibratory yoke, whereby the raising of such yoke will cause the friction-clutch to act as a brake for retarding the descent of the carbon-holder, substantially as described.

2. The combination, with the double U-shaped electro-magnet composing magnets of different resistances, of the double-edged friction knife clutch and brake adapted to impinge simultaneously against the opposite sides of the channel-shaped carbon-holder, and mechanism for operating said clutch, substantially as set forth.



3. In combination with the channel-shaped carbon-holder and the friction-clutch brake, the link-levers f' M and the armature-yoke Y, connected with the stirrup *l*, whereby the carbon-holder will rise and fall and adjust the arc of the light, substantially as described.

4. The soft-iron case A, inclosing the two U-shaped electro-magnets of different resistance magnetically connected to the interior of the case, in combination with a carbon-holder passing vertically up through the case, and the automatically-operating devices for connecting the armature-yoke with the carbon-holder, substantially as herein set forth.

5. An electric lamp comprising the soft-iron case A and the two U-shaped electro-magnets of different resistances magnetically connected to and located within the interior of the case, said magnets having rising and falling axial cores united by a common armature-yoke, with an automatically-adjusting clutch mechanism adapted to raise and lower a metallic carbon-holder passing loosely up through the case, substantially as herein set forth.

6. In an electric lamp, the double U-magnet comprising coils of different resistance, with rising and falling axial cores united by a common armature-yoke, the rise and fall of which armature-yoke and cores operate the adjusting clutch mechanism for adjusting the arc of the light, the electro-magnets being magnetically connected to the metallic shell of the case, which acts as a metallic conductor and forms a part of the lamp-circuit through the carbon-holder and carbons, an external circuit being employed for regulating the magnetic forces actuating the common yoke of the two magnets, substantially as set forth.

257,679. MERCURY AIR-EXHAUSTER. EDGAR A. EDWARDS, Cincinnati, Ohio. Filed Apr. 18, 1881. (No model.)

Claim.—1. An air-exhauster composed substantially of the primary exhaust-chamber C, having stop-cock N, pipe C' *e* and seal *e'*, and reservoir B, combined with guide-rods, cord, and pulley, so as to be rapidly operated, in the manner substantially as herein set forth.

2. The exhaust-chamber C, with the tubes *e e*, connected to the top of said chamber, in combination with the seal cut-off cock N, substantially as herein set forth.

3. The combination of the series of drop-tubes D with the air-chamber E, feed-tube E', and discharge-chamber D', in combination with an elevated mercury-reservoir, F', for exhausting air from a vessel, L, in the manner substantially as herein set forth.

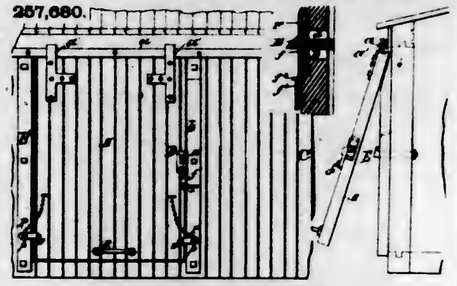
4. In combination with one or more drop-tubes, D, and reservoir F', the U-shaped tube F, with an air-trap, W, arranged to connect the parts, in the manner substantially as herein set forth.

5. In combination with the U-shaped tube F, the air-trap W and seal cut-off cock U, substantially as herein set forth.

6. In combination with the reservoir F, the float F'', and alarm *f'* H, the reservoir G, arranged to be raised and lowered by cord and pulley, in combination with the reservoir F', tube *f*, and drop-tubes D, substantially as herein set forth.

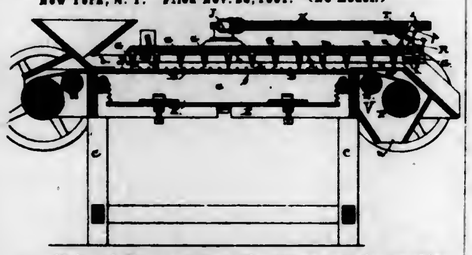
7. The combination of the primary exhausting apparatus B C with the compound series of drop-tubes D and feed-tube E' in air-chamber E and elevated mercury-reservoir F', for exhausting air from a vessel, L, in the manner substantially as herein set forth.

257,680. CAR-DOOR. THOMAS EUBANK, Sedalia, Mo. Filed Nov. 14, 1881. (No model.)



Brief.—A slotted plate on the door has a slotted sliding keeper with depending foot, the keeper engaging a hook on the car. The door-frame has a vertical stop on each side, one of which is beveled at the top to allow the door suspended by hooks on a rail to swing over and past it.

Claim.—1. The combination of the plate D, having slot *d*, keeper F, having foot *f'*, and catch E, substantially as shown, and for the purpose described.



2. The combination of the door A, provided with the hangers *a'*, and keeper F, with the metallic rail or slide *a*, and catch C, substantially as shown, and for the purpose described.

3. A sliding car-door, in combination with a door-frame having a beveled and unbeveled step to secure it against cinders, the door swinging over and past the beveled stop and locked, substantially as shown and described.

257,680.

257,681. DRY-ORE CONCENTRATOR. WILLARD B. FARWELL, New York, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—1. In an ore separating or concentrating machine, the combination of a perforate ore-supporting surface, means for moving it forward or backward when desired, means for distributing the pulverized ore thereon evenly and for moving the light particles forward toward the discharge end, and an air-blast apparatus located beneath and forcing the current of air upward through the supporting-surface and ore-stratum, as set forth.

2. The combination, in an ore-separator, of the perforate ore-supporting surface B and means for directing upward through said surface a blast of air with the ore-spreading blades G and the bars L, as set forth.

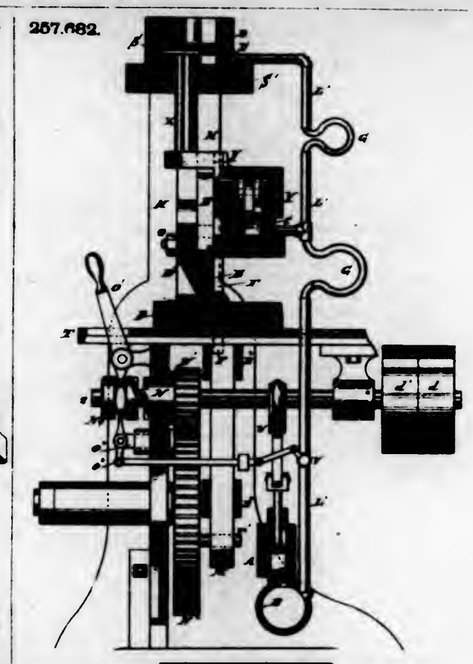
3. In an ore-separator, the combination, with a perforate ore-supporting surface, means for delivering ore thereon, and means for moving said surface in either direction, of a series of rakes, G, and means for imparting to them a reciprocating movement for acting upon the stratum of light material in one direction and for elevating them above it in the other direction, substantially as set forth.

4. The combination of the reciprocating frame *h i* and supporting-surface B with the pivoted bars G, provided with blades *g*, mechanism for giving said frame a longitudinal reciprocating motion, and means for turning said bars upon their pivots to bring the blades thereof into an inclined or angular position during the reciprocation of their carrying-frame in one direction and for turning them down into vertical or working position at the return movement of the said frame, substantially as hereinbefore described, for the purpose set forth.

5. The combination, in a dry-ore separator, of the longitudinally-movable perforate supporting-surface B, the transverse slats L, the longitudinally-reciprocating scrapers *g g*, and the air-blast mechanism E E, substantially as hereinbefore described.

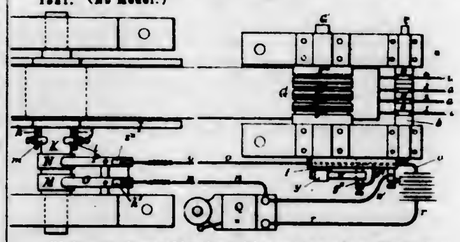
6. The reciprocating frame *h i*, having scrapers G, the bar *m*, connections *n*, the lever *p*, post R, the pitman, the crank, and the stop T, all combined to operate substantially as set forth.

257,682. PAPER-CUTTING MACHINE. HENRY P. PRENTIS, Philadelphia, Pa. Filed Sept. 1, 1880. (No model.)



Claim.—1. The clamp E, in combination with air-cylinders C C, pistons I I, flexible rubber connections G G, and conducting-pipes L, substantially as shown and described.

2. In a paper-cutting machine, the combination, with yoke Y and table T, of air-cylinder D, piston S, and rod X, adapted to operate as and for the purpose set forth.



3. In a paper-cutting machine, the combination, with clamping-bar E and yoke Y, respectively, of air-cylinders C C, pistons I I, air-pipes L', flexible connections G G, and air-valve V, adapted to operate substantially as set forth.

4. The combination of starting-lever O', unshipping-bar O², cam *n*, connecting-rod O³, and two-way air-valve V, all substantially as set forth.

257,682.

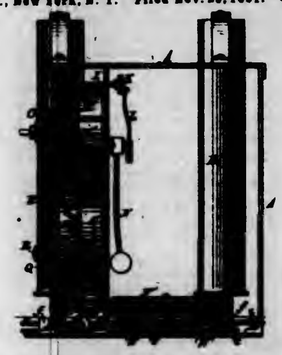
257,683. ALARM FOR DETECTING DEFECTS IN INSULATING CONDUCTORS. LOUIS FIGUIER, Melrose, assignor of one-half to Lewis S. Judd, New Bedford, Mass. Filed Sept. 26, 1881. (No model.)

Claim.—1. In combination with machinery for coiling wires into a cable and the wires operated on thereby, a battery, a signal, and electric connections between said signal and battery and between these latter parts, respectively, and the alternate wires aforesaid, whereby the contact of two of these wires completes the circuit and operates the signal, substantially as set forth.

2. The combination of a battery with compressing-rolls electrically connected to one of its poles, an insulated wire electrically connected to its other pole, and a signal forming part of the circuit, whereby the contact of said wire with said rolls consequent on the uncovering of said wire will operate said signal, substantially as set forth.

3. The series G H of rolls, in combination with a battery and wires passing between the rolls, each wire being of different polarity from the rolls between which it passes, and the alternate rolls on the same shaft being of the same polarity.

4. In combination with the wires *a* and *i* and a battery and signal, the reel I, supporting said wires *a* at one end and making a part of the electric circuit, substantially as set forth.



5. In combination with the series G H of rolls, the wires *a*, the reel I, the battery and wires to constitute an electric circuit, and the bell or signal Q, substantially as set forth.

6. The wires *a*, polarized alternately in pairs of opposite polarity and connected at one end with the reel I, in combination with said reel, the battery, wires *i*, and electrical connections, substantially as set forth.

7. In combination with a battery, a signal and cable-wires electrically connected to said battery, the rolls forming series G H, each roll being insulated from the roll nearest it, each alternate roll being insulated from its shaft, and said rolls being polarized alternately, substantially as set forth.

8. In combination with wires *a* and the battery, signal, and electrical connections, a pair of shafts and the rolls thereon, each shaft being connected to the pole of a battery and serving the purpose of polarizing the rolls, substantially as set forth.

257,684. ADVERTISING APPARATUS. JONATHAN S. FOWLER, Jr., New York, N. Y. Filed Nov. 29, 1881. (Model.)

Claim.—1. The combination of the apron C, adapted to move on the supporting-rolls B, the clock-train, and the intermediate mechanism, substantially as described, whereby the clock-train is adapted to cause the apron to advance by a series of quick movements, with long intervals of rest, in one direction, and then in like manner in the opposite direction, whereby the cards or signs are displayed successively and one changed instantly to expose another.

2. In an advertising apparatus, the combination of a movable part or apron, C, a clock-train adapted to be propelled by a spring and intermediate mechanism, substantially as shown and described, whereby the belt is moved automatically and rapidly back and forth, the movement in each direction being effected by right and left hand cam-teeth upon a wheel, causing a succession of long quick movements of the apron, separated by longer intervals of rest, whereby each sign or placard is exposed at rest and an instantaneous change made to expose the next sign.

3. The combination of the driving-train, the cam-wheel provided with the right and left hand cam-teeth, the pin acted upon by said teeth, and devices, substantially such as described, connecting the pin with the movable display-surface.

4. The cam-wheel S, provided with the right and left hand cam-teeth, as described, in combination with a member reciprocated by the action of said teeth, and two springs arranged to operate alternately and force said member to the right and left.

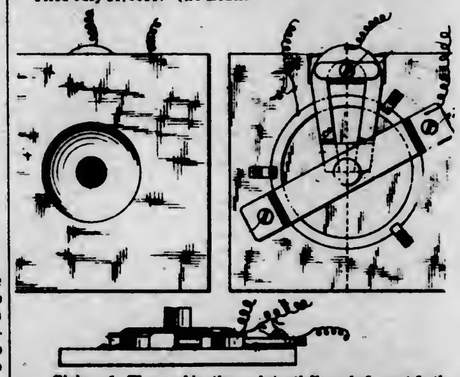
5. The combination of the cam-wheel S, provided with right and left hand cam-teeth, as described, the reciprocating rack-bar V, connected with said wheel, and the two alternately-acting spring-arms W W'

6. The combination of the cam-wheel having right and left hand teeth, the reciprocating rack-bar V, the springs W W', and the two driving-wheels connected by ratchet mechanism with pinions driven by the rack-bar, as shown and described.

7. The combination of the rolls B, the driving-pulleys with gear-wheels E', gear-wheels A', B', C', and D', with their ratchet mechanism, the reciprocating rack-bar V, the spring-arms W W', and the cam-wheel having teeth *a a'*.

8. In combination with the cam-wheel having right and left hand teeth, as described, the reciprocating bar, the two gear-wheels A' and B', two spring-arms to operate upon said bar, and stops for said arms, whereby they are caused to operate alternately on the rack-bar.

9. In combination with a member adapted for reciprocation, a cam-wheel provided with two series of cam-teeth, *a* and *a'*, and passages *b* between said teeth, as described and shown.



257,685. APPARATUS FOR RIVETING KNIFE-SCALES. HENRY H. FRANCIS, Hangatuck, Conn. Filed Feb. 16, 1882. (No model.)

Claim.—1. The combination of the two pairs of cutters *b a, f h*, arranged to receive the scale and lining between them, with guides to conduct the wire through the hole in the scale and lining, while arranged between the two pairs of cutters, substantially as described.

2. The combination of the two pairs of cutters *b a, f h*, arranged to receive the scale and lining between them, with guides to conduct the wire through the hole in the scale and lining, while arranged between the two pairs of cutters, and mechanism, substantially such as described, to adjust the two pairs of cutters relatively to each other substantially as described.

257,686. ELECTRIC TELEPHONE. JAMES P. FREEMAN, Chicago, Ill., assignor to the Home Telephone Company, of Illinois. Filed July 21, 1881. (No model.)

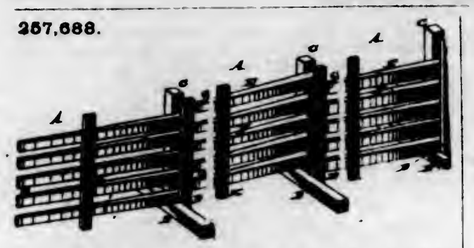
Claim.—1. The combination, substantially as before set forth, of the diaphragm, the fixed permanent magnet, the flat oscillatory keeper in constant contact with said magnet, and the electrode carried by the keeper and held in contact with the diaphragm solely by magnetic attraction exerted on the flat side of the keeper.

2. The combination, substantially as before set forth, of the diaphragm, the fixed permanent magnet, the flat oscillatory keeper in constant contact with said magnet, the electrode carried by the keeper and held in contact with the diaphragm solely by magnetic attraction exerted on the flat side of the keeper, and the fixed electrode.

3. The combination, substantially as before set forth, of the diaphragm, the electrode operated thereby, and the oscillatory keeper, of a permanent magnet carrying said electrode, the fixed electrode, the cross-bar supporting said fixed electrode, and the elastic cushions interposed between the cross-bar and the door or side to which the cross-bar is secured by screws.

257,687. TELEPHONE-TRANSMITTER. JAMES P. FREEMAN, TRUAT T. PROCTER, and HENRY B. PROCTER, Chicago, Ill., assignors to the Home Telephone Company, of Illinois. Filed Oct. 22, 1880. (Model.)

Claim.—1. A tension-regulator composed of a compressed compound of steel filings, coke, lamp-black, and balsam of fir, substantially as before specified.



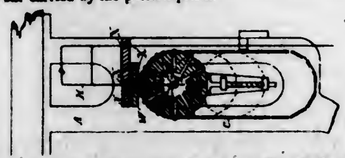
2. The combination, substantially as before specified, of the spring-arm, the button secured in a ring thereof, and the platinum-foil strips inserted between the button and its encircling ring.

3. The combination, substantially as before specified, of the spring-arm carrying the button or tension-regulator, the rigidly-secured but somewhat elastic non-conducting bracket supporting said arm, and the adjusting-screw acting on said bracket.

257,688. FENCE. MICHAEL FRENCH, French, Texas. Filed Mar. 14, 1882. (No model.)

Claim.—1. The combination of two or more panels, having

257,688.



the sides of the horizontal rails tapered toward the end and secured to uprights, with a space between the rails, the smaller ends of the rails of one panel being adapted to be inserted into this space between the larger ends of the rails of the adjoining panel, as and for the purpose specified.

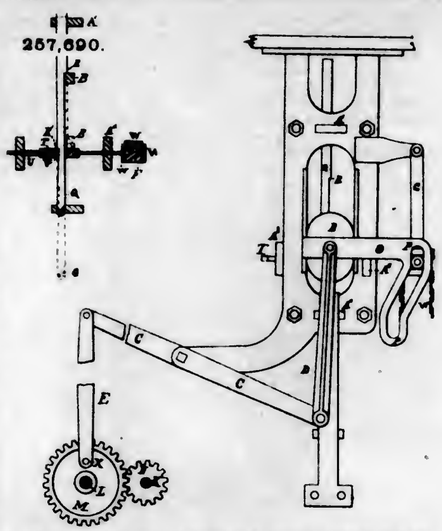
2. The panels A, consisting of cross-piece B, having vertical post C, between which and the binding-strip D the large ends of the tapering rails are secured, the latter being provided at some distance from their smaller end with a vertical bracing-strip, H, as and for the purpose herein set forth.

257,689. JACQUARD LOOM. JOHN O. PAYNE, Lowell, Mass. Filed Sept. 18, 1880. (No model.)

Brief.—The upper shuttle interweaves the silk or other weft carried by it with the figuring-warps operated by the pattern-hooks to form the face of the fabric, and is moved at every other pick of the loom, while the other shuttle interweaves its weft with the warps of the body of the fabric and is moved at every pick. The pattern-prism is reciprocated at every other pick, and is overhung by the upper bent ends of the hooks, which are raised directly by the unperforated parts of the pattern-cards, the threads connected with the selected hooks so raised being elevated to form the upper portion of the top shed. The hooks which pass through the perforations in the cards are also raised to lift the warps connected thereto into the middle line between the two sheds by a stop plate or bar carried by the pattern-prism.

Claim.—1. The combination of the hooks H with the prism B, the stop I', and mechanism for giving to said prism and stop a reciprocating motion, as and for the purpose specified.

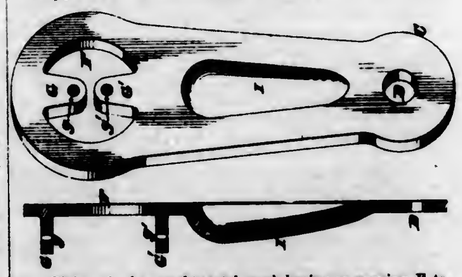
2. The combination of the prism B, pattern-card C, hooks H, stop I', and mechanism for giving to said prism, card, and stop a reciprocating motion at every other pick of the loom, with the upper shuttle, K, and mechanism for throwing the same at every other pick, as and for the purpose specified.



3. The combination of the prism B, pattern-card C, hooks H, stop I', and mechanism for giving to said prism, card, and stop a reciprocating motion at every other pick of the loom, with the upper shuttle, K, and mechanism for throwing the same at every other pick, and the lower shuttle, K', and mechanism for throwing the same at every pick, and harnesses D and mechanism for operating them, as and for the purpose specified.

257,690. JACQUARD MECHANISM FOR LOOMS. JOHN O. PAYNE, Lowell, Mass. Filed July 8, 1880. (No model.)

Brief.—The griff is raised once in two picks—that is, at every other pick—of the loom, being operated by a lever connected to a crank upon a counter-shaft driven by gearing from the main shaft of the loom at half the speed of the latter. A plate secured to the griff and slotted upward and outward causes the pattern-prism to move outward as the griff descends and inward against the needles as the griff ascends. The hooks are passed through slotted needles, and are all lifted at each rise of the griff, those selected to be kept elevated for the next pick being retained up by their needles, which, when permitted by holes in the pattern-card to move forward, pass under shoulders upon the needles.



Claim.—1. The combination, with the griff B, piece O, slotted upward and outward, and mechanism for causing said griff to fall at every other pick of the loom, of the prism F and mechanism for causing said prism to revolve at the falling of said griff, as and for the purpose specified.

257,690.

2. The combination of the griff B, piece O, slotted at P upward and outward, the griff-lever C, and its connecting-rods D E, the counter-shaft L, provided with a crank, X, and a gear, M, the main shaft K, also provided with a gear, N, the former gear, M, having twice as many teeth as the latter gear, N, and caused to revolve by the latter, the prism F, provided with pins I, and the pawl or hook H, as and for the purpose specified.

257,691. CRANK FOR MACHINERY. ALBERT E. GATCHELL, Newport, Ky. Filed Feb. 4, 1881. (No model.)

Claim.—1. A wrought-metal crank having an opening, F, to receive the shaft and one or more lugs, G G', capable of being bent so as to afford a means of attachment to said shaft, substantially as described.

2. A wrought-metal crank having an opening, F, to receive the shaft and one or more perforated lugs, G g G' g', capable of being bent so as to afford a means of attachment to said shaft, substantially as described.

3. A wrought-metal crank having an opening, F, to receive the shaft and one or more perforated lugs, G g G' g', bent about at right angles to the face of said crank, for the purpose specified.

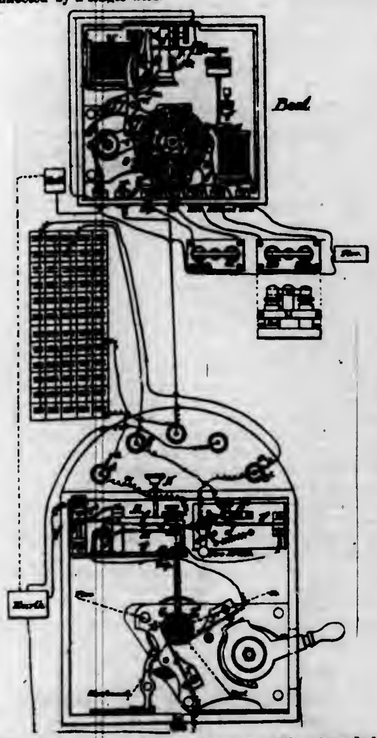
4. A wrought-metal crank having an opening, F, to receive the shaft, one or more lugs, G G', for attachment to said shaft, and an eye, D, to receive the wrist-pin or handle-shank, substantially as described.

5. A wrought-metal crank having an opening, F, to receive the shaft, one or more attaching-lugs, G G', an eye, D, to receive the wrist-pin or handle-spindle, and a stiffening bead or groove, I, disposed longitudinally of the web of the crank, for the purpose specified.

6. A wrought-metal crank bent back on itself to afford a double thickness of material to receive the wrist-pin or handle-spindle, substantially as described.

7. A wrought-metal crank having a groove or bead swaged longitudinally of the web of the same, as and for the purpose specified.

257,692. VENT FOR CASKS. RICHARD GORSALL, Baltimore, Md. assignor of one-half to W. A. Roberts, same place. Filed Mar. 16, 1882. (No model.)



Claim.—1. In combination with the tube adapted for insertion into a barrel or keg, an inclined valve-chamber, and a gravity-valve having a stem, the said chamber being provided with a guide socket or recess for such valve-stem.

2. Combined with a tube adapted to be inserted into a barrel or cask, a valve-chamber connected with such tube and having a recess, 2, a screw-plug adapted to fit in such chamber and having a vent-orifice and an upwardly-tapering internal cavity, and a gravity-valve having a guide-stem, substantially as described.

257,693. CURRENT-CONTROLLING DEVICE FOR TORPEDO-BOATS. GEORGE E. HAIGHT, Hartford, Conn., assignor, by mesne assignments, of one-half to William E. Winsor, New York, N. Y. Filed June 14, 1881. (No model.)

Brief.—The devices consist of a step-by-step switch to be carried by the boat, having connections to the various electrical devices for propelling and steering the boat and firing the torpedo, and a controlling mechanism located on shore or in any other suitable place, whereby the switch may be operated to connect with any desired device in the boat, and more or less battery put to the line according to requirement. The boat and shore mechanisms are connected by a single wire.

Claim.—1. A current-director located within a torpedo-boat or other desirable point, consisting of a clock mechanism carrying a switch actuated by the armature of an electro-magnet and having a switch-board electrically connected with the several different functional mechanisms of the boat, in combination with a key-board mechanism on shore or other suitable directing-point, electrically connected to the current-director by a single wire, said mechanism consisting of a circuit making and breaking piece, with means, substantially as described, for operating the same.

2. The spring-driven switch, the series of wires leading therefrom to the operative mechanisms of the boat, and the locking device, constructed substantially as described, and electrically connected with said switch to lock it at the unison-point, all constructed to act in combination substantially as set forth.

3. The spring-driven switch consisting of a revolving switch-arm and its contacts with wires leading therefrom, as described, the locking device for holding said switch at the unison-point, and the escapement or equivalent device, and connecting operating-wire, all in combination substantially as described.

4. The spring-driven switch, a locking device holding said switch at the unison-point, which locking device is constructed so as to be controlled from a distant point by means of an electric circuit, substantially as described, an escapement device having several contact-points, wires leading from the switch to several operative mechanisms, and a key-board and controlling-stops, substantially as described, whereby the escapement-wheel may be detained at any point by means of currents acting through a single wire, all in combination substantially as described.

5. A spring-driven switch having several operating-wires leading therefrom, as described, the locking device for the switch at the unison-point operated by an increase of the battery-current, and the single escapement and pawl connected with said switch and controlled by the operator through an electro-magnetic circuit, all in combination substantially as described.

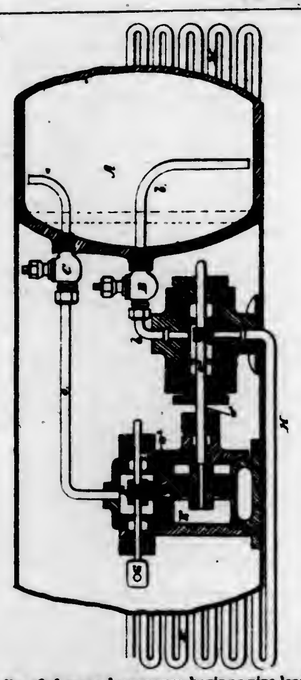
6. The combination of the spring-driven switch, the unison-stop, and the several wires leading from the switch, with the escapement, its pawl operated by an electro-magnetic circuit, as described, and the several keys and their connections, substantially as described, whereby the operator is enabled to throw the switch into line with any wire leading therefrom or to bring it to the unison-stop by means of a current operating through a single wire, as set forth.

7. The combination, with a spring-driven switch, of two or more electro-magnets of different power, but connected to the same wire, whereby the switch may be controlled by throwing more or less electrical elements into the circuit through the single wire, substantially as described.

8. The combination of the spring-driven switch, as R, and its connections, the unison-stop controlled by a current of a given power, the escapement and connections controlled by a current of different power, a single wire leading to both, and a battery constructed to throw greater or less currents through the wire, as set forth.

9. In combination with a notched oscillating ring, as described, a series of buttons or operating-keys having projections designed to arrest the revolving needle of a spring-driven or equivalent train of gears at the desired points, for the purpose described, said projections being so constructed and arranged that the pressing down of one button and its projection will cause any one previously pressed down to be released.

10. The combination, with a notched oscillating ring and a series of buttons or operating keys, substantially as described, of a unison-key which, when operated, releases all buttons or keys held down and allows the needle to freely revolve, for the purpose substantially as set forth.



11. The herein-described method of propelling, steering, and firing a torpedo-boat from any suitable directing-point through an electrical wire connection, consisting, first, in the employment of a comparatively feeble normal current sufficient only to throw into electrical connection any one of the several operative circuits, as described; secondly, in the employment of a stronger current of sufficient intensity to effect the desired movement of the boat through the circuit previously placed in electrical connection; thirdly, in transferring the current to the firing-circuit, whereby the torpedo will be fired by contact with an obstruction.

12. The herein-described method of propelling, steering, and firing a torpedo-boat from any suitable directing-point through an electrical wire connection, consisting, first, in the employment of a comparatively feeble normal current sufficient only to throw into electrical connection any one of the several operative circuits, as described; secondly, in the employment of a stronger current of sufficient intensity to effect the desired movement of the boat through the circuit previously placed in electrical connection; thirdly, in transferring the current to the firing-circuit; and, fourthly, in sending a still stronger current whereby the torpedo will be instantaneously exploded.

257,694. DEVICE FOR CONTROLLING TORPEDO-BOATS. GEORGE E. HAIGHT, Hartford, Conn., assignor of one-half to William E. Winsor, New York, N. Y. Filed Sept. 7, 1881. (No model.)

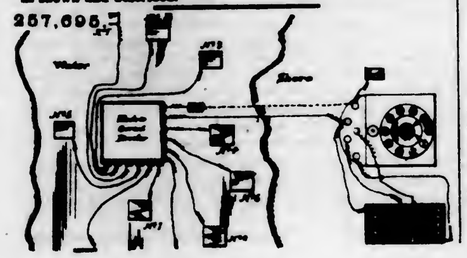
Claim.—1. In a valve apparatus for torpedo-boats, a reservoir

257,694.

containing liquefied gas under pressure, having a pipe leading from the liquid and a pipe leading from the gas therein, substantially as described, and for the purpose set forth.

2. A reservoir containing liquefied gas under pressure, having a pipe leading from the liquid and a pipe leading from the gas therein, in combination with a valve apparatus, substantially as described, whereby the pressure from the gas contained in the reservoir is applied to shift the liquid-controlling valve.

3. In combination with a valve apparatus for torpedo-boats, the reservoir A, having the pipe *c* in communication with the top and pipe *b* in communication with the bottom thereof, substantially as and for the purpose described.



4. A reservoir containing liquefied gas under pressure, having a pipe leading from the liquid therein to and in combination with an expansion chamber or pipe, the passage thereto being controlled by a valve, and said reservoir having another pipe leading from the gas therein to valve apparatus, substantially as described, whereby the pressure of gas contained in the reservoir is used to shift the said liquid-controlling valve, for the purpose described.

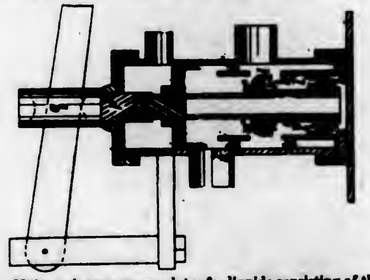
5. In a valve apparatus for torpedo-boats, the combination of cylinder E, slide-valve F, magnet G, piston *e*, piston-rod *d'*, and valve D, substantially as described.

6. The combination with the gas-reservoir, of a pipe, *c*, leading from the gas in the reservoir to cylinder E, and pipe *b*, leading from the liquid in the reservoir to the expansion-pipes, but closed or opened by valve D, which is operated by the piston in cylinder E, substantially as described.

7. The combination of reservoir A, gas-pipe *c*, and liquid-pipe *b*, valve F, operated by magnet-cylinder E, valve D, operated as described, and expansion-pipes leading to the engine, substantially as shown and described.

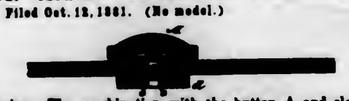
257,695.

257,695. ELECTRICAL DEVICE FOR OPERATING SUBMERGED MINES, &c. Gurdon E. Halsey, Hartford, Conn., assignor of one-half to Harvey D. Winsor, New York, N. Y. Filed Sept. 7, 1881. (No model.)



Claim.—A series of fixed submerged mines or torpedoes, each having a wire leading to a submerged current-selector, said current-selector being in electrical connection through a single wire with a key-board apparatus and battery located at a distant point on shore or shipboard, the whole constructed to act in combination, in the manner and for the purposes set forth.

257,696. COMBINED SHOULDER-BRACE AND SUSPENDERS. John D. Hanbury and Charles H. Clifton, New York, N. Y.; said Clifton assignor to said Hanbury. Filed Mar. 3, 1882. (Model.)



Claim.—As an article of manufacture, a combined shoulder-brace and suspenders consisting of the supporting-straps A, the arm-straps B, the adjustable transverse strap C, attached to the supporting-straps, and the adjustable transverse strap E, attached to the arm-straps, substantially as herein shown and described.

257,697. WATER-PRESSURE REGULATOR. Patrick Harvey, Chicago, Ill. Filed Apr. 4, 1881. (No model.)

Claim.—A pressure-regulator for liquids consisting of the following elements: first, a tubular shell closed at the ends and having lateral induct, educt, and relief openings, the educt being longitudinally between the other two; second, three pistons fitted within such shell, rigidly attached to and moving with a single piston-stem, which penetrates the end of the shell nearest to which is the relief-opening, the first or lowest piston playing below the induct-opening, the second or highest piston playing above the educt and to and beyond the relief opening, and the third piston being between the other two, situated and serving as a valve to open and close the induct; third, a conduit or water-way opening into the piston-chamber at one end below the first piston and at the other end between the other two pistons, and which may be either through the piston-stem or in the body of or exterior to the shell; fourth, a weighted lever, or its mechanical equivalent, adjusted against the outer end of the piston-stem, actuating it inward against the water-pressure, all combined and operating substantially as set forth.

257,698. SEPARABLE BUTTON. Asa K. Hawley, Delhi, La. Filed Oct. 12, 1881. (No model.)

Claim.—The combination, with the button A and slotted washer *d*, of the plate B, having a flanged head, *a*, made fast to the button, elastic posts *b b*, forming the button-shank, and turned-up ends *c c*, all constructed and arranged to adapt the button to be applied as described.

257,699. HAME. William B. Haynes, Columbus, Ohio. Filed Apr. 3, 1882. (Model.)

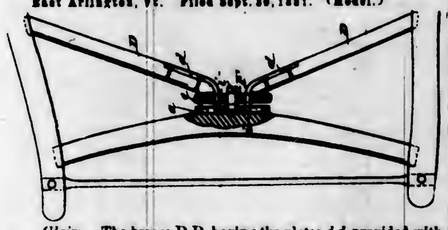
Claim.—1. The combination, with the slotted metal hame-

257,699.

top having a series of sockets, *d'*, formed along each of its two opposing walls and located entirely within the slot, of the metal-strap loop, having a pair of studs projecting inwardly from one of its cross-bars, said studs being adapted to be received within the sockets, and the loop being adapted in size to embrace the hame-tip and to leave a space for the hame-strap between one of its bars and the hame-top when the studs upon the opposite bar are received in the aforesaid sockets, substantially as and for the purpose described.

2. The combination, with the slotted metal hame-top having the raised portions *d'* formed along each of its two opposing walls, and provided with sockets *d'*, of the metal-strap loop having the two studs *e* projecting inwardly from one of its cross-bars, the loop being adapted to embrace the hame-top and to leave a space between the same and side of the loop that is opposite the side provided with the studs, substantially as described.

257,700. BUCKLE. William B. Haynes, Columbus, Ohio. Filed Apr. 3, 1882. (Model.)

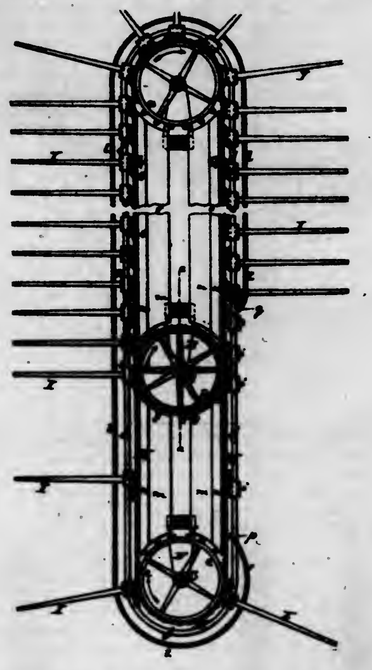


Claim.—1. As an improved article of manufacture, a buckle having its front cross-bar formed with a transverse rib or swell-bearing, 6, depending from the plane of the under side of the said cross-bar, substantially as and for the purpose described.

2. A buckle having the inner edge of its front cross-bar formed with a transverse rib or swell-bearing, 6, depending from the plane of the under side of the cross-bar, and with a uniformly-curved upper surface, 8, which terminates or vanishes in said rib or swell-bearing, substantially as described.

3. A cast-iron buckle-frame formed integral with the front and rear cross-bars, the inner edge of the front bar being formed with a curved upper edge, 8, and a transverse rib or swell-bearing 6, depending from the plane of the under side of the cross-bar, substantially as and for the purpose described.

257,701. FRAME FOR BUCK-SAWS. Frederick L. Hemmer, East Arlington, Vt. Filed Sept. 30, 1881. (Model.)



Claim.—The braces D D, having the plates *d d*, provided with the projections or studs *i i*, in combination with the slotted plate *a* and the right and left hand screw-bolt F, substantially as and for the purposes set forth.

257,702. UNDERSHOE. Frederick W. Hesse, Santa Rosa, Cal. Filed Mar. 13, 1882. (No model.)

Claim.—As an improved article of manufacture, an undershoe or slipper of seamless paper-pulp re-enforced by a facing of textile fabric, substantially as set forth, and for the purposes described.

257,703. APPARATUS FOR DRYING WALL-PAPER. Henry Hilbert, Flushing, N. Y. Filed Mar. 22, 1882. (No model.)

Claim.—1. In apparatus for drying paper or other fabric, the traveling festoon-carriers I I, combined with the guiding-rail *j*, and with one or more moving chains, G H, and supporting-rail *l*, substantially as and for the purpose specified.

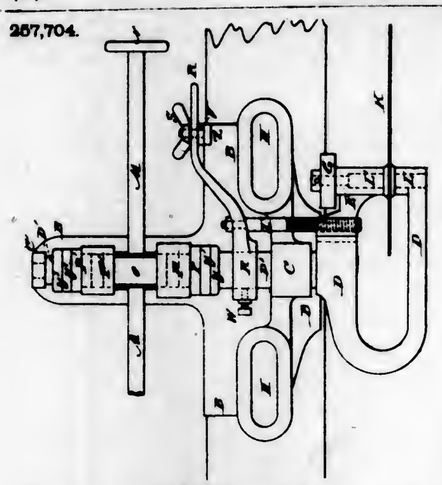
2. The combination of the beams *m*, brackets *j'*, and extensions *k* with the rail *j*, supporting-rail *l*, festoon-carriers I and their blocks *i*, and with one or more chains for moving the festoon-carriers, substantially as specified.

3. The apparatus for drying paper or other fabric, consisting of series of traveling festoon-carriers, which are combined with the supporting-rail *l*, to be dropped automatically when they reach the end of said rail, substantially as specified.

4. The combination of the chain G, having closely-set projections *g*, with the chain H, having more widely set projections *h*, and with the festoon-carriers I and apparatus for supporting the same, substantially as herein shown and described.

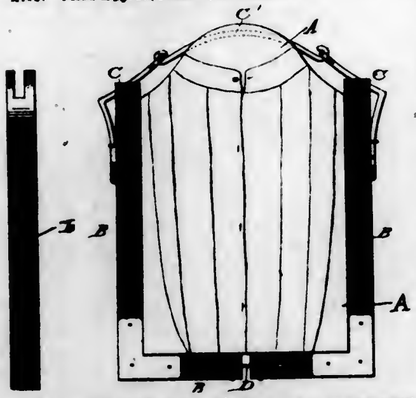
5. The festoon-carrier I, adapted to be moved by bolt or chain and combined with the round rod *j*, on which it can slide and be swung into vertical or into horizontal position, substantially as herein shown and described.

257,704. SAW-GUIDE. William E. Hill, Big Rapids, Mich. Filed May 10, 1881. Renewed Mar. 27, 1882. (No model.)



Claim.—1. A saw-guide constructed substantially as herein shown and described, consisting of the adjustable swiveled jaws D E, having journal D' and rod T, the adjusting-lever E, the adjustable legs F F', the eccentric O and shaft M, and the elastic cushions P P', as set forth.

2. In a saw-guide, the combination, with the journal D' of the jaws D E, of the adjustable legs F F', the eccentric O, and its shaft M, substantially as herein shown and described, whereby the guide D E can be adjusted laterally, as set forth.



3. In a saw-guide, the combination, with the journal D' of the guide D E, the legs F F', and the eccentric O, of the elastic cushions P P', substantially as herein shown and described, whereby the breaking of the saw or guide by a sudden jar is prevented, as set forth.

4. In a saw-guide, the combination, with the lever E, attached to the journal D' of the jaws D E, of the link V, the bolt X Z, and the hand-nut S, substantially as herein shown and described.

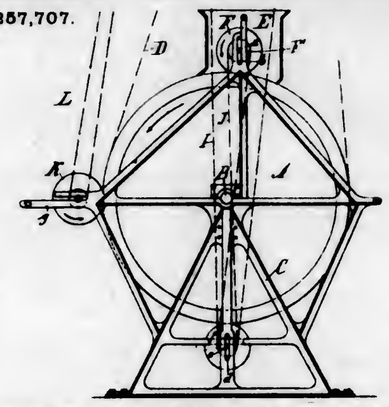
257,704.

257,706. BOSOM-BOARD. WILLIAM A. HILTON, Battle Creek, Mich. Filed Aug. 26, 1881. (No model.)

Claim.—The combination, with the board A, provided with a groove at its upper edge, of the frame B, constructed in two parts hinged together by a link, D, and the springs C and connecting-wire C', all constructed and adapted to be operated substantially as specified.

257,706. CRAYON. WILLIAM CULLEN HOSER, Bexley, County of Kent, England. Filed Oct. 8, 1881. (No specimens.) Patented in England Feb. 25, 1881.

Claim.—A crayon, pencil, or writing-chalk composed of a luminous substance and a base or vehicle, substantially as herein described.



257,707. MACHINE FOR CLEANING FUR ROBES. FRANDSEN HANSEN, Brooklyn, N. Y. Filed Feb. 23, 1882. (No model.)

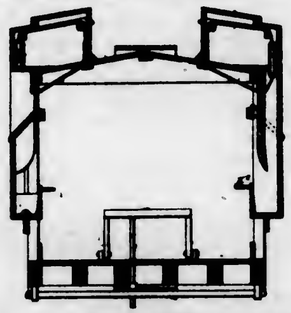
Claim.—1. In a machine for cleaning fur robes, the combination, with a revolving drum to which the robes are to be secured, of a brush resting on the drum and contained in a longitudinal box adapted to receive sawdust, sand, and like material, and of a series of brushes for combing and smoothing the fur and removing the sand and sawdust that have been brushed or beaten into it to clean it, substantially as herein shown and described, and for the purpose set forth.

2. In a machine for cleaning fur robes, the combination, with the revolving drum A, of the brush F, on the top of the drum A, the sand-box E, surrounding the brush F, the brush K at the side of the drum A, and the brush G at the bottom of the drum A, substantially as herein shown and described, and for the purpose set forth.

3. In a machine for cleaning fur robes, the drum A, having

257,707.

longitudinal grooves M, combined with a bar or rail, P', and devices for securing the ends of a rail or bar, P, for holding the ends of the robes in the grooves, substantially as herein shown and described, and for the purpose set forth.



4. In a machine for cleaning fur robes, the drum A, constructed with longitudinal grooves M, a raised band, *l*, at one edge of the drum, and swiveled keys at the ends of the grooves M, substantially as herein shown and described, and for the purpose set forth.

5. In a machine for cleaning fur robes, the combination, with the drum A, provided with a series of grooves, M, and a transverse groove, Q, of an adjustable clamp, S, and a bar or rail, P, fitting in the grooves M and adapted to hold the end of the robe, substantially as herein shown and described, and for the purpose set forth.

6. In a machine for cleaning fur robes, the combination, with a drum, A, provided with longitudinal grooves M and a transverse groove, Q, of plates *s*, projecting from the sides of the grooves Q, the bar or rail P, fitting in the grooves M, the sliding clamp S in the groove Q, and the screw *o* and winged nut *p*, for locking the clamp S in the desired position, substantially as herein shown and described, and for the purpose set forth.

7. In a machine for cleaning fur robes, the combination, with the drum A, provided with a series of longitudinal grooves, M, of a bar or rail, P, fitting in the grooves M, and provided on its under side with a series of studs or spikes, A, substantially as herein shown and described, and for the purpose set forth.

257,708. STOCK-CAR. JAMES HOWARD, Toronto, Ontario, Canada. Filed Dec. 19, 1881. (No model.)

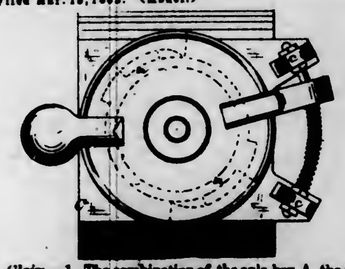
Claim.—1. In a stock-car, a vertically-sliding door provided with a trough or receptacle for food and water, and adapted to be secured at any desired elevation, substantially as described.

2. In a stock-car, the combination of the swinging body-rest, the levers pivotally connected at one end to the same and at the other end to the car-floor, a rod attached to the body-rest and projecting downward therefrom, and a lever located beneath the car and connected with said rod for swinging the body-rest, substantially as and for the purpose described.

3. In a stock-car, the combination, with feed-bins arranged at the top of the car and spouts leading therefrom to troughs at the

sides of the car, of tubes arranged in the upper ends of said spouts and adapted to be raised above or lowered below the contents of the bins for the purpose of regulating the passage of feed by gravitation to the troughs, substantially as described.

4. In a stock-car, the combination, with a feed-bin and its discharge-spouts, of a shaft arranged in said bin and having on its projecting end a registering-wheel, tubes arranged to hang in the upper ends of the discharge-spouts, and cords or bands connecting said tubes with the shaft, whereby the rotation of said shaft will cause the tubes to be lowered below the level of the contents of the bin, and thereby permit the passage of feed by gravitation through the discharge-spouts, substantially as described.

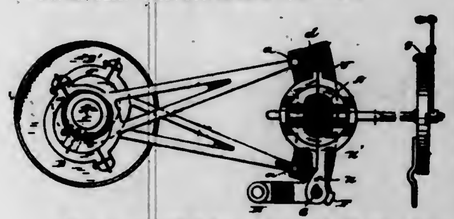


5. In a stock-car, the combination, with a bin having suitable discharge-spouts, a shaft provided with registering-wheel, having projecting pins and tubes arranged to hang in the upper ends of the spouts and connected with the shaft by cords or bands, of a spring-catch adapted to engage with the pins on the registering-wheel, and thereby prevent the rotation of its attached shaft, substantially as described.

6. In a stock-car, the combination of feed-bins arranged above the roof, troughs arranged at the sides of the car and having tops provided with hinged covers, spouts connecting said bins and troughs vertically-sliding doors provided with troughs, flexible partitions adapted to divide the car into compartments, and an adjustable body-rest adapted to be raised and lowered, substantially as shown and described.

7. In a stock-car, sliding cross-rails supported in sliding frames carried on the sides of the car, said cross-rails constituting partitions, and also serving to maintain the body-rest in position, as described.

8. In a stock-car, a series of separate feed-receptacles arranged along the top of the car, on each side thereof, to contain the feed for each animal separate from that for the others, in combination with a series of tubes, *a*, one for each feed-receptacle, and means for operating the same, substantially as and for the purposes described.

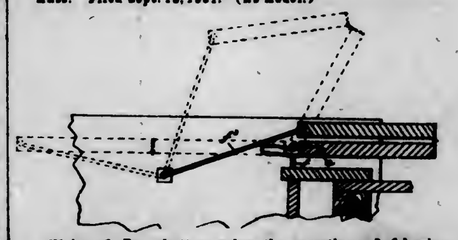


257,709. CAR-AXLE BOX. EDWARD FISHER, Marion, Ohio. Filed Mar. 18, 1882. (Model.)

Claim.—1. The combination of the axle-box A, the interlocking lugs on the collar surrounding the feed-opening therein, the cover hinged to a segment-pintle, the interlocking lugs on the cover, and the loaded handle, substantially as described.

2. The combination of the axle-box provided with lugs, the hinged cover provided with interlocking lugs, the segment-pintle, and the spring applied on this pintle, substantially as and for the purposes described.

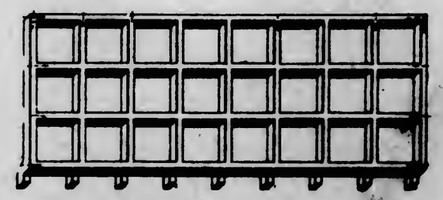
257,710. REVERSIBLE LINK-MOTION. EDWARD HOSER, Marion, Ohio. Filed Feb. 10, 1882. (No model.)



Claim.—1. The combination of the slotted adjustable link D, receiving motion from eccentrics on a shaft or axle, the toothed rack applied rigidly to the link, and a pinion having its bearing on the rock-arm frame, substantially as described.

2. The combination of the frame F, adapted to rock in suitable bearings, the valve rock-arm H on this frame, the block E, oscillating on the pin *e* on the arm *b* of said frame F, the vertically-adjustable link receiving oscillation from eccentrics on a shaft or axle, A, the toothed segment J, the pinion M, the bearing-arm K, and means, substantially as described, for turning said pinion and sustaining the link at any desired point of adjustment.

3. The oscillating stirrup-shaped frame F, bearing the valve rock-arm H, the block E, and the arm K, in combination with the rock-plate J, the pinion M, means for turning this pinion and locking it, and means for oscillating the link and its segment-plate, substantially as described.



257,711. SHUTTER-WORKER. LAFAYETTE HUNTOON, Natick, assignor to the Huntoon Manufacturing Company, Boston, Mass. Filed Sept. 15, 1881. (No model.)

Claim.—1. In a shutter-worker, the operating-rod *f*, having its inner pivoted section extended beyond the pivot, so as to form a lock when said inner section is in a vertical position, in combination with the screw-threaded bushing *c*, through which the rod passes and with which the hinged section of the rod co-operates to form the lock, said bushing being capable of adjustment in and out, so as to adapt the device to castings of different thicknesses, substantially as described.

2. The combination, with a blind composed of an inner fold hinged to the building, an outer fold hinged to the inner fold of the stud on the inner fold, of the rod and slotted plate co-operating with said stud, and a rod articulated at one end to the building and at the other to the outer fold of the blind, whereby said outer fold is operated simultaneously with the inner fold, as set forth.

257,712. CONSTRUCTING AND REPAIRING ILLUMINATING-ROOFS, &c. THADDEUS HYATT, New York, N. Y., assignor to Elizabeth Adelaide Lake Hyatt, same place. Filed Apr. 14, 1882. (No model.)

Claim.—1. Illuminating-roofs and roof-pavements made by combining quarry glass holders with foundation-gratings, substantially as and for the purposes herein set forth and illustrated.

2. Monomorphous illuminating-roofs and roof-pavements constructed substantially as and for the purposes herein set forth and illustrated.

3. Illuminating-roofs made by combining illuminating-quarries with curved foundation-gratings, substantially as and for the purposes herein set forth and illustrated.

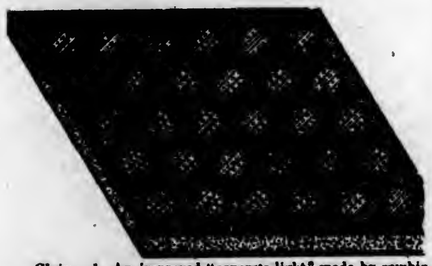
4. Illuminating area-coverings formed by combining illuminating-quarries with foundation-gratings cast in steep and step form, substantially as and for the purposes herein set forth and illustrated.

5. Illuminating area-gratings cast in steep and step form and combined with glass, substantially as and for the purposes herein set forth and illustrated.

6. Foundation-gratings cast or formed with ventilating-cuttles, substantially as and for the purposes herein set forth and illustrated.

7. Concreted foundation-gratings, in combination with either concrete or concreted illuminating-quarries, substantially as and for the purposes herein set forth and illustrated.

8. Foundation-gratings cast with underlapping lugs, substantially as and for the purposes herein set forth and illustrated.



9. Foundation-gratings formed with an open side of abutting cross-bars, in combination with foundation-gratings made with underlapping laps to give support thereto, substantially as and for the purposes herein set forth and illustrated.

10. Illuminating-gratings formed with no dead material at the borders, substantially as and for the purposes herein set forth and illustrated.

11. Facing illuminating-roofs and roof-pavements with concrete or material held to the face of the grating by means of nocks or glass surplusage, substantially as and for the purposes herein set forth and illustrated.

12. Illuminating-roofs and roof-pavements made by combinations of illuminating-gratings or of quarry glass holders, the glasses of which are formed with glass surplusage or nocks to stand above the general level of the work as a means of attachment for a monomorphous finishing coat of material, substantially as and for the purposes herein set forth and illustrated.

257,713. ILLUMINATING GRATING OR VAULT-COVER. THADDEUS HYATT, New York, N. Y., assignor to Elizabeth Adelaide Lake Hyatt, same place. Filed Apr. 11, 1881. (No model.)

Claim.—1. An improved "concrete light" made by combining lens-shaped glasses with concrete and protecting metallic knobs, substantially as and for the purposes herein set forth and illustrated.

2. An improved concrete light made by combining protecting metallic knobs with the concrete and glasses, substantially as and for the purposes herein set forth and illustrated.

3. An improved "knob-light" made by combining with the glasses and knobs a non-slipping or foot-holding material which practically surrounds both glasses and knobs, substantially as and for the purposes herein set forth and illustrated.

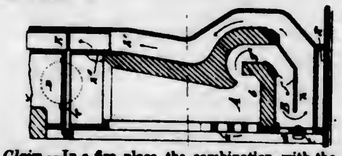
257,714. ILLUMINATING VAULT-COVER OR GRATING. THADDEUS HYATT, New York, N. Y., assignor to Elizabeth Adelaide Lake Hyatt, same place. Filed Apr. 11, 1882. (No model.)

Claim.—1. A concrete light or illuminating stone grating formed with a channeled foot-surface, substantially as and for the purposes herein set forth and illustrated.

2. A concrete light or illuminating stone grating formed with a soft-metal foot-surface, substantially as and for the purposes herein set forth and illustrated.

3. A cast-iron illuminating-grating, combined with a soft-metal facing-plate and concrete, substantially as and for the purposes herein set forth and illustrated.

4. A soft-metal perforated facing-plate formed with boltheads and a channeled face, in combination with an illuminating-grating, substantially as and for the purposes herein set forth and illustrated.

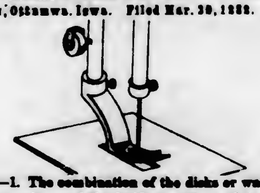


257,715. PAVEMENT-PLATE OR VAULT-COVER. THADDEUS HYATT, New York, N. Y., assignor to Elizabeth Adelaide Lake Hyatt, same place. Filed Apr. 11, 1882. (No model.) Patented in England Oct. 18, 1873.

Claim.—1. Soft foot-surfaces formed upon metal pavement-plates, tiles, gratings, or covers, and upon foot-surface constructions made therefrom, by means of lead veneers, substantially as and for the purposes herein set forth and illustrated.

2. Illuminating or glass-set lead-plated foot-surface plates and constructions, substantially as and for the purposes herein set forth and illustrated.

257,716. FIRE-PLACE OR STOVE. MATTHEW INGHAM, Manchester, County of Lancaster, England. Filed Jan. 13, 1882. (No model.) Patented in England May 3, 1881, and in France Nov. 2, 1881.



Claim.—In a fire-place, the combination, with the grate *a b* and combustion-chamber A, of the downflue *g*, the combustion-chamber B, having valved door *c d*, and the flue *h*, leading to chimney, as shown and described.

257,717. MANUFACTURE OF RED COLORING-MATTER. EMIL JACOBSEN, Berlin, Germany. Filed Mar. 13, 1882. (No specimens.)

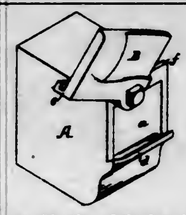
Claim.—The mode or process, substantially as described, for the manufacture of the red or violet coloring-matter, as explained, the said process consisting in heating a mixture of equal, or about equal, parts of chinoline or pyridine and benzotrichloride, and subsequently treating such with water, an acid, and an alkali, as set forth.

257,718. THREAD-CUTTER FOR SEWING-MACHINES. ALLEN JOHNSTON, Ottumwa, Iowa. Filed Mar. 30, 1882. (No model.)

Claim.—1. The combination of the disks or washers, pressed together by a spring, and the knife or cutter, substantially as described.

2. The combination of the disks or washers, spring, and knife or cutter in one piece with said spring, substantially as described.

3. A combined thread holder and cutter comprising two disks or washers pressed together by a bent spring, the cutting-edge being formed on said spring, substantially as described.



257,719. DIE FOR BUTTONS. JOHN G. KRAECHE, Newark, N. J., assignor of one-half to John C. Dickinson, Brooklyn, N. Y. Filed Sept. 30, 1881. (No model.)

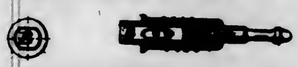
Claim.—The combination, with the countersunk plate *a*, that forms the backs of the buttons, of the die-plate *b* and separate button-dies *c*, each of which has a tapering base and a stud at the bottom passing into a hole in the die-plate *b*, for the purposes and as set forth.

257,720. GAR-AXLE BOX. FLORUS KRIEBS, Pottstown, Pa., assignor of one-half to George J. Folker, same place. Filed Aug. 19, 1881. (No model.)

257,720.

Claim.—1. The combination of the box A and lug *b* on the top of the same, near one side, with the lid B, hung at one of its upper corners to the said lug *b*, and having a stop, *a*, for limiting its movement and maintaining it in a balanced position when opened, as set forth.

2. The combination of the box A, having a rib, *f*, on its upper front edge, with the laterally-swinging lid B, having on its upper edge a recessed projection, *c*, as set forth.



257,721. SNAP-HOOK. ELNATHAN KEMPSHALL, New Britain, Conn. Filed Dec. 15, 1881. (No model.)

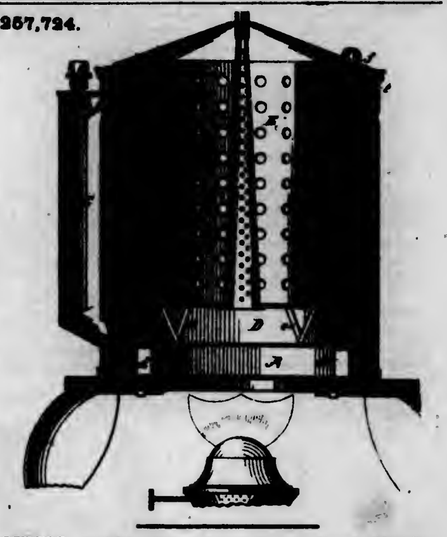
Claim.—1. In a snap-hook, the cylindrical body consisting of two semi-cylindrical shells having lugs upon one part and corresponding recesses in the other part, which hold the parts together when the lugs are put in place and bent inward, substantially as described, and for the purpose specified.

2. The improved double-hooked snap, consisting of the cylindrical body, two hooks and sliding bolts, and one spring acting upon both sliding bolts, substantially as described, and for the purpose specified.

257,722. SASH-FASTENER. ELNATHAN KEMPSHALL, New Britain, Conn. Filed Mar. 6, 1882. (No model.)

Claim.—A sash-fastener consisting of the solid cylindrical case having a screw-threaded periphery and the flattened orifice at its outer end, the spring-actuated bolt projecting from both ends of said case and having its outer end of a flattened form corresponding to that of the flattened orifice in the case, and having also the longitudinal slot through which the pin passes, substantially as described, and for the purpose specified.

257,723. PAPER-BOARD FOR DRESSING WOUNDS. PAUL KOCH, Neuffen, Würtemberg, Germany. Filed Sept. 24, 1881. (Specimens.) Patented in Germany Mar. 24, 1881, and June 13, 1881, in Belgium Apr. 11, 1881, in France Apr. 13, 1881, in England Apr. 23, 1881, in Austria May 21, 1881, and in Hungary May 21, 1881.



Claim.—1. The method of preparing a pulp for dressing wounds, consisting in beating up the pulp employed in the manufacture of pasteboard and then steeping the same in an alcoholic solution of shellac, resin, and turpentine, then softening the article after it has been dried, and rolling it out, as and for the purpose specified.

2. Treating the pulp employed in the manufacture of pasteboard as above specified, and then coating it, first, with a solution of gutta-percha and chloroform; secondly, with a coating of alcoholic copal varnish, and, thirdly, with a coating of any ordinary varnish, for the purpose set forth.

257,724. APPARATUS FOR TREATING LEAF-TOBACCO. LOUIS KRUCKENBERG, Cincinnati, Ohio. Filed Dec. 27, 1881. (No model.)

Claim.—The combination of the vessel A, having cone-shaped locked cover B, with the perforated vessel E, having inclined flange F, and the intervening vessel D, said vessels being constructed and located with relation to each other as shown and described.

257,724.

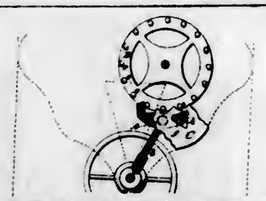
257,725. LATCH. THOMAS LALOR, Toronto, Ontario, Canada, assignor of one-half to William Hamilton, same place. Filed Aug. 29, 1881. (Model.)

Claim.—A cylindrical block having a notch, G, to receive the bar of the gate, and pivoted in the frame of a lock provided with a semicircular guard-piece, K, in combination with a wing or projection, H, attached to or forming part of the cylindrical block C, and arranged in connection with the tumbler I, substantially as and for the purpose specified.

257,726. WATCH-MAKER'S COMBINATION-TOOL. WILLIAM H. LAMB, San Francisco, Cal. Filed Oct. 3, 1881. (No model.)

Claim.—1. The frame A, having [illegible] and C formed in its ends, as shown, in combination with [illegible] arms D, having inclines *b* and *d*, substantially as and for the purpose herein described.

2. The parallel arms D, having the sockets *e e* to receive the pivots of a wheel, and having the converging inclines *b* and *d* for adjusting the distance between the arms, in combination with frame A, having slots B and C, substantially as herein described.

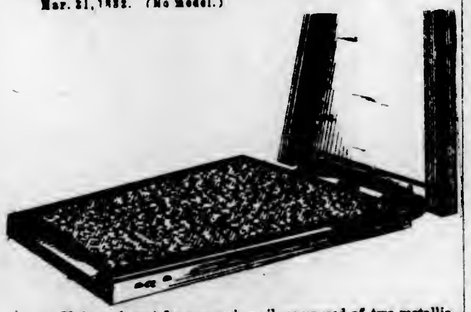


3. The hinged or pivoted swinging plate G, having groove *i*, the bar H, having corresponding grooves equidistantly arranged to groove *i*, the frame A, having perforations I', and the spring-bar K, with its locking-pin J, the whole constructed to act in combination, as set forth.

4. In combination with the frame A, the pivoted arm L, perforated spring-arm *m*, and perforated and socked spring-arm *n*, arranged for operation substantially as described.

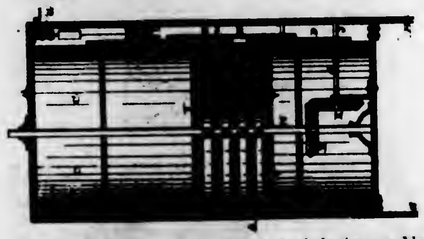
5. A tool consisting of the frame A; dotted, and having the arms D, with their inclines and the sockets *e*, together with the pivoted clamping-plate G, with its locking-pin, and the perforated arms L *m n*, substantially as herein described.

257,727. CLOCK-ESCAPEMENT. FREDERIC A. LAMB, New Haven, Conn. Filed Mar. 3, 1882. (Model.)



257,727.

Claim.—1. The herein-described improvement in marine clock-movements, consisting of the thin metal verge and lever *a b*, in one and the same piece, combined with the collar *d*, attached thereto to form connection with the shaft, and the crown-wheel, constructed with pins projecting from its side parallel with the axis of the wheel, substantially as described.

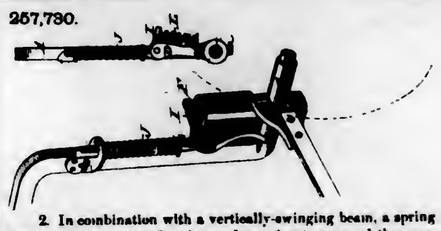


2. In a marine clock-movement, the pin *f*, extending from the verge or lever, and the frame, constructed with a triangular opening, through which said pin projects, and upon opposite sides of which the said pin will bank, and between which sides the said pin may be adjusted, substantially as and for the purpose described.

257,728. OIL-MAT. GEORGE LEDEE, Demopolis, Ala. Filed Mar. 21, 1882. (No model.)

Claim.—A mat for expressing oil, composed of two metallic leaves hinged together at one end, each leaf being provided with two side flanges or ridges, and each side flange or ridge being traversed by transverse and longitudinal grooves, substantially as and for the purpose hereinbefore described.

257,729. MECHANICAL HEATING APPARATUS. SYLVESTER J. LIEB, Nordamia, assignor of one-half to S. W. Holden, Magnolia, Iowa. Filed Feb. 20, 1882. (No model.)



Claim.—The combination of a frame, A, having a cooking or heating chamber, C, and a chamber in which the frictional plates are placed, with the operating-shaft N, having a series of plates secured to it, a series of stationary plates, and an operating mechanism that is connected to the shaft, substantially as shown.

257,730. WHEEL-CULTIVATOR. EDWARD P. LYNCH, Davenport, Iowa. Filed Feb. 8, 1882. (No model.)

Brief.—A cultivator-coupling combining two springs, one to exert a lifting force in raising the drag-bar, the other to limit the descent of the plow into the ground. The latter only comes into action when the shovel is at work and counteracts the action of the mainspring when it passes the dead-center. In the ordinary positions of working or being lifted the effect of each spring diminishes as the other increases.

Claim.—1. In combination with a vertically-swinging plow-beam, a lifting-spring and a suspending-spring, arranged to operate substantially as described and shown.

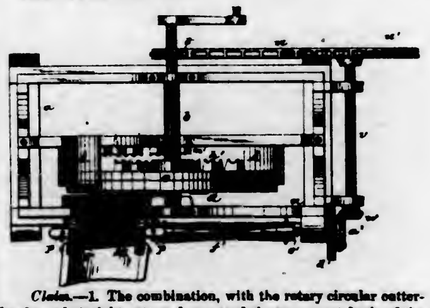
257,730.

2. In combination with a vertically-swinging beam, a spring to raise the same out of action and a spring to suspend the same in an operative position, the two arranged to operate alternately.

3. In combination with the plow-beam and the upright arm connected thereto, the rod pivoted to said arm and provided with the finger, the guide for the rod, and the two springs applied substantially as shown.

4. The combination of the beam and its rigid arm, the movable rod pivoted to the arm, and the compression-spring located between the rod and arm forward of their connecting-pivot, to suspend the beam in an operative position, substantially as described.

5. In combination with the vertically-swinging beam and the arm D, connected therewith, the rod J, jointed to said arm, the spring F, to limit the descent of the beam, located directly between the arm and rod, forward of their connecting-joint, and the adjustable spring-sustaining spindle L, as described and shown.



6. The combination of the beam, the upright arm connected rigidly therewith, the movable rod pivoted to said arm, the suspending-spring F, located between the arm and rod, to sustain the beam in an operative position, and the adjustable spindle L, mounted and arranged to support the spring.

7. The coupling-box for a cultivator, provided with the upright arm D, and a spindle, L, adapted to support a spiral spring, as described and shown.

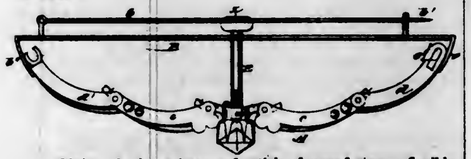
8. In combination with a vertically-moving beam, two springs, substantially as described, one tending to raise and the other to depress the beam when the latter is in an operative position.

9. In combination with the vertically-swinging beam, the spring attachment constructed, substantially as shown, with two springs, which tend one to raise and the other to depress the beam when it is in an operative position, whereby the beam is held by spring-pressure from either rising or falling, as set forth.

257,731. CORNSTALK CUTTER AND CRUSHER. WILLIAM H. H. LYNN and GEORGE W. HYLER, Staunton, Va. Filed Feb. 8, 1882. (No model.)

Claim.—1. The combination, with the rotary circular cutter-head *c* and straight cutters *d*, arranged thereon, as set forth, of the inclined ledger-plate *l*, open at its outer end and provided with the inclined cutting-edge l^2 and upwardly-curved inner end, l^3, having its cutting-edge in line with the edge l^2 of the ledger-plate, substantially as described, and for the purpose set forth.

2. The combination, with the lower longitudinally-fluted conical feed-roll, *e*, of the upper adjustable longitudinally-fluted conical feed-roll, *e*, the apices of the projecting ribs of both conical rolls being cut away and provided with flutes, substantially as described, and for the purpose set forth.



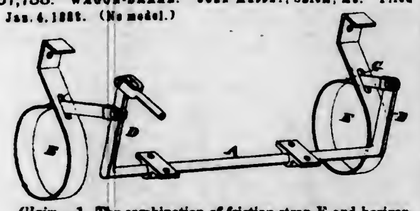
3. The combination, with the cutter-head *c*, of the pyramidal tooth h', having a hollow or cup-shaped top face, h^1, provided with the four projecting points, h^2, substantially as described, and for the purpose set forth.

4. The combination, with the cutter-head *c*, provided with pyramidal teeth h', each having a hollow or cup-shaped top face, h^1, provided with projecting points h^2 and arranged on its back face at

irregular distances from the center, of the stationary crusher-plate l', provided with similar pyramidal teeth m', similarly arranged on its inner face, substantially as described, and for the purpose set forth.

257,732. COMBINED FINGER-RING, LACE-PIN, AND BRACELET. LEON MAISON, New York, N. Y., assignor to Heller & Bardel, same place. Filed Feb. 18, 1882. (No model.)

Brief.—The flexible ornament is adapted to be clasped together and worn as a finger-ring, and to be unfolded and straightened out and worn as the ornamental portion of a lace-pin or bracelet.

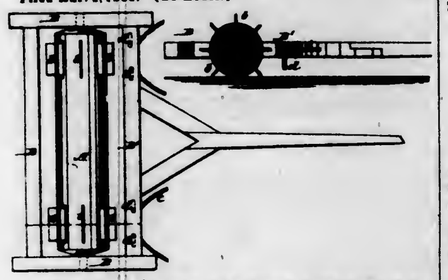


Claim.—1. As an improved article of manufacture, a flexible ornament, A, consisting of a series of quadrantal sections hinged to each other and adapted to be clasped together to form a finger-ring and to be straightened out to form the ornamental portion of a lace-pin or bracelet, substantially as herein shown and described.

2. The combination, with the flexible ornament A, of the pin-plate B, provided with the plate b'', and means, substantially as herein shown and described, for securing the said plate to the ornament, as set forth.

3. The central section, *a*, of the flexible ornament, formed with the threaded socket a', and having the sections *c* and d d hinged thereto, in combination with the pin-plate B and screw E, substantially as described.

4. The combination, with the pin-plate B, provided with the hinged pin *b*, of the flexible ornament A, provided with the ornamental extension-plate *f* on one of its sections, substantially as and for the purpose set forth.



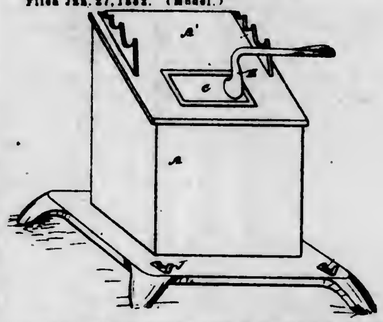
257,733. WAGON-BRAKE. JOHN MASSEY, Salem, Mo. Filed Jan. 4, 1882. (No model.)

Claim.—1. The combination of friction-strap E and horizontal rock-shaft A, having crank-arm or handle D, one end of said friction-strap being secured to a stationary part of the vehicle and the other end passed under and over the hub of a wheel and secured to the crank arm or handle, substantially as set forth.

2. The combination of bracket H, removable and replaceable friction-strap E, horizontal rock-shaft A, and crank-arm or handle D, as set forth.

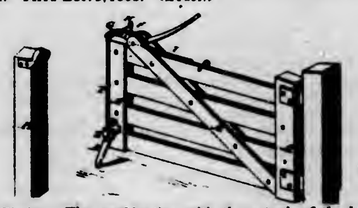
257,734. STALK-BREAKER. NEILL MCDUFFIE, Kentyre, S. C. Filed Mar. 4, 1882. (No model.)

Claim.—The combination, with the roll A and frame B B', of the blades *b*, the pairs of diverging stalk-gatherers *c* projecting in front and in rear of said gatherers, and the downwardly-projecting stalk-holders *d*, whereby the stalks are first gathered, then held in position, and finally broken, as described.



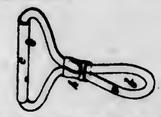
257,735. CIGAR-MOLD. FREDERICK C. MILLER and HENRY C. PETERS, New York, N. Y. Filed Apr. 18, 1881. (Model.)

Claim.—1. A wooden cigar-mold plunger provided with a margin of rubber or analogous elastic material, substantially as described.



2. The combination, with a wooden plunger for cigar-molds, of an exterior covering or margin of rubber or analogous elastic material, substantially as described.

257,736. INKSTAND. GEORGE C. MILLER, Johnstown, Pa. Filed Jan. 27, 1882. (Model.)

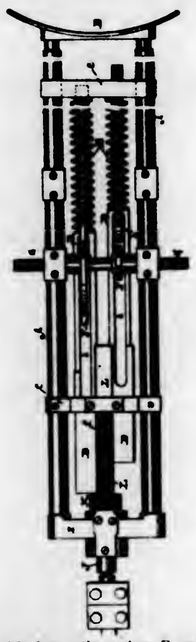


Claim.—The combination, with the inkstand A, provided with the opening B, of the lid C, hinged to the under side of the top A', the weight D, attached to the hinged end of the said lid, and the angular arm E, projecting from the top of the lid to one side of the inkstand, and having its outer end flattened and recessed, substantially as and for the purpose set forth.

257,737. GATE-HOLDER. WILLIAM H. MILLS, Clear Creek, Ill. Filed Mar. 2, 1882. (Model.)

Claim.—The combination, with the gate A, of the hinged pawls D, having eyes E on top, the rods F, the cross-rod H, the lever G, and the spring I, all arranged substantially as and for the purpose specified.

257,738. SUSPENDER-LOOP. SELON E. MOORE, Swanton, Vt. Filed Apr. 1, 1882. (No model.)



Claim.—1. A triangular cord-loop for suspenders, having its ends secured in and held together by the transverse ferrule *c* and its sides held in to form the button-loop by a clasp or clamp, substantially as specified.

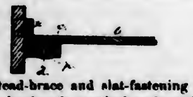
2. The cord-loop *a*, the transverse punched ferrule *c*, holding its ends together, and the clamp *b*, holding the sides together to form the button-loop, substantially as specified.

257,739. HAND ROCK-DRILL. HUGHES MURRAY, San Francisco, Cal., assignor to Theodore A. Sterling, same place. Filed Sept. 12, 1881. (No model.)

Claim.—1. In a machine hand rock-drill, the combination and arrangement of the reciprocating hammers D D, having their

257,739.

shanks provided with slots *a*, the springs E, and the cams F, revolving in said slots *a*, substantially as herein described.



2. In a machine hand rock-drill having reciprocating hammers D D, or a single hammer, and a loosely-journaled drill-containing rod, J, having a head, K, adapted to receive the impact of said hammer or hammers, the combination and arrangement of the feathered ratchet *i* upon the rod J, counter or retaining pawl *r*, loose sleeve M, with its pawl *m* and lug O, the sliding strip L, with its inclined groove *o*, fitting over the lug O, its spring *f*, and downwardly-extending shoulder *c*, adapted to engage with the shoulders *d d* upon the hammers D D, or an equivalent device, whereby said strip L is drawn back by the operation of the hammers, substantially as and for the purpose herein described

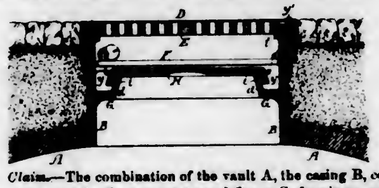
257,740. BED-PAN. WALTER F. MORGAN, Leavenworth, Kans. Filed June 27 1881. (Model.)

Claim.—A porcelain bed-pan provided with a socket into which is secured a permanent rubber cushion, in combination with a soft rubber evacuating-tube, substantially as described.

257,741. DEVICE FOR STRENGTHENING BEDSTEADS. FRANK MORRIS, Brown's Station, Mo. Filed Mar. 4, 1882. (No model.)

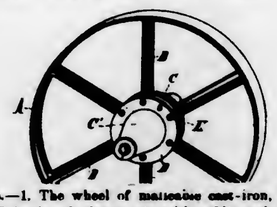
Claim.—The bedstead-brace and slat-fastening consisting of the angular rail-plate *b*, having the vertical perforated flange *b* and the perforations *p* in the horizontal portion, and the slat-plate *c*, having the studs *d* projecting downward, and the screw-holes *e*, substantially as specified.

257,742. TOY. ENOCH R. MORRISON, Chicago, Ill., assignor to Samuel F. Estell and William S. Estell, same place. Filed Mar. 16, 1882. (No model.)



257,742.

Claim.—1. The wheel C, crank *a*, and bar E, in combination with the body and a fore and hind leg of a toy imitation of a quadruped, substantially as and for the purpose described.



2. The combination of body A, legs D and D', wheel C, bar E, and handle B, said body and handle being pivoted at *a*, and the whole arranged to operate substantially as and for the purpose set forth.

257,743. VAULT FOR UNDERGROUND CONDUITS. WILLIAM B. MURRAY, Philadelphia, Pa., assignor of one-half to Calvin Detrick, same place. Filed Jan. 19, 1882. (No model.)

Claim.—The combination of the vault A, the casing B, cover D, and support for the same, upturned flange G, forming a receptacle, *y*, cover H, the flange and cover being constructed substantially as described, whereby a packing-ring may be interposed between the two, and a device for keeping the said cover H down to its place, all substantially as set forth.

257,744. VEHICLE-WHEEL. WILLIAM MUHRING, Cincinnati, Ohio, assignor to the Queen City Malleable Iron Company, same place. Filed Feb. 20, 1882. (No model.)

Claim.—1. The wheel of malleable cast-iron, composed of spider A B, having the inner extremities of its spokes without direct cast connection, and secured by rivets E between the flanged hollow cones or frustums C C', substantially as set forth.

2. In described combination with the spider A B, cones C C', and rivets E, the core G, whose groove *g* receives a tongue, *c'*, that projects from the interior of one of the cones, for the purpose designated.

3. The wheel of malleable cast-iron, composed of spider A B, having the inner extremities of its spokes without direct cast connection, and occupying notches *d* in flanges D of the bottom frustums, C C', to which they are secured by bolts or rivets E, substantially as set forth.

257,745. GRATE FOR STOVES AND FURNACES. OSCAR W. NOBLE, Lynn, Mass., assignor to himself and Robert L. Markland, same place. Filed Mar. 22, 1882. (No model.)

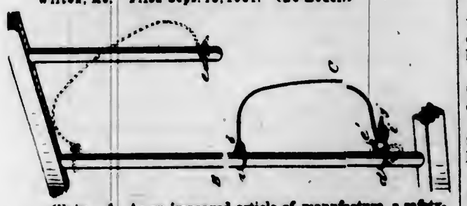
Claim.—1. The combination, with the open-center grate B, of the convex central dumping portion, D, extending up above the edge of the central opening, c, and pivoted directly to the grate B, said portion D being provided with a shaft or arbor, E, which serves the double purpose of reciprocating or shaking the grate

and dumping the central portion thereof when the grate is in any position, substantially as described.

2. The combination, with the grate B, dumping portion D, and lug G, with its rib or portion *h*, of the arbor E, provided with a collar or flange, *g*, extending partially around it, and having ends 7 8, which form stops for limiting the movement of the dumping portion D in either direction, substantially as described.

257,746. BOTTLE-STOPPING DEVICE. SIMEON S. MORRIS, Baltimore, Md. Filed Feb. 18, 1882. (No model.)

Claim.—1. A bottle-stopping device composed of an elastic plug having in the middle of its length a collar adapted to rest upon the edge of a bottle-mouth, a head above said collar, and a neck thereunder, said head and neck being formed with the same periphery and provided with a conical recess, *b'*, being adapted for use alternately, substantially as and for the purposes described.



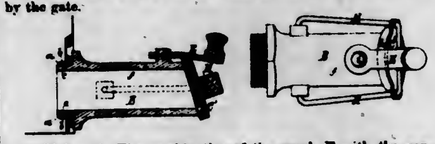
2. In a bottle-stopping device, the combination of an elastic plug perforated through the center thereof, and having a collar adapted to rest upon the edge of a bottle-mouth, a head projecting above said collar, and under said collar a neck provided with a central conical recess, with a metal cap adapted to cover the head of the stopper, and provided with a shank passing through the stopper.

3. In a bottle-stopping device, the combination of an elastic plug perforated through the center thereof, and having a central collar adapted to rest upon the edge of a bottle-mouth, and two ends adapted to be used and each one inserted alternately within said bottle, with a metal cap adapted to cover either end of the plug, and the shank of said cap passing through the stopper, substantially as and for the purpose described.

4. The combination of a bottle neck-band consisting of a wire bent and twisted to form a vertical looped branch upon one side and a loop, *e*, upon the other, with a stopper-cap provided with ears *c'*, a link, *f*, permanently secured to one of the ears and adapted to engage with the under side of the loop *e* of the neck-band, and a lever, G, pivoted upon the neck-band and consisting of wire bent and coiled to form a bearing adapted to engage with the loop *e*, and present a convex surface for the link *f* to slide over, substantially as and for the purpose described.

5. The combination of a bottle neck-band having a looped branch upon one side and a loop, *e*, upon the other, with a stopper-cap provided with ears, a link, *f*, permanently secured to one of the ears and adapted to engage under the loop *e*, and a lever, G, constructed to form a bearing adapted to engage with the loop *e* and present a convex surface for the link *f* to slide over, with projection *g'*, substantially as and for the purpose described.

257,747. SAFETY-TIE FOR CATTLE. MERRILL J. NORTH, Wilton, Me. Filed Sept. 15, 1881. (No model.)

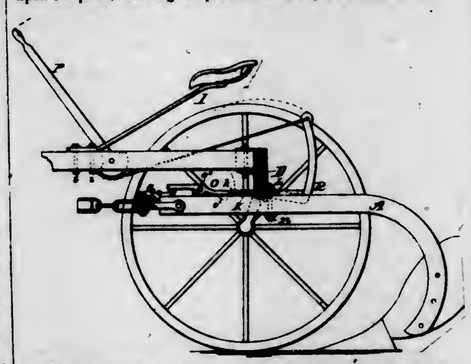


Claim.—1. As an improved article of manufacture, a safety-tie for cattle, consisting of the bow C, provided at one end with a ring adapted to slide upon the stanchion-bar, and at its other end with a hook having spring-catch adapted to engage with a loose ring on the said stanchion-bar, substantially as shown and described.

2. The combination, with the post B, provided with the loose ring *d* and the pin *d'*, of the bow C, provided at its upper end with the ring *a* and its lower end with the hook *i*, substantially as and for the purpose set forth.

257,748. OIL-CAN EDUCT. AARON P. ORDWAY and ARTHUR F. RYDER, Lawrence, Mass. Filed Jan. 9, 1882. (No model.)

Brief.—By revolving the crank around on the screw the altitude of the crank may be varied relatively to the nozzle and gate. In this way the crank may be adjusted to obtain by it the necessary pressure on the gate to effect the proper closing of the nozzle by the gate.



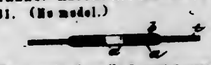
Claim.—1. The combination of the crank E with the can-nozzle *f*, having its outer end inclined as set forth, and with the gate C and its supporting-yoke H, applied to the said nozzle, all being substantially as described.

2. The combination of the can-nozzle *f*, inclined at its outer end, as set forth, the gate C', yoke H, crank E, and the supporting and adjusting screw *i* of said crank, all being arranged and applied and to operate substantially in manner as explained.

257,749. SULEY-PLOW. ALVAH P. OSBORN, Trumansburg, N. Y., assignor to Orman Osborn, same place. Filed Dec. 9, 1881. (No model.)

Brief.—A plate on the plow-beam to lock it in line of draft. When released by a foot-pawl it may swing around freely and on returning lock automatically. The lifting-arm comes under a stud upon the plate, allowing the plow to rise freely over obstructions.

Claim.—1. The combination, in a sulky-plow, of a plow-beam vertically pivoted to the frame, and mechanism for automatically locking it in a position corresponding to the line of draft, substantially as and for the purpose set forth.



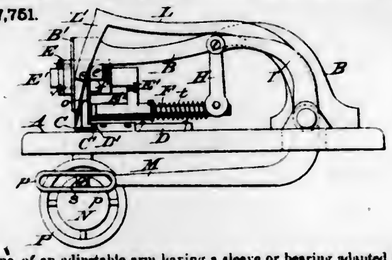
2. The combination, in a sulky-plow, of a plow-beam pivoted to the frame forward of the point of the plow, and mechanism for automatically locking it in a position corresponding to the line of draft and releasing it therefrom at the will of the operator, as set forth.

3. In a sulky-plow, a vertically-pivoted plow-beam provided with a locking-lever, combined with a frame having a catch to receive the locking-lever, whereby the beam may be automatically locked in position, substantially as and for the purpose set forth.

4. In a sulky-plow, the beam A, having the locking foot-lever O, in combination with the shaft L, arch-axle D, clutch K, having detent *k*, and yoke N, substantially as and for the purpose set forth.

5. In a sulky-plow, the beam A, secured to the clutch K, having the arm M, in combination with the crank R and hand-lever P, substantially as and for the purpose set forth.

257,750. EYELET. ALBERT L. PARCELLS, Boston, Mass. Filed June 24, 1881. (No model.)



Claim.—The herein-described eyelet, consisting of the two metal plates *b a*, concaved or bent inward at their outer edges, and united by means of the central tubular knife-edged projection on the plate *a* entering the central orifice of the plate *b*, and turned down against said plate *b*, so as to form a close joint therewith, substantially as described.

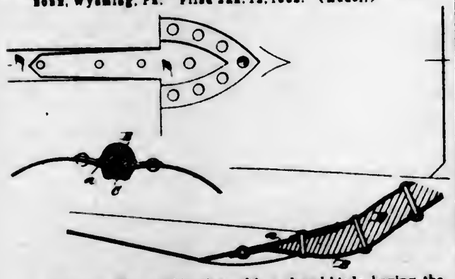
257,751. TRIMMER FOR SEWING-MACHINES. THOMAS S. PARKER, Schenectady, N. Y. Filed Mar. 3, 1882. (No model.)

Claim.—1. The combination, with the head of a sewing-ma-

257,751.

chine, of an adjustable arm having a sleeve or bearing adapted to receive a rock-shaft, to which is attached the upper or movable knife, substantially as described.

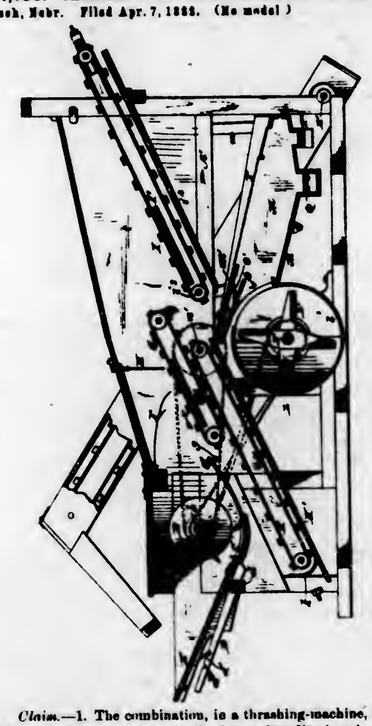
2. In a sewing-machine trimmer, the combination, with a rock-shaft provided at one end with a movable knife and at its opposite end with a lever, of a bent arm adjustably secured to a rock-shaft arranged at a right angle to the knife-carrying rock-shaft, said bent arm being connected with the lever by means of a link, and the various parts being adapted for joint operation, substantially as shown and described.



3. In a sewing-machine trimmer, the combination, with the bed A and adjustable plate D, having an inclined portion provided with stationary knife D', of the slotted or bifurcated presser-foot C, having an inclined arm, C', arranged above the end of said stationary knife, and a movable knife, F', adapted to vibrate in said slot in contact with the cutting-edge of the stationary knife, substantially as described.

4. In a sewing-machine trimmer, the combination, with the head B', slotted presser-foot C, and stationary knife D', of the adjustable arm E', supported in a bracket attached to said head and provided with a sleeve or bearing, E², the rock-shaft F, supported in said bearing and provided with a knife, F', adapted to vibrate in the slotted presser-foot in contact with the cutting-edge of the stationary knife, and means for actuating said knife-carrying rock-shaft, substantially as described.

5. In a sewing-machine trimmer, the combination, with a rock-shaft, F, supported in a suitable bearing and provided with a knife, F', and a spring, *t*, adapted to hold said knife in contact with a stationary cutter, of an adjustable lever, G, attached to said shaft, a rock-shaft, K, arranged at a right angle to the knife-carrying shaft and provided with an adjustable arm, I, a link, H, connecting the arm I and lever G, and suitable mechanism for actuating the shaft K, substantially as described.



6. In a sewing-machine trimmer, the combination of the bed A, arm B, having head B', slotted presser-foot C, attached thereto and provided with inclined arm C', adjustable plate D, having an inclined portion provided with stationary knife D', arm E', adjustably secured to the head B', and provided with sleeve E², rock-shaft F, supported in said sleeve and provided with movable knife F' and spring *t*, the lever G, link H, and arm I, connecting said rock-shaft with a rock-shaft, K, arranged at a right angle thereto and provided with levers L M, needle-bar L', attached to the upper lever, L, and the wheel P', and eccentric disk N, adapted to actuate the levers and simultaneously operate the needle and movable knife, substantially as described.

257,752. SHOVEL, SPADE, OR SCOOP. ROBERT T. PEYTONSON, Wyoming, Pa. Filed Jan. 13, 1882. (Model.)

Claim.—The combination, with a shovel-blade having the handle-socket portion *a*, of a back strap, B, having its edges bent back, as described, to form straight flanges on the sides of the socket portion, and rivets passing through said flanges and socket-sides, as and for the purpose specified.

257,753. THRASHING-MACHINE. JASON L. PHILLIPS, Tecumseh, Nebr. Filed Apr. 7, 1882. (No model.)

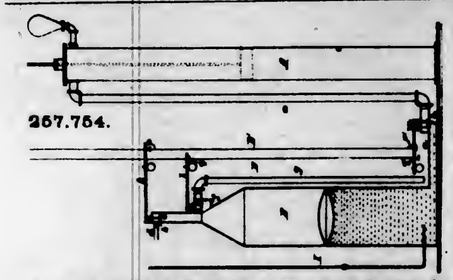
Claim.—1. The combination, in a thrashing-machine, of the feed-board, the hinged concave, the levers for adjusting the same, and the swinging bail for actuating the levers, substantially as described.

2. The combination, with the hinged concave C, of the notched levers D, for adjusting the concave, the swinging bail *d'*, engaging in the notches of the levers, and the pivoted feed-board, which is raised or lowered by the adjustment of the concave, substantially as described.

3. The combination of the thrashing-cylinder, the straw-carrier G, and the stationary spring-fingers F, extending over the middle portion of the said carrier, these spring-fingers being arranged with relation to the thrashing-cylinder so that the grain, as it is thrown back by the latter, shall strike the fingers and be thereby spread upon the carrier, substantially as described.

4. The combination of the fan, the frame-work of the machine, and the fan-case composed of the two sections *l*, detachably secured in the main frame of the machine, substantially as described.

5. The combination, with the shoe and the fan, of the blast-regulator O, the incline M', and a rod, O', substantially as described.



6. The combination of the grain-well and board *k*, the slatted carrier-belt K, for lifting the grain from the well, and the slatted straw-carrier belt G, engaged and driven by the said carrier K, substantially as described.

257,754. HYDRAULIC ELEVATOR. GOLDSBURY H. POND, New York, N. Y. Filed Apr. 14, 1882. (No model.)

Claim.—1. The combination, with the elevator-cylinder A, tank B, connecting-pipe *a*, and steam-pipe *d*, and the valves *c v i*, of the rods D D', both provided with tappets arranged so as to open the water-valve and afterward the steam-valve, to raise the piston, in the cylinder, and also to open the overflow-valve before the water-valve is raised to lower the piston, for the purpose set forth.

2. The combination of the steam and water tank B, communicating with the cylinder, with the overflow-pipe which regulates the water-line, and a steam-pipe communicating with an extension of the tank above the water-line, substantially as described.

3. The combination, with the steam and water tank communicating with the cylinder and provided with steam and overflow

257,754.

valves and pipes, of pipe I, admitting cold water to the tank, for the purpose specified.

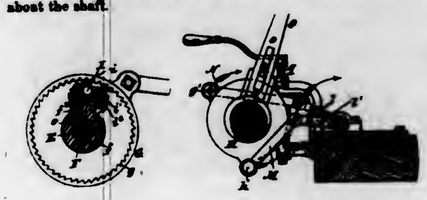
4. The combination, with the steam and water tank B, communicating with a steam-pipe and with an elevator-cylinder, of a water-inlet pipe and an overflow-pipe, substantially as and for the purpose set forth.

5. The combination, with the steam and water tank, communicating with a steam-pipe and with an elevator-cylinder, and provided with a water-inlet pipe and an overflow, of valves arranged in the steam-inlet overflow, and in the pipe between the tank and cylinder, and appliances, substantially as described, for operating the valves successively, as specified.

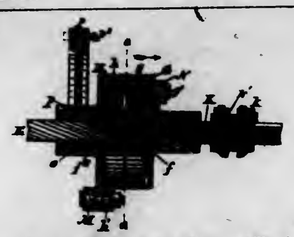
257,755. PORTABLE FENCE. SANFORD P. PORTER, West Richfield, Ohio. Filed Feb. 28, 1882. (Model.)

Claim.—1. The combination of a panel provided with the sharp projections upon its lower edge with a brace having horizontal projections which catch upon opposite sides of the end of the panel, substantially as set forth.

2. A brace for fences, provided with horizontal projections upon opposite sides, so as to catch over the ends of the two panels at the same time, substantially as described.



257,756. FOUNTAIN-PEN. FRANÇOIS XAVIER POSTANSKI, Paris, France. Filed Nov. 30, 1881. (Model.) Patented in France June 30, 1881.



Claim.—The combination of the piston *d*, elastic tube *b*, sleeve *c*, reservoir-tube *a*, having the shouldered end tube, *a'*, the hollow plug *e*, having closed bottom *f* and side opening, *g*, the rod *h*, and the tube *i*, to form a pen-holder adapted to receive and distribute ink, as described.

257,757. SETTING MECHANISM FOR SAW-MILLS. DE WITT C. PRESCOTT, Marinette, Wis. Filed Feb. 18, 1881. (No model.)

Brief.—Upon the knee-driving pinion-shaft is secured a pawl-support. To this is pivoted a pawl with a spring on one side of the pivot and a sliding bar on the other side. This bar is moved out against the pawl to retract its point by a wedge sliding longitudinally in a groove in the shaft. Engaging with the pawl are ratchet-teeth on the inside of circular boxes, which are revolved about the shaft.

257,757.

Claim.—1. In a setting mechanism for saw-mills, the knees and connections, in combination with a pawl-carrier fastened to the shaft by which the knees are adjusted, two ratchet-wheels mounted loosely on the same shaft and surrounding the carrier, and connecting mechanism, substantially as described, operated by a lever, whereby the vibration of the latter causes the ratchet-wheels to oscillate in opposite directions and engage alternately with their respective pawls on the carrier, substantially as and for the purpose set forth.

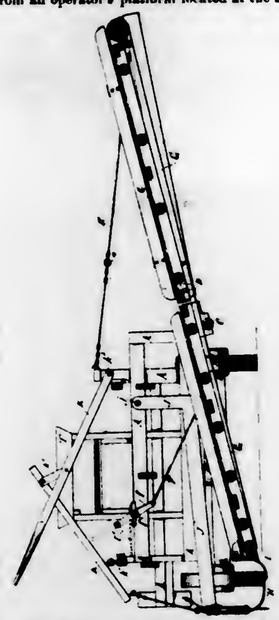
2. The pawl-carrier F, mounted rigidly on the actuating-shaft, in combination with the ratchet-wheels G and H, mounted loosely on said shaft and arranged around the carrier, the pawls I and J on the carrier, the vibrating toggle L, the pitmen M and N, the knees C, and mechanism connecting the latter with the actuating-shaft, whereby the knees are adjusted by the movement of the shaft, substantially as and for the purposes set forth.

3. In a setting mechanism for saw-mills, the ratchet-wheels G and H, mounted on the shaft from which motion is communicated to the adjustable knees, in combination with the pitmen M and N, the vibrating toggle L, constructed with sections in different planes, to each of which one of said pitmen is connected, and an operating-lever, substantially as and for the purposes set forth.

4. The actuating-shaft of a setting mechanism for saw-mills, in combination with a pawl-carrier rigidly attached thereto and provided with suitable pawls, the ratchet-wheels mounted loosely thereon, the toggle L, provided with the arms *l'* in different planes, and the central web-arm, *F*, and the pitmen M and N, substantially as described.

5. The actuating-shaft of a setting mechanism for saw-mills, in combination with the pawl-carrier F, rigidly secured thereto, the pawls I and J, mounted thereon and provided with tail-pieces *i j*, the loose pin *f''*, arranged on the carrier underneath the tail-pieces of the pawls, and mechanism whereby the pin may be lifted to turn the pawls on their pivots and disengage them from the ratchet-wheels, substantially as described.

6. The actuating-shaft of a setting mechanism for saw-mills, in combination with the pawl-carrier F, rigidly secured thereto, the pawls I and J, mounted thereon and provided with tail-pieces *i j*, the loose pin *f''*, arranged on the carrier underneath the tail-pieces of the pawls, the beveled slide K, arranged in a groove in the shaft, and mechanism for reciprocating the latter, substantially as and for the purposes set forth.



7. The actuating-shaft of a setting mechanism for saw-mills, in combination with the pawl-carrier F, rigidly secured thereto, the pawls I J, mounted thereon and provided with tail-pieces *i j*, the springs *i' j'*, arranged in sockets in the carrier under the working ends of the pawls, the loose pin *f''*, arranged on the carrier underneath the tail-pieces of the pawls, and mechanism for raising said pin, substantially as and for the purposes set forth.

8. In a setting mechanism for saw-mills, the knees and connections, in combination with a pawl-carrier fastened to the shaft by which the knees are adjusted, the two pawls mounted on said carrier, the two loose ratchet-wheels mounted on said shaft and surrounding the carrier and pawls, mechanism connecting the two ratchet-wheels, whereby the oscillation of one will cause the other to oscillate in the opposite direction, a lever for oscillating one of the ratchet-wheels, and a graduated series of stops, all arranged and operating, substantially as described, to make half the set by the vibration of the lever in one direction and the other half by its return movement, both these movements being determined by the adjustment of the stops.

257,758. GRADING AND DITCHING MACHINE. JOHN C. PRESCOTT, Cincinnati, Ohio, assignor of one-half to John O. Sloan, same place, said John O. Sloan Administrator of John C. Prescott, deceased. Filed May 12, 1881. (No model.)

Brief.—The main truck-frame carries a hinged two-part endless conveyer-frame, the lower end of which carries one section of the scraper, the other scraper-section being supported by a vertically-adjustable frame. The inner section of the conveyer-frame

and the outer scraper-section are adjustable through rod and lever connections from an operator's platform located at the side of the machine.

Claim.—1. In a machine of the character described, the combination of the frame A, the two-part endless conveyer-frame, the lower part carrying the part I of the scraper, and means for the independent adjustment of either outer end of the conveyer-frame upon bearings arranged near the hinged joint, substantially as described.

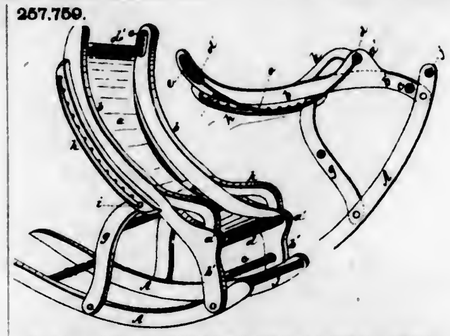
2. The combination, substantially as specified, of frame A, the transversely-arranged endless conveyer G and its frame, and the part I of the scraper secured to the lower end of the conveyer-frame and carrying over the lower end and front edge of the apron to protect the same.

3. The two-part scraper H I, each part having vertical and lower horizontal edges, the lower edges being cut back toward the center, in combination with the endless conveyer of a grading and ditching machine, as shown and described.

4. In a machine of the character described, the combination of the endless carrier G and its adjustable frame, the scraper composed of two parts, H I, the scraper-frame J J', with levers K K' to independently elevate the part H, substantially as described.

5. The combination, substantially as specified, of the adjustable endless conveyer, the part I of the scraper secured thereto, the rods F, their actuating-levers and retaining-pawl with the frame J J', part H; and compound lever K K', for the purpose described.

6. The combination, substantially as hereinbefore set forth, of frame A, to support the operative parts, the adjustable apron and scraper-frames, and clutch N, with platform B, and the levers for elevating and lowering the frames, and for operating the clutch in proximity to said platform, for the purpose set forth.



257,759. HAMMOCK-CHAIR. JOHN PURSELL, Sr., New Haven, Conn. Filed Jan. 14, 1882. (No model.)

Claim.—1. In a reclining hammock-chair, the combination, with the pivoted adjustable frame forming the front legs, and the back provided with the inside slotted rack-plates, *c*, of the hammock *a*, secured to a fixed round, *d*, of the front legs, and to an adjustable head-round, *d'*, provided with headed bearings *f*, interlocking with said slotted rack-plates, substantially as described, for the purpose specified.

2. The combination, with the pivoted adjustable frame forming the front legs, and back provided with the outside slotted rack-plates, *h*, and hammock-seat, of the rear pivoted legs, *g*, provided with headed bearings *i*, interlocking with said slotted rack-plates, and means, substantially as described, for connecting the front and rear legs, for the purpose set forth.

3. The hammock chair and bed herein described, consisting

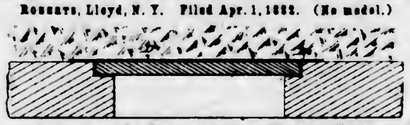
257,759.

of the pivoted frame provided with inside and outside slotted rack-plates, *c h*, the hammock *a*, the rear pivoted legs, *g*, and the rockers A, the upper round of the hammock and the upper ends of the rear legs having headed bearings interlocking with said slotted rack-plates, substantially as described, for the purpose specified.

257,760. FLY-NET FOR HORSES. JAMES R. RUBURTTON and FRANK H. HACK, Woodsport, N. Y. Filed Feb. 16, 1882. (No model.)

Claim.—1. A fly-net having its longitudinal bars and transverse lashes secured together by means of eyelets applied one on each side of the lash, whereby the edges of the lash are overlapped by the edges of the eyelets and the lash firmly bound upon the bar without puncturing the lash, substantially as shown and described.

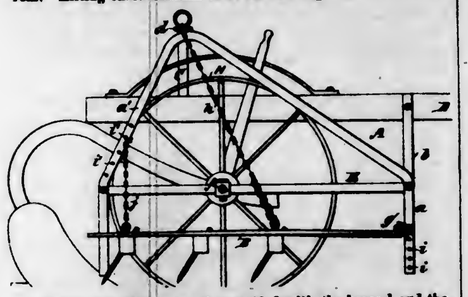
2. A fly-net having its transverse lashes passing through slits in the longitudinal bars, and secured to the said bars by eyelets located along the edges of the lashes out of line with each other, a portion of the edge of each eyelet overlapping the edge of the lash for binding the same firmly upon the bar, all substantially as shown and described.



257,761. WATERPROOFING PAPER. JOB H. RIDGWAY, Philadelphia, Pa. Filed Feb. 13, 1882. (No model.)

Claim.—1. The mode herein described of imparting a coating of paraffine to the surface of paper or pasteboard, the said mode consisting in applying a block or blocks or granulated or powdered masses of paraffine to the surface of the paper under pressure while the paper or the paraffine is in motion, substantially as described.

2. As an article of manufacture, paper or pasteboard having on one or both faces a thin film of paraffine, as set forth.

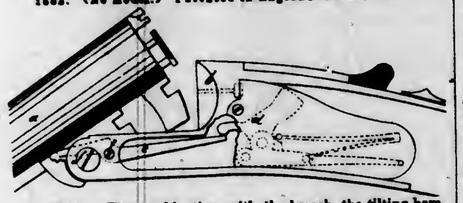


257,762. PRESERVING ENSILAGE IN SILOS. CHARLES H. ROGERS, Lloyd, N. Y. Filed Apr. 1, 1882. (No model.)

Claim.—In a silo, the combination, with the walls, doors, and covers of the ensilage-receptacle, of one or more sheets or strips of water and air proof fabric, substantially as herein shown and described, to prevent access of air or the evaporation of the moisture of the ensilage, and thereby preserve the same from decomposition, as set forth.

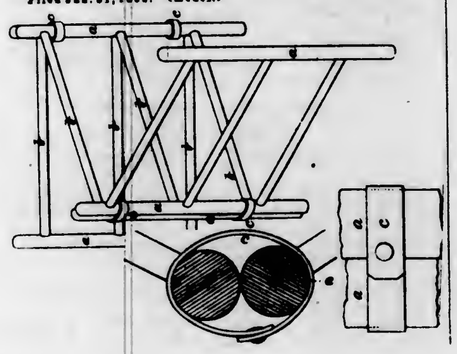
257,763. COMBINED SULKY-PLOW AND DRAG. MILES ROBINSON, Wichita, Kans. Filed Nov. 29, 1881. (Model.)

Brief.—Bent frame-piece with means for attachment to outside of any ordinary sulky-plow. Drag is connected with frame-piece by adjustable hinged connection at front and chain at the rear. Lifting-chain sustains outer side of drag.



Claim.—1. The frame A, provided with the brace *b* and the bent arm C, in combination with the hinged drag B, the frame being provided with the cross-bar E, having the attachment *f*, substantially as and for the purposes set forth.

2. The bent frame A, provided with the opposite holes, *i* and *i'*, in combination with the chain *j* and drag B, hinged to the part *a* of the frame at *g*, substantially as described, and for the purpose set forth.



3. The combination, with the frame A, provided with the holes *i i'*, brace *b*, cross-bar E, having the attachment *f*, and bent arm C, of the drag B, hinged at *g* to the frame A, and chains *j h*, substantially as described and for the purpose set forth.

257,764. BREECH-LOADING FIRE-ARM. JOHN T. ROGERS and JOHN ROGERS, Birmingham, County of Warwick, England, assignors to John B. Clabrough, same place. Filed Jan. 24, 1882. (No model.) Patented in England Jan. 29, 1881.

Claim.—The combination, with the breech, the tilting hammer, and barrel, of a main fulcrum-pin, *f*, for connecting the barrel to the breech, extending from side to side of the breech, and the cocking-lever *e*, fulcrumed upon an independent center between the barrel-fulcrum and the hammer, and having its forward end raised to a higher level than its rear end, and extended over and past the main fulcrum-pin, and arranged to play between the same and the lower face of the barrel, substantially as shown and described.

257,765. CLOTHES-DRIER. THOMAS ROWE, New York, N. Y. Filed Jan. 31, 1882. (Model.)

Claim.—In combination with the uprights *a a* of a folding clothes-drier, the elliptical spring-metal bands *c*, embracing said uprights to connect and hinge them together, as specified.

257,766. WELL-DRILLING MACHINE. OSCAR RUST, St. Joseph, Mo. Filed Feb. 9, 1882. (No model.)

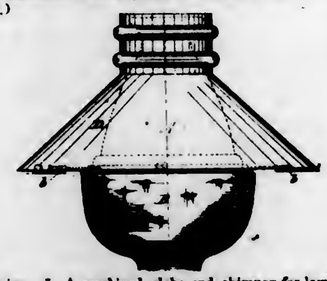
Claim.—1. In a well-drilling machine, the combination, with the driving-shaft *a*, located at the center of the sweep of lever *c*, of the drum *d*, carrying the rope of the slush-bucket and geared at will directly with the driving-shaft, whereby the greatest power of the machine shall be applied to lift and sink a heavy bucket through a bed of sand, as specified.

2. In a well-drilling machine, the shaft *h*, having the sprocket *j*, which is provided with a clutch rigidly secured thereto at one end, the drum *d*, loosely mounted on the shaft and adapted to be shifted into engagement with said clutch, the collar *m*, sliding on the shaft at its other end, and the sprocket *k*, loosely mounted on said shaft and adapted to be engaged by the said collar, whereby two shafts, in addition to the driving-shaft, shall suffice for operating the two drums independently of each other, as specified.

257,767. WELL-DRILLING MACHINE. OSCAR RUST, St. Joseph, Mo. Filed Feb. 7, 1882. (No model.)

Claim.—1. A well-drilling machine having the driving-shaft located at the center of the arc described by the drill-operating lever, whereby the said lever shall be operated by the shortest arm possible on the driving-shaft, substantially as shown and described, and for the purpose set forth.

2. A well-drilling machine having the driving-shaft located at the base of the supporting-frame, and the fulcrum of the drill-operating lever on a horizontal level with the said shaft, whereby power shall be gained in the operation of the lever by the arm on the said shaft, and the frame shall be rendered steady when the machine is in motion, substantially as set forth.

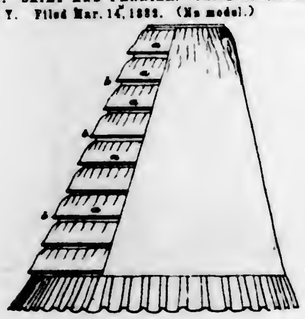


3. In a well-drilling machine, the combination, with the lever *c*, of an open shackle, *e*, for supporting the sheave *f*, substantially as shown and described, whereby the rope may be removed from the sheave to allow it to be wound evenly on the drum, as set forth.

4. In a well-drilling machine, the mast composed of two vertical side pieces placed nearly in juxtaposition with each other, and having spaces for journaling the sheaves formed by intervening blocks inclosed between the side pieces, substantially as shown and described, whereby the spaces shall be formed without mortising the mast, and the upper and lower sheaves shall be supported by the side pieces immediately at the sides thereof, as specified.

5. In a well-drilling machine, the combination, with the drum *h*, carrying the drill-rope, of the sliding pinion *m*, gearing directly with the drive-wheel *b*, and connected with the drum, substantialy as shown and described, whereby the drum shall be wound with increased rapidity in hoisting the drill from the well, as set forth.

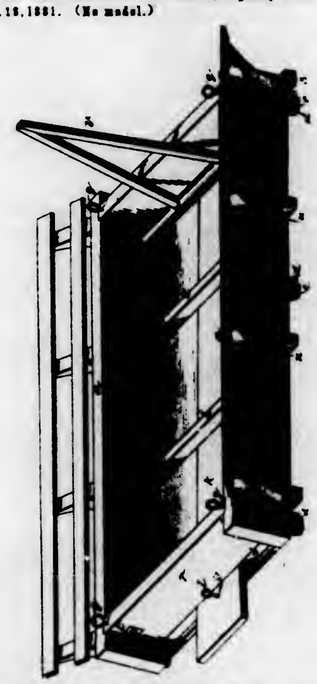
6. In a well-drilling machine, the combination, with the fly-wheel *p*, of the flanged drum *q*, carrying the rope of the slush-bucket, and adapted to be shifted to throw the flange into frictional contact with the side of the fly-wheel, substantially as shown and described, whereby a rapid motion shall be given to the drum without the use of intermediate gearing between the drum and the fly-wheel, as set forth.



257,768. COMBINED GLOBE AND CHIMNEY FOR LAMPS. PETER SCHNEIDER, Brooklyn, N. Y. Filed Feb. 11, 1882. (No model.)

Claim.—1. A combined globe and chimney for lamps provided with a ledge or shoulder for the support of a shade, in combination with a shade the base of which is extended laterally beyond the base of the chimney, and suitable arms interposed between the base of the shade, and a ring supported on the ledge or shoulder and connecting the base of the shade with the ledge or shoulder, substantially as described.

2. The combination of the shade D, having its base extended laterally beyond the top of the globe, the ring *a*, provided with the arms *b*, and the ledge or shoulder C of the combined globe and chimney, substantially as described.



257,769. SKIRT AND PANNIER. JACOB SCHOENHOF, New York, N. Y. Filed Mar. 14, 1881. (No model.)

Claim.—1. A skirt provided with a series of ruffles on its back breadth, said ruffles being sewed to the skirt at their upper edges and ends, and having springs in their free lower edges, substantially as set forth.

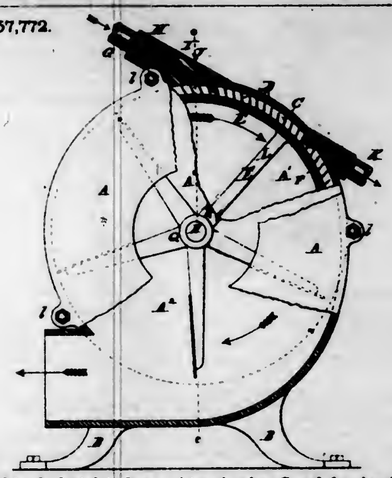
2. The combination, to form a combined skirt and pannier, of the skirt, the ruffles *a*, gathered and stitched to the skirt at their upper edges and ends, the springs *b* arranged in the lower free edges of the ruffles, and the lacing device comprising the strips *c c* and lacing cord *d*, all constructed and arranged substantially as set forth.

257,770. HAY-RACK. JOHN SHAFER, Logansport, Ind. Filed Nov. 18, 1881. (No model.)

Claim.—1. The combination, with the end-gate *r*, provided with the projections *t t* and recesses *p*, and side-board *a*, provided with end mortises, *c*, of the end brace, *m*, provided with a tenon, *m'*, extending through the side-board and into the recess, and secured thereto by a pin, *q*, substantially as described, and for the purpose set forth.

2. The combination of the side-boards *a*, provided with the mortises *b c* and hooks *e*, removable cross-bars *h d*, removable wedge-shaped boards *i i k*, braces *m m' n n'*, connected by slats *o o*, end-gates *r r*, constructed as set forth, and pins *l q u*, whereby the hay-racks and wagon-box can be separated or put together, substantially as described, and for the purpose set forth.

257,771. FUNNEL-BLOCK FOR PARTITIONS OF BUILDINGS. DENNIS SHEA, Portsmouth, and ROMAINE TRIPPLETHEN, Dover, N. H. Filed Dec. 28, 1881. (No model.)



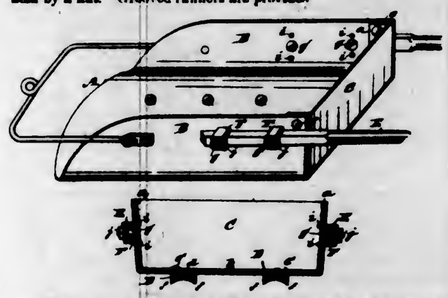
Claim.—As a new article of manufacture, a funnel-block, A, having its edges rabbeted at *b* on each side to form tongues or projections *c* of less thickness than the body of the block, and adapted to fit between the two series of laths on opposite sides of a partition, substantially as and for the purpose set forth.

257,772. ROTARY FAN. HOWARD M. SMITH, St. Louis, Mo. Filed Aug. 5, 1881. (No model.)

Claim.—1. The combination of case A, side plate, A', having bearing P, and head A', having bearing O, the said case, side plate,

257,772.

and head adapted to form a piston-chamber, C, and fan-chamber W, as set forth.



2. The rotary piston with buckets D and packing-grooves, combined with the packing-ribs *s* of the case, for the purpose set forth.

3. The removable jet-nozzle J, in combination with the head A', having socket I, the connecting-piece H, and the steam-pipe G, the jet-nozzle being adapted to be dropped into position, as set forth.

4. The combination of head A', having socket I, the nozzle J, connecting-piece H, steam-pipe G, and exhaust-pipe K, as set forth.

257,773. EARTH-SCRAPER. PHILIP SMITH, Sidney, Ohio. Filed Jan. 26, 1882. (No model.)

Brief.—The scraper-body consists of a metal blank bent up to form the sides and an end piece having side and bottom flanges, by which it is riveted to the main portion. Each handle is secured by a metal clip having ends projecting through the side of the scraper and by a bolt passing through the clip and handle and held by a nut. Grooved runners are provided

Claim.—1. An improved earth-scraper, consisting of the blade A, struck up to form the sides B, the end plate, C, and the runners D, substantially as herein shown and described.

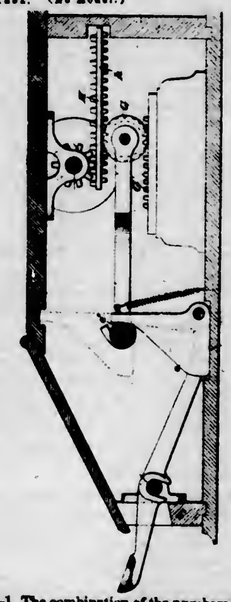
2. In combination with an earth-scraper, the runners D, guttered upon the under side or concaved to form the projections *f f*, substantially as described.

3. In an earth-scraper, the combination, with the sides of the plate and the handles E, of the staple-plates F, provided with points *i*, entering perforations in the said sides, and the bolts *g*, passing through the sides of the blade, the handle, and the staple-plates, and provided with nuts *j*, substantially as herein shown and described, whereby provision is made for taking up the shrinkage or wear of the handles, as set forth.

4. In an earth-scraper, the end plate, C, formed with the flanges *a* and *b* and riveted to the bottom and sides of the scraper, substantially as described.

5. The body of the scraper, formed of the steel blade A and sides B B, in combination with the guttered runners D D, end plate, C, and adjustable handles E E, substantially as described.

257,774. WASHING-MACHINE. RACHEL P. SMITH, Chicago, Ill. Filed Jan. 19, 1882. (Model.)



Claim.—1. In combination with the frame adapted to be secured to the edge of the tub, the movable frame connected to the stationary frame by links, the adjustable extensions secured to the movable frame, and the pivoted rubber secured to said extensions, the whole adapted to operate substantially in the manner specified.

2. In combination with the stationary and movable frames, the links provided with lugs or stops for holding the frames in proper relative positions when folded, substantially as specified.

3. A hollow metallic rubber provided with a valve aperture or seat at its under side, and a flap-valve longer in one direction and narrower in the other than said aperture, whereby the valve is supported and the water allowed to escape, as described, in combination with the fluted rolls journaled thereto, substantially as specified.

257,775. ADDING-MACHINE. WALTER C. SPELLIER, New York, N. Y., assignor to Rastus S. Ransom, same place. Filed Mar. 16, 1882. (No model.)

Claim.—1. The combination of the numbered levers, the cams thereon, the operating bail or frame, the gearing, and the registering mechanism, substantially as set forth.

2. The combination of the levers, the cams, the operating-bail, its pinion, the racks G' and H, the register-wheel, the registering mechanism, and a spring for automatically returning the traveling rack to its normal position, substantially as set forth.

3. The combination of the numbered lever, its cam pivoted thereto, the operating bail or frame, and the spring which serves to restore the lever to its normal position, substantially as set forth.

4. The combination of the traveling operating bail or frame, mechanism for imparting to it a series of motions corresponding with and proportioned to a series of numbers, the pinion carried by the bail, the racks, the registering-pinion, and means for automatically returning the parts to normal position after the bail has been operated, substantially as set forth.

5. The combination of the levers, their cams, the operating bail or frame, and the guides in which the cams work, substantially as set forth.

257,776. ELECTRIC CANDLE. LOUIS SELIGNAC, Paris, France, assignor to the Jablochkoff Electric Lighting Company, New York. Filed Jan. 4, 1882. (No model.) Patented in France Mar. 7, 1879, No. 129,743.

Claim.—1. The combination, with two parallel conductor sticks or pencils, one of which is approximately twice the size of the other, of a wire, core, or sheath composed of a material that is a better conductor of electricity than the material of said pencils, said wire, core, or sheath being applied to the smaller of the two pencils in the manner described, whereby the resistance of the two combustible sticks or pencils of different size is equalized, as and for the purpose set forth.

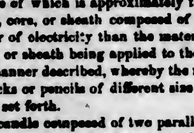
2. An electric candle composed of two parallel sticks of carbon separated by insulating material, one of which is approximately half the size of the other, and is provided with a metallic conducting core, sheath, or wire, substantially as and for the purpose set forth.

257,777. SUSPENDER-BUCKLE. FREDERICK B. SPOONER, Brooklyn, N. Y. Filed Feb. 14, 1882. (No model.)

Claim.—1. In a buckle, the combination, with the buckle-plate, of a sliding frame provided with a hook passing through an aperture in the buckle-plate, substantially as herein shown and described, and for the purpose set forth.

2. In a buckle, the combination, with the plate A, of the sliding frame D, provided with a hook or tongue, F, and of the spring C, substantially as herein shown and described, and for the purpose set forth.

3. In a buckle, the combination, with the plate A, provided with spring-tongues K, having jaws at their free ends, of the sliding frame D, provided with a hook or tongue, F, and of the spring C, substantially as herein shown and described, and for the purpose set forth.



4. In a buckle, the combination, with the plate A, provided with an aperture, G, and with spring-tongues K, having jaws at their lower ends, of the sliding frame D, provided with a tongue, F, passing through the aperture G, and having a hook or head at its upper end, and of the spring C, substantially as herein shown and described, and for the purpose set forth.

5. In a buckle, the combination, with the plate A, of the sliding frame D, provided with a hook or tongue, F, the spring C, and the holder or straps E, attached to the frame D, substantially as herein shown and described, and for the purpose set forth.

6. In a buckle, the combination, with the plate A, provided with an aperture, G, of the sliding frame D, provided with a tongue, F, passing through the aperture G, and provided at its end with a hook or head, H, substantially as herein shown and described, and for the purpose set forth.

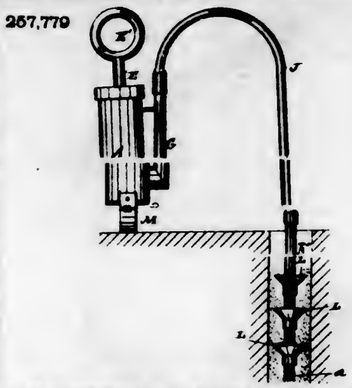
7. In a buckle, the combination, with the plate A, provided with slots B and J, forming spring-tongues K, of the sliding frame D, provided with a tongue, F, and of the spring C, substantially as herein shown and described, and for the purpose set forth.

257,778. CONDUCTOR. J. HILTON STEARNS, Jr., Brooklyn, assignor, by mesne assignments, to the New York Telegraph Company, New York, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—An underground cable for telegraphic or telephonic purposes which consists of two or more wires, A, having insulating coatings B and induction-casing C, said insulated wires being arranged in the bends of the induction-casing and on alternately-opposite sides of same, substantially as and for the purpose specified.

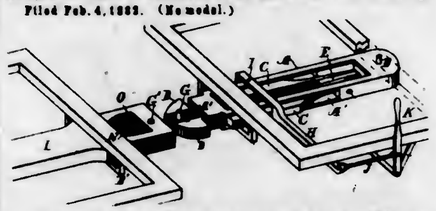
257,779. DRILL-HOLE CLEANER. WILLIAM H. STEWART and REMBY J. CHAPMAN, Denver, Colo. Filed Jan. 30, 1882. (Model.)

Claim.—1. In a drill-hole cleaner, the combination, with the tube K, carrying one or more sediment-cups, L, at its lower end, of an air-compressor, A D, substantially as herein shown and described, and for the purpose set forth.



2. In a drill-hole cleaner, the combination, with the tube K, of one or more adjustable sediment-cups mounted on its lower end, and of an air-compressor, A D, substantially as herein shown and described, and for the purpose set forth.

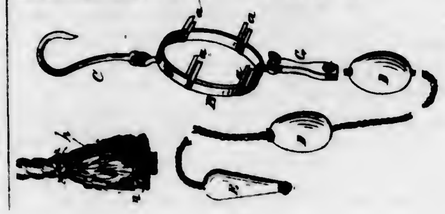
3. In a drill-hole cleaner, the combination, with the tube K, having its lower end threaded, of one or more sediment-cups, L, screwed on this threaded part of the tube, and of an air-compressor, A D, substantially as herein shown and described, and for the purpose set forth.



4. In a drill-hole cleaner, the combination, with the tube K, provided at its lower end with a series of notches or recesses, *a*, of the sediment-cups L, mounted on the tube K, and of an air-compressor, A D, substantially as herein shown and described, and for the purpose set forth.

5. In a drill-hole cleaner, the combination, with the tube K, of the sediment-cups L, mounted on the lower end of the same, and of the air-compressor A D, provided at its lower end with a stirrup, M, substantially as herein shown and described, and for the purpose set forth.

257,779

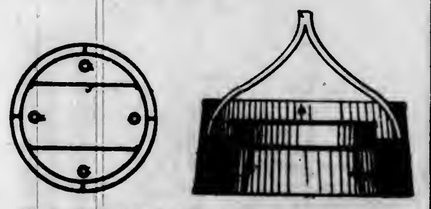


257,780. CAR-COUPLING. LOUIS A. [illegible], Pleasant Lick, Ky. Filed Feb. 4, 1882. (No model.)

Claim.—In car-couplers, the draw-bar A, having within a recess, A', containing the latches C, provided with leaves or wings which project through the sides of the draw-bar, and with jaws D, which project from the forward end, and looped lever H, in combination with the draw-bar L, having the mouth N, provided with ledges or shoulders O, substantially as herein set forth.

257,781. FIRE-ESCAPE. JOHN H. O. SULLIVAN, Hopkinton, Mass. Filed Mar. 20, 1882. (No model.)

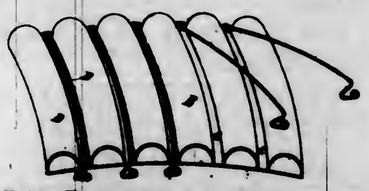
Brief.—Bunches of fiber are inserted between the strands of the rope and fastened, forming conical stops for the hand-pieces, which are bored and slid down onto them. The reel is provided with bifurcated spring-holders to receive and hold the rope.



Claim.—The improved portable fire-escape described, the same consisting of the rope A, provided with the stops A, hand-pieces D link G, and plumb E, in combination with the reel B, provided with the holders *a a*, and hook C, all constructed and arranged to operate substantially as set forth and specified.

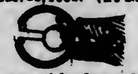
257,782. NUT-LOCK. JOHN B. SUTTON, Pittsburg, Pa. Filed Feb. 23, 1882. (No model.)

Claim.—A device for locking nuts on bolts, consisting of a small steel bar bent to form an open ring to be placed on a bolt under a nut as a washer, of which one end overlaps the other, the inner end having a pointed projection at its under surface, the other end, when bent upward, locking the nut, substantially as described.



257,783. CLOTHES-POUNDER. FRANKLIN W. SUTTON, Angola, Ind. Filed Mar. 6, 1882. (Model.)

Claim.—1. A clothes-pounder having two or more chambers, and provided with tubes which extend down into each chamber, and also having a groove or channel upon its top, substantially as described.

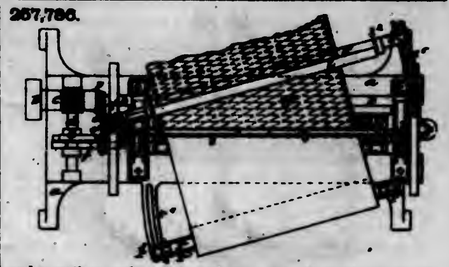


2. The combination of the clothes-pounder having a groove or channel formed in its top, and provided with the tubes which extend downward into each chamber, with the guide or guard which is secured around the pounder, substantially as set forth.

257,784. HAIR-CRIMPER. MARY SWARTS, Greenville, Ohio. Filed Mar. 9, 1882. (No model.)

Claim.—The combination of plate B, having convex faces, furrows between the faces, and spring-clamps hinged at one end of the furrows, and having catch-hooks and handles at their free extremities, as set forth.

257,785. TOY HOOP-STICK. WILLIAM L. TAYLOR, Philadelphia, Pa. Filed Mar. 20, 1882. (No model.)



Claim.—1. As a new article of manufacture, a toy hoop-stick consisting of the body of wood surrounded on its end with a metallic ferrule, and provided with a globe-bell on said end, substantially as and for the purpose specified.

2. A globe-bell provided on the top with a hole large enough to admit a screw-head and on the bottom with a hole large enough to admit the shank of a screw, in combination with the screw and hoop-stick, substantially as shown.

257,786. SEWING-MACHINE FOR QUILTING. JOS. THOMAS, Hoboken, N. J. Filed Jan. 18, 1882. (No model.)

Claim.—1. In combination, the feed-rollers *l l'*, carried by the adjustable frame F, the bevel-wheels *m m'*, ratchet-wheels *n* and *n'*,

257,786.

and operating-pawl *o*, substantially as and for the purpose set forth.

2. As a variable device for feed-rollers of sewing-machines, the plain ratchet *n*, secured rigidly to its shaft, the ratchet-wheel *n'*, turning freely on the shaft adjacent thereto, and having teeth of varying depth, and operating-pawl *o*, in combination, substantially as set forth.

3. The combination of the row of needles *i i* with the feed-rollers *l l'*, carried by the frame F, which is pivoted at one end in close proximity to one end of the row of needles and secured at its other end to a curved slotted bracket, whereby the said feed-rollers may be set at different angles to the row of needles, substantially as set forth.

4. In combination, the row of needles *i i*, the adjustable frames F and *f'*, pivoted at one of their ends at the opposite sides and ends of the row of needles and secured at their other ends to curved slotted brackets, whereby they may be set at different angles to the row of needles and parallel to one another, said frame F being adapted to carry the feed-rollers *l l'*, and the said frame *f'* being adapted to carry the roll of goods *g*, substantially as and for the purpose set forth.

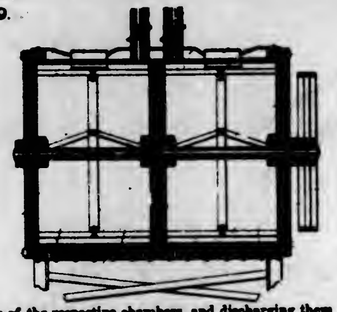
257,787. HEAD-COVERING. RICHARD H. TRESTER, Greenville, N. J. Filed Mar. 9, 1882. (Model.)

Claim.—1. As a new article of manufacture, a hat made of strips of napped fabric, napped either on one or on both sides, sewed or pasted together.

2. A lady's or child's hat of strips of cotton, silk, or woolen napped fabric, napped either on one or both sides, and sewed into a hat alternating with strips of straw or other braid, sized and blocked into shape, substantially as specified.

3. The method herein described of making ladies' and children's hats from strips of fabric napped on one or both sides, or napped fabric and straw or other braid sewed or stuck together, sizing and blocking the same into shape, substantially as set forth.

257,788. NUT-LOCK. CHARLES B. TYLER, Newark, N. J., assignor to himself, Clark W. Hills, Pompton, N. J., and Gaolair Thoren, New York, N. Y. Filed Jan. 9, 1882. (No model.)

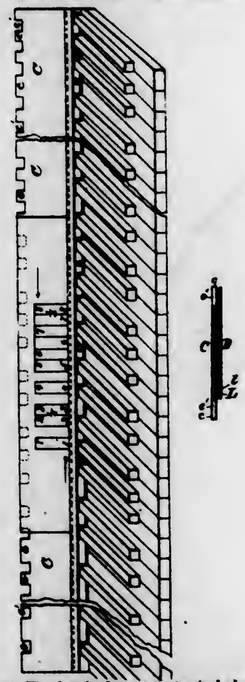


Claim.—In combination with a nut and a bolt having one side removed, a washer having points and a tapering tongue turned up from the metal of the washer in forming the hole for the bolt, the base of such tapering tongue being of a width to cause it to be compressed at its angles by the nut as it is screwed upon the tongue, substantially as and for the purposes set forth.

257,789. HEATING AND COOKING APPARATUS. GILBERT N. VENABLE, Memphis, Tenn. Filed May 26, 1881. (No model.)

Claim.—1. The heating or cooking apparatus herein described, consisting of a horizontal cylinder transversely divided into two or more separate chambers with independent discharge-doors, and a rotary shaft carrying scrapers adapted for stirring the

257,789.



contents of the respective chambers, and discharging them either simultaneously or separately, so that one chamber may be in full operation while another is being filled or emptied.

2. In combination with a cylindrical heater and a spider revolving axially therein, the V-shaped knives arranged to stir the materials under treatment, as described.

3. In combination with a cylindrical heater and an axially-revolving spider carrying suitable scraping-knives, the strengthening band or ring connecting said knives, for the purposes set forth.

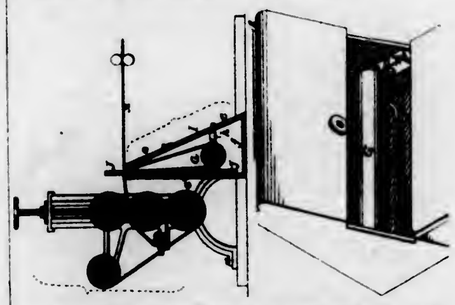
257,790. MUSIC-CHART. MAXIMILIAN WAGNER, Berlin, Germany. Filed Dec. 24, 1881. (No model.) Patented in England Dec. 27, 1881, and in France Dec. 27, 1881.

Claim.—1. The herein-described musical chart C, composed of two or more sections hinged together for folding, and provided on its opposite edges with teeth *c* and a ledge, L, having a wedge-shaped groove therein, substantially as and for the purpose specified.

2. The main chart C, having ledge L, and provided with teeth *c* on its opposite edges, the end teeth at both edges being longer than the intervening teeth, substantially as and for the purpose specified.

3. The combination, with the main chart C, having teeth *c* and ledge L, provided with a wedge-shaped groove, of a chart, D E F G having one of its edges beveled, substantially as and for the purpose specified.

257,791. GONG-BELL. JAS. WALKER, New York, N. Y. Filed Apr. 8, 1882. (No model.)



Brief.—A gong and attaching device which have but a single joint, so as not to unnecessarily break the continuity of the metal and thereby impair the sonorous vibrations.

Claim.—1. A gong-support having an attaching body, a coiled or volute shank, and a securing-plate cast in a single piece, combined with a gong, whereby the gong is firmly secured to a clock or other object with but a single joint, as specified.

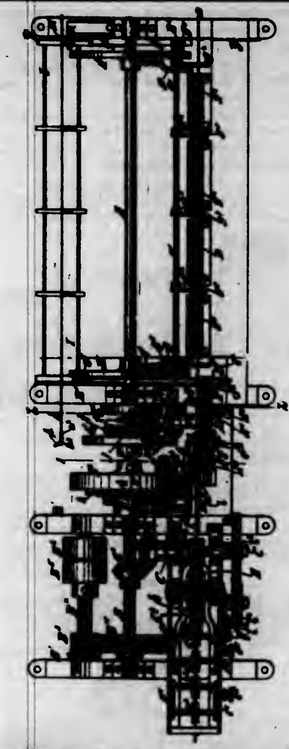
2. The gong A and head B, welded or brazed together, as shown, combined with the support composed of the body D *d*, shank E, and plate F, cast in a single piece, and with the attaching-screw C, as and for the purposes specified.

257,792. CLOTH-STEAMING BOX. ROBERT J. WALKER, Philadelphia, Pa. Filed Jan. 12, 1882. (No model.)

Claim.—1. The combination of a steaming-box having at the top an elongated opening, with a pipe for admitting steam to the box, and with a roller whereby the fabric is directed downward and upward through the said opening and in the course described within the box, all substantially as set forth.

2. The within-described steaming-box, having converging front and rear and an elongated opening in the top, in combination with a roller, G, and a steam-pipe, J, substantially as described.

3. A steam-box provided with door I, roller G, and slotted bearings *i j*, whereby the said roller may be readily removed, all being combined substantially as set forth.



257,793. MACHINE FOR MAKING WIRE BALE-BANDS. THEODORE A. WEBER, New York, N. Y., assignor to Susan C. Nicholson, same place. Filed Oct. 12, 1881. (No model.)

Brief.—The wire passes through a straightening device, the feed-rolls, a stationary cutter, a conical guide, and the eye in a link onto arms on a rotating carrier, which clutch and hold the wire. The wire is then severed by a knife on a rotating disk. The conical guide opens the rotating holder, carries the wire so as to place the rear end of it on a twisting-nib, the link going into a notch in said nib. The end of the wire is then bent around the nib and held alongside of the main portion in a notch by a spring-pawl. The nib is then rotated, twisting the two parts of the wire together, forming an eye, in which the link is held. The twisting-nib, the bending-arm, the notch, and pawl for holding the two parts during twisting are mounted on disks, which rotate with the carrier. After the bale-band has been completed it is freed from the carrier and drops onto a registering device.

Claim.—1. In a machine for making the wire bale-bands herein described, the combination of feeding mechanism, shears for cutting off the wire, mechanism for feeding the links, and mechanism for doubling or bending the wire and twisting it to form a loop, all constructed and operating substantially as herein described.

2. In a machine for making the wire bale-bands herein described, the combination of feeding mechanism, shears for cutting off the wires, mechanism for feeding the links, a rotary carriage for the wire after being cut off, and mechanism rotating with said carriage for doubling or bending the wire and twisting it to form a loop, all constructed and operating substantially as herein described.

257,793.

3. The combination, with the grooved and geared feeding-wheels C' C', of the lever E, provided with uprights b^3, the yoke *e*, and cam *e'*, substantially as herein described.

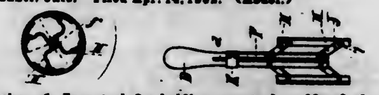
4. In a machine for making wire bale-bands, the combination of feeding mechanism, shears for cutting off the wire, a box or trough for the reception of links, mechanism for ejecting the links transversely from said box or trough, a divided guide for the wire, and mechanism for opening said guide to permit the removal of the wire transversely therefrom, substantially as herein described.

5. The combination of the box or trough F', the pusher or blade *e*, the arm *e'*, rock-shaft *e²*, and lever *e³*, for working said pusher or blade, and the disk or flange H, provided with the depression *d'* and spring *d²*, all substantially as herein described.

6. The combination of the divided conical guide *f f'*, the lever f^3, the link f^4, arm f^5, rock-shaft f^6 and the lever f^7, and the disk or flange H, provided with the depression *d'* and spring *d²*, all substantially as herein described.

7. In a machine for making wire bale-bands, the combination of a rotary carriage for the wire, comprising fixed fingers and a series of oscillating fingers, a table or bed for the cut wire, through which said oscillating fingers may pass, and mechanism for moving said oscillating fingers in one direction to pass under and lift the wire from said table or bed, and mechanism for moving said fingers in the other direction to carry the wire into said fixed fingers, substantially as herein described.

8. The combination of the V-shaped table or bed g^9, the shaft B, and its disks or flanges H H', the fixed fingers or forks *g*, the shaft or rod *g'*, the oscillating fingers or forks g^3, the spring g^4, and the cam g^5 and arm g^6, all substantially as herein described.



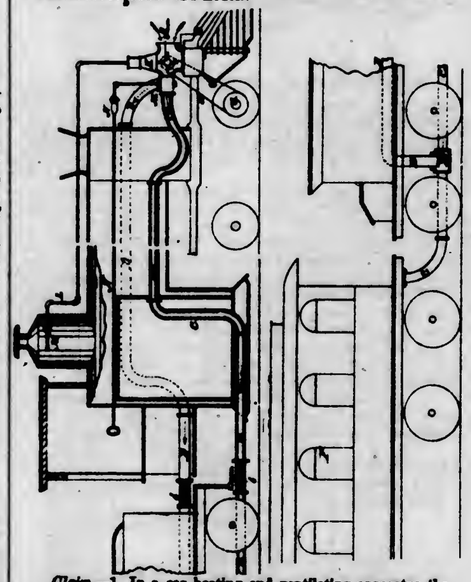
9. In a machine for making wire bale-bands, the combination of feeding mechanism, shears for cutting off the wire, a main shaft, a rotary wire-carriage, and two disks, all fixed upon said shaft, a rotary twister carried by one of said disks, mechanism carried by the other disk for doubling or bending the wire over said twister and holding it while being twisted, substantially as herein described.

10. In a machine for making wire bale-bands, the combination of the shaft B, the rotary wire-carriage, the disk G, the shouldered finger *i*, the dog i^2, the rotary dog j^2, the reciprocating rack-bar j^3 and stationary cam G', and the disk F, carrying the twister A, and the stationary cam F', for operating the twister, all substantially as herein described.

11. In a machine for making wire bale-bands, the combination of the main shaft B, the rotary wire-carriage, the flange F, the rotary twister *h*, carried by said flange, and the reciprocating rack-bar *h* and stationary cam F', for rotating said twister, all substantially as herein described.

12. In a machine for making wire bale-bands, the combination of the main shaft B, the flanges or disks F and G, and the rotary wire-carriage fixed upon said shaft, the doubling or bending and the twisting mechanism carried by said flanges or disks, the feed-wheels C' C', and the transverse counter-shaft C, and gearing by which said shaft C is driven from the shaft B, and through which it drives said feed-wheels, substantially as herein described.

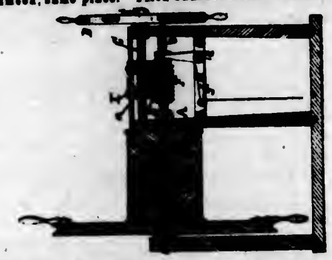
257,794. FRUIT-CAN-SOLDERING TOOL. JACOB F. WHITSEL, Cincinnati, Ohio. Filed Apr. 14, 1882. (Model.)



Claim.—1. In a tool for holding cans to be soldered, the handled shank or stem D F, so connected to a congeries of equidistant expanders or arc-plates J by as many pairs of curved elastic parallel-rule links H as to become self-locking in the act of insertion, substantially as set forth.

2. In combination with a congeries of arc-plates, H, arranged equidistantly around the circle, and with as many pairs of curved elastic hinged links H, the X-formed stem F, having the handle D, substantially as set forth.

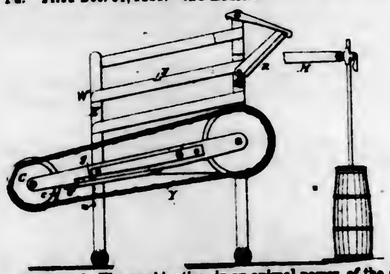
3. In combination with the expanders J and the curved elastic hinged links H, the stem F, composed of four L-formed strips, and occupying a cruciform kerf, *d*, in handle D, in the manner described.



257,795. CAR HEATING AND VENTILATING APPARATUS. LEWIS B. WHITE and LEONARD HENDERSON, Middleburg, N. C. Filed Jan. 16, 1881. (No model.)

Claim.—1. In a car heating and ventilating apparatus, the combination, with the hot-air tubes C and D and the valve M', of the automatic valve R, located at the rear junction of said tubes, so as to close the exit-opening of one of them when air is forced through the other, as set forth.

2. In a ventilating apparatus for railway-cars, the combination, with the blower and its shaft, of the engine K and chain, locomotive-axle, and chain-pulley having a ratchet-and-pawl connection with said shaft, and the open-mouthed tube which extends rearward and connects with a car, as shown and described, whereby the rotation of the shaft may be continued by the operation of either the engine or the chain, as required.



257,796. STEAM STEERING MECHANISM. WILLIAM G. WILLIAMSON and HALVOR O. FLADVAD, Philadelphia, Pa., assignors to said Williamson, George W. Williamson, and John B. Williamson, same place. Filed Jan. 26, 1882. (No model.)

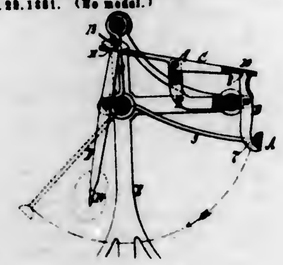
Claim.—1. The combination, substantially as before set forth, of the hand-wheel D, screwed spindle C, nut E, moving in guides, screwed sleeve F, and the lever H.

2. The combination, substantially as before set forth, of the hand-wheel D, screwed spindle C, nut E, moving in guides, screwed sleeve F, lever H, and shaft G.

257,797. CHURN-POWER. JEFFERSON WILSON, Beaver Falls, Pa. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination, in an animal-power, of the supporting-frame W, the web-frame A, pivoted within said frame W, between its ends, so that it may be turned within the frame to a vertical position, and provided with a device, substantially as described, for securing it in any position to which it may be adjusted, substantially as set forth.

2. The combination, in an animal-power, of the supporting-frame W, its notches *y* and *u*, and the pivoted web-frame A, provided with the sliding bar *g*, substantially as set forth.



3. The web-link provided with a cross-head at one end and with sockets at the opposite end, adapted to the cross-head of the adjacent link, all cast in one piece, substantially as set forth.

4. The combination of the links, their cross-heads and sockets, each cast in one piece, as set forth, and slats Y, retaining the cross-heads in the sockets, substantially as described.

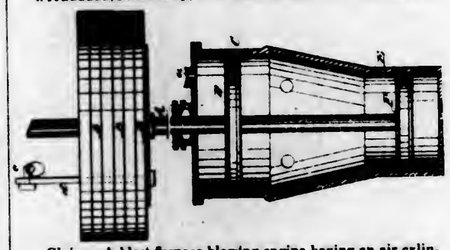
5. The combination, with the operating-lever H, of the pivoted clamp provided with a cam-lever, Q, grooved and sparred, substantially as described, for the purpose set forth.

6. The combination, with the supporting-frame of the apparatus, of a hinged head-board, R, and devices for securing said head-board in its different positions, substantially as described.

257,798. ANIMAL-TRAP. CHARLES G. WILTSE, New York, N. Y., assignor to himself and Argus L. Freeman, same place. Filed Sept. 29, 1881. (No model.)

Claim.—1. In an electric-light regulator constructed to offer two conducting-paths to the current, an axial electro-magnet placed in the main or light circuit, and provided with a movable core seated upon a coiled spring, in combination with contacts controlling a branch or safety circuit around the lamp of a resistance approximately equal to that of the normal arc.

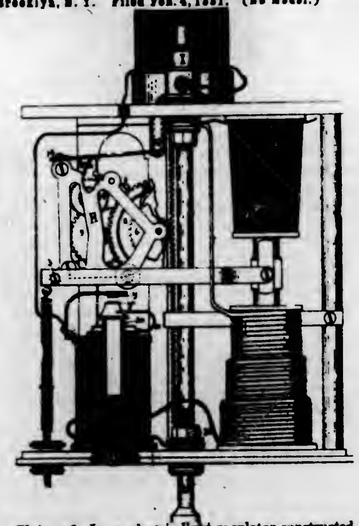
2. An axial electro-magnetic circuit-closer consisting of electro-magnetic coils or helices and a movable core provided with a contact, in combination with a metallic plate seated upon the head of the coils, and bent around to form a circuit-closing point to act in conjunction with the core.



3. In an axial electro-magnet switch, a movable core and supporting-spring, in combination with a supporting metallic plate and an inclosing metallic cylinder, substantially as described.

4. In an axial electro-magnet switch, the combination of a movable core, an inclosing metallic cylinder, and a flexible electrical connection from the cylinder to the core.

Claim.—1. The combination of a bar, 4, a horizontal knocker, A, hung to springs arranged on said bar, a vertical pivoted catch B, adapted to engage the knocker and hold it suspended, a detent C, adapted to engage the upper end of the catch, and a pendent bait holder engaging the other end of the detent, all substantially in the manner described.



2. The combination of the knocker A and its springs 3, the pivoted catch B, having the hook 7 and toe 8, the pivoted detent C, having openings 10 11, and the pivoted bait-holder D, having the head 13, for the purpose specified.

257,799. REGULATOR FOR BLOWING-ENGINES. THOMAS F. WITHERBEE, Port Henry, N. Y. Filed Feb. 9, 1882. (No model.)

Claim.—A blast-furnace blowing-engine having an air-cylinder, C, connecting with the blast-pipe, a steam-cylinder, E, having piston F, and a speed-governor having the rod and piston A D working in the cylinder C, whereby a given volume of air may be maintained regardless of the steam-pressure and the air-resistance, as described.

257,800. ELECTRIC-LIGHT REGULATOR. JAMES J. WOOD, Brooklyn, N. Y. Filed Feb. 4, 1881. (No model.)

Claim.—1. In an electric-light regulator constructed to offer two conducting-paths to the current, an axial electro-magnet placed in the main or light circuit, and provided with a movable core seated upon a coiled spring, in combination with contacts controlling a branch or safety circuit around the lamp of a resistance approximately equal to that of the normal arc.

2. An axial electro-magnetic circuit-closer consisting of electro-magnetic coils or helices and a movable core provided with a contact, in combination with a metallic plate seated upon the head of the coils, and bent around to form a circuit-closing point to act in conjunction with the core.

3. In an axial electro-magnet switch, a movable core and supporting-spring, in combination with a supporting metallic plate and an inclosing metallic cylinder, substantially as described.

4. In an axial electro-magnet switch, the combination of a movable core, an inclosing metallic cylinder, and a flexible electrical connection from the cylinder to the core.

5. In an axial electro-magnet switch, the combination of a movable core, a metallic plate bent to form a circuit-closer for the core, and seated upon the head of the coils, an inclosing metallic cylinder for the core, and flexible electrical connection from the end of the core to the cylinder, substantially as described.

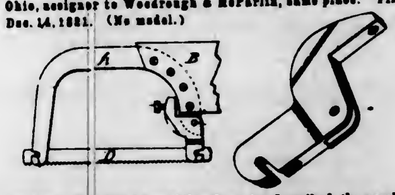
6. The combination, substantially as described, of regulating devices for an electric-arc lamp, two axial magnetic cores controlling or supporting said regulating devices, two sets of coils or helices inclosing the ends of the cores, one set of coils being in the circuit with the arc and the other in a derived circuit to the arc, so as to be under the constant action of electric currents, and a common bridge or cross-piece of magnetic material joining the cores between the coils and at or near the center of the cores, the whole arranged, as set forth, so that the coils at each end of the cores are free to exert their full force without interference from the opposing influence of the magnetic induction from the coils at the other end.

7. In an electric-light regulator, a releasing-train the members of which are supported in a frame-work pivoted on the armature-lever, in combination with a parallel-motion link attached at one end to the frame-work in which the train is mounted and at the other to the plate or frame of the lamp.

8. In an electric-light regulator, a releasing-train supported and pivoted on the armature-lever, in combination with a parallel-motion link carrying a detent for the train.

9. In an electric-light regulator, a pivoted releasing-train supported on the armature-lever, in combination with a parallel-motion link consisting of a flexible spring carrying a detent.

10. In combination with a flexible spring forming a parallel-motion link for a pivoted releasing-train, a detent formed by cutting and bending up a portion of the spring.

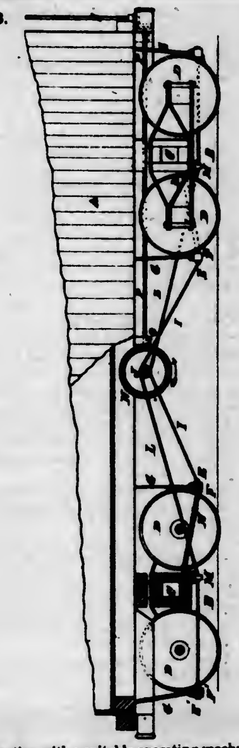


257,801. CAR-COUPLING. SIDNEY WOODRING, Du Bois, Pa. Filed Mar. 9, 1882. (No model.)

Claim.—1. The double link A, composed of a right-angular bar provided with the hole *o* near its angle and links *m* at right angles to each other, substantially as described.

2. The combination, with the double link A, constructed as set forth, of the draw-head *a*, provided with a horizontal slot, *b*, extending crosswise through its vertical sides, and slots *c c* in the upper and lower faces of the draw-head, and coupling-pin *d*, substantially as described, and for the purpose set forth.

257,802. HANDSAW. JAMES R. WOODBURN, Cincinnati, Ohio, assignor to Woodrough & McParlin, same place. Filed Dec. 14, 1881. (No model.)



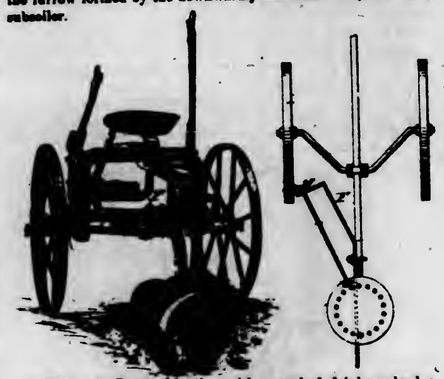
Claim.—In a handsaw of the character described, the combination, substantially as hereinbefore set forth, of blade D and handle B with a curved metal frame, one end of which extends to receive the end of the blade and the opposite end shortened to receive a lever which forms a continuation of said frame, a lever fulcrumed upon said shortened end, one arm of said lever adapted to receive one end of the saw-blade and the opposite arm extended opposite the shortened end of the frame, and a screw passing through said arm and bearing against said shortened end to turn said lever on its fulcrum for the purpose of tightening or loosening the saw-blade.

257,803. CAR-BRAKE. DANIEL W. WOODS, St. Louis, Mo. Filed Mar. 16, 1882. (No model.)

Claim.—1. The two trucks B, with springs H and brake-bars E and E', connected to a central shaft, J, by chains I and L, wound on the shaft in opposite directions.

2. The brake-bars E and E', springs H, forcing the brake-bars E toward the wheels, chains I and L, extending from the brake-bars E E' to a shaft, J, and wound in contrary directions thereon,

257,803.



in combination with a suitable operating mechanism, as hand-shaft S, wheels R Q O N, and shaft P.

3. The combination of trucks B B, body A, brake-bars E E', chains I L, shaft J, cog-wheels N O Q R, shafts P and S, hand-wheel T, and holding device U V W, or their mechanical equivalents, for the purposes set forth.

257,804. COMBINED PLOW AND PLANTER. EDGAR A. WRIGHT, Moline, Ill. Filed Jan. 31, 1882. (No model.)

Brief.—The plow-beam, at the rear, has an angular supplemental frame secured to it, upon which is mounted seeding devices that are operated from the ground-wheel for discharging seed into the furrow formed by the downwardly and backwardly extending subsoiler.

Claim.—1. In combination with a spoked driving-wheel, a seeder-operating wheel provided with a series of arms engaging with and driven by the spokes, as described and shown.

2. The combination of the main frame, its sustaining-wheels, the plow-beam, the supplemental frame attached to the plow-beam,

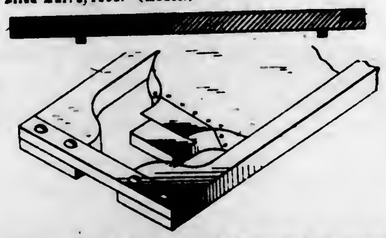
the seeding device, and the shaft extending from the seeding device and provided with arms engaging with and driven by the spokes of the ground-wheel, substantially as shown.

3. In combination with a main frame and sustaining-wheels, one of which is provided with spokes, a seeding device having an actuating-wheel provided with arms, substantially as described, to engage with and be driven by the spokes.

4. The improved attachment for transmitting motion from the ground-wheel of a wheeled machine, consisting of the supplemental frame or support, provided with a wheel constructed substantially as described and shown, whereby it is adapted to engage with and receive motion from the spokes of the ground-wheel.

5. The seeding attachment for wheeled plows, consisting of a supplemental frame adapted, substantially as described and shown, to be carried wholly by the plow-beam, said supplemental frame being provided with seeding devices, and with driving-gear for imparting motion thereto, substantially as shown.

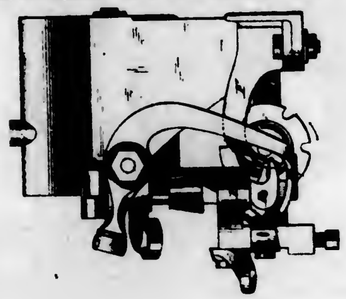
6. In combination with the wheeled main frame and plow, the supplemental frame attached to the plow-beam, the seeding devices upon the supplemental frame, and the driving-shaft provided with arms engaging with the ground-wheel spokes, as described and shown.



7. The angular supplemental frame F, in combination with the seed-discharging devices and the shaft for imparting motion to said devices, both mounted upon said supplemental frame, and the actuating-arms M upon the forward end of said shaft, substantially as shown, the whole constituting a seeding attachment for wheeled plows.

8. The subsoiling device consisting of the base-piece and its standard, having a downward and backward inclination, substantially as described and shown.

9. In combination with the base-piece, the share or standard extending upward and forward therefrom, with the cutting-edge at its front.



10. In a subsoiling device, the base-piece, and the standard extending downward and backward therefrom, the standard being carried below and in front of the front end of the base, substantially as described and shown.

257,805. BOSOM-BOARD. FRANK H. WRIGHT, Palmyra, N. Y. Filed Mar. 2, 1882. (Model.)

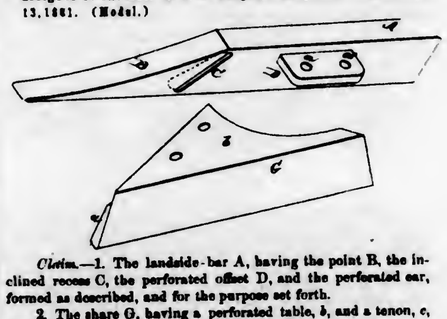
Claim.—The combination, with the board having rounded shoulders near its upper end and an extension provided with an angular undercut recess, of the rectangular frame of a configuration to fit upon the edges of the board and provided with a cross-bar having a beveled edge, the sides of the board and inner sides of the frame being reversely beveled, as described, substantially as and for the purposes specified.

257,806. GRAIN-BINDER. FREDERICK J. YANDLE, Beloit, Wis., assignor to the McCormick Harvesting Machine Company, Chicago, Ill. Filed Oct. 20, 1881. (Model.)

Claim.—1. In combination with the knotter or band-securing device, an underlying cord-guide and a holder beneath the cord-guide adapted to receive the ends of the band and carry them along the guide until they come in position for the action of the band-securing device.

2. In combination with the knotter or tying-bill, a holder adapted to move thereteward to render up slack in the knotting operation and a support between said knotter and holder arranged to resist the lateral thrust of the band ends.

3. In combination with the knotter or tying-bill, an underlying cord-guide and a holder beneath said guide adapted to move toward the knotter during the tying operation to render up slack.



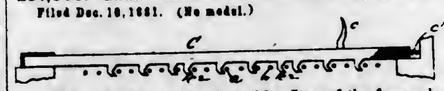
4. In combination with the knotter, underlying cord-guide, and holder beneath said cord-guide, a cutter moving transversely between the guide and holder to sever the cord ends.

5. In combination with the knotter, an underlying cord-guide, a holder beneath said cord-guide, a movable guide and stripper on the other side of the knotter, and a cutter attached to said guide and stripper in position to be drawn by its movement across the cord between the first-named guide and holder to sever it.

6. In combination with the tying-bill having pivoted inner jaw, a cord-guide formed and arranged as described, whereby the nose of the fixed jaw is caused to traverse a part of said guide as it approaches the end of its revolution and while the pivoted jaw is open.

7. The cord-guide B, having the outline shown and described, and arranged substantially as set forth.

257,807. PLOWSHARE. CYRUS YEISER, Newmanstown, Pa., assignor of one-half to M. A. Yingst, same place. Filed Dec. 13, 1881. (Model.)



Claim.—1. The landside-bar A, having the point B, the inclined recess C, the perforated offset D, and the perforated ear, formed as described, and for the purpose set forth.

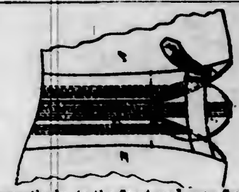
2. The share G, having a perforated table, *b*, and a tenon, *c*, formed as described, and for the purposes set forth.

3. The combination of the bar A, its point B, inclined recess C, and perforated offset D with the share G, its perforated table *b*, tenon *c*, and bolt-fastenings, substantially as described.

257,808. HARP. CHARLES F. ZIMMERMAN, Philadelphia, Pa. Filed Dec. 10, 1881. (No model.)

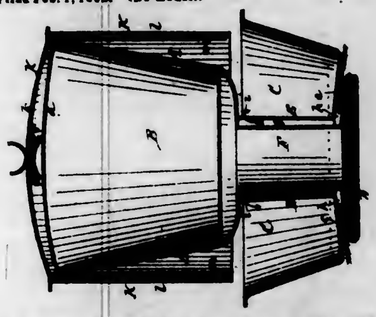
Claim.—1. The combination, with a harp of the form substantially as shown and described, of a series of bars, C C, arranged transversely across the strings thereof, and provided with depending teeth or fingers designed and adapted to come in contact with and silence or "cut out" certain strings when said bars are moved, substantially as set forth.

2. In a harp of the form substantially as shown and described, the combination of trigger-bars C and C′, the latter being placed transversely across the middle of the strings of the harp, substantially as shown, and for the purpose set forth.



3. In combination with harp A, the transversely-arranged triggers C C′, provided with depending fingers or teeth *c*′, resting at one end against springs *c*′ *c*′, substantially as shown, and for the purpose set forth.

4. The combination, with a harp of the form shown and described, of a series of trigger-bars arranged transversely across the strings of said harp, and constructed, substantially as shown and described, for silencing certain strings thereof, substantially as and for the purpose set forth.



257,809. CORSET. MAX ADLER, New Haven, Conn., assignor to Mayer, Strauss & Co., same place. Filed Mar. 6, 1882. (Model.)

Claim.—A corset constructed with the two side portions, A B, cut away, respectively, to the front and rear from the waist-line downward, combined with the central portion, C, between the said two portions A B, detached from them below the waist-line, expanded to lap upon the two parts A B, with a series of stays on the central part, C, extending from under the arm down over the hip, and an adjustable device to connect the two parts A B over the hip, substantially as described.

257,809.

257,810. BOILER FOR COOKING GRAIN. WILLIAM E. ARNOLD, Rochester, N. Y., assignor to Wilmot Castle, same place. Filed Feb. 1, 1882. (No model.)

Claim.—1. In a cooking-boiler, the combination, with the boiler A and supply-reservoir C, of the condenser K, covering the boiler, and having an open bottom which rests over the supply-reservoir, as and for the purpose specified.

2. In a cooking-boiler, the combination of the supply-reservoir C, the heating-reservoir D, the tubular water-passage F, the casing E, the boiler A, the kettle B, and the condenser K, as shown and described, and for the purpose specified.

3. In a cooking-boiler, the combination, with the supply-reservoir C and heating-reservoir D, of the central tubular water-passage, F, forming the intermediate portion of the boiler, and the exterior casing, E, leaving a flue-space between itself and the water-passage, and provided at its top with holes *i i*, as shown and described, and for the purpose specified.

4. In a cooking-boiler, the combination of the heating-reservoir D, the tube F, and casing E, forming a flue, the boiler A, the kettle B, the cover *a*, having the projecting boss *r*, and the condenser K, substantially as specified.

5. In a cooking-boiler, the combination, with the supply-reservoir C, of the double-walled flue, consisting of the tube F and casing E, with holes *i i* at the top of the casing and holes or passages *c c* leading from the supply-reservoir to the heating-reservoir beneath the tube F, as herein shown and described.

257,811. PROCESS OF PHOTOGRAPH-COLORING. HARRY AUSTIN and LA VERNE J. KIMBALL, San Francisco, Cal. Filed Jan. 4, 1882. (No specimens.)

Claim.—1. The process of producing colored pictures from photographs, the same consisting of the following steps: first, in fixing the paper on which is the picture to a plate of glass by means of a cement composed of amylum, water, nitrate of strontia, granulated sugar, and gum-arabic; second, removing almost all of the paper fiber by abrasion, leaving only a thin film adhering to the glass; third, coating this film with a hot solution of paraffine and beeswax; fourth, coloring the back of the picture; fifth, excluding air from the same by cementing another transparent plate to the back of the first and retouching in colors on the back of this plate; and, sixth, applying a third plate or board set back of the second plate and frosted or covered with colored fabric, all substantially as described.

2. In the process of treating photographic pictures to be applied on glass and rendered transparent, the compound consisting of amylum, water, nitrate of strontia, granulated sugar, and gum-arabic mixed together in about the proportions specified.

257,812. PREPARATION OF MATERIAL FOR MANUFACTURE OF ARTIFICIAL INDIGO. ADOLF BAEYER and VICTOR B. DARWERS, Munich, Bavaria, assignors to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Apr. 14, 1882. (No specimens.)

Claim.—The within-described process for producing orthonitrocinnamylformic acid from orthonitrobenzaldehyde by the action of pyroracemic (pyruvic) acid in the presence of hydrochloric acid, substantially as described.

257,813. PREPARATION OF MATERIAL USED IN THE MANUFACTURE OF ARTIFICIAL INDIGO. ADOLF BAEYER and VICTOR B. DARWERS, Munich, Bavaria, assignors to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Mar 11, 1882. (Specimens.)

Claim.—As a new article of manufacture, orthonitrocinnamylformic acid, possessing the properties substantially as described.

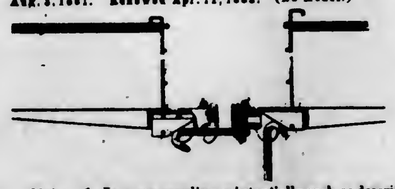
257,814. MANUFACTURE OF ARTIFICIAL INDIGO. ADOLF BAEYER and VICTOR B. DARWERS, Munich, Bavaria, assignors to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Apr. 14, 1882. (No specimens.)

Claim.—The within-described process for producing artificial indigo from orthonitrobenzaldehyde by the action of acetone in the presence of a diluted solution of an alkali, such as caustic soda, substantially as described.

257,815. ARTIFICIAL INDIGO. ADOLF BAEYER and VICTOR B. DARWERS, Munich, Bavaria, assignors to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Mar. 11, 1882. (Specimens.)

Claim.—As a new product, an artificial indigo having the properties above stated, and prepared by the action of acetone upon orthonitrobenzaldehyde in the presence of a diluted solution of caustic soda, substantially as described, or by any other means which will produce a like result.

257,816. CORSET. BYRON BALDWIN, Chicago, Ill. Filed Jan. 16, 1882. (Model.)



Claim.—1. A corset fabric or foundation fitted to the form of the wearer, combined with stiffeners of close-coiled wire, B, inserted in pockets in said foundation, whereby they are restrained from lateral movements with respect to said foundation, substantially as set forth and described.

2. The combination, with a corset, of the series of tubular stiffeners B, of close-coiled wire, constructed and arranged substantially as herein described.

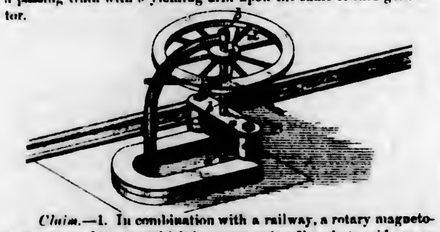
3. As a new article of manufacture, a corset having a series of close-coiled-wire stiffeners inserted in pockets, so as to be confined and restrained from lateral movement, substantially as and for the purpose described.

257,817. CAR-COUPLING. JNO. BRADLEY, Newark, N. J. Filed Aug. 3, 1881. Renewed Apr. 11, 1882. (No model.)

Claim.—1. In a car-coupling substantially such as described, the pivoted upwardly-engaging link provided with the eccentric, in combination with movable cam-block when operating in conjunction, substantially in the manner and for the purpose set forth.

2. In a car-coupling substantially such as described, the mova-

ble cam-block provided with and capable of being actuated by either the vertical rod from the top of the car or the auxiliary side levers for the purpose of controlling the position of the upwardly-engaging link, substantially in the manner and for the purposes herein set forth.

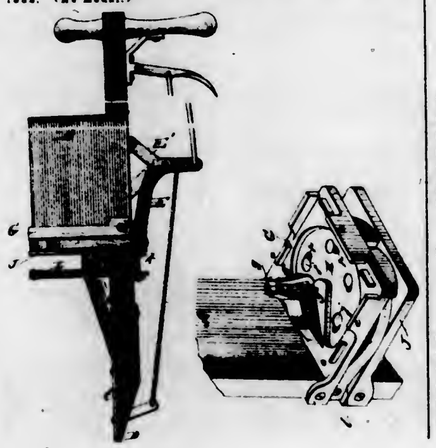


257,818. FASTENING FOR LEATHER. GEORGE W. FREEMAN, Frankfort, Ind., assignor of one-half to Theodore F. Albee, same place. Filed Feb. 21, 1882. (No model.)

Claim.—The herein improved method of uniting two pieces of leather, consisting in first securing the overlapping ends together by a line or lines of stitching and surrounding such overlapping portions by a metallic loop or loops held in place by indentations or inwardly-punched perforations, substantially as set forth.

257,819. RAILWAY-SIGNAL. WESLEY W. GARY, Boston, Mass. Filed Apr. 21, 1881. (No model.)

Brief.—The magneto-generator is driven by direct contact of a passing train with a yielding arm upon the shaft of said generator.



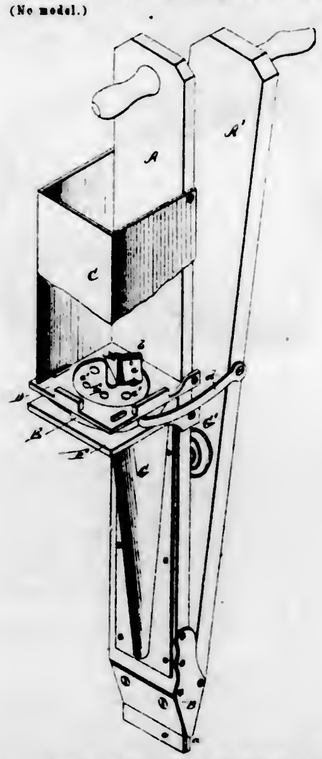
Claim.—1. In combination with a railway, a rotary magneto-generator and an arm which imparts motion directly to said generator, said arm, constructed and arranged substantially as described, to be operated directly by passing trains.

2. In combination with a rotary magneto-generator, an operating-arm applied directly to the shaft or arbor of its armature and arranged to be driven by the direct action of passing trains.

3. In combination with a rotary magneto-generator, a driving-arm applied directly to its shaft or arbor, said arm being constructed to yield in a backward direction without affecting the generator and arranged to be operated by the direct action of passing trains.

4. In combination with the magneto-generator and its operating-arms arranged to be operated by passing trains, yielding sections applied to said arms and adapted to yield freely in one direction and to a limited extent in the opposite direction, substantially as described and shown.

257,820. HAND CORN-PLANTER. THEODORE HORTON, Bluffton, Ind., assignor to himself, and Washington I. Fitch and William W. Wisill, Sr., both of same place. Filed Feb. 13, 1882. (No model.)



Claim.—1. The frame G, consisting of the gateway and the offset g^2, in combination with the dropping-wheel, the perforated bracket, the passage leading therefrom to the bottom of the staff, the cut-off valve L, and means for actuating the dropping-wheel, substantially as described.

2. The combination of the frame G, the gateway g, formed thereon, the dropping-wheel turning about a pivot on the bracket J, the pawls k l, the cut-off valve L, and the lever E, connected to the spring point-plate D and to the finger-lever, substantially as described.

3. The frame G, cast entire and consisting of the gateway g, the offset g^2, the lugs e, and lugs f, substantially in the manner and for the purposes described.

257,821. HAND CORN-PLANTER. THEODORE HORTON, Bluffton, Ind., assignor to himself, and Washington I. Fitch and William W. Wisill, Sr., both of same place. Filed Feb. 13, 1882. (No model.)

Claim.—A hand corn-planter having the following elements: the two hand-staffs A A', pivoted together, the penetrating-blades a a, the handles on said staffs, a spring interposed between the staffs, a hooked spring-pawl, d, pivoted to the staff A', a retaining spring or pawl, e, attached to the staff A, the ratchet dropping-wheel R, the perforated bracket F, the cast-metal frame D, the gateway, its cut-off, the hopper-box, and the tube G, fixed to the staff A, all arranged and constructed as herein described.

257,822. ILLUMINATING-GRATING AND BUILDING LIGHTED THEREBY. THADDEUS HYATT, New York, N. Y., assignor to Elizabeth A. L. Hyatt, same place. Filed Apr. 19, 1882. (No model.)

Claim.—1. Illuminated basements, illuminated basement-extensions, and illuminated ground-floors of buildings lighted by metallic gratings set with prism-glasses, when the same are formed with either single or cluster lenses upon the weather-face thereof, the glasses being so set in the gratings and the gratings so combined with the parts of the building to be lighted as that the reflecting-slopes of the prisms shall lie parallel with the front and

257,822.

rear walls of the building, substantially as and for the purposes herein set forth and illustrated.

2. Combination lens and prism-glasses, where the prism portion of the glass is formed of two non-reflecting or perpendicular ends and two sloping opposing sides, the internal faces of which receive and distribute the light of the lenses, and combining the same with metallic gratings, substantially as and for the purposes herein set forth and illustrated.

3. Combination lens and prism-glasses, where the prism portion of the glass is formed of two non-reflecting or perpendicular ends and two sides, one of which is perpendicular, or nearly so, and the other a slope, the internal face of which receives and distributes the light of the lenses, and combining the same with metallic gratings, substantially as and for the purposes herein set forth and illustrated.

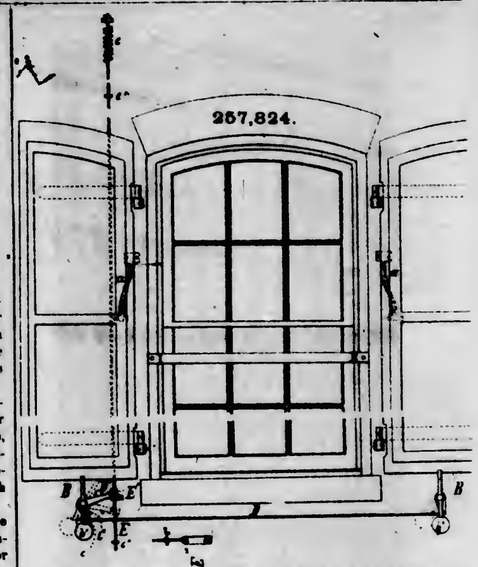
4. Combination lens and prism-glasses, where the area of the internal reflecting face or faces of the prism is enlarged, and combining the same with metallic gratings, substantially as and for the purposes herein set forth and illustrated.

5. An illuminating rear-extension roof constructed in the form of steps, made of illuminating treads and risers, substantially as and for the purposes herein set forth and illustrated.

6. Illuminating-steps and step-roofs formed of metallic gratings set with combination lens and prism-glasses, substantially as and for the purposes herein set forth and illustrated.

7. Illuminating area-coverings formed of metallic gratings set with combination lens and prism-glasses, substantially as and for the purposes herein set forth and illustrated.

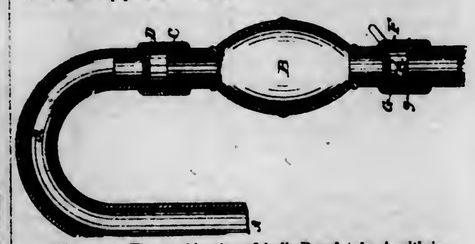
257,823. BREECH-LOADING ORDNANCE. HENRY P. HANN, Pittsburg, Pa. Filed Apr. 17, 1882. (No model.) Patented in England Dec. 19, 1876.



Claim.—In breech-loading ordnance, the combination, with the barrel, of side straps attached to the breech-block and pivoted on a carriage, the barrel being pivoted on the side straps by separate trunnions, substantially as and for the purpose specified.

257,824. SHUTTER-FASTENER. PEARL O. MATTERNEGH, Irvington, N. Y. Filed Apr. 6, 1882. (No model.)

Claim.—1. A series of self-closing window-shutters, with fastenings for holding open the shutters, capable of being independently oscillated by hand in one direction for the purpose of releasing the shutters, respectively, and a corresponding series of crank-levers adapted by their action to oscillate the shutter-fastenings in like manner, in combination with a series of horizontal sway-bars, each connecting two or more crank-levers together, and a corresponding series of bell-crank levers for imparting endwise movements to the said horizontal sway-bars, respectively, and a vertically-sliding rod for oscillating the said bell-crank levers, and thereby causing the simultaneous oscillation of the shutter-fastenings and the consequent simultaneous release of the series of shutters to the action of the springs or other instrumentalities by which they are severally closed over the window-openings.



257,824.

2. A vertical rod or chain, E, capable of endwise movement and suitably connected with a series of bell-crank levers, D', provided with the crank-pins c, in combination with the series of buttons B of a number of self-closing window-shutters located one above another, substantially as shown and described.

257,825. SIPHON. FRANCIS W. HAKSTAFF, Albany, N. Y., assignor of one-half to Bernhard Manbaum, same place. Filed Apr. 15, 1882. (No model.)

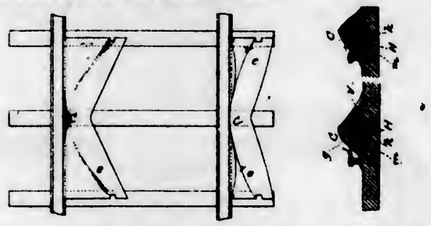
Brief.—The siphon A has a bulb, B, located in the longer arm, so as to be able to start the flow by suction. Check-valves D and F are placed above and below the bulb, and the latter is provided with a locking device, so that sufficient fluid may be retained in the pipe to start the flow.

Claim.—1. The combination of bulb B and tube A with induction-valve D, eduction-valve F, and a locking device which at will can be made to prevent said valve F from opening.

2. The combination, with the tube A and elastic bulb B, of the induction-valve D, the eduction-valve F, rock-shaft g, arm G, and means for operating said rock-shaft and arm to lock said eduction-valve and thereby cut off the flow of liquid, substantially as set forth.

257,826. CURTAIN-FIXTURE. JAMES ANDREW MCCUTCHEON, Pine Grove, assignor of one-third to Wm. H. Dight, Mercer, Pa. Filed Mar. 6, 1882. (No model.)

Brief.—The cord passes over pulleys and through eyes at the top and down under the roller at the bottom, so that the blind may be lowered from the top and raised from the bottom by the same cords.



Claim.—The combination, with the window-blind provided with a roller and a top strip, of the pulleys D D D' D', the cord E, fixed at a a to the lintel, passed over the outer pulleys, around the curtain-roller, over pulleys D' D', through an eye or ring attached to the tassel, through the eye d and the eye g, all substantially in the manner and for the purposes described.

257,826.

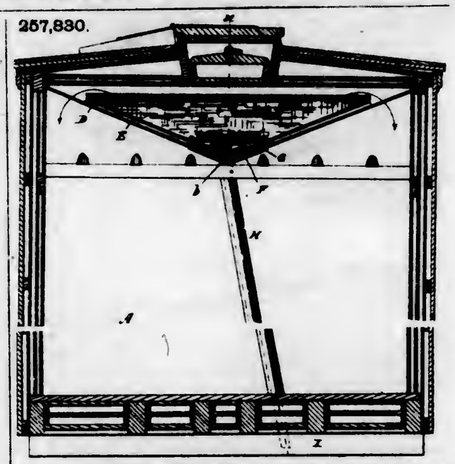
257,827. CAR-REPLACER. JOHN E. NORWOOD, Sykesville, Md., assignor of one-half to Charles R. Favour, same place. Filed Mar. 23, 1882. (No model.)

Brief.—Plates are made centrally and obliquely rigid and inclining toward each end, the center supports being provided with spikes and rabbets under their projecting edge. In the outside plate the oblique ridge is rounded from end to end and its upper surface is provided with a valley or groove.

Claim.—1. The car-replacer consisting of a plate centrally and obliquely ridged, at C, and inclined toward each end, as at *e*, the center post or support, H, its holding point or spike *k*, and the rabbet or groove *m* under the projecting edge *d*, substantially as specified.

2. The outside replacer-plate having the central oblique ridge, C, rounded from end to end and merging into the oblique inclines *e* toward each end, the projecting undergrooved edge *d*, the valley or groove *c* in the upper surface, back of said edge, and the center support, H, substantially as specified.

257,828. TARTRATE OF OXYCHINOLINE. WILHELM PICKHARDT, New York, and HERMANN RUDEMANN, Brooklyn, N. Y. Filed Mar. 21, 1882. (Specimens.)



Claim.—The tartrate of oxychinoline prepared by the action of tartaric acid upon the oxychinoline of Skraup, substantially in the manner above set forth.

257,829. HYDROCHLORATE OF OXYCHINOLINE. WILHELM PICKHARDT, New York, and HERMANN RUDEMANN, Brooklyn, N. Y. Filed Mar. 21, 1882. (Specimens.)

Claim.—The hydrochlorate of oxychinoline prepared by the action of hydrochloric acid upon the oxychinoline of Skraup, substantially in the manner above set forth.

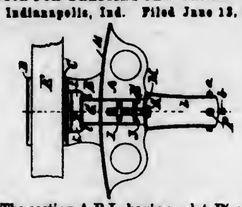
257,830. REFRIGERATOR-CAR. CHARLES F. PINAUD, Chicago, Ill. Filed Aug. 15, 1881. (No model.)

257,830.

Claim.—1. In a refrigerator-car, the car-roof or ceiling, in combination with a V-shaped ice-pan arranged lengthwise of the car, and supported a short distance from the ceiling, whereby open spaces are provided between the side edges of the pan and the ceiling for the free circulation of air, substantially as described.

2. In a refrigerator-car, an ice-pan provided with inclined or sloping sides with waste-openings at the bottom, in combination with a separate waste-gutter arranged underneath the pan, substantially as described.

3. The ice-pan B, having its sides sloping downward and inward, and provided with waste-openings at the angle, in combination with a separate waste-gutter, F, arranged underneath the angle of the pan, and hangers D, substantially as described.



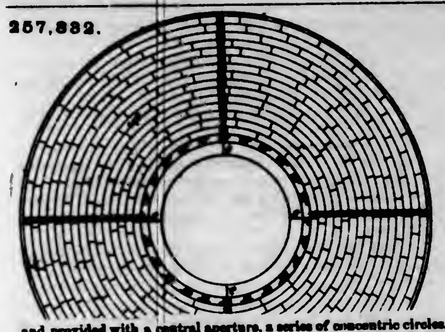
4. The ice-pan B, having sloping sides, in combination with the hangers D, wooden strips E, and gutter F, substantially as described.

5. The car-body A, in combination with the sloping ice-pan B, of less width than the interior of the car, and arranged lengthwise in the upper part of the latter on suitable supports, and a separate waste-gutter, F, substantially as described.

6. The ice-pan provided with sloping sides, in combination with the waste-gutter F and separate waste-pipe H, substantially as described.

7. The sloping ice-pan B, in combination with the separate metallic gutter F and wooden sheathing-strips G, arranged to cover the under sides of the gutter, substantially as and for the purpose set forth.

257,831. DEVICE FOR DRESSING SAW-TEETH. ROBERT E. POINDEXTER, Indianapolis, Ind. Filed June 13, 1881. (No model.)



Claim.—1. The casting A B L, having a slot, B', and upward-projecting arms *f f'*, bar C, and the ribs H and M, combined with adjusting-screw P *a*, the clamp-slide G D, and the screw K, substantially as shown and described.

2. The clamp-jaw D on the slide G, combined with the jaw C on the main casting, the screw K, nut I, guide J, and rib M, by means of which the file E is held firmly in position to dress the sides of the teeth of a saw, substantially as shown and described.

257,832. POLYGON-PROTRACTOR. ARTHUR FRÜHER, Vienna, Austria-Hungary, assignor of one-half to Victor Schlesinger, same place. Filed Sept. 24, 1881. (No model.) Patented in Austria Feb. 22, 1880, in Hungary Feb. 22, 1880, in France July 10, 1880, and in Germany Aug. 20, 1880.

Claim.—1. The herein-described polygon-protractor, consisting of a disk constructed of material capable of being perforated,

257,832.

and provided with a central aperture, a series of concentric circles, each divided into a given number of equal parts, and radial indices indicating the subdivisions of said circles, substantially as and for the purpose specified.

2. The herein-described polygon-protractor, consisting of a disk constructed of a material capable of being perforated, and provided with a central aperture, a circle divided into degrees, a series of auxiliary circles, each divided into a given number of equal parts, and radial indices indicating the subdivisions of said circles, substantially as and for the purpose specified.

257,833. LIFTING-JACK. WILLIAM SCHREMER, Denver, Colo. Filed Feb. 16, 1882. (Model.)

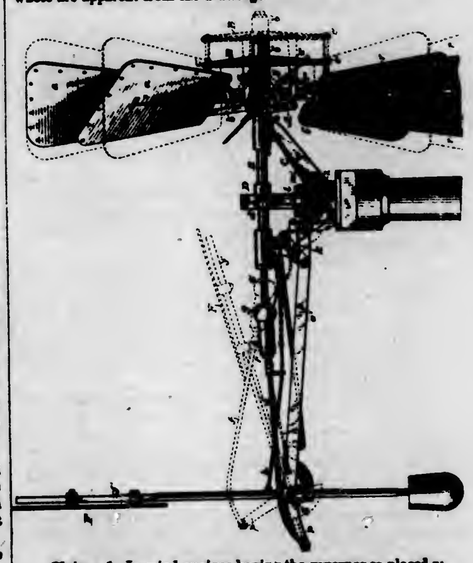
Claim.—1. In a lifting-jack, the combination of the upright or standard A, having vertical groove G, the extension-slide B, having pins or studs I, and the adjustable hand-lever D, substantially as set forth.

2. In a lifting-jack, the combination of the vertically-grooved upright or standard, the extension-slide provided with pins or studs I, and the lever D, having slot E, provided with notch H, by which it is fulcrumed upon the upright or standard, substantially as set forth.

3. As an improvement in lifting-jacks, the combination of the vertically-grooved upright or standard, the extension-slide B, having pins or studs I, the lever D, having slot E, provided with notch H, and the notched latch J, all arranged and operating substantially as set forth.

4. In a lifting-jack, the combination of the vertically-grooved upright, the extension-slide B, having pins or studs I, the rest or bracket P, adjustable upon said pins or studs, and suitable operating mechanism, substantially as set forth.

257,834. CASTER. JOHN SCOTT and FRANK S. AVERY, Chicago, Ill., assignors of one-third to Herbert H. Avery, same place. Filed June 7, 1881. (No model.)



Claim.—1. In a caster, the combination of the case A, provided with recess I, and having beveled surface D and downward-extending flange C, with the caster-frame B, with a pivot, H, and having an oblique slot, K, adapted to receive the anti-friction wheel C', all arranged and operating as set forth.

2. The improved caster hereinbefore described, consisting of the frame B, with the side cheek-pieces, B', between which is journaled and revolves the wheel G, and formed with the oblique slot K, in which is journaled diagonally the anti-friction wheel C', and provided with the pivot or shank H, formed with the groove, and the flanged casing A, formed with the central elevation, as shown and set forth.

257,835. WIND-ENGINE. FLAVIUS W. SHELLABARGER, Miami County, assignor to the Iron Monitor Wind Engine and Manufacturing Company, Troy, Ohio. Filed Mar. 16, 1881. (No model.)

Brief.—The rod supporting the governing-vane is twisted, thereby increasing its strength by the resistance of the edge instead of the flat side. The vane, by means of suitable connections, actuates the spider B, which controls the position of the vanes. The vanes are strengthened by a band around their outer edges and cross-bar *b''*, enlarged at its middle part, forming the thimble *c''*, through which passes the strengthening-rods *r*. The vanes are also provided with brace-rods O. The purpose of the other parts of the machine structure and the operation of the wind-mill as a whole are apparent from the drawings.

Claim.—1. In wind-engines having the governor so placed as to face the wind, the combination of the spider B on the rear end of the hollow shaft E, having the terminals *a'*, by which the several spokes of the spider are each connected with the wheel-vane next in advance of it, by the longitudinal movement of which the vanes are turned into or out of wind, substantially as shown, for the purpose set forth.

2. Vane-arm *b*, having cross-bar *b''* and thimble *c''*, and cast in a single piece, whereby the wing-vane is strengthened at the point where it is connected with the arm or spoke of the spider B, as shown.

3. In wind-engines, the combination of the centrally-pivoted wind-vanes *a*, strengthened at their edges by a border of strap-iron, with the thimble *c''* and brace-rods *r*, attached thereto and to the strengthened edges, as shown and described.

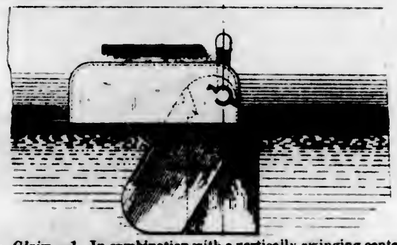
4. In a wind-engine having its wheel connected with the governor through a hollow main shaft by a rod or its equivalent, the combination of a ball-and-socket joint-piece and adjusting-nuts with its connecting-sections, substantially as herein shown and specified.

5. In a wind-engine, the combination of the arm *b*, cross-bar *b''*, and thimble *c''*, formed in a single piece, with the vane *a*, provided with centrally-secured brace-rods *r* and strengthening-binding *a''*, as shown and described.

6. The wheel-vane *a*, formed with a hole therein, in combination with the cap or thimble *j* and brace-rods *o*, substantially as shown and described.

7. The eccentric strap *d*, having the arm *d'*, extending obliquely downward therefrom, in combination with lever *m'* and arm *m* and the ball-and-socket end joint, *n' l*, as shown and described.

8. In combination with fork C and the supporting-column,



the hollow stem S, having the friction-rollers s, pivoted in niches formed in its sides, as shown and described.

9. In a wind-engine, the vibrating governor having vane F, twisted stem f', rock-shaft G, rod h, and bell-crank k and chain, in combination with arm p, rod f, coupling $g\ g'$, rod e, hollow shaft b', and spider B, as shown and described.

10. The combination, with the automatic rock-shaft G, curved arm p, and rod f, of the flexible coupling $g\ g'$, rod e', hollow shaft b', and spider B, as shown and described.

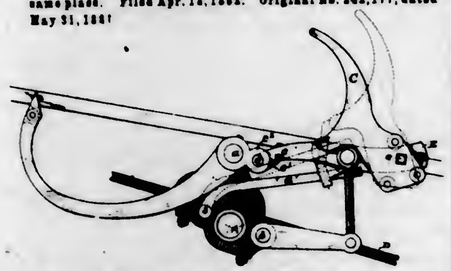
REISSUES.

10,105. CENTER-BOARD FOR BOATS. MONTRAVILLE W. ATWOOD, Clayton, N. Y. Filed Mar. 8, 1882. Original No. 230,949, dated Aug. 10, 1880.

Claim.—1. In combination with a vertically-swinging center-board, a hinge-pin sustaining the same, and provided with a handle or operating device, substantially as shown, whereby the board may be swung upward and downward.

2. The vertically-swinging center-board, mounted upon and turning with a transverse pivot or hinge-pin, arranged, as described, to be raised and lowered by the rotation of said pin.

3. In a boat, the combination of the closed well, the vertically-swinging center-board mounted therein, the transverse pivot arranged to sustain and rotate with said board, and an operating device applied to the end of said pivot outside of the well, substantially as described and shown.



4. In combination with the well, the vertically-swinging center-board, the transverse pivot arranged, as described, to turn the center-board upward and downward, and the tightening devices applied to the transverse pivot, substantially as shown and described, whereby lateral pressure may be applied to retain the center-board in position.

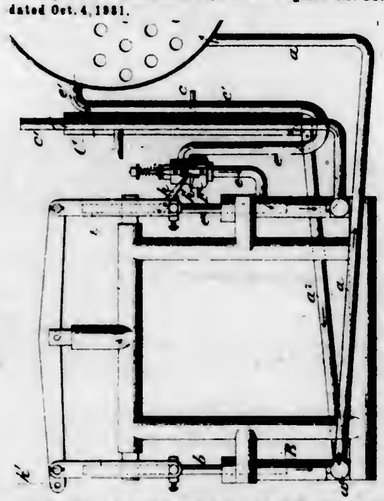
5. In combination with the well and the flattened pivot-pin provided with an operating-handle extending through and beyond the same, the center-board sections, one provided with the rectangular slot and the other with a slot having widened ends.

6. The combination of the well, the vertically-swinging center-board, the flattened threaded pivot-bolt extended through the well and the center-board, the hand-lever, the washers, and the tightening-nut applied to said bolt, as shown.

7. In combination with the well, the two center-board sections mounted upon a common pivot within the well, and having their forward ends constructed, as described and shown, to co-operate with the front of the well and form stops to sustain the sections in their proper relative positions for action, as set forth and shown.

10,106. HARVESTER-BINDER. WILLIAM E. BAKER, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Apr. 13, 1882. Original No. 243,177, dated May 31, 1881.

Claim.—1. In a grain-binder, the combination, with the grain-receptacle and supporting-bar which carries the tripping-fingers, of locking mechanism which holds said bar positively against movement away from the receptacle until the tripping-fingers have started the binding mechanism.



2. In a grain-binder, the combination, with the trip-lever, the yielding tripping-fingers, and the spring-supported bar which carries said fingers, of locking mechanism which positively stops the arm from yielding against the stress of the spring until the trip-lever has been actuated by the fingers.

3. In a grain-binder, the combination, with the vibrating binding-arm, the tripping finger or fingers, and the supporting-bar which carries the latter, of a hinge-connection between said binding-arm and supporting-bar rigid in one direction, whereby the bar is locked against yielding or sagging when the binding-arm is down.

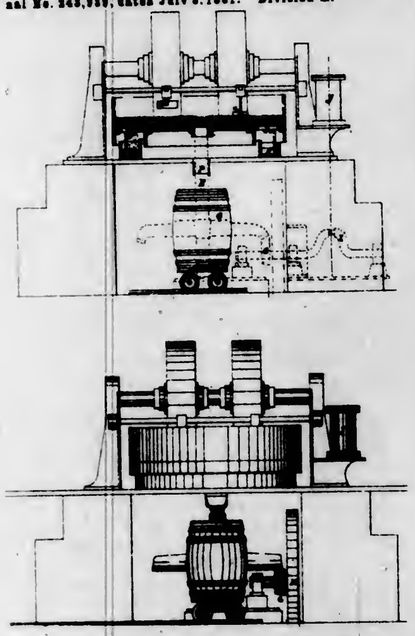
4. In a grain-binder, the combination of the trip-lever, the tripping-fingers, the supporting-bar which carries the latter, the vibrating binding-arm, and a hinge-connection between said binding-arm and supporting-bar adapted to lock the latter against yielding away from the grain-receptacle until the trip-lever has been actuated and the binding mechanism started.

5. In a grain-binder, a support, E, for the compressing and tripping fingers C, hinged to the binding-arm, in combination with a pin, c, on support E, and a lip, c', on the binding-arm, all arranged to operate substantially as and for the purpose specified.

10,107. FEED-WATER REGULATOR. NICHOLAS CLUTE, Schenectady, N. Y. Filed Jan. 19, 1882. Original No. 247,889, dated Oct. 4, 1881.

Claim.—1. The herein-described method of supplying steam-boilers with feed-water, consisting essentially in the continuous supply of more water than is evaporated, the surplus being conveyed from the boiler by means of an eduction-pipe at the water-line and returned to the circulation, whereby a uniform water-level is constantly maintained within the boiler, substantially as described.

2. In an automatic feed-water regulator for steam-boilers, the combination, with a boiler and a pump, of a receiver for hot and cold water, said receiver having an overflow-nozzle and an air-vent, and being adapted to receive the overflow hot water from the boiler and cold water from any suitable supply, and to deliver its contents to the pump to be constantly fed to the boiler, whereby a uniform water-line is maintained in said boiler, substantially as described.

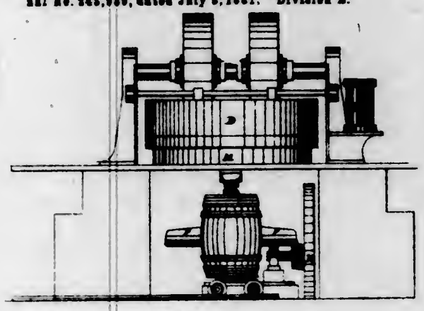


3. In an automatic feed-water regulator for steam-boilers, a receiver for hot and cold water, having an overflow-nozzle, an air-vent, a supply pipe or pipes for hot and cold water, and an outlet to a pump, substantially as described.

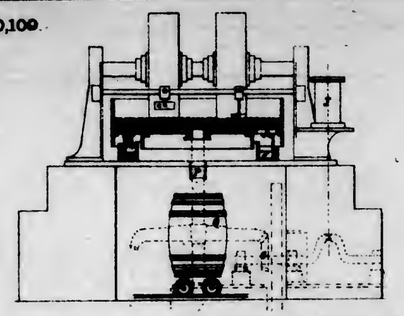
4. In an automatic feed-water regulator for steam-boilers, a cut-off check-valve having an entrance for water and steam above the valve, and a valve-stem extending up through a packing-box and actuated to positively seat the valve by a spiral spring, substantially as shown and described.

5. In an automatic feed-water regulator for steam-boilers, the combination of the cut-off check-valve F with the means for operating the same, consisting of the trips h h, attached to a pump or its connections, substantially as shown and described.

6. In an automatic feed-water regulator for steam-boilers, the combination, with the boiler A and supply-pump B, connected by pipe a, of the receiver C, having one or more inlets for hot and cold water, an outlet to the pump, an overflow-nozzle, and an air-vent, and the valve F, placed between said boiler and receiver, and communicating with each through pipes $a\ a'$, respectively, whereby the overflow hot water from the boiler is conveyed to the receiver to heat the incoming cold water, and the whole automatically fed to the boiler, substantially as shown and described.



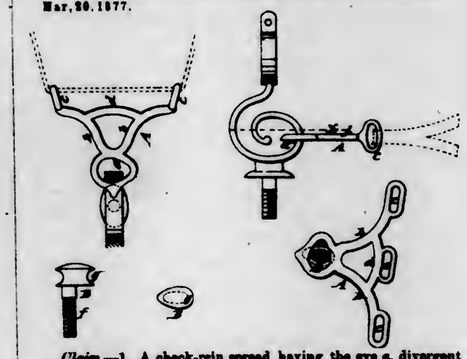
10,108. GRINDING AND SIEVING CAUSTIC ALKALI. WILLIAM J. HENNING, Saint Helen's, County of Lancaster, England, assignor of one-half to George T. Lewis, Philadelphia, Pa. Filed Apr. 12, 1882. Patented in England Oct. 21, 1879. Original No. 243,930, dated July 5, 1881. Division A.



Claim.—1. The within-described process for producing ground or powdered caustic alkali, consisting in grinding the alkali while hot or in a temperature sufficiently high to prevent deliquescence.

2. The within-described process for producing ground or powdered caustic alkali, consisting in grinding the alkali while hot or in a temperature sufficiently high to prevent deliquescence, and sieving or bolting the same.

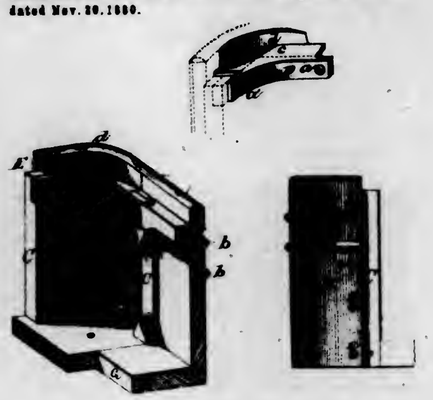
10,109. GRINDING AND SIEVING CAUSTIC ALKALI. WILLIAM J. HENNING, Saint Helen's, County of Lancaster, England, assignor of one-half to George T. Lewis, Philadelphia, Pa. Filed Apr. 12, 1882. Patented in England Oct. 21, 1879. Original No. 243,930, dated July 5, 1881. Division B.



10,109.

Claim.—Dry ground or powdered caustic alkali, as herein described.

10,110. CHECK-REIN SPREAD AND ATTACHMENT. DANIEL SCHOENMAKER, Newark, N. J., assignor to Henry C. Maxwell, Rome, N. Y. Filed Feb. 23, 1882. Original No. 186,546, dated Mar. 20, 1877.



Claim.—1. A check-rein spread having the eye a, divergent arms $b\ b$, and the eyes $c\ c$ on the free end of said arms, all formed in one piece of cast metal, substantially as described and shown.

2. The combination, with the curved divergent arms $b\ b$, each provided with the eye c, for the reception of the check-rein, as shown, of the brace d, as and for the purpose set forth.

3. As an improved article of manufacture, the check-rein spread A, composed of the oval eye a, curved arms b, the eyes $c\ c$, arc-shaped brace d, and loop e, substantially as shown and described.

4. The combination of the check-rein spread A and saddle-bolt B, having the oval grooved head g, substantially as shown and described.

10,111. CORNER-IRON FOR WAGON-BODIES. CHARLES CORCORAN, Racine, Wis. Filed Feb. 13, 1882. Original No. 234,883, dated Nov. 30, 1880.

Claim.—1. A corner-iron, E, for wagon-bodies, having corrugations *b' b'*, in combination with binding-piece D, having flanges *c d* and suitable bolts, whereby the end portions of the body are clamped between the corner-iron and the binding-piece, as set forth.

2. A corner-iron in combination with a clamping-piece, D, having flanges *c d* and suitable securing-bolts, as set forth.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

HEALD *v.* RICE.

Decided March 6, 1882.

1. REISSUE—PATENT WITH DRAWING—NEW MATTER.

In cases of reissues of patents, inoperative or invalid by reason of a defective or insufficient specification, or by reason of the patentee claiming as his own invention or discovery more than he had a right to claim as new, it is imperative that the new patent, when issued, shall be for the same invention, and that no new matter shall be introduced into the specification when, as in the present case, there is a drawing, with reference to which the invention is described.

2. SAME—COMPARISON OF PATENTS—QUESTION FOR COURT.

If it appears from the face of the instruments that extrinsic evidence is not needed to explain terms of art or to apply the descriptions to the subject-matter, so that the court is able from mere comparison to say what are the inventions described in each, and to affirm from such mere comparison that they are not the same but different, then the question of identity is one of pure construction and not of evidence, and consequently is matter of law for the court without any auxiliary matter of fact to be passed upon by a jury if the action be at law.

3. SAME—SAME—STEAM-BOILERS—DIFFERENT INVENTIONS.

In the present case it appears from the mere reading of the two specifications that the invention described in the first is for the return-flue boiler, while that described in the second, abandoning the claim for the boiler itself, is for a particular mode of using it with straw as a fuel by means of an attachment to the furnace-door for that purpose. These two inventions are distinct, and a patent originally issued for one cannot lawfully be surrendered as the basis for the reissue for the other.

4. SAME—EXPANSION OF CLAIM.

The rule reiterated that a patent for a machine cannot be reissued for the purpose of claiming the process of operating that machine, because if the claim for the process is anything more than for the use of the particular machine patented it is for a different invention. (*Campbell* v. *James.*)

5. RICE PATENT ANTICIPATED BY MOREY PATENT.

The invention, moreover, is anticipated in Morey's patent, which, in covering the combination of the feeding-tube with any kind of thrashing engine or boiler, necessarily includes the combination of the feeding-tube with the return-flue boiler. This particular application of the feeding-tube to the return-flue boiler is within the scope and provision of Morey's invention, whether it had been tested by his experience or was anticipated by his foresight or not.

IN ERROR to the Circuit Court of the United States for the District of California.

Mr. George Harding for the plaintiff.

Mr. A. Wheaton for the defendant.

Mr. Justice MATTHEWS delivered the opinion of the Court.

This was an action at law brought by Rice to recover damages for an alleged infringement of Reissue Letters Patent No. 6,422, granted May 4, 1875, to him for improvements in steam-boilers. The original patent was No. 146,614, dated January 20, 1874. The invention, as stated in the complaint, consisted, among other things, of a combination of a straw-feeding attachment with the furnace-door of a return-flue steam-boiler, for the use of straw alone as fuel in generating steam ample for practically operating steam-engines. The case was tried by a jury and resulted in a verdict and judgment for the plaintiff, to reverse which this writ of error is prosecuted.

A bill of exceptions sets out the exceptions of the plaintiff in error to the rulings of the court below and all the evidence. The court was asked at the close of the plaintiff's testimony, and again when all the evidence on both sides had been introduced, to instruct the jury to return a verdict for the defendant, the refusal to do which, among other rulings, is assigned for error, and thus the whole case on the merits is brought here for review so far as they rest upon questions of law.

The plaintiff below introduced in evidence his original and reissued patent. For the purpose of comparison, which, in view of the questions of law raised, becomes important and necessary, the specifications and claims are exhibited here in parallel columns, using one copy for both patents when they are identical and putting all the language that is in the original and not in the reissued patent in the left-hand column in italics and putting in the right-hand column in italics all the language used in the reissued patent that is not in the original.

Specifications forming part of Letters Patent No. 146,614, dated January 20, 1874.

Reissue No. 6,422, dated May 4, 1875.

Application filed *November 3, 1873.* *March 17, 1875.*

To all whom it may concern:

Be it known that I, Harvey Wood Rice, of Haywood, Alameda county, State of California, have invented new and useful Improvements in Steam-Boilers; and I do hereby declare the following description and accompanying drawing are sufficient to enable any person skilled in the art or science to which it most nearly appertains to make and use my said invention without further invention or experiment.

My invention relates to *certain improvements in the construction of steam-boilers, whereby I am enabled to utilize straw and other light substances for fuel, so that a complete combustion of the smoke is attained, and the danger from fire in the harvest-fields, where those boilers are more especially useful, is entirely obviated; and*

the combination of a straw-feeding device with the furnace-door of that class of boilers which are known as "return-flue" boilers, by which combination I am able to provide a superior arrangement for utilizing straw as a fuel for generating steam.

Many attempts have heretofore been made, both in this country and in Europe, to successfully utilize straw as a fuel for generating steam in steam-boilers; but these attempts have always resulted in failures or partial failures.

When straw is fed into the furnace of an ordinary steam-boiler it burns too quickly to do much good in heating the water in the boiler, until a sufficient quantity

of cinders accumulates upon the grate-bars to impede the draft; and unless the cinders are frequently removed from between the grate-bars, they soon accumulate to such an extent as to choke the draft entirely and prevent combustion.

Many devices have been tried and patented for overcoming these troubles; but, as far as I am aware, none of them have succeeded in remedying the difficulties sufficiently to make the straw-burning engine a practical success.

My experiments, however, have developed the fact that, by attaching a tube or box-door to the furnaces of that class of boilers known as "return-flue" boilers, in which the chimney or stack is constructed directly above the furnace, and the heat and products of combustion from the furnace are carried along under the boiler, and then returned back to the stack through flues or tubes leading through the length of the boiler, the combustion will be so complete that no sparks and but very little smoke will escape from the chimney, and the straw will be burned freely, giving out a high degree of heat without danger of choking the grate-bars.

My invention also relates to a novel method of securing the tubes and tube-sheet within the shell of the boiler, so that they can be at any time easily removed for the purpose of cleaning or repairing, and at a much less expense than is ordinarily entailed for such work.

Referring to the accompanying drawings for a more complete explanation of my invention, Figure 1 is a perspective view *exposing the tube-sheet of one end of the boiler. Fig. 2 is a longitudinal section. Fig. 3 is an end view with rear head removed. Fig. 4 shows the tube and tube-sheet removed. Fig. 5 is an enlarged view, showing the manner of securing the tube-sheet in the shell. and ring.*

A is the shell of my boiler, which is more especially intended to be used for that class of engines employed in thrashing and other field work where there is straw or other light material enough for fuel, but which has never been satisfactorily burned without an artificial draft or blast, and which has always been dangerous by reason of the sparks thrown out on account of incomplete combustion. In order to remedy these faults and perfectly consume all the smoke and sparks I perforate my tube-sheet B B so as to admit one large *tube* *furnace* C, near the bottom, which receives the fuel upon the grate D, and acts at the same time as a tube and fire-box.

Any suitable feeder may be employed to supply straw to the grate; but I have found the device patented by D. Morey, June 20, 1873, to be very suitable.

To the door of the furnace C, I attach a straw-feeding tube, E, through which the straw or other light fuel is fed to the furnaces. This tube can be constructed in the manner described by David Morey in his patents dated February 11, 1873, and May 25, 1873, for straw-feeding attachment for furnaces, or in some other similar manner for feeding the straw without admitting a draft of air.

Above and around the sides of the large *tube* *furnace* C. I place small or locomotive boiler-tubes *e e*, as shown, and these serve to return the heat and the products of combustion to the chimney F, which is located at the front end of the boiler, and communicates with the chamber H, formed between the flue-sheet and the head or door G. A similar chamber, H', is formed at the back end of the boiler, into which the products of combustion pass from the large *tube* *furnace* C before entering the return-flues *e*.

By this construction the light fuel is thoroughly ignited in its passage through the large tube, which has plenty of air admitted for the purpose. The heat and flame will be concentrated in returning through the small flues, and the combustion will be so complete that no sparks and but very little smoke will escape from the chimney, and this latter will not even need a bonnet.

The tube-sheets B B are made with a flange, *i*, which is turned outward, and these flanges are pierced, so as to admit screw-bolts or rivets *g*, as may be preferred. These bolts secure the tube-sheets in their places perfectly steam and water tight.

Whenever, by reason of long use, there is a collection of scale or sediment, or if the tubes or the interior of the boiler need repairing, the screw-bolts can be removed; or, if rivets are used, they can be cut off, when the two tube-sheets, with the tubes, can be removed from the shell in a body, and repairs or cleaning can be easily effected with much less time and trouble than when the boilers are made in the ordinary manner.

The flange on the rear tube-sheet is turned so much smaller than the interior of the shell that an iron ring, *n*, can be introduced between it and the shell, the bolt passing through it. When it is necessary to remove the tubes and sheets this ring can be taken out after removing the nuts and rivets, and this leaves the rear tube-sheet small enough to pass any rivets or obstructions freely when taking it out.

By this construction I am enabled to make a boiler and furnace in which straw can be used as a fuel with perfect safety, and in which repairs can be easily effected.

Having thus described my invention, what I claim, and desire to secure by Letters Patent, is—

1. *The boiler A, having the furnaces C, grate D, return flues or tubes e e, and stack or chimney E arranged as described, in combination with the straw-feeding furnace-door attachment, substantially as and for the purpose described.*

2. In a horizontal steam-boiler the *large tube* *furnace* C, formed with a grate, D, to serve as a fire-place, in combination with small return-flues, *e e*, when the tubes and tube-sheets are secured by flanges *i* and bolts *g*, so as to be removable from the shell in a body, substantially as and for the purpose described.

It is admitted that there had been no infringement by the defendant of the second claim of the reissued patent, which included that feature of the improvement described, which consisted in the peculiar construction by which the tubes and tube-sheets were secured by flanges and bolts so as to be removable from the shell in a body. This claim, therefore, is excluded from further consideration in the case.

The patents of David Morey for a straw-feeding attachment, referred to in the specifications in the Rice original and reissued patent, consisted of an original Patent No. 135,659, dated February 11, 1873, reissued as Reissue No. 6,420, dated May 4, 1875, and original Patent No. 139,075, dated May 20, 1875. The specifications of the latter describe the invention as relating to—

An improved furnace-door attachment which is especially intended for facilitating the use of straw as a fuel, especially applicable to the removable furnaces of thrashing-machine engines; and it consists in attaching to the opening of the furnace (intended for the door) a tube or funnel having arranged within it a diagonal swinging valve, with its lower end turned up into a shoe, whereby the straw can be inserted into the furnace and no sparks allowed to fly out nor a draft of air allowed to enter.

It was also therein declared that the straw was to be fed through the tube by means of an ordinary hay-fork. When the straw is pushed through the tube the valve or door will be lifted so as to allow the straw to pass through, when it will immediately drop down and cut off the draft of cold air which would otherwise be admitted into the furnace to the detriment of the fire.

The claim of the patent was for—

The removable tube or funnel having arranged within it the diagonal valve with its lower edge turned up, in combination with a furnace, as set forth.

In the reissued Morey patent a revolving partition in the box or attachment is substituted for the diagonal swinging valve suspended upon and revolving upon journals and kept in position by means of springs. The office of the partition is to keep the box or tube closed and prevent the entrance of air after the straw has been pushed through the tube, though the specification adds that "it is evident that by leaving the tube or box filled so as to choke the opening through it the partition or door can be dispensed with." The straw is introduced into the furnace through the hopper of the box by means of an ordinary hay-fork. The fork-load of straw is placed against the lower end of the partition and pushed through the box, the pressure turning the partition to a horizontal position to admit the hay or straw. As soon as the fork is unloaded and withdrawn the partition is closed automatically by the springs, thus making a half-revolution each time a fork-load of straw is introduced and immediately closing again, so as to shut off the draft. The claim of the reissued patent

embraced, first, "in combination with the furnace of a thrashing-machine, the detachable box or tube provided with a flaring mouth, the base of the tube projecting from the furnace at, or nearly at, a right angle to the front of the furnace, substantially as and for the purpose set forth;" and, second, "in combination with the furnace of a thrashing-engine, the box or tube provided with a flaring mouth and having the partition or door, substantially as and for the purpose set forth."

The following is a statement in the language of counsel for the defendant in error of what he claims to be the proof on the trial of the cause as contained in the bill of exceptions, showing the state of the art and the history of the inventions attributed to Morey and Rice, respectively:

For many years before the invention thrashing-machines had been driven by steam as a motive power. In generating steam portable fire-box boilers had been used. Such fire-box boilers were about like the ordinary locomotive-boilers in common use. They had a fire-box furnace and a number of tubes or flues passing from one end to the other through the water in the boiler. The fire and products of combustion passed from front to rear through such tubes or flues, and thence out through a smoke-stack placed at the end of the boiler farthest from the furnace. Wood or coal was used for fuel with such fire-box boilers. During all this time it had been a great *desideratum* to substitute straw as fuel in place of wood and coal. In California in most grain districts wood and coal were very expensive, and were inconvenient on account of having to be transported to the harvest-fields and from place to place in the fields, as the thrashing-machine was moved from one spot to another as one section of the field was thrashed and another about to be commenced. The transportation of the wood and coal for fuel required teams and men at a time when all were needed in the harvest-fields for other purposes. At the same time where the thrashing was done there was always an accumulation of straw which was of no value, and which the farmers were glad to burn to get it out of the way. With the portable engines and boilers then in use straw could not be successfully used as fuel. Steam could be raised with it while the engine was not working; but when the engine was put to work the steam would run down. In 1872 David Morey attempted to accomplish the desired object by attaching straw-feeding attachments to the fire-box boilers then in use with wood or coal for fuel. He experimented with one in Watsonville, and believed from that experiment that his efforts were successful. He took out two patents early in 1873 for his inventions. * * * He made his experiment in Watsonville in 1872 after the thrashing season was over for that year. He was anxious to introduce his supposed invention and desired to exhibit it to the large dealers in agricultural implements in San Francisco. He accordingly went to San Francisco and looked for a place to try his invention at which it would be convenient for the merchants to attend. Rice had a machine-shop at Haywards, and also had thrashing-engines which he had for many years used in the harvest-fields during the thrashing season. He had at his place two portable engines with return-flue boilers and one with a fire-box boiler. One of the engines with return-flue boilers was used for running the machinery in his shop when not in the field during the thrashing season. Morey went to Rice and requested the privilege of attaching his straw-feeder to one of Rice's boilers and exhibiting its operation. Rice readily consented and assisted in making the attachment and test. Morey wished to attach the straw-feeder to Rice's fire-box boiler, but Rice insisted on attaching it to the return-flue boiler. It was attached to the return-flue boiler. A test of it was made and an exhibition given by getting up steam and running the machinery in the shop with it. The test and exhibition gave satisfactory results as far as they went, as Morey's experiment had previously done when made with the same straw-feeder attached to fire-box boiler in Watsonville. No one learned from the test and exhibition at Haywards whether there was any advantage in substituting the return-flue boiler for the fire-box boiler or not. Rice was the only man that thought the return-flue boiler was the better for the purpose. Morey then licensed the firm of Treadwell & Co. to make and sell his invention. The exhibitions of Morey had created a belief that straw could be used for fuel in generating steam for running thrashing-machines, and that very season (1873) many of the heaviest firms in San Francisco and Morey himself used and exercised their means and abilities to make the invention practically successful. Hawley & Co. tried it, Baker & Hamilton tried it, Treadwell & Co. tried it, and Morey tried it. Some of the partners or engineers of each of the said firms had witnessed the exhibition with the return-flue boiler at Haywards. Yet each of said firms and Morey himself made all their subsequent tests in the season of 1873 with fire-box boilers and they all failed. They all gave up the invention after testing it that season, and believed that their tests and experiments had proved that straw could not be successfully used for fuel in generating steam for running thrashing-machines. Not one of them thought for a moment that anything could be gained by substituting the return-flue boiler for the fire-box boiler. All of them worked and experimented with the fire-box boiler, and when they found it impossible to make that do the work with the straw-feeding attachment they believed that they had exhausted the subject by proving that it was impossible to utilise straw for fuel, as desired, by any possible means. Yet they had all seen or thoroughly understood all that was shown or proved by the test and exhibition with the return-flue boiler at Haywards in the previous month of March. Rice alone believed in the advantages of a return-flue boiler combined with the straw-feeding attachment. Rice alone went into the harvest-fields with the return-flue boiler and straw-feeding attachment, and it proved entirely successful. Rice did not know at the time what the other parties were doing; neither were they informed of what Rice was doing. Rice's operations in the thrashing season of 1873 were in different sections of the country from where the other parties were experimenting. While all the other parties were by their experiments with fire-box boilers proving that straw could not be utilized for fuel, as desired, Rice alone proved that it could be so utilized by substituting the return-flue boiler for the fire-box boiler. Rice was the first and only one that suggested the combination of the return-flue boiler with the straw-feeding attachment, and he was the only one that tested and proved its advantages, and except for this individual and independent idea and action of Rice there is no reason for supposing that the great advantages of using straw for fuel in the harvest-fields would have been enjoyed to-day.

It further appears from the testimony of Rice that he considered the main principle of his invention to be combining the arrangement patented by Morey with the return-flue boiler. He supposed at first that his invention covered the boiler itself, though he found afterward that it was not new, but was, on the contrary, well known as the "Cornish" boiler. The main difficulty he claimed to overcome by his invention was in preventing air from being admitted when the straw was fed into the furnace. He says:

I took his (Morey's) tube and attached it to this boiler, (the return-flue boiler,) and it was a success.

The act of invention he specified to consist in "combining the two together."

The contention on the part of the defendant in error is set forth in the language of his counsel in argument, as follows:

Applying the rules of law to the Morey and Rice patents and (admitting Morey's patents to be valid) the following are the extent and limits of their respective inventions, viz: Morey discovered that by attaching a straw-feeding tube with a door in it to prevent a draft of air through it to portable locomotive or fire-box steam-boilers straw could be used with them for fuel more effectively than it could be without such tube. The combination of a straw-feeding tube which would prevent a draft of air through it with portable steam-boilers was Morey's invention. The discovery that a draft of air must not be admitted between the top of the fire and the bottom of the boiler was his discovery. All of Morey's discoveries and inventions, however, were insufficient to make portable steam-boilers adequate to the one great task which it was so desirable for them to perform, viz: that of running thrashing-machines with only straw for use as fuel. Rice began his discoveries and invention where Morey left off. Morey's patents were both issued before Rice had given the subject a thought. Rice discovered that by tearing out the inside of the boiler, which he found in Morey's combination, and by adding to the combination (but inside of the boiler) the large tube C, to serve as a furnace and the return-flues, that he obtained a combined machine which was a very great improvement over Morey's. Rice's combination may have and probably did include Morey's combination, but it included more, viz: the large tube or furnace C and the return-flues *e e*.

* * * * * * * * *

In this case Morey's patents were for combining straw-feeders with portable steam-boilers generally. Rice discovered that by substituting one particular kind of portable steam-boiler, which no one else had used, for the steam-boilers which had been used that he had a better combination than was ever before made, a combination which did better work than any others, and had within it a new and better mode of operation than any others. It burned all of the straw put in it, while the others would not. It did not choke up with partly-burned straw and cinders, while the others would. It caused the heat and flame of the fire to pass twice through the length of the boiler, while in the others the heat and flame passed but once through the length of the boiler.

* * * * * * * * *

It is to be noticed that the Morey patents describe and claim only the combination of the straw-feeding device with the furnace of a boiler. His patents stop at the furnace-door. They do not go into the boiler beyond the furnace. Rice's patent, on the other hand, begins at the furnace-door, where Morey's stop, and goes beyond into the boiler, adding new elements.

The bill of exceptions contains fourteen exceptions to as many rulings of the court during the trial, but in argument all the points raised by them were reduced and classified by counsel for plaintiff in error under three heads, as follows:

1. That the reissued letters patent to Rice on which the action was founded were for an invention different from that described in the original, and was therefore void.

2. That the invention described and claimed in the first claim of the plaintiff's reissued patent, which alone was material to the controversy, was anticipated and covered by the letters patent granted to Morey.

3. That if, after the Morey patents were issued, there was any invention in the combination claimed in the Rice reissued patent, then, in fact, it is to be attributed to Morey himself, and not to Rice.

I. The first question for our determination is that raised as to the identity of the invention intended to be described in the original and reissued patents to Rice, upon the answer to which the validity of the latter, so far as this suit is concerned, depends.

In cases of reissues of patents, inoperative or invalid by reason of a defective or insufficient specification, or by reason of the patentee claiming as his own invention or discovery more than he had a right to claim as new, it is imperative that the new patent, when issued, shall be for the same invention, and that no new matter shall be introduced into the specification when, as in the present case, there is a drawing, with reference to which the invention is described. (Rev. Stats., sec. 4916.)

The principles for determining the validity of reissued patents have been discussed and formulated so repeatedly and so recently in this Court that it is necessary at present only to refer to the cases of *James* v. *Campbell* and *Miller & Co.* v. *Bridgeport Brass Company*, decided at the present term, *Burr* v. *Duryee*, (1 Wall., 531,) and *Powder Company* v. *Powder Works*, (98 U. S., 139.)

In the present case the question of the identity of the invention in the original and reissued patents is to be determined from their face by mere comparison, notwithstanding what was said in *Batten* v. *Taggart*, (17 Howard, 74, 85,) and consistently with *Bischoff* v. *Wethered*, (9 Wall., 812,) according to the rule laid down in *Seymour* v. *Osborne*, (11 Wall., 515,) and *Powder Company* v. *Powder Works*, (98 U. S., 134.) That is, if it appears from the face of the instruments that extrinsic evidence is not needed to explain terms of art or to apply the descriptions to the subject-matter, so that the court is able from mere comparison to say what are the inventions described in each, and to affirm from such mere comparison that they are not the same but different, then the question of identity is one of pure construction and not of evidence, and consequently is matter of law for the court, without any auxiliary matter of fact to be passed upon by a jury if the action be at law.

The question arises in the present record upon an exception of the defendant below to the refusal of the court after the plaintiff had read in evidence the original patent to sustain an objection to the introduction in evidence of the reissued letters patent, on the ground that they were void for want of identity in the invention, and also upon the refusal of the court to instruct the jury, both after the close of the plaintiff's case and after all the evidence was in, to return a verdict for the defendant. Looking therefore to the original patent nothing can be more clear than that the supposed invention described in it is nothing more nor less than the return-flue boiler itself. The patent is for a new and useful improvement in steam-boilers. The specification begins by declaring that the invention relates to certain improvements in the construction of steam-boilers, whereby the inventor says:

> I am enabled to utilize straw and other light substances for fuel, so that a complete combustion of the smoke is attained, and the danger from fire in harvest-fields, where these boilers are more especially useful, is entirely obviated.

It also relates, as is said, to a novel method of securing the tubes and tube-sheets within the shell of the boiler. Reference is then made to the accompanying drawings for a more complete explanation of the invention. He refers to the shell of the boiler, which he says is more especially intended to be used for that class of engines employed in thrashing and other field work where there is straw or other light material enough for fuel, but which has never been satisfactorily burned without an artificial draft or blast, and which has always been dangerous by reason of the sparks thrown out on account of incomplete combustion. It was, "in order to remedy these faults and perfectly consume all the smoke and sparks," he continues, that "I perforate my tube-sheets, so as to admit one large tube near the bottom, which receives the fuel upon a grate and acts at the same time as a tube and fire-box." Then occurs this sentence:

> Any suitable feeder may be employed to supply straw to the grate; but I have found the device patented by D. Morey, June 20, 1873, to be very suitable.

He then proceeds with the description of the tubes and the return-tubes conducting to the chimney in front, and the communicating chamber between the flue-sheet and the boiler-head, and the similar chamber at the back end of the boiler, into which the products of combustion pass from the large flues before entering the return-flues. "By this construction," the specification continues, "the light fuel is thoroughly ignited in its passage through the large tube, which has plenty of air admitted for the purpose. The heat and flame will be concentrated in returning through the small flues, and the combustion will be so complete that no sparks and very little smoke will escape from the chimney, and this little will not even need a bonnet." This is followed by a description of the device for removing the tubes and tube-sheets from the shell in a body for repair or cleaning, which is not material. The inventor then adds: "By this construction I am enabled to make a boiler and furnace in which straw can be used as a fuel with perfect safety and in which repairs can be easily effected," and concludes:

> Having thus described my invention, what I claim, and desire to secure by Letters Patent, is—
>
> In a horizontal steam-boiler, the large tube C, formed with a grate, D, to serve as a fire-place, in combination with small return-flues *e e*, when the tubes and tube-sheets are secured by flanges *f* and bolts *g*, so as to be removable from the shell in a body, substantially as and for the purpose set forth.

The allusion to the mode of supplying straw to the grate is merely casual and incidental. Any suitable feeder may be employed, it is said. The inventor adds: "But I have found the device patented by D. Morey, June 20, 1873, to be very suitable." In what respect this device has been found to be very suitable is not mentioned, nor is it hinted that there are not many others quite as good. No attempt is made to explain what is needed in a feeder to make it suitable, nor any hint that any of the advantages described as resulting from the operation of the machine depend in any degree upon the character of the feeder. For aught that may be inferred from what is said concerning it there need be nothing peculiar in the mode of supply, except

what is rendered necessary by the character of straw as a fuel in lightness and bulk and a supposed convenience on that account of supporting it as it is pushed into the furnace. There is certainly no suggestion that is considered important much less necessary in supplying this fuel to do it in such manner and by means of such device as will prevent the introduction of a draft of cold air between the top of the fuel and the bottom of the boiler while in the act of replenishing the supply. Neither the mode of feeding the fuel nor any device for doing it is made any part of the described invention, nor is either referred to in any way as performing any useful or essential function in the operation of the machine described. Every desired advantage which it is expected to accomplish is referred expressly to the boiler itself and its structure and internal arrangement. As is well said by counsel for plaintiff in error on this point:

> What he sought was complete combustion of the straw by making the products of combustion pass through the boiler twice before they were allowed to escape into the chimney, and the office of the feeder was not auxiliary to the combustion, but preliminary to it. It supplied the straw. It did not burn it. It is true that a Morey tube is shown in the drawing as attached to the front of his engine, but that does not make it part of his invention any more than a set of wheels and axles would have become part of it if the drawing had represented his boiler as mounted on running-gear.

If we turn now to the reissued patent we find that the patentee declares that—

> My invention relates to the combination of a straw-feeding device with the furnace-door of the class of boilers which are known as "return-flue" boilers, by which combination I am able to provide a superior arrangement for utilizing straw as a fuel for generating steam.

He then refers to the failure of previous attempts to utilize straw as fuel for generating steam, and gives as the reason that "when straw is fed into the furnace of an ordinary steam-boiler it burns too quickly to do much good in heating the water in the boiler until a sufficient quantity of cinders accumulates upon the grate-bars to impede the draft, and unless the cinders are frequently removed from between the grate-bars they soon accumulate to such an extent as to choke the draft entirely and prevent combustion." He then adds that his experiments have developed the fact that by attaching a tube or box-door to the furnaces of that class of boilers known as "return-flue" boilers the combustion will be so complete that no sparks and but very little smoke will escape from the chimney, and the straw will be burned freely, giving out a high degree of heat without danger of choking the grate-bars. He then gives a description with reference to the drawings, which are the same as those attached to the original specifications. In that description, differing in that respect from the former one, he inserts: "To the door of the furnace C, I attach a straw-feeding tube, E, through which the straw or other light fuel is fed to the furnaces," and changes the sentence in reference to the character of the straw-feeder so as to read as follows:

> This tube can be constructed in the manner described by David Morey in his patents dated February 11, 1873, and May 25, 1873, for straw-feeding attachment for furnaces, or in some other suitable manner for feeding the straw without admitting a draft of air.

The first claim of the reissued patent reads thus:

> The boiler A, having the furnace C, grate D, return flues or tubes *e e*, and stack or chimney B, arranged as described, in combination with the straw-feeding furnace-door attachment, substantially as and for the purpose described.

It appears, then, from the mere reading of the two specifications that the invention described in the first is for the return-flue boiler, while that described in the second, abandoning the claim for the boiler itself, is for a particular mode of using it with straw as a fuel, by means of an attachment to the furnace-door for that purpose. It might well be that Rice was entitled to patents for both separately or to one for both inventions; but it is too plain for argument that they are perfectly distinct. A patent, consequently, originally issued for one cannot lawfully be surrendered as the basis for a reissue for the other. They are as essentially diverse as a patent for a process and one for a compound, as in the case of *Powder Company* v. *Powder Works*, (98 U. S., 134,) where the reissued patent was avoided, although the original application claimed the invention both of the process and the compound. The case comes directly within the principle held in *James* v. *Campbell*, *supra*, that a patent for a machine cannot be reissued for the purpose of claiming the process of operating that class of machines, because if the claim for the process is anything more than for the use of the particular machine patented it is for a different invention.

II. The second principal objection to the validity of the Rice reissued patent is that it is anticipated by the Morey patents. We are of opinion that it also is well taken. Morey's reissued patent of May 4, 1875, covers distinctly and expressly a combination of the furnace of a thrashing-engine with a detachable box or tube provided with a flaring mouth, the base of the tube projecting from the furnace at, or nearly at, a right angle to the front of the furnace, the office of which is to furnish means for the supply of straw as fuel to the furnace in such manner as to prevent the entrance of air after the straw has been pushed through the tube, which may be effected either by means of a movable partition, for which a separate claim is made, or without it, by merely having the tube or box filled, so as to choke the opening through it with successive supplies of straw. It applies to every description of thrashing engines and boilers, whether fire-box or return-flue. It is true that it does not specify either class, but it embraces both by its language; and in its application to both it operates in precisely the same manner and with precisely similar effect. If there is any superiority in the return-flue boilers used with this attachment as a straw-burner over the fire-box boiler when used in the same way the superiority is due not to any difference in the straw-feeding attachment, nor in the mode of its operation, nor to any new feature of the combination, but merely to the superiority of the return-flue boiler itself; and it does not militate against the validity of Morey's patent or limit the extent and effect of its application to concede what is claimed that he was not aware at the time of his invention of the superior value of its application to return-flue boilers over fire-box boilers or that the discovery of that superiority is attributable to Rice. That application of it is within the scope and provision of Morey's invention, whether it had been tested by his experience or was anticipated by his foresight or not. If at the date of Morey's invention return-flue boilers had not been known, but had been subsequently invented, his patent, as applied to them, would still have prevailed against any new claimant, for the new application does not produce any new effect. It is only the occasion which is new; the use itself is merely analogous. The case of *Hall's Patent*, (1 Webst. Pat. Cas., 96,) where the flame of gas

was used instead of an Argand lamp for singeing lace, is pressed upon us as authority for a different conclusion upon this point; but the decision of Lord Abinger in *Losh* v. *Hague* (1 Webst. Pat. Cas., 207) and his comments upon the case of Hall's patent show that it has no application here. There was no patentable invention in Rice's adaptation. The return-flue boiler, it is admitted, was old. The Morey attachment had been already invented. The idea and principle of its operation in adapting boilers to the use of straw as a fuel was the essence of his invention. Rice, it is confessed, discovered nothing more than that for such purposes a return-flue boiler was better than fire-box boilers, which were the only kind that had then been used. "But this," in the language of Mr. Justice Nelson in *Hotchkiss* v. *Greenwood* (11 How., 266,) "of itself can never be the subject of a patent. No one will pretend that a machine made in whole or in part of materials better adapted to the purpose for which it is used than the materials of which the old one is constructed, and for that reason better and cheaper, can be distinguished from the old one, or, in the sense of the patent law, can entitle the manufacturer to a patent. The difference is formal and destitute of ingenuity or invention. It may afford evidence of judgment and skill in the selection and adaptation of the materials in the manufacture of the instrument for the purposes intended, but nothing more." *Hicks* v. *Kelsey* (18 Wall., 670) affirms this case. The same principle was applied in the case of *Stow* v. *City of Chicago*, decided at the present term. The case would not be altered if we suppose that at the date of Morey's patent there had been also a valid patent outstanding in a stranger for the return-flue boiler. On that supposition could it for a moment be contended that Rice could secure for himself a valid patent for the combination as an improvement on both? What invention could he claim? He uses Morey's device precisely as Morey's patent contemplated and the Cornish boiler exactly as it was designed it should be used; and in the combination each operates separately, producing its own results. There was no inventive resource drawn upon to bring them together. Could not the owners of the patents for the straw-feeding attachment and the return-flue boiler unite their machines and work them together in defiance of a claim for the combination? To ask the question is to answer it. Yet the case supposed does not differ from the case as it exists, for the public owned the right to the Cornish boiler and was entitled to every use to which a patentee owning it might lawfully apply it.

On the trial of the cause below Morey's patent seems to have been treated in the charge of the court as if it were a patent for a combination of a straw-feeding attachment with the furnace of boilers other than those with return-flues, and that Rice added to the combination the new element of the return-flues with a new and important result. But this view, in our opinion, is not justified by the true construction of the patents. If Morey's patent is for a combination it is a combination of the straw-feeding attachment with all boilers for generating steam when it is desired to use straw for fuel, and therefore includes the very combination claimed by Rice. And if it is for the straw-feeding attachment as an independent device, but to be used in boilers for generating steam when straw is to be used as fuel, then the application of it to the return-flue boilers, although these were not actually known to the inventor, is merely a new and analogous use of an old device, operating in the very manner intended by its inventor, and the use of which in the new application involved no invention, and could not therefore be the subject of a patent.

III. In fact it is very apparent from the testimony on the part of the plaintiff below that the actual application of the Morey straw-feeding attachment to the return-flue boiler at Rice's establishment was a demonstration made by Morey himself of the practical operation of his device, intended to show, what he had already proved by previous trials with fire-box boilers to his own satisfaction, that he had invented an arrangement for applying the principle by which straw could be made useful as a fuel for steam-boilers, that principle being to prevent the introduction of a draft of cold air while feeding the supply. He showed this to Rice by the trial at the establishment of the latter on one of his own return-flue boilers. Rice, by subsequent experience or previous knowledge, it matters not which, perceived the advantages of the return-flue boiler over the fire-box boiler for such a use. That was his sole discovery and constitutes the basis of the claim for his patent. The marvel is that he should have succeeded in persuading Morey that he had given all its value to the invention of the former, and obtained from him the conveyance of his patent for a consideration dependent upon the result of this litigation.

The court below in its rulings upon objections to the introduction of the reissued patent of Rice, in its refusals to charge the jury as requested by the defendant below, and in its charge as given took views of the validity of the patent on which the case of the defendant in error rested, opposed to those expressed in this opinion, and which necessarily resulted in the verdict and judgment against the plaintiff in error. For these errors the judgment is reversed and a new trial ordered, and for that purpose the cause is remanded.

DESIGNS.

12,928.—GATE.—*Henry Faller*, Middle Village, assignor to *John Timmes*, Brooklyn, N. Y. Application filed March 30, 1882. Term of patent 7 years.

12,929.—NAP-SURFACE OF CLOTH.—*Felix Samson*, New York, N. Y. Application filed February 25, 1882. Term of patent 3½ years.

12,930.—HANGING LAMP.—*F. Robert Seidensticker*, Meriden, Conn., assignor to *The Bradley & Hubbard Manufacturing Company*, same place. Application filed March 25, 1882. Term of patent 7 years.

12,931 and 12,932.—CARPET.—*Thomas J. Stearns*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Applications filed March 16, 1882. Term of patents 3½ years.

12,933.—FONT OF PRINTING-TYPE.—*Charles E. Heyer*, Chicago, Ill., assignor to *Arthur M. Barnhart*, *Alson E. Barnhart*, and *Charles E. Spindler*, same place. Application filed November 18, 1881. Term of patent 7 years.

12,934.—PLATES OF A HEATING-STOVE.—*James M. Atchison*, Philadelphia, Pa., assignor to *Francis P. Nicholson*, same place. Application filed March 27, 1882. Term of patent 7 years.

12,935.—FONT OF TYPE.—*John West*, Brooklyn, N. Y. Application filed April 5, 1882. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,354.—PLUG CHEWING-TOBACCO.—*Brown & Brother*, Winston, N. C. Application filed April 20, 1882.

"The word and figure 'HONEST 7.'"

9,355.—MEDICINAL PREPARATIONS.—*Fredrick W. A. Bergengren*, Lynn, Mass. Application filed April 4, 1882.

"A pictorial representation of the national flags of the United States of America and of the Kingdom of Sweden, in connection with the Swedish national coat of arms."

9,356.—SYRUPS.—*August Buermann*, Newark, N. J. Application filed April 7, 1882.

"The figure of a star."

9,357.—FLOUR.—*Leonard Day & Co.*, Minneapolis, Minn. Application filed April 3, 1882.
"The word 'PALISADE.'"

9,358.—FLOUR.—*Leonard Day & Co.*, Minneapolis, Minn. Application filed April 3, 1882.
"The words 'ROYAL ROSE.'"

9,359.—FLOUR.—*Leonard Day & Co.*, Minneapolis, Minn. Application filed April 3, 1882.
"The word 'BISMARCK.'"

9,360.—FLOUR.—*Day, Rollins & Co.*, Minneapolis, Minn. Application filed March 30, 1882.
"The word 'ORIENT.'"

9,361.—FLOUR.—*Day, Rollins & Co.*, Minneapolis, Minn. Application filed March 30, 1882.
"The words 'GOLD LEAF.'"

9,362.—FLOUR.—*Day, Rollins & Co*, Minneapolis, Minn. Application filed March 30, 1882.
"The words 'WHITE SPRAY.'"

9,363.—FLOUR.—*Day, Rollins & Co.*, Minneapolis, Minn. Application filed March 30, 1882.
"The word 'HERCULES.'"

9,364.—FLOUR.—*Day, Rollins & Co.*, Minneapolis, Minn. Application filed March 30, 1882.
"The word 'ZENITH.'"

9,365.—FLOUR.—*Day, Rollins & Co.*, Minneapolis, Minn. Application filed March 30, 1882.
"The word 'ADVANCE.'"

9,366.—HARNESS-TRIMMINGS OR HARNESS-MOUNTINGS, AND OTHER GOODS PERTAINING TO SADDLERY-HARDWARE.—*William F. Ford*, Newark, N. J. Application filed April 10, 1882.
"The arbitrary word-symbol 'BONANZA.'"

9,367.—SUSPENDERS OR BRACES.—*James Bowers*, Newark, N. J. Application filed April 12, 1882.
"The word-symbol 'ELECTRIC.'"

9,368.—PAINTS.—*Harrison Bros. & Co.*, Philadelphia, Pa. Application filed April 15, 1882.
"The words 'QUEEN ANNE.'"

9,369.—PAINTS.—*Harrison Bros. & Co.*, Philadelphia, Pa. Application filed April 15, 1882.
"The word 'ARCHITECTURAL.'"

9,370.—MEDICINAL PREPARATIONS.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 10, 1881.
"The letters 'D. JAYNE' in the form of a water-mark."

9,371.—CIGARS, CIGARETTES, AND SMOKING AND CHEWING TOBACCO. *Kaufmann Bros. & Bondy*, New York, N. Y. Application filed April 13, 1882.
"The arbitrary word 'JUMBO.'"

9,372.—CEMENT.—*T. R. Keator & Co.*, New York, N. Y. Application filed April 15, 1882.
"A red cross."

9,373.—STEEL PENS.—*Benjamin Lawrence*, New York, N. Y. Application filed April 4, 1882.
"The letters and words 'B. L. METALLIC QUILL.'"

9,374.—SOAP.—*Christopher Lippe*, Baltimore, Md. Application filed September 5, 1881.
"A medallion bearing on its face the representation of Helvetia, goddess of Switzerland."

9,375.—LEATHER.—*Augustus B. Martin & Co.*, Boston and Lynn, Mass. Application filed April 6, 1882.
"The arbitrarily-selected word 'SIAMANG.'"

9,376.—CIGARS AND CIGARETTES.—*Michalitschke Bros. & Co.*, San Francisco, Cal. Application filed April 7, 1882.
"The representation of a peacock."

9,377.—DAIRY-SALT.—*North American Chemical Company*, (Limited,) Montreal, Quebec, Canada. Application filed March 24, 1882.
"The autograph 'GEO. RICE.'"

9,378.—BAKING-POWDERS.—*James A. Parent & Co.*, Detroit, Mich. Application filed July 5, 1881.
"The fac-simile signature of James A. Parent & Co. and the pictorial representation of a man carrying a tray."

9,379.—CIGARS, SNUFF, AND SMOKING, FINE-CUT, AND PLUG CHEWING TOBACCO.—*Spaulding & Merrick*, Chicago, Ill. Application filed April 3, 1882.
"The words 'OLD GLORY.'"

9,380.—MAGNETO-THERAPEUTIC APPLIANCES.—*Hugh Thomas*, New York, N. Y. Application filed April 10, 1882.
"The word-symbol 'SPHEROTHERAPEUTIA' and the representation of the hand, sphere, and the zigzag lines."

9,381.—HAMMOCKS.—*Thomas Trestlian*, Gloucester, Mass. Application filed April 15, 1882.
"The fanciful title 'UNION.'"

9,382.—CIGARS, CIGARETTES, SNUFF, AND CHEWING AND SMOKING TOBACCO.—*George A. Trymer* and *Horace C. Richardson*, Bloomington, Ill. Application filed April 6, 1882.
"The two cigars crossed obliquely, the barred helmet with crest of feather, the Maltese cross, and the two stripe or streamers, the upper one of which having the name 'De Molay' on its face and the lower one containing the sentence 'La Vuelta Abajo.'"

9,383.—MEDICAL PREPARATION FOR EXTERNAL APPLICATION.—*Weeks & Potter*, Boston, Mass. Application filed March 20, 1882.
"The representations of the man, horse, and cow.

9,384.—CONDITION-POWDERS.—*James Yates & Co.*, Atchison, Kans. Application filed March 10, 1882.
"The arbitrarily-selected word 'OVERLAND' and design of a tallyho coach."

LABELS.

2,680.—Title: "NEW YORK CITY SOAP."—*Charles Memmert*, Washington, D. C. Application filed April 21, 1882.

2,681.—Title: "DR. OWEN'S (O & C'S) CAMPHORATED HARTSHORN LINIMENT."—*Luther P. Owen*, Marion, Iowa. Application filed April 6, 1882.

2,682.—Title: "DR. OWEN'S (O & C'S) COUGH REMEDY."—*Luther P. Owen*, Marion, Iowa. Application filed April 6, 1882.

2,683.—Title: "DR. OWEN'S COLIC, CHOLERA AND DIARRHŒA REMEDY."—*Luther P. Owen*, Marion, Iowa. Application filed April 10, 1882.

DISCLAIMERS.

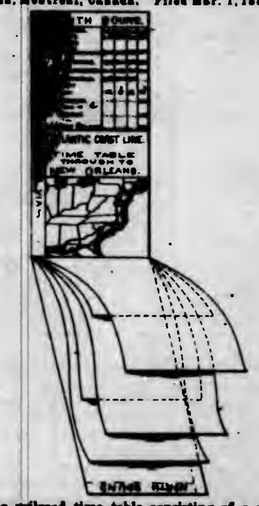
4,636, (Reissue.)—*Theodore E. Harris*, Green Bay, Wis., patent dated November 14, 1871. IMPROVEMENT IN MACHINES FOR SHEARING AND PUNCHING SHINGLE-STRAPS. Disclaimer filed May 5, 1882, by *Matthew Graf* and *William M. Everson*, assignees.

Enter their disclaimer to the first claim of said reissued letters patent, which is in the following words, to wit: "1. A machine cut and punched shingle-strip or bale-fastening made from sheet-iron, substantially in the manner described."

Also, to the following words in the printed copy of the said specification commencing on the nineteenth line and ending with the word "end" in the forty-seventh line thereof, as follows: "In packing shingles at the mill for the market the ordinary method has always been to arrange them with the points together, as shown at A in Fig. 5, and tie the ends of the wooden binders B B together by means of withes, cords, or wires, or connect them by strips of hoop-iron nailed or otherwise fastened to them. None of these articles have ever, to my knowledge, been prepared and put into the market as an article of manufacture and sale, but the manufacturer of the shingles has always been obliged to prepare them for his own use. Cords of any kind are objectionable on the score of expense, and also of weakness and liability to decay. Wires are difficult to fasten properly. Withes are not to be had in many localities, and hoop-iron, besides being scarce, is inconvenient to cut and punch at the mill. From these causes the supply of proper materials for tying the binders together has never been regular and reliable, and great inconvenience has resulted to manufacturers therefrom. The object of my invention is to produce a new article of manufacture and sale, which, being adapted to convenient use as a fastening for the binders, can be furnished to the market in any required quantities at a reasonable expense, thereby obviating all the inconveniences heretofore suffered from the cause referred to. To this end."

Also, to the following words, commencing with the word "first" on the forty-seventh line of page 1 of said printed specification and ending with the word "secondly" on the fifty-first line thereof, as follows: "First, in the new article of manufacture, to wit, a cut and punched sheet-metal shingle-strip, formed substantially as shown in Fig. 4, and adapted to be applied as represented in Fig. 5; and secondly."

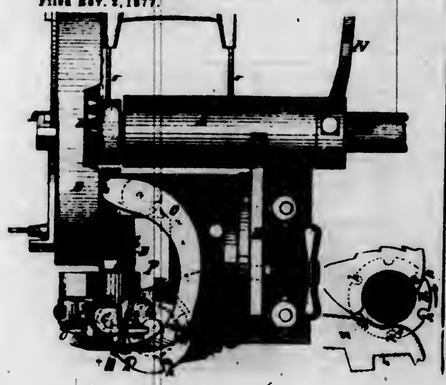
92,469.—*Jacob Reese*, Pittsburg, Pa., patent dated July 13, 1869. IMPROVED METHOD OF MAKING BANDS FOR SHINGLE-BUNDLES. Disclaimer filed May 5, 1882, by *Matthew Graf* and *William M. Everson*, assignees.



Enter their disclaimer to the first claim of said letters patent, which is in the following words, to wit: "1. A machine cut and punched shingle-strip or bale-fastening made, substantially in the manner described, from sheet, as distinguished from hoop-iron."

Also, to the following words on page 2 of the printed specification attached to and forming a part of said letters patent: "Metallic strips made substantially as described are useful for other purposes, or for securing bundles and bales of other articles, and all such uses of such strips I include in my invention."

PATENTS



GRANTED MAY 16, 1882.

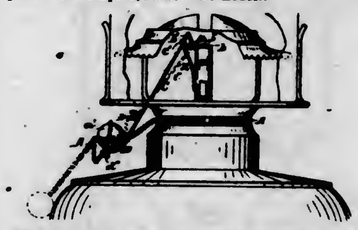
257,836. RAILROAD TIME-TABLE. RICHARD ALEXANDER, New York, N. Y., assignor to Gustave Love, same place, and Henry P. Alden, Montreal, Canada. Filed Mar. 1, 1882. (No model.)

Claim.—The railroad time-table consisting of a series of leaves of varying lengths, all fastened together at one edge, and adapted to be folded one upon the other, and when folded one upon the other, to produce continuous reading-matter and continuous time-tables between terminal stations, as herein shown and described.

257,837. GRAIN-BINDER. JOHN F. APPLEBY, Beloit, Wis. Filed Nov. 2, 1877.

Claim.—1. In combination with the driving-shaft A and its sheaf-discharging arm M, located at the outer side of the tying mechanism, an auxiliary revolving arm, N, located at the inner side of said mechanism, and rotating about the shaft A simultaneously with arm M, substantially as and for the purpose set forth.

2. The cord-guide O, having the cord-severing knife P mounted thereon and operating therewith in substantially the manner and for the purpose herein specified.



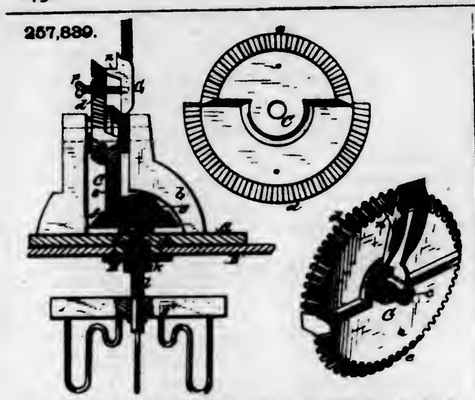
3. The combination of the intermittingly-revolving disks Q and R, the holder-plate S, having its operative edge arranged between said disks and shaped as described, and means, substantially as described, by which said holder is adapted to act first with a yielding and then with a rigid pressure, all substantially in the manner and for the purpose described.

4. The combination, with the disks Q R, provided with a ratchet-wheel, of the pawl T, the bolt *m*, which actuates said pawl, and the cam *n*, formed with two steps, *n n'*, for actuating said bolt and imparting to said disks two successive movements at each stroke of the pawl, substantially as herein before described.

5. The combination, as shown, of the cord-guide O, severing-knife P, and their actuating mechanism with the tyer C and cord-holding devices Q, R, and S, for the triple purpose of guiding the cord to the tyer, drawing the knot therefrom, and severing the cord, all substantially as set forth.

6. In combination with the tying mechanism, the actuating cam-and-rock wheel provided with the cam *w*, the sliding bar *m*, and the springs *o o* acting thereon, the construction and operation being such, as described, that the bar *m*, with its springs *o o*, operates as a brake on said wheel to insure the stoppage of the parts in the proper place, substantially as set forth.

257,838. LAMP-EXTINGUISHER. WILLIAM H. BALDWIN, Chicago, Ill., assignor of one-half to Henry C. Whitney, same place. Filed Apr. 3, 1882. (No model.)



Claim.—1. In an automatic lamp-extinguisher, the combination of the metallic sleeve B, the extinguisher *b'*, the spring E, the wire C, the tongue D, and the weight *a'*, constructed and arranged as herein described and shown.

2. An automatic lamp-extinguisher, *b'*, operated by the weight *a'*, the tongue D, the wire C, and the spring E, substantially as set forth and described above.

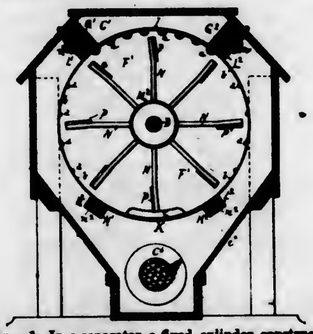
3. An automatic lamp-extinguisher, held in reserve when the lamp is in use by the combination of the wire C, the tongue D, and the weight *a'*, and caused to move upon the flame, when an exigency arrives, by the joint action of the spring E, the tongue D, and the wire C, substantially as set forth above.

257,839. WASHING-MACHINE. EUGENE H. BARNES, Oskaloosa, Iowa. Filed Feb. 8, 1882. (No model.)

257,839.

Claim.—1. In a washing-machine, the combination, with the agitator thereof, having connected to its shaft a bevel-gear wheel with two sets of teeth, of a driving gear-wheel connected to a horizontal shaft, said wheel having two sets of teeth, each of which describes a segment of a circle on different vertical planes and of different radii, and an operating-lever adjustably connected to the said wheel, substantially as and for the purpose set forth.

2. In a washing-machine, the combination, with the gear-wheel D, having teeth *f g*, for operating the agitator, of the wheel C, constructed, as shown, with the teeth *d e*, and the seat G, having teeth *n*, and means for connecting it to the wheel, substantially as and for the purpose specified.



257,840. PLASTERED WALL. AUGUST H. BECKER, St. Louis, Mo. Filed Mar. 10, 1882. (No model.)

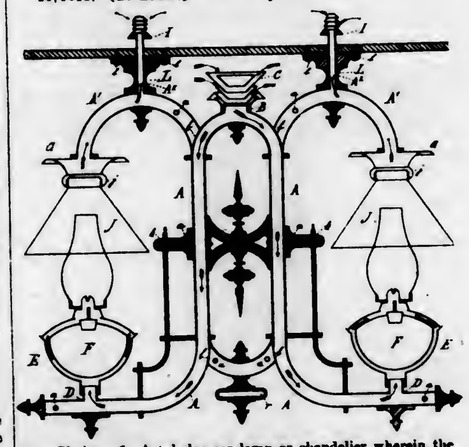
Claim.—1. The herein-described mode of producing a surface upon a plastered wall, which consists in placing a textile fabric against the wall and then working paint onto, through, and beneath the fabric, and thereby causing the fabric to adhere to the wall, substantially as described.

2. A plastered wall having a textile fabric attached thereto, paint being worked onto, through, and beneath the fabric, as and for the purpose described.

257,841. CENTRIFUGAL SEPARATOR. ALBERT D. BULLINGER, Minneapolis, Minn. Filed Jan. 24, 1882. (No model.)

Claim.—1. In a separator, a fixed cylinder constructed with a closed top and bottom, and bolting-cloth sides, with beater-strips *d* on the inside thereof, in combination with a revolving beater, substantially as set forth.

2. In a separator, a fixed cylinder constructed with bolting-cloth sides, a closed top, I, a fabric covering the inside of the top, and beater-strips in front thereof, in combination with a revolving beater, substantially as set forth.



3. In a separator, a fixed cylinder constructed with a closed top, I, beater-strips *c*, a closed bottom, K, open sides covered with bolting-cloth *b*, and beater-strips *d* in front thereof, in combination with a revolving beater, substantially as set forth.

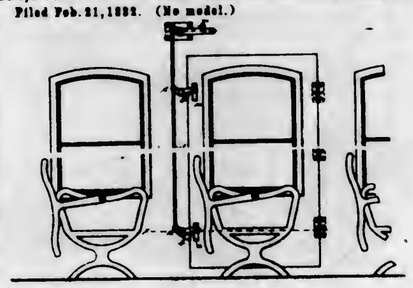
4. In a separator, a fixed cylinder constructed with closed top I, strips *c* in front thereof, a closed bottom, bolting-cloth sides, and strips *d*, smaller than strips *c*, in front of the bolting-cloth, in combination with a revolving beater, substantially as set forth.

5. In a separator, a fixed cylinder constructed with a closed top, beater-strips *c* in front of said top, a closed bottom, bolting-cloth side strips, *d*, on the inside of said cloth, and a discharge-spout, *i*, next to the closed bottom, in combination with revolving beater, substantially as set forth.

6. In a separator, a cylinder composed of heads F' F², ribs G' G² H' H², plates I, strips *c*, plate K, connecting ribs H' H², bolting-cloth sides *b*, and strips *d*, in combination with a revolving beater, substantially as set forth.

257,842. CAR-LAMP. LEWIS F. BEVIS, Norton, Pa., assignor of one-half to Robert E. Dietz, New York, N. Y. Filed Mar. 20, 1882. (No model.)

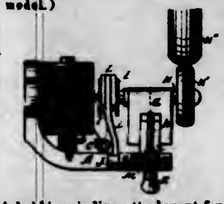
Claim.—1. A tubular car lamp or chandelier wherein the tubes forming the conduits for the fresh air and for the products of combustion are constructed of two cast-metal sections secured together by bolts or screws, substantially as shown and described.



2. In a tubular car lamp or chandelier of the character herein specified, the combination, with the tubes A, cast in two parts and secured together by screws or bolts, of the injecting device C, adapted and arranged to direct a current of fresh air to the burners, substantially as shown and described.

3. In a tubular car lamp or chandelier of the character herein specified, the combination, with tubes A, constructed, substantially as set forth, of air-injector C, smoke-bell G, tubes A', and ejecting devices I, substantially as shown and described.

4. A tubular car lamp or chandelier having tubes A and A', cast in two parts, said parts being secured together by bolts *s*, air-injecting device C, projections D, supporting shells E, inclosing lamp-pot F, and tubes A², surmounted by ejectors I, the whole combined and arranged to operate substantially as shown and described.



5. In a tubular car-lamp of the character herein specified, the combination, with tubes A', of smoke-bell G, springs *j*, holding shade J, and tubes A², terminating in ejecting devices I, substantially as shown and described.

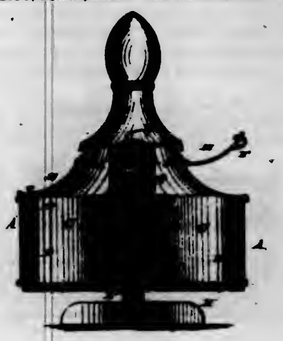
257,843. RAILWAY-CAR. ISAAC BLUMENTHAL, Chicago, Ill. Filed Feb. 21, 1882. (No model.)

Claim.—In a passenger-car having end doors, as usual, inlets and outlets, and auxiliary side doors, the latch-hooks *a*, secured to said doors, latches *b*, pivotally connected to the wall of the car and having tail-projections *c*, by which the same are pivotally connected to and operated by a rod, *d*, and lever E, having handle *f*, substantially as and for the purpose set forth.

257,844. BOBBIN-WINDING ATTACHMENT FOR SEWING-MACHINES. GILBERT A. BRADY, Chicago, Ill. Filed Feb. 25, 1881. (No model.)

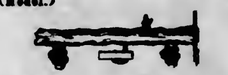
Claim.—A bobbin-winding attachment for sewing-machines, consisting of the combination of the base-piece or frame A, the vertically-movable bearing G, the shaft H, having therein the groove *f* and carrying the spring-catch N, arranged in the said groove, the attachment-driver H', the shaft or rocker J, having thereon the catch K, and the arm L, the spring M, and the bobbin I, having therein a socket to receive the stud *g*, substantially as and for the purposes specified.

257,845. ALARM-LOCK. ISAAC M. BUCK, Elgin, Ill. Filed Jan. 27, 1882. (Model.)



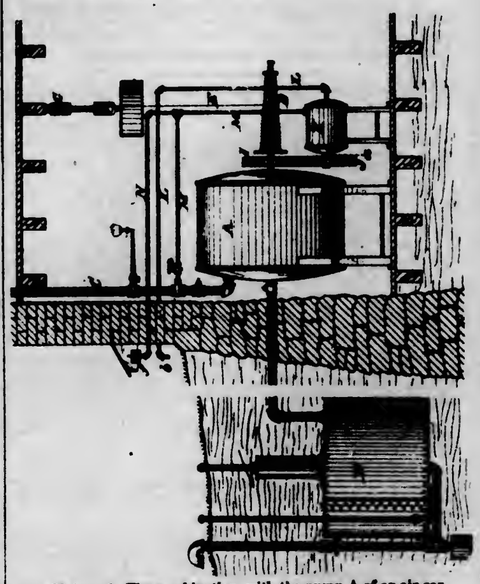
Claim.—1. The combination, substantially as hereinbefore described, of a bolt, a clock-work alarm, and a sliding block for controlling said alarm and adjustable with relation to the bolt and its actuating devices, whereby, when said bolt is retracted, the alarm will or will not be sounded, according to whether the block be movable or stationary as a result of the special adjustment of said block.

2. The combination, substantially as hereinbefore described, of a knob-latch bolt, a clock-work alarm, and a sliding block for controlling said alarm and adjustable with relation to the bolt, whereby, when the knob is rotated, the alarm will or will not be sounded, according to whether the block be movable or stationary as a result of the special adjustment of said block.



3. The combination of the bolt, the alarm, and the sliding block with the setting-cam, which prevents said block from sliding or permits it to slide, and is accessible from the exterior of the lock-case, substantially as described.

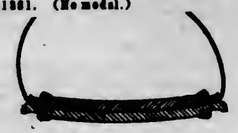
257,846. REVOLVING CADDY. JOHN H. BURDEN and JOHN R. BANCROFT, Vassar, Mich. Filed Mar. 31, 1882. (No model.)



Claim.—The combination of the base H, having vertical shaft G, the caddy A, having central vertical tube, B, partitions C, forming compartments D, and doors E, the cap I and washer K, having grooves M, and the wires N, arranged, as described, to secure the said cap and washer in the tube B, as and for the purpose set forth.

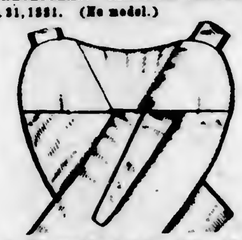
257,847. BOARD AND WIRE FENCE. NATHAN CHENEY, Fairmount, Ill., and MOSES CHENEY, Coshocton, Ohio. Filed Nov. 25, 1881. (Model.)

Claim.—The combination, with fence wires or boards and posts consisting of growing timber, of spikes driven into said timber and having at their outer ends means for securing said wires or boards, the said means and boards or wires being located a sufficient distance from said timber to prevent the dislodgment of said spikes and boards by the force exerted by the timber in growing, substantially as described.



257,848. AIR-GAS MACHINE. JAMES P. CLIFFORD, Brooklyn, N. Y. Filed Dec. 23, 1881. (No model.)

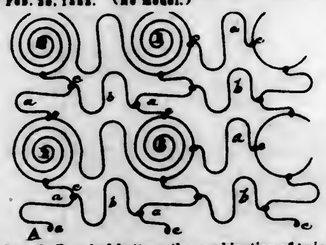
Claim.—1. The combination, with the pump A of an air-carbureting or air-gas machine provided with the usual drum, D, of the supplemental air-pump K, connecting actuating mechanism, an air-inlet pipe, L, connecting with the said pump K, and an air-outlet pipe, M, extending from the supplemental pump K to the main or conducting pipe C, which forms the outlet of the pump of the machine, all substantially as and for the purpose herein set forth.



2. The combination of the branch pipe N, having a valve or seal at its outer end, with the pipes M and L, the pump A of the machine, the supplemental pump K, connecting actuating mechanism, and the main or conducting pipe C, the whole arranged for joint use and operation, substantially as and for the purpose herein set forth.

257,849. SHOE. WILLARD GOODY, Westborough, assignor to the Improved Sole Sewing Machine Company, Boston, Mass. Filed Aug. 17, 1881. (No model.)

Claim.—The improved sewed shoe above described, having both its inner and its outer soles channeled, and stitches extending through both the inner and outer soles and the upper, and covered on the inside of the sole by the lip of the channel of the inner sole and on the outside of the sole by the lip of the channel of the outer sole, as shown.



257,850. NECKSCARF. CHARLES H. CROSSETTE, Chicago, Ill. Filed Aug. 31, 1881. (No model.)

Claim.—1. The combination, in a flat scarf, of the stiffening-boards with the stiffening connecting-strip, substantially as described.

2. In a flat scarf, the combination, with the two aprons and with independent stiffening-boards attached to the upper ends of said aprons, of a metal strip connecting said boards, said scarf having a flexible center piece, substantially as described.

257,851. BED-SPRING. SAMUEL CROSSMAN, Middleville, Mich. Filed Feb. 25, 1882. (No model.)

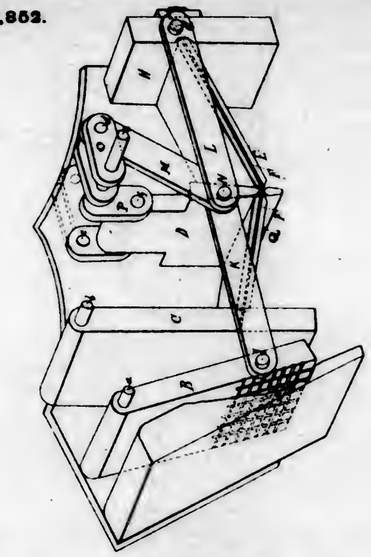
Claim.—1. In a bed-bottom, the combination of twin springs having S-shaped connecting portions with a yielding connecting-link of substantially S shape, substantially as shown and described.

2. As an article of manufacture, the yielding connecting-link A, being substantially S shape, and adapted to be attached to the coils of a spring, substantially as shown and described.

3. In a bed-spring, the clamp B, consisting of the parts *d e f g*, formed integral with the spring, and having the end *g* abutting against the under surface of the final coil thereof, substantially as shown and described.

257,852. MECHANICAL MOVEMENT FOR ORE-CRUSHING MACHINES. JACOB DAVIS, Brooklyn, N. Y. Filed July 27, 1881. (No model.)

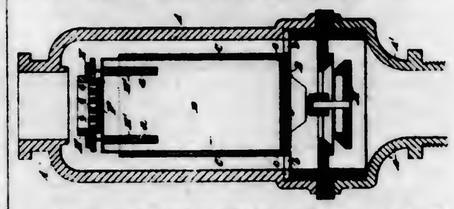
Claim.—1. In ore-crushing machines, a mechanical movement consisting of the movable support C, the toggle-levers Q E, the pitman D, provided with notches, the crank P, and shaft *c*, in combination with the mechanical movement consisting of the movable support B, the toggle-levers K L, the immovable support H, crank-levers M, and cranks O, for the purpose as shown and described.



2. The toggle-levers Q E, the pitman D, crank P, jaw C, support H, and the toggle-levers K L, crank-levers M, cranks O, shaft *c*, and jaw B, whereby the movable jaws B C will approach to and recede from each other twice at each revolution of the shaft, as shown and described.

3. A mechanical movement for ore-crushing machines, consisting of the shaft *c*, cranks O O, crank-levers M M, toggle-levers K K and L L, one set of each on each side of the machine, a fixed support, and a movable support or crushing-jaw, B, for the purpose as shown and described.

4. The combination of the steel bars F F with toggle-levers having a longitudinal groove on each side, and the notched pitman D, as shown and described.



5. In ore-crushing machines, in combination with toggle-levers having a longitudinal groove or orifice and a pitman having a corresponding orifice, the steel springs or bars F F, an immovable support, and a movable object, for the purpose as shown and described.

257,852.

257,853. AIR-VALVE FOR WATER-PIPES. JOHN L. DIBBLE, Brooklyn, N. Y. Filed Jan. 25, 1882. (No model.)

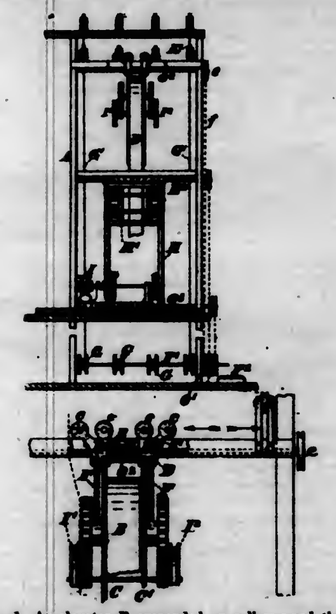
Brief.—The device is to be attached to the top of a system of pipes, so that when filling the system for the first time from the bottom the air which is in the pipes may escape through E, while the water rising to that height will raise the float D and close the valve. Also, in case of the pipes draining very rapidly, the valve will fall and prevent a vacuum forming in the pipes.

Claim.—1. The casing A, inclosed float D, main valve E, and sub-valve F, and means for attachment to a pipe, arranged to serve as herein specified.

2. The valve or valves F, arranged to control the series of small apertures *c c*, and open one of the apertures at a time, in combination with the operating-float D and with a casing, A, with provisions for connecting with a water-pipe, as herein specified.

3. The hollow float D, open only at or near the bottom, in combination with the main valve E, sub-valve F, and casing A, as herein specified.

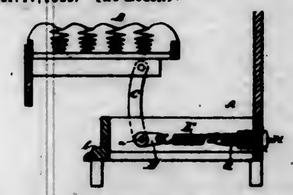
4. The shield-plate B and internal case or cup, C, having limited openings *c*, arranged to serve relatively to the float D, main valve E, and external casing, A, as herein specified.



5. The combination, with the main valve E, float D, shield-plate B, and casing A, of the check-valve M, arranged to serve as herein specified.

257,854. NUT-LOCK. WILLIAM S. F. DILLON, Madeira, Ohio. Filed Apr. 13, 1881. (No model.)

Claim.—The combination, substantially as specified, of bolt A with the nut composed of two parts, B and C, secured by screw-thread connection, as shown, the screw connecting the two parts of the nut being of a different pitch from the screw upon the bolt.



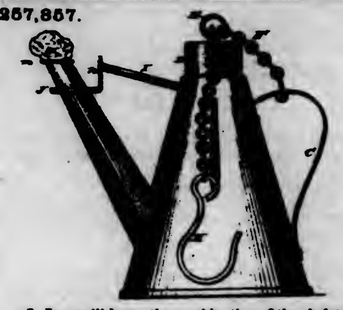
257,855. GRAIN-CONVEYER. ROBERT DUNBAR, Buffalo, N. Y. Filed Jan. 28, 1882. (No model.)

Claim.—1. An elevator, B, suspended on rollers *e* and their supporting and connecting mechanism C C' D' D² and beams E E', substantially as specified, in combination with a screw-shaft, *d*, provided with a pulley, *e*, for connecting by a suitable cable, *f*, with the engine-pulley *d'*, for the purpose of giving it a horizontal adjustment, substantially as described.

2. An elevator, B, provided with rollers *e* and their connecting and supporting mechanism C C' D' D² and beams E E', as specified, and having the driving-pulleys I' I², frames H H', and tightening-pulleys, and the engine I and its connecting-cables, in combination with the horizontally-adjustable screw-shafts, the winding-drums G and their connecting-cables and pulleys and a suitable engine, whereby either a horizontal or vertical adjustment may be given to the elevator.

257,856. BED-LOUNGE. FREDERICK FREDERICK, Chicago, Ill. Filed Mar. 17, 1882. (No model.)

Claim.—1. In bed-lounges of the class described, a single spring, E, coupled with an arm, D, on shaft *c*, and adjustably connected with the body A, substantially in the manner and for the purpose described.

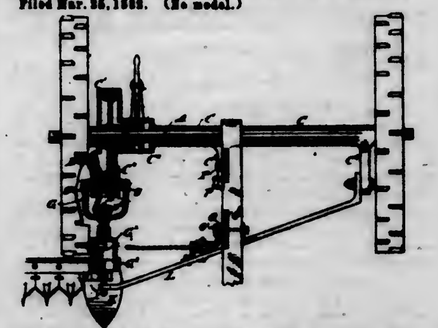


2. In bed-lounges of the class described, the combination of shaft *c*, arm D, spring E, hook G, and adjusting-screw H, all constructed and arranged substantially as and for the purpose set forth.

257,857. MILK-LAMP. JAMES L. FORSAITH and AARON S. KREITER, Sharpsburg, Pa.; said Kreiter assignor to said Forsaith. Filed Jan. 14, 1882. (No model.)

Claim.—1. In a milk-lamp, the combination of the tube I, vertical arm a, and dish J with the wick-tube B, having opening *c*, substantially as herein described, and for the purpose set forth.

2. In a milk-lamp, the combination, with the wick-tube B, the skeleton wick-tube K, having flange *m*, and the skeleton tube L, substantially as herein described, and for the purpose set forth.



257,857.

3. In a milk-lamp, the combination of the skeleton wick-tube K, having a flange, *m*, with the wick-tube B, substantially as herein described, and for the purpose set forth.

4. In a milk-lamp, the chain F, having a hook, H, attached to the handle C, and passing through the swivel E, substantially as herein described, and for the purpose set forth.

257,858. MOWING-MACHINE. WILLIAM GAYER, Kokomo, Ind. Filed Mar. 26, 1882. (No model.)

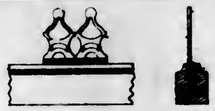
Claim.—1. The tubular main frame inclosing and protecting the main driving-gear, in combination with the pivoted casing-sleeves and shoe-bases connecting the cutting apparatus with said frame, substantially as described.

2. The tubular main frame surrounding the axle and provided with the arms C' and C², in combination with the cutter-frame hinged thereto in line with the pinion-shaft, the lever-arm C³, the pivoted tongue, and the adjusting-lever arranged and operating substantially as described.

3. The casing-sleeve G', surrounding the crank-shaft and rigidly connected with the finger-bar, in combination with the internal gear for actuating the crank to which the sickle-bar is attached.

4. The crank-wrist actuating the sickle-bar, in combination with the pinion on the crank-shaft, and the internally-geared rim for actuating said crank-wrist, whereby the latter is adapted to move in right lines and to be connected directly to the reciprocating sickle-bar head, substantially as described.

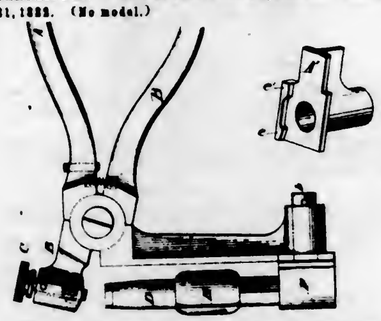
5. The reciprocating sickle-bar, in combination with an actuating crank-wrist connected directly thereto, and mechanism by which said crank-wrist is reciprocated in right lines, substantially as and for the purpose set forth.



6. The crank-shaft above pivoted to and adjustable around the secondary shaft as a center, in combination with the sleeve to which the inner shoe is rigidly connected, pivoted and turning upon the crank-shaft sleeve, and the means for adjusting said sleeves, arranged and operating in connection with the hinged shoe-brace and the hinged pole or tongue frame, substantially as described.

7. The combination, with the main drive-wheel axle, of the tubular casing-frame C, provided with the arms C', C², and C³, the casing-sleeves G and G', the latter rigidly connected with the shoe, brace L, and lifting-levers C' and F, substantially as described.

257,859. GRAVE-GUARD. ALFRED GERT, Sherman, Tex. Filed Dec. 29, 1881. (No model.)



Claim.—A grave-guard consisting of panels having a flange upon their front and a wedge-shaped tongue projecting downwardly into a groove, and of a base having a groove of greater width than

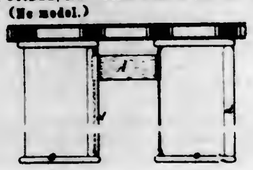
257,859.

the tongue, which is held in said groove by cement inserted from the rear of the panel, all combined and arranged for the purpose set forth.

257,860. IMPLEMENT FOR CAPPING AND DECAPPING CARTRIDGES. JAMES H. GILL, Philadelphia, Pa. Filed Jan. 21, 1882. (No model.)

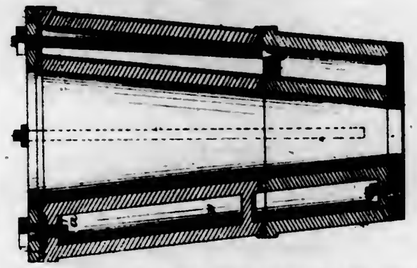
Claim.—1. The arm B, provided with the head I, having the recess *e* and adjustable punch C, in combination with the arm A, provided with the pendant A′, having the support or sleeve F journaled to its lower end, with the reversible or adjustable stud D, said parts being constructed and arranged to operate substantially as and for the purpose set forth.

2. In combination with the pivoted arms A B, the stud D, provided with the detachable spring-sleeve E, said stud D being journaled to the pendant A′ of the arm A, the construction and arrangement being substantially as shown and described.



3. In combination with the arm B, provided with the head I and adjustable punch C, the arm A, having the holding socket or sleeve F journaled thereto, as shown, and the stud D, provided with the detachable sleeve E, all arranged for joint operation as set forth.

257,861. PLOW. THEODORE E. GOLDEN, Columbus, Ga. Filed Mar. 1, 1882. (No model.)



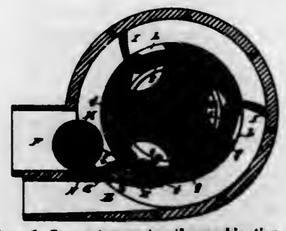
Claim.—The combination, with the beam A and standard C, provided with the upwardly and forwardly projecting side pieces, *g*, of the brace B, provided with perforations H, or their equivalent, arranged on an arc of a circle, the bolt D, extending through the upper ends of the side pieces, *g*, and the brace, and serving to clamp the standard in any desired adjustment, and bolt F, extending through the standard and through or beneath the beam, substantially as set forth.

257,862. LIMB-REST FOR RAILWAY TRAVELERS. FRANK H. GARDE, Ottawa, Ill. Filed June 30, 1881. Renewed Apr. 16, 1882. (No model.)

Claim.—As a new article of manufacture, the portable car-seat limb-rest, comprising the canvas portion A, adapted to fill the space between two car-seats, the cords B B, provided with hooks *b b*, and loosely confined by the side edges of the canvas, so that the canvas can be slid along upon the cords and compressed into a compact condition at one end of two adjoining seats when not in use or unoccupied, substantially as described.

257,863. TUYERE. ARCHIBALD D. GRIFFIN, Woodbury, Pa. Filed Jan. 17, 1882. (No model.)

Claim.—1. In a tuyere, the combination, with a body-section and a detachable nose-section, of bolts provided with hooks at their inner ends to engage bridges of the nose-section, and screw-threaded at their outer ends to receive nuts, substantially as set forth.



2. In a tuyere, the combination, with the tapering body-section, composed of two concentric shells separated by bridges, and the tapering detachable nose-piece, composed of two concentric shells separated by bridges, of hook-bolts adapted to engage the two sections in the manner described and bold them together.

3. In a tuyere, the combination, with the body-section composed of concentric shells separated by bridges and provided on opposite ends with the circular bridges or grooves, as described, and the removable end piece provided with grooves or ridges adapted to register with the ridges or grooves on the body, of the detachable nose-piece provided with the removable end and provided with ridges and grooves described, and means for securing the said nose to the body portion.

4. The combination, with the body of the tuyere provided with a removable end piece, the latter being provided with means for conveying water into and discharging from the water-space, and the detachable nose-piece, also provided with a removable end piece, of hook-bolts adapted to secure the said body and nose-piece together, substantially in the manner described.

5. The combination, with the body of the tuyere, constructed substantially as described, of the nose portion provided with a detachable end, the latter being provided with screws adapted to pass through bridges in the said nose portion and be secured therein by nuts and hook-bolts, adapted by engagement with the said body and nose portions to secure them together, substantially as set forth.

257,864. MOTOR. WILLIAM J. GUEST, Sarnia, Ontario, Canada. Filed Jan. 20, 1882. (No model.)

Claim.—1. In a rotary motor, the combination, with the pivoted wing-pistons, of the rubber-faced wheel M, as and for the purpose specified.

2. In a rotary motor, the combination, with the pivoted wing-pistons, of the rubber-faced wheel M and inclined planes or horns N, substantially as and for the purpose specified.

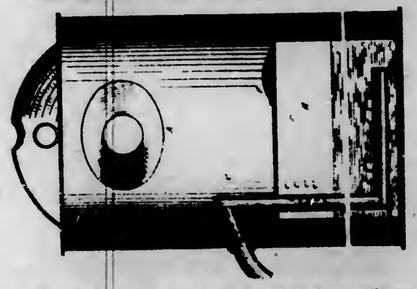
3. In a rotary motor, the combination, with a series of pivoted wing-pistons, of the circular guideway K, the rubber-faced wheel M, and the inclined planes or horns N, substantially as and for the purpose specified.

4. In a rotary water-motor, the pivoted wing-pistons I, in combination with the hub having recesses L, and with the water-exits *f* and *g*, as and for the purposes specified.

5. In combination with a rotary motor, the abutment G, provided with the leather flap *b* and spring-plate H, as and for the purpose described.

257,865. TIP FOR FLEXIBLE CORDS. JAMES H. HAMILTON, New York, N. Y., assignor to Eugene F. Phillips, Providence, R. I. Filed Nov. 26, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a flexible electric insulated conductor, an internally-threaded shell, and a stem or tip projecting through said shell, connected to the conductor, and compressed into close contact with the wire thereof by the screwing of the conductor into said shell, as set forth.



2. The combination of a flexible electric insulated conductor with an internally-threaded shell and a stem or tip provided with an enlarged stab at its inner end, which engages with the wire of the conductor and is compressed into close contact therewith by the screwing of the conductor into the shell, substantially as described.

3. The combination of an insulated spiral conducting-wire, an internally-threaded shell, and a stem or tip provided with a spiral stab for engaging internally with the wire between the convolutions thereof, substantially as described.

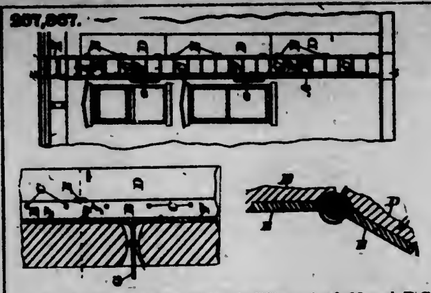
4. The stem or tip for flexible electric cords, provided with an enlarged flat spiraled stab at its inner end, substantially as described.

5. The cylindrical tip-shell internally threaded, open at its rear end and closed at its front end, with the exception of a central aperture for the reception of a tip or stem, substantially as described.

257,866. PROCESS OF AND APPARATUS FOR ADMINISTERING ANÆSTHETICS. SAMUEL J. HAYES, Pittsburg, Pa. Filed Mar. 17, 1881. (Model.)

Claim.—1. The process herein described of generating anæsthetic vapors and of aerating and applying the anæsthetic elements to the patient, which consists in charging the liquid into a suitable vessel or receiver and subjecting it to the action of a series of air-currents, and of surcharging the vapor arising therefrom with counter-currents of atmospheric air under pressure, whereby a light agreeable anæsthetic vapor having the necessary properties to support respiration and life is produced or developed and administered under pressure, substantially as herein described.

2. The vessel A, containing the chamber B, and having the perforated air-induction pipe C, substantially as set forth.



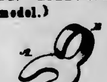
3. The combination of the vessel A with an interior generating-chamber, B, and an air-induction pipe, C, with an elastic tube, D, and an air-forcing device, constructed and arranged substantially as herein set forth.

257,867. FIRE-ESCAPE. JAMES C. HENDRICKS, Indianapolis, Ind. Filed Mar. 21, 1882. (No model.)

Brief.—A ladder fastened to the building is inclosed by a door having spring-hinges. The door is opened by a releasing-bar, to which the catch is secured, and operated by levers extending into the inside of the building. A hinged supplemental ladder leads to the roof.

Claim.—1. A fire-escape for buildings, consisting of a common ladder attached permanently to the wall, a door for inclosing the same, and means, substantially as described, for operating said door, whereby said operation can be effected from the inside of the building, substantially as set forth.

257,867.



2. The combination, with a building, of a ladder, A B C, a door, D, therefor, a catch thereon, and a rod, F, provided with handles or levers extending to the inside of the building, whereby said catch mechanism can be operated from any one of several floors to release said door, substantially as set forth.

3. The combination, with a building, of a fire-escape consisting of a ladder, a door or doors therefor, mounted on spring-hinges, and mechanism, substantially as described, for fastening and releasing said door or doors, all substantially as set forth.

4. The combination, with an inclosed fire-escape ladder, as specified, of a supplemental roof-ladder, H, which is adapted to be thrown back or let down, substantially as described, and for the purposes specified.

257,868. HOG-RING. HENRY C. HILL, Clinton, Ill. Filed Mar. 11, 1882. (No model.)

Claim.—The nose ring or jewel for swine, consisting of the plate A, of horseshoe form, having prong or prongs B, extending endwise therefrom, and the indentation *a* in its front part, as shown and described.

257,869. GRINDING-SURFACE OF ORE AND OTHER PULVERIZERS. FREDERICK J. HOYT and WILLIAM H. HOYT, New York, N. Y. Filed Sept. 24, 1881. (No model.)

Claim.—1. The revolving heads (one or more) having their grinding-surfaces composed of soft metal of the character specified, in combination with a shell adapted to such heads, for the purpose set forth.

2. The shell having its grinding surface or surfaces composed of soft metal of the character specified, in combination with revolving heads (one or more) co-operating with such shell, for the purpose set forth.

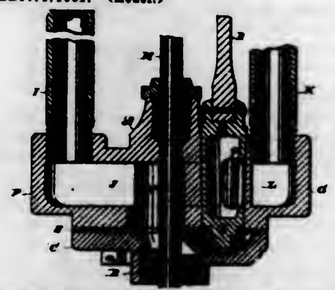
3. The combination of the revolving heads (one or more) and the shell or concave, both having soft-metal grinding-surfaces of the character specified, for the purpose set forth.

257,870. CAVITY-PLANE. FRANK A. HUMPHREY, Worcester, Mass. Filed Nov. 28, 1881. (No model.)

Brief.—A plane adapted to smooth the inner surfaces of cylindrical or curved holes or recesses.

Claim.—1. The body or frame formed with cylindrical ends or neck-bosses, constructed by the externally-rounded back bar and inwardly-inclined guard-flange, and the straight cutter-blade seated

on said back bar, with its sharpened edge protruding through the throat-opening at the rear of said guard-flange, the parts being combined and located in relation to each other and the exterior curvature substantially as shown and described.



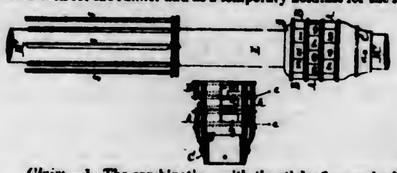
2. The combination of the body or frame having the back bar and front guard, the straight blade supported on said back bar, and the cheek-pieces fitted into said frame and pressed against the ends of said blade in direction of its length by a screw or clamping device axially arranged within the ends of the frame for retaining it in position, substantially as set forth.

3. The combination, substantially as hereinbefore described, of the frame having hollow screw-threaded ends A^5, connected to each other by the back bar, *a*, and guard-flange *a'*, as shown, the straight cutting-blade B, rested on said back bar, the cheek-pieces C, fitted in recesses of the frame ends and resting with a beveled surface against the ends of said blade, and the detachable handles D, having studs or threaded ends for screwing into said frame ends and against said cheek-pieces, for the purposes set forth.

4. The combination, with the detachable handles D and blade supporting frame A, of the convertible tip-pieces E, adapted for use as set-screws for the cheek-pieces when the handles are detached or as end nuts on said handles, substantially as hereinbefore described.

5. The combination, with the body or frame A, of the handles D, having the screw-threaded end studs, D', with projection *f*, ferrule D^2, and tang D^3, screw-threaded at its outer end, *d*, and the convertible tip-pieces E, with sinks *e*, as shown and described.

257,871. PUMP. JOHN HUMPHREYS, Jr., Salem, Ohio, assignor to the Silver and Deming Manufacturing Company, same place. Filed Nov. 1, 1881. (Model.)



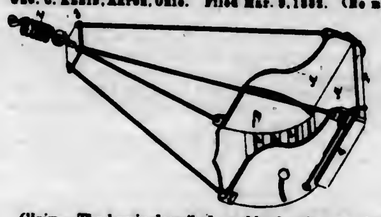
Claim.—1. In a pump for windmills, a valve-seat provided with channels *c*, *d*, and *f*, chamber P, and a plug, Q, all arranged for communication with the pump-cylinder, air-chamber, discharge-pipe, and escape-pipe, substantially as set forth.

2. The combination of the seat A, provided with chambers N, J, L, and P, with the pipes I and K and plug Q, substantially as shown and described.

3. In a pump for windmills, the combination of an air-chamber with a valve-seat provided with a three-way cock, with which the air-chamber is in direct communication, an inlet-opening, an escape-pipe, and a discharge-pipe, substantially as shown and described.

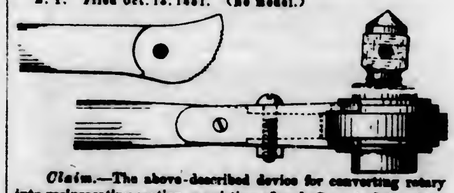
257,872. UMBRELLA OR PARASOL. ALPHONSE ISEL, Hasnamet, France. Filed Mar. 2, 1882. (No model.) Patented in France Aug. 30, 1881, in England Dec. 6, 1881, in Belgium Dec. 23, 1881, and in Austria Dec. 27, 1881.

Brief.—The lock is fixed to the stick and serves as a permutative lock for the runner and as a temporary holdfast for the same.



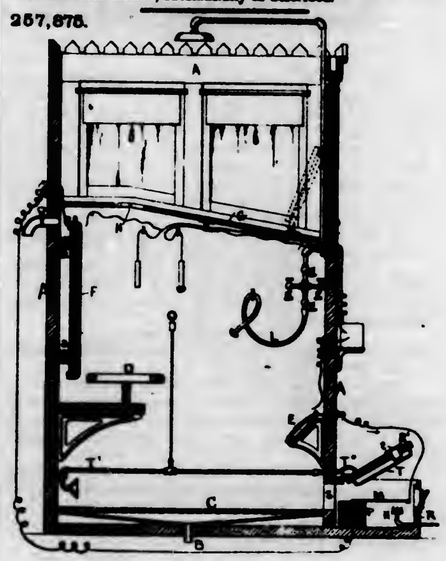
Claim.—1. The combination, with the stick of an umbrella or parasol, of a runner provided with a catch, *g*, a tube, D, mounted on and fixed to the stick and provided with a fixed ring, B, a vertical slot, *c*, and a lateral slot, *b*, and a loose ring, A, mounted to turn on the tube D, and provided with recessed flanges *a c*, and with characters on its outer periphery arranged to be brought into coincidence with similar characters on the fixed ring B, all arranged substantially as set forth.

2. The combination, with the stick of an umbrella or parasol, of a runner provided with a catch, *g*, a tube, D, provided with a vertical slot, *c*, and lateral slot *b*, and a fixed ring, B, and a loose ring, A, mounted to turn on the tube D, and provided with characters on its outer periphery adapted to be brought into coincidence with similar characters on the ring B, the tube D being fixed on the stick with the entrance of the slot *c* a little to one side of the path of the catch on the runner, whereby it is necessary to twist the runner on the stick in order to cause the catch to enter the slot, substantially as and for the purposes set forth.



3. The combination, with the stick of an umbrella or parasol, of the slotted tube D, provided with the fixed ring B, of the loose ring A and the screw-collar F, all constructed and arranged to operate substantially as set forth.

257,873. COMBINED BABY-JUMPER, SWING, AND BED. GEO. C. KLEIN, Akron, Ohio. Filed Mar. 9, 1882. (No model.)

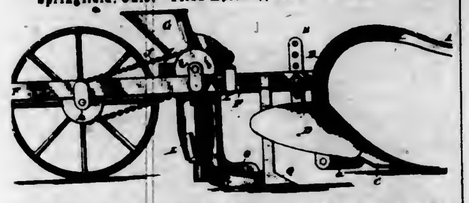


Claim.—The herein-described combined swing, consisting of the seat A, swinging back B, sliding board F, supporting-cords and revolving plate J, and spring L, all constructed and arranged substantially as shown, and for the purpose specified.

257,874. DEVICE FOR CONVERTING RECIPROCATING INTO ROTARY MOTION. WLADYSLAW T. KOSINSKI, Brooklyn, N. Y. Filed Oct. 13, 1881. (No model.)

Claim.—The above-described device for converting rotary into reciprocating motion, consisting of a shaft or stock to which rotary motion is applied by means of a serrated lever, pinochets rotating or having free motion around the shaft or stock, which are connected with the lever, and a spring for assisting in the production of said motion, substantially as described.

257,875.



257,875. ELECTRIC BATH. GEORGE W. LAWSON, Brooklyn, N. Y. Filed Jan. 24, 1882. (No model.)

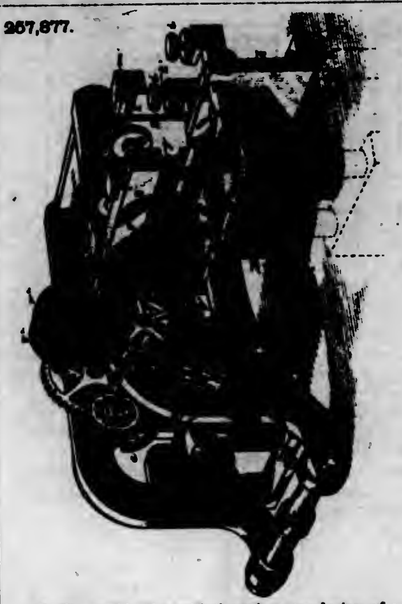
Claim.—1. The combination of a bath-chamber, A, a separate communicating chamber, B, burners M, placed therein, adapted to heat said chambers, an electro-thermal pile or battery, M M', adapted to be heated continuously on one side by said burners, and to be cooled on the other by a continuous current of water, and a back plate, F, and foot-rest E, constituting the electrodes of said battery, all substantially as and for the purpose herein set forth.

2. The combination, with an electro-thermal pile or battery, M M', a back plate, F, and foot-rest E, constituting its electrodes, and a bath-chamber, A, inclosing said electrodes, of a hot-water and vapor-generating tank, T, adapted to be heated by the calorific device of the battery, and communicating with the bath-chamber by a connecting-pipe, T, substantially as and for the purpose herein set forth.

257,876. CORN-PLANTER. JOHN LOGAN, Delphos, Kans., assignor, by mesne assignments, of one-half to E. S. Evans, Springfield, Ohio. Filed Apr. 26, 1881. (No model.)

Claim.—1. In a combined listing-plow and corn-planter, the combination of the triangular double-edged share having a flat front portion, the long and narrow mold-boards D, the subsoil-plows Q, arranged at the rear of said mold-boards and having inwardly-projecting wings R, the fixed seed-spout L, and vertically-adjustable furrow-opener O I', with the beam A, pivoted frame F, and seed-distributing mechanism, as and for the purpose herein set forth.

2. The plows Q, arranged on each side of frame F, and formed with the wing-shares R, and the vertically-adjustable furrow-opener O, having leg P, formed with ears *p*, in combination with the flanged seed-spout L, wheel K, chain J, the seed-dropping devices, frame F, and plow C D, substantially as shown and described.



257,877. PRINTING-TELEGRAPH. J. HOLMES LONGSTREET, Hoboken, N. J., and JOHN E. WRIGHT, New York, N. Y., assignors of one-half to John O. Moore, New York, N. Y. Filed Feb. 6, 1882. (No model.)

Brief.—A double-line printer with the type-wheel-rotating magnet in one line and the printing-magnets for the double type-wheel in the other line. The transmitter sends intensity-currents to line No. 1, which operates the step-by-step mechanism and rotates the type-wheels. When the desired letter or number is reached a key is pushed down, which stops the transmitter. One of two keys in the printing line or circuit No. 2 is closed and a plus or a minus current sent through the printing-magnet, dependent upon whether it is desired to print a number or a letter. A peculiar double-tongued electro-magnet whose armatures are released or retained by currents of opposite polarities.

Claim.—1. In a telegraphic printing-instrument, the combination, with two type-wheels and devices for rotating the same to and stopping them in desired positions, of a printing-pad for each type-wheel, separate armatures arranged to operate said pads, and two connected helices having permanently magnetic cores arranged to control said armatures, respectively, the arrangement of said helices being such that an electric current therethrough in one direction will neutralize, or partly neutralize, the core of one, while a current in the opposite direction will have a similar effect upon the other, substantially as described.

2. In a telegraphic printing-instrument, the combination, with two type-wheels fixed upon the same shaft and devices for rotating the said shaft to and stopping it in desired positions, of two printing-pads, one for each type-wheel, separate armatures for operating said pads, and controlled by the cores of separate helices, said cores being connected to one pole of a permanent magnet and the armatures pivoted to the other pole of said magnet, the arrangement of the said helices being such that an electric current in one direction will neutralize, or partly neutralize, the core of one, while the current in the opposite direction will have a similar effect upon the core of the other, substantially as described.

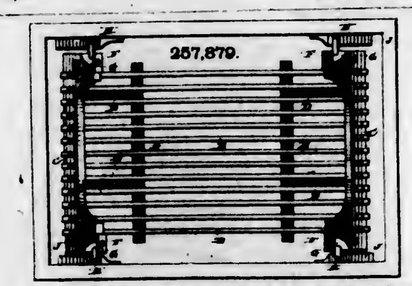
257,877.

3. The combination, with the unison-stop devices of a printing-telegraph provided with two type-wheels fixed upon the same shaft, of two armatures arranged to operate separate printing-pads for said wheels, respectively, and intermediate devices by which both of said armatures control said unison-stop devices independently of each other, substantially as described.

4. The combination, with the two type-wheels fixed upon the same shaft and suitable escapement devices, of the helices D D', surrounding cores forming extensions of one pole of the permanent magnet H, the armatures E and E', pivoted to the other pole of said permanent magnet, and provided with the arms *f* and *f'*, having the attached printing-pads, and the springs *g* and *g'*, substantially as described.

5. The combination, with the unison-stop devices, substantially as described, and the shaft *l*, carrying the tripping-arm M and provided with the pins *m* and *m'*, of the armatures E and E', controlled by separate electro-magnet cores, and the hooked arms *k* and *k'*, having their hooks arranged to strike said pins, substantially as described, and for the purpose set forth.

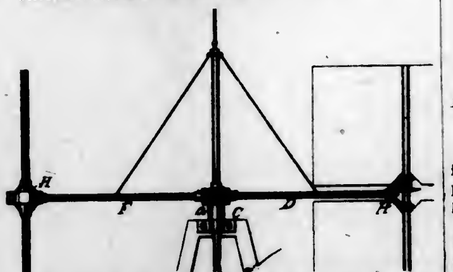
6. The combination, with a printing telegraph-instrument provided with two type-wheels fixed upon the same shaft, the escapement, and duplex printing devices, substantially as described, of a transmitting apparatus provided with means for sending reversed currents over one wire for operating said escapement devices, and means for sending reversed currents over a separate wire for operating independently of each other the two portions of said printing devices, substantially as described.



257,878. CAR-COUPLING. HENRY HARCHERTER, Wallaceburg, Ontario, Canada. Filed Feb. 20, 1882. (No model.)

Claim.—In a car-coupler, the combination of the chambers B, C, D, and E with the shuttles G and J, and their relation to each other, as herein shown and described.

257,879. BED-SPRING. JOSIAH B. HARTERS, Johnsonville, N. Y. Filed Apr. 13, 1882. (No model.)



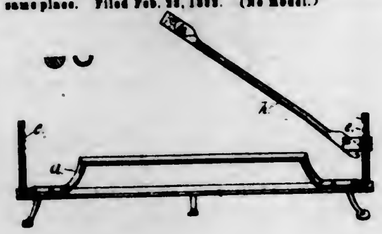
Claim.—1. The herein-described improved bed-bottom, consisting of the end frames, C D E, having sockets F, provided with diagonal arms G, having laterally-projecting lugs H, and the longitudinal slats B, connecting said end frames, as herein described.

2. In a bed-bottom constructed as herein described, the sockets F, having diagonal arms G, provided with outward-projecting triangular lugs H, as and for the purpose shown and specified.

3. The combination, with the bed-frame having the inclined ratchet-bars J secured to its sides, near the ends, of the bed-bottom consisting of the end frames, C D E, capable of being adjustably pivoted between the said ratchet-bars by lugs H, projecting outward from the diagonal arms G of sockets F upon the end bars of said end frames, said end frames being connected by the longitudinal elastic slats B, as herein described.

257,880. WIND-ENGINE. FRANK MCCLINTOCK, West Union, Iowa, assignor of one-half to Wm. McClintock, same place. Filed Mar. 20, 1882. (No model.)

Claim.—1. In a horizontal wind-engine, the combination, with a vertical vane-shaft and vertical revolving mill-shafts, of bevel-gearing arranged and operating substantially as and for the purpose specified.



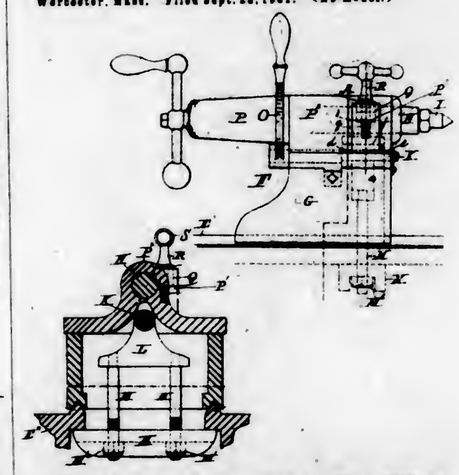
2. In a horizontal wind-engine, the combination, with a vertical vane-shaft and vertical mill-shafts connected by bevel-gearing, so that two revolutions of the engine cause the mill-shafts to make one revolution in the same direction, of covered beam C and H, and hollow arms D, E, F, and G, for covering and protecting the gearing, substantially as specified.

257,881. ROOFING-PAINT. ALLEN MCDERMELL, Rule, Nebr. Filed Oct. 14, 1881. (No specimens.)

Claim.—1. The herein-described paint for roofs, consisting of a mixture of coal-tar, turpentine, sulphuric acid, and a suitable pigment material, substantially as herein described.

2. A composition for painting roofs, consisting of a mixture of coal-tar, turpentine, sulphuric acid, and asphaltum, when mixed in the proportions and by the process substantially as herein described.

257,882. ROSE-LOCK FOR VEHICLES. HENRY C. MCFARLAND, Indianapolis, Ind., assignor to Martha A. McFarland, same place. Filed Feb. 28, 1882. (No model.)

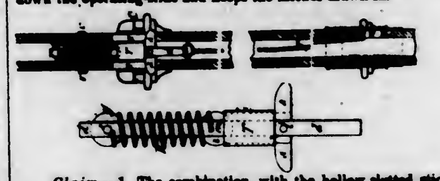


Claim.—1. The combination, with frame *a*, of bar *b*, adjustably secured to uprights *c* and *c'*, substantially in the manner described, for the purpose set forth.

2. A robe-locking device consisting of the holding-frame *a* and locking clamping-bar A, substantially as described.

3. The above-described robe holding and locking device, combined with a foot-rest and a carriage-body, substantially in the manner described.

257,883. TAIL-STOCK FOR LATHES. MICHAEL F. MCMAHON, Worcester, Mass. Filed Sept. 28, 1881. (No model.)

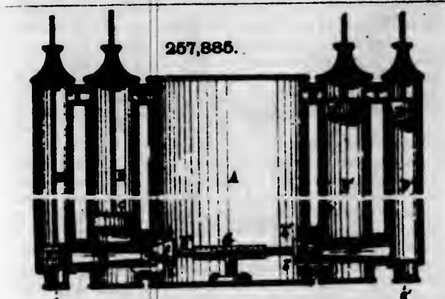


Claim.—1. The combination, with the part P' of spindle-casing P' and spindle H, of friction-block Q and its holding and compressing bolt R, substantially as shown and described, for the purpose stated.

2. The combination of a horizontal longitudinal cam-spindle, K, provided with a turning-handle, O, and so formed as to raise and lower a hanger, L, when said spindle K is turned, tie-rods M M, and binding-shoe N, substantially as shown and described, for the purpose stated.

257,884. UMBRELLA. JULES WIENER, Paris, France. Filed Apr. 6, 1882. (Model.) Patented in France Feb. 27, 1882.

Brief.—When the umbrella is raised the runner rests on the projecting ends of the latches. When closed the runner presses down the operating-slide and keeps the latches drawn in.

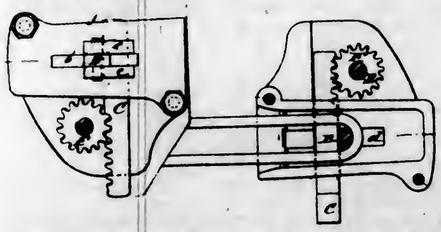


Claim.—1. The combination, with the hollow slotted stick and the draw-rod, of the spring-rod, the latches pivoted in the spring-rod and arranged to project through slots in the stick, the spring arranged to press upon the latches, and an intermediate piece between the latches and the spring, all arranged to operate substantially as set forth.

2. The combination, to form a device for holding and releasing the runner of an umbrella, of the spring-rod *d*, the roller *g*, the latches *a a*, the intermediate piece, *p*, and the spiral spring R, all arranged to operate substantially as set forth.

3. The combination, to form a device for holding and releasing the runner of an umbrella, of the spring-rod, the roller *g*, the latches, the tubular piece *p*, the disk *r*, and the spring R, all arranged to operate substantially as set forth.

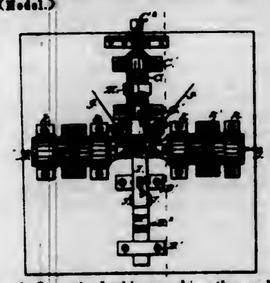
257,885. AIR-COMPRESSOR. CHARLES HOUSON, New Haven Conn. Filed Mar. 20, 1881. (Model.)



Claim.—1. The cylinder B, discharging compressed air through its port *b* into the air-chamber A by means of the piston C, in combination with the cylinder D, discharging natural air through its port *d* into the air-chamber A by means of its piston E, said pistons descending simultaneously within their respective cylinders for the purpose of injecting a current of natural air into a current of compressed air while both currents are moving in the same direction, substantially as specified.

2. The combination of the air-chamber A, the cylinders B D, the pistons C E, the ports *a b c d*, and valve *e*, to facilitate the descent of the piston E in its cylinder D by the pressure of the compressed air upon its upper surface, substantially as described.

3. The improved air-compressor herein described, consisting of the chamber A, cylinders B E' D D', pistons C C' E E', ports *a a' b b' c c' d d'*, valves *e e'* F, and standard G, all operating substantially as shown, and for the purpose specified.



257,886. CAR-COUPLING. ADONS MORRISON, Boston, Mass., assignor to William J. Bride, same place. Filed Mar. 23, 1881. (No model.)

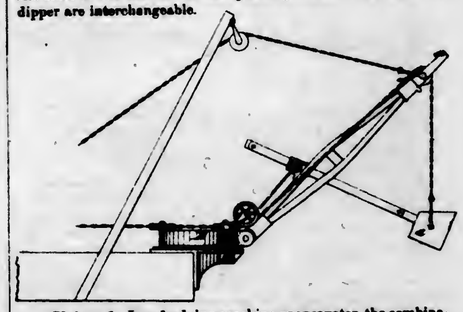
Claim.—1. In a car-coupling, the pivoted coupling-pin B, in combination with the sliding bar C, substantially as and for the purposes set forth.

2. In a draw-head of a car-coupler, the combination of the pivoted pin B, adapted to swing vertically in the passage *j* and recess *d* on a horizontal pivot, and the abutment or bar C, adapted to be moved across the recess *d*, to form a stop against which the end of the pin shall contact, and to be withdrawn from said recess to release the pin in the act of uncoupling, all substantially as described, and for the purposes set forth.

257,887. MACHINE FOR MAKING WIRE-BARB FENCES. ANDREW H. HUNTER and BENDIX HUNTER, Lee, Ill. Filed Jan. 16, 1882. (Model.)

Claim.—1. In a wire-barbing machine, the combination, with mechanism for cutting the barbs and mechanism for twisting them around the main wire, of a movable die, *b*, and a die, *c*, for forming a bend or offset, *d*, on the main wire D prior to cutting and twisting the barbs around the main wire, substantially in the manner herein shown and described.

2. In a wire-barbing machine, the combination of the steel dies S S, having grooves or guides *f'*, arranged on different horizontal planes for the reception of the wires *g g*, and the rocking or vibrating shaft provided with the knives E E, arranged relatively to each other, substantially in the manner as and for the purpose specified.



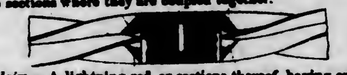
3. In a wire-barbing machine, the combination of the tubes K K, adapted to be revolved in opposite directions, and each provided with the projecting portions L L, provided with plates *l l*, having beveled lugs *l' l'*, provided with slots *l' l'*, substantially as and for the purpose specified.

4. In a wire-barbing machine, the combination, with the steel dies S S, of the longitudinally-adjustable and transversely rocking or vibrating shaft C, provided with the knives E E, substantially in the manner as and for the purpose herein shown and described.

5. In a wire-barbing machine, the combination, with the die *c*, of a movable die, *b*, having a central depression, *b'*, and two of its corners diagonally opposite each other, provided with tapering or pointed projections *b' b'*, substantially as and for the purpose specified.

257,888. DREDGER AND EXCAVATOR. RALPH E. OSBORN, Troy, N.Y. Filed May 27, 1880. (No model.)

Brief.—The pole-guides are pivoted on the same boom or crane, with a pivoted guide for the dipper-handle, and on opposite sides of the sheaves for the operating-chains. The scoop and dipper are interchangeable.



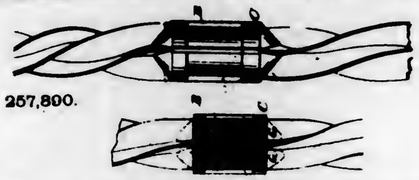
Claim.—1. In a dredging-machine or excavator, the combination, with the swinging boom or crane, carrying the shovel-handle guide, of the pole-guides for the clam-shell-dipper poles mounted upon said boom or crane, and adapted to operate substantially in the manner and for the purposes set forth.

2. In combination with the swinging boom or crane, the guide for the dipper-handle axled upon said boom, and the pole-guides also axled thereon on opposite sides thereof and on opposite sides of the sheaves for the operating-chains, substantially as shown and described.

3. The herein-described convertible excavator, the same being composed essentially of the boom or crane carrying the movable dipper-handle guide and fittings, and the clam-shell-pole guides mounted upon said boom or crane, the whole being adapted for use substantially in the manner and for the purposes set forth.

257,889. LIGHTNING-ROD COUPLING. THEODORUS H. PAYNE, Greencastle, Ind. Filed Oct. 18, 1881. (No model.)

Brief.—An enlarged portion is wrought upon or near the ends of the sections where they are coupled together.



Claim.—A lightning-rod or sections thereof having enlargements wrought upon them at or near their ends, which form a part of the material of which the sections are made, whereby said sections are strengthened at and near the points where they are joined together and the conducting capacity of the rod is increased, all substantially as set forth.

257,890. LIGHTNING-ROD COUPLING. THEODORUS H. PAYNE, Greencastle, Ind. Filed Mar. 3, 1881. (No model.)

Brief.—The screw-threaded ends of the spirally-flanged rod-sections are screwed into the couplings, the pointed projections of the couplings fitting between the flanges of the rod. The couplings are then screwed together.

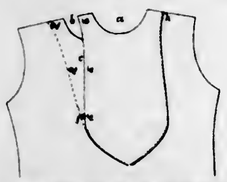
Claim.—A coupling for uniting the sections of a lightning-rod, consisting of two parts, B and C, the former being provided upon one of its ends with pointed projections and with an inter-

257,890.

nally screw-threaded cavity for the reception of an externally screw-threaded tenon or projection formed on the end of a section of the spirally-flanged portion of the rod and at its opposite end with a female screw-thread for the reception of a male screw formed on the part C, which part is provided with a cavity for the screw-threaded tenon or projection on the spiral portion or section, and with pointed projections, all substantially as and for the purposes set forth.

257,891. LIGHTNING-ROD COUPLING. THEODORUS H. PATER, Greencastle, Ind. Filed Nov. 1, 1881. (No model.)

Brief.—The sheet-metal portions, which are secured to the rod-sections, are swaged into depressions on the cast or wrought plugs, which are screw-threaded to form a coupling.

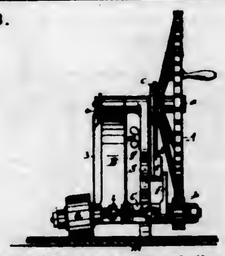


Claim.—1. In a coupling-section for lightning-rods, the sheet-metal portions B and F, their outer ends being formed with projections and depressions, whereby they are made to fit the spiral or intermediate sections of the rod, substantially as shown and described.

2. The combination, in a coupling-section for lightning-rods, of the sheet-metal part B and cast or wrought portion C, substantially as and for the purpose set forth.

3. The parts B, C, E', and F, in combination with the spiral or equivalently formed sections A A' of a lightning-rod, substantially as set forth.

257,892. SHIRT. ALBERT R. PERKINS, Newton, assignor to Simons, Hatch & Whitten, Boston, Mass. Filed Feb. 27, 1882. (No model.)



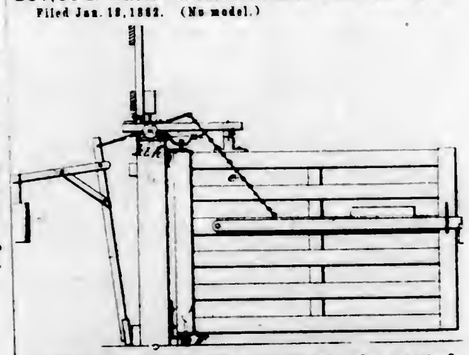
Claim.—The shirt-front having in its upper part the neck-notch *a*, and one or two supplementary notches, *b*, and a slit, *c*, extending down from each of said supplementary notches, all being substantially and for the purpose as set forth, the said shirt-front being provided with buttons and button-holes or other suitable separable fastenings, arranged substantially as represented.

257,893. MACHINE FOR GRINDING MOWER AND HARVESTER KNIVES. KING H. C. PRESTON, Manlius, N. Y. Filed Oct. 18, 1881. (No model.)

Claim.—1. A machine for grinding mower and harvester knives, consisting of a driving-wheel journaled at a fixed point on a stationary standard, a grinding-wheel hung in a vibratory frame, a suitable gear connected to the shaft of the grinding-wheel and actuated directly by the driving-wheel, an eccentric connected to the driving-wheel, and an oscillating lever having an adjustable fulcrum on the standard and actuated by the aforesaid eccentric, and engaging with its free end the frame which carries the grinding-wheel, all as described and shown.

2. In combination with the standard S, the arbor *a*, having

257,893.



connected to it the driving-wheel A and vibratory arm B, said arm having at its free end the horizontal extension C, and supporting thereby the grinding-wheel G and the shaft thereof, the pinion *b* on said shaft, the eccentric *e*, fixed to the driving-wheel, and the eccentric rod or lever *d*, fulcrumed on the standard S, and having at its free end the elongated bearings *e e*, engaging the lug *f* on the arm-extension C, substantially as described and shown.

3. In combination with the vibratory arm B, supporting at its free end the grinding-wheel and its axle, and the driving-wheel A, provided with the eccentric *e*, the eccentric-rod *d*, engaging with its free end the support of the grinding-wheel, and provided with the slot *r*, the standard S, provided with the slot *s*, and the fulcrum *g*, having a screw-threaded shank passing through the slot of the standard, and provided with the clamping-nut *r*, substantially in the manner set forth and shown.

4. The combination, with the grinding-wheel G, journaled on a frame which is connected with the vibratory arm B by a swivel or universal joint, of the shaft *k*, made flexible, or with universal joints *l l*, substantially as and for the purpose shown and set forth.

257,894. GATE. ADDISON F. PURNELL, Wake Forest, N. C. Filed Jan. 18, 1882. (No model.)

Claim.—1. The combination, with the gate and gate-post, of the lever pivoted to said post and provided with a slot, a pin on the gate working in said slot, devices for operating the lever to open and close the gate, and an auxiliary latch-releasing device connected with aforesaid devices and adapted to release the latch before motion is imparted to said lever, substantially as described.

2. The combination, with the latch, of the rock-shaft, its arms, and connections between the said arms and the latch for releasing the said latch, substantially as described.

3. The combination of the gate, gate-post, latch, horizontal lever for moving the gate, rock-shaft or other latch-releasing device carried by said lever, and operating devices connected with said lever and rock-shaft or latch-releasing device, so that in opening the gate the latch is first released independently of the said lever, and motion is then communicated to the latter to move the gate, substantially as described.

4. The combination, with the gate and gate-post, of the upright lever pivoted at the base of the post, and a horizontal lever pivoted to the said post at the top, and connected with the gates by means of a slot-and-pin connection, and adapted to be operated to move the gate by said upright lever, substantially as described.

5. The combination, with a gate, gate-post, and mechanism for moving the gate, of an upright lever having its pivot or fulcrum at the base of the post and connected with said mechanism, and one or more arms attached to and projecting from said upright lever to operate the same, substantially as described.

6. The combination of the upright lever, its operating-arms,

horizontal lever, rock-shaft, and connections for unlatching and for opening and closing a gate, substantially as described.

7. The combination, with mechanism for opening and closing a gate, of devices carried by the gate-post and operating independently of the weight of the gate, for holding the gate when opened in that position, while permitting it to be closed through said mechanism, substantially as described.

8. The combination, with a gate and mechanism for opening and closing the same, of mechanism operating independently of the weight of the gate and comprising a weight, a notched device, and one or more rollers, pins, or other projections for engaging the notch or notches of said device, as and for the purpose set forth.

9. The combination, with a moving lever capable of a slight vertical movement or movement lengthwise of its pivot, of rollers or projections on said lever and a notched disk or device, substantially as described.

10. The combination, with a hinged gate and its gate-post, of one or more counterpoises supported at the base of the post and connected with the pivot of the upper hinge, as set forth.

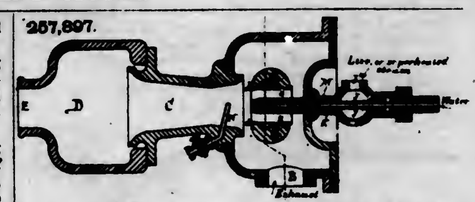
11. The hinge comprising, in combination with a pivot-pin, a plate pierced with a hole for the passage of the pivot-pin, and bent upon itself to form bearing for the end of the said pin, substantially as described.

12. An automatic gate comprising, in combination with the gate, gate-post, and latch, the following elements: upright lever with operating-arms, horizontal lever connected with gate, rock-shaft, or other latch-releasing device, such as indicated, carried by the horizontal lever, and connected with said upright lever and with the latch, and means, as explained, for holding the gate open by the engagement of rollers or projections in notches, substantially as described.

257,895. ALCOHOL-VESSEL FOR WATCH-MAKERS' USE. OSCAR P. ERRO, Melrose, Mass. Filed Jan. 25, 1882. (No model.)

Claim.—In an alcohol-vessel for watch-makers' use, a larger compartment, in combination with a smaller communicating compartment and a cover common to both, said cover being arranged to uncover the smaller compartment without uncovering the other, substantially as set forth.

257,896. CORE BREAKER AND LIFTER. H. C. ERICHARDT, Pottsville, Pa. Filed Feb. 19, 1883. (No model.)

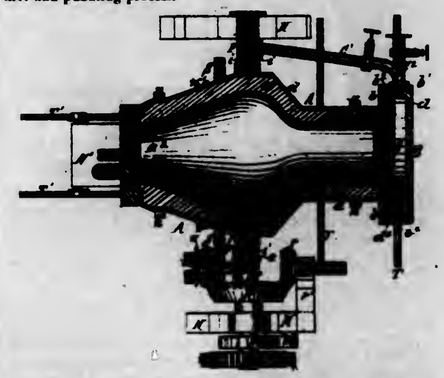


Claim.—1. In a core breaker and lifter for diamond-drills, the cylinder D, having an unobstructed internal surface for the passage of cores, and having the springs 1 1 1 attached thereto, each spring carrying a toothed wheel, 2, for the purpose of engaging the core and breaking or lifting it, in combination with the shell A, having the chambered recess B, with inclined surface roughened or grooved, with which the wheels 2 2 2 engage, and are forced downward and outward against the core, as shown and set forth.

2. The herein-described core breaker and lifter, consisting of the shell A, the cylinder D, the springs 1 1 1, the toothed wheels 2 2 2, in combination with the inner core-barrel, X, having slots X' X' X', as shown and set forth.

257,897. INJECTOR. DAVID RENSHAW, Cohasset, and SHARON B. H. TOWNE, Boston; said Towne assignor to said Renshaw; said Renshaw assignor of one-half to Harvey T. Litchfield, Hull, Mass. Filed Jan. 14, 1880.

257,897.



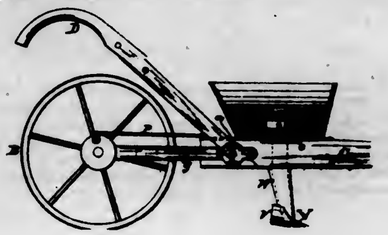
Claim.—1. In an injector, the ring G, provided with a chamber, *a*, in combination with the tube H, the passages *o c*, and the exit or mouth *d*.

2. In an injector, the combination of the steam-chamber J, adjustable tube M, tube K, and ring G, constructed as described, substantially as and for the purpose set forth.

3. In an injector, the combination of the chamber A, the ring G, constructed as described, the tube H, tubes K and M, and the tapering nozzle C, substantially as and for the purpose set forth.

257,898. MANUFACTURE OF PUDDLED IRON. WILLIAM SMITH, Pittsburg, Pa. Filed Oct. 24, 1881. (No model.)

Brief.—The apparatus is capable of use in a combined Bessemer and puddling process.



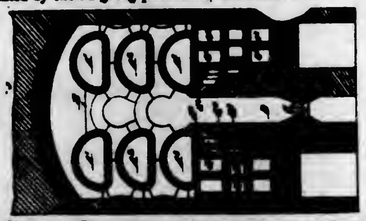
Claim.—1. The converter-body A, in combination with band I, rim F, trunnions E E', and supports H, whereby the body has rotary movement on both its transverse and longitudinal axes, as described, and with an air-supply chest, C, loosely secured to the body, as described, whereby such air-supply chest is movable with the body on its transverse axis, but stationary with relation to rotary movement of the body on its longitudinal axis, and tuyeres *c*, substantially as set forth.

2. A converter-body, A, having a surrounding flange, d^3, at its bottom end, in combination with chambered bottom B, having rim *b'*, cap or band *b*, tuyeres *c*, such bottom being adapted to permit axial rotation of the converter-body, the bottom being stationary, and blast-pipe C', substantially as set forth.

3. A converter, A, having a band, I, with tongue *i*, surrounding and secured to its middle zone, in combination with rim F, having groove *e* therein, adapted to receive tongue *i*, trunnions E E', and frames H, for supporting the rim and converter, and mechanism for rotating the converter on its trunnions and also axially within the rim, substantially as and for the purposes set forth.

257,899. SEED-PLANTER. ELISHA SPILLER, St. Helena Parish, La. Filed Jan. 3, 1882. (No model.)

Claim.—In a seed-planter for planting seed in drills, the combination of beam C, wheel B, eccentric and rod *g*, handles D, hollow standard W, slotted arms Y, plow V, adjustable plates *f*, and spider *z*, all as described, and for the purposes specified.

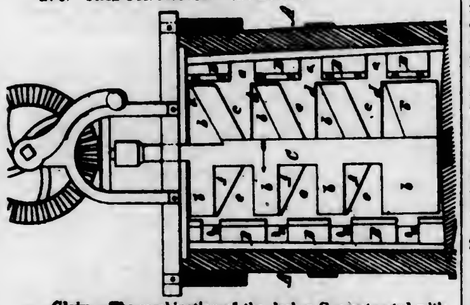


257,900. FENCE-POST. JOHN J. SQUIER, Sedalia, Mo. Filed July 11, 1881. (No model.)

Claim.—As a new article of manufacture, the cast-metal post A, having a rounded or semi-cylindrical body, D, provided with a central rounded rib, E, notched at *e*, and integral therewith, a base, B, having pointed and ribbed end *b b' b² b³*, said base being offset from D, so as to have on its upper end the driving-cap C, all substantially as described.

257,901. FURNACE FOR RETORTS. WILLIAM A. STEBBINS, Newport, R. I., and IRA H. STANLEY, Brooklyn, N. Y. Filed June 4, 1881. (No model.)

Brief.—The ingoing air to support combustion in the furnace is heated by the outgoing products of combustion.

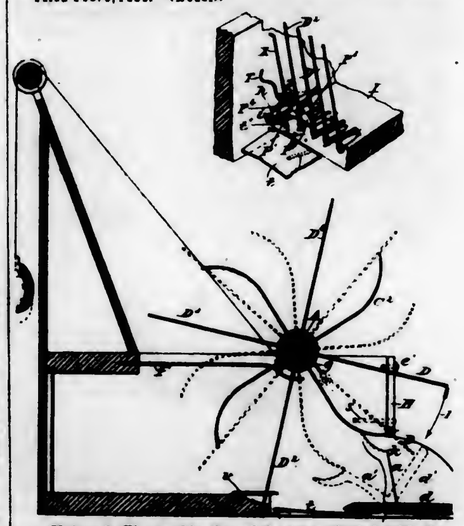


Claim.—1. In a gas apparatus, the combination, with a bench of retorts, A' A² A³, with provisions for circulating hot products of combustion around them, of inclosing masonry B, having flues *c' c² c³*, arranged to conduct the products of combustion twice forward and back, and also having flues *d' d²*, for conducting air through the space between them, arranged to absorb heat from above and below, substantially as herein specified.

2. In a gas-manufacturing apparatus, the furnace D, formed with orifices *d²* in the side walls, as shown, in combination with longitudinal hot-air flues *d' d³* and connecting-passages, and with the flues *d' d²*, receiving the air and partially heating the same, all arranged relatively to each other and to the flues *c' c² c³*, for conveying the hot products of combustion from the vicinity of the retorts, substantially as herein specified.

3. In combination with the bench of retorts A' A², &c., surrounding masonry B, and furnace D, the hollow grate-bar C, valved and connected as shown, and having perforations *e e* arranged in the contracted base of the furnace, as and for the purpose herein specified.

257,902. CHURN. VALENTINE STIREWALT, Davidson College, N. C. Filed Dec. 12, 1881. (No model.)



Claim.—The combination of the dasher C, constructed with sets of blades *b b*, having inclined surfaces and alternating spaces *c c*, as described, and the churn-body A, constructed with vertical cleats B B on its inner surface, the said cleats being broken or interrupted by cross notches or spaces *a a*, the notches of one cleat alternating in position with those of adjacent cleats, substantially as and for the purpose herein specified.

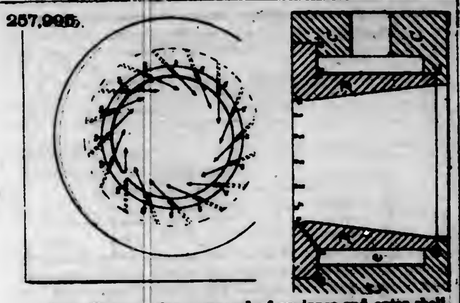
257,903. BUFFING-TOOL. FRANK W. STORY, Lynn, assignor of two-thirds to Frederick S. Andrews, Gloucester, and Fitzhugh S. Andrews, Essex, Mass. Filed Jan. 24, 1882. (No model.)

Claim.—The improved tool above described, consisting of the elastic yielding pad A, having its bottom face covered with fine emery or other suitable scouring material attached directly to the surface of the pad, the non-elastic shaft D, and base E, molded in the pad, substantially as set forth.

257,904. ANIMAL-TRAP. HIRAM B. SWARTS, Wooster, Ohio. Filed Feb. 8, 1882. (Model.)

Claim.—1. The combination of the trap-wheel A with the spokes D, the floor having the grooves *c*, and the feeders F, when arranged to intercorrespond, the feeder X, and the set of first four spokes, D' D² D³ D⁴, when arranged to intersect consecutively the swivel E, substantially as shown and described, and for the purpose specified.

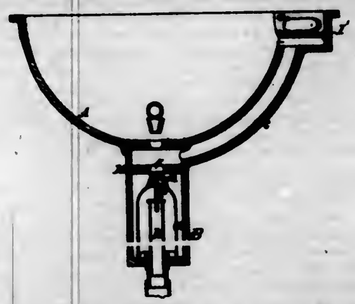
2. The combination of the four spoke-arms *c c' c² c³*, extending from one end of the axle of the trap-wheel at right angles to each other, respectively, and the tilting arm *a* with the tilting board *d*, all being shaped substantially as shown, and as and for the purpose specified.



3. The combination of the four spoke-arms *c c' c² c³* with the swinging stop H upon the pivot *s*, operated and limited in its movement by the spring *s'* and the stop *s*, substantially as and for the purpose specified.

4. The swivel E, having four arms, P P' P² P³, at right angles to each other, respectively, and rotating upon a pivot, *c''*, in connection with the stop *f*, which limits its movement, and the lever T, fulcrumed at *c''* and resting with its short arm upon the treadle *t*, substantially as and for the purpose specified.

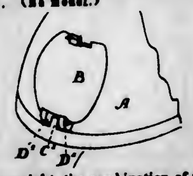
257,905. FEEDING AIR TO FURNACES. GEORGE B. H. TOWER, Boston, assignor to David Renshaw and Lydia F. Renshaw, Cohasset; said David Renshaw assignor to Harvey T. Litchfield, Hull, Mass. Filed Oct. 21, 1878.



Claim.—1. The combination, with the bridge-wall of a furnace, of the tile or casting provided with a double wall, between which is formed an annular chamber for the heating of air, and oblique outlets, whereby the air issuing therefrom forces the passing products of combustion to take a circular or revolving course for the better admixture of the two elements, as described, and in the manner set forth.

257,905.

2. A tile or casting composed of an inner and outer shell, forming an air-chamber between them, one of which is provided with recesses and the other with corresponding projections to fit therein, the inner shell having oblique apertures, whereby the air and gases are made to take a whirling or revolving course while passing through the flue, substantially as herein set forth and described.



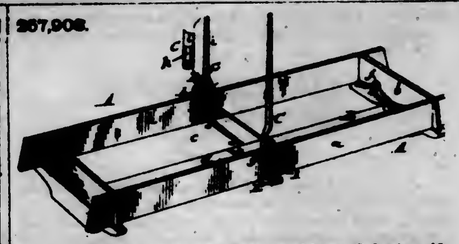
257,906. WASTE-PIPE TRAP. EDWARD A. TUTTLE, New York, N. Y. Filed Mar. 31, 1881. (No model.)

Claim.—1. The combination, with the trap-case B and the vertical extension K of the waste-pipe therein, of the inverted cup-shaped valve G and the seat H therefor, located above said valve, substantially as described.

2. The waste-pipe-trap case B and its connections with the basin, constructed together and integral with the basin A, and with an opening from the basin into said case for the admission of the valve, also with the seat for said valve detachably arranged, substantially as described.

257,907. TOE-WEIGHT. GEORGE E. TWAMBLEY, Saco, Me. Filed Dec. 5, 1881. (No model.)

Claim.—In a toe-weight, the combination of the shoe C, provided with the projection *d'*, with the bolding-piece D D², latch-spring H, and weight B, all operating together substantially as described, and for the purpose set forth.



257,908. DUMPING-WAGON. DAVID S. WATSON, Stratford, N. Y. Filed Mar. 7, 1882. (Model.)

Claim.—1. The herein-described box or body for wagons, consisting of the fixed ends and sides, the longitudinally-divided bottom having hand-levers rigidly applied to its pivoted sections, and devices, substantially such as described and shown, for locking said levers in an upright position.

2. In combination with a pivoted section of a wagon-box bottom, a tipping or operating lever connected with said section, and provided with an ear to engage over the side of the box for the purpose of sustaining said section.

3. The herein-described wagon-box, consisting of the body A,

257,908.

the pivoted bottom sections, *c d*, the hand-levers C, having side cam, *g*, attached to the bottom sections, *c d*, and the catching or locking devices D, all combined and operating substantially as described.

4. In combination with the tipping sections *c d*, provided with rollers *j*, the curved supporting track or bar H, substantially as and for the purpose set forth.

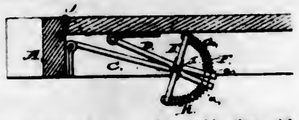
5. In combination with the body having tipping bottom sections and hangers, *h*, the supporting track or cross-bar having its ends notched and passing through the eyes of the hangers, as explained.

6. In combination with the sections *c d*, pivoted or journaled at their ends, a support located at a point between the ends and concentric with the pivots or journals, as and for the purpose set forth.

7. In combination with the tipping sections *c d*, the levers C, having the sockets *h* and detachable handle *i*, as and for the purpose explained.

257,909. MECHANISM FOR SUPPORTING AND LUBRICATING THE SPINDLES OF RING-SPINNING FRAMES. JOSEPH W. WATTLES, Canton, Mass. Filed Feb. 18, 1882. (No model.)

Brief.—Improvement upon Letters Patent No. 248,816. The spindle is supported by a tubular bolster, which is carried by a fixed standard or wick-carrier, between which and said bolster is placed a tubular wick. Lateral oil-ducts are provided in the bolster, wick-carrier, and spindle-foot step in such position that when said parts are adjusted for operation such holes will open into each other, whereby the oil drawn from the reservoir by the wick will pass not only to the spindle-foot step, but to the outside of the tubular bolster, thereby lubricating all parts.



Claim.—1. The bearing-tube E and the spindle-foot step, arranged, connected, and provided with oil-ducts substantially as set forth, in combination with the oil-reservoir B, wick-carrier C, and tubular wick D, and with the spinning-frame spindle A, having the bearing foot or pivot *a*, the whirl *a*, and its sleeve *b*, all substantially as described.

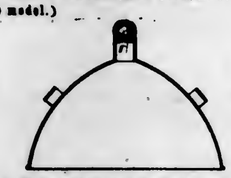
2. The spindle-foot step *s*, arranged within and connected to the bearing-tube E at the upper part thereof, and having not only a wick-receiving space between them, the said tube and step, but one or more ducts leading from the said space into the said step, all being substantially as set forth.

3. The wick-carrier provided with the tubular wick and extended upward from the oil-reservoir, and having in its upper part a step-socket, as described, in combination with the said oil-reservoir, and with a spindle having a foot or pivot, a whirl, and its sleeve, arranged as set forth, and also with a removable bearing-tube encompassing the wick and having a spindle-foot step extending into the socket of the said wick-carrier, and being, with the said bearing-tube, provided with oil-ducts, as set forth.

4. The combination, with the oil-reservoir, its wick, and stationary wick-carrier having the step-socket, the oil-ducts *v*, and stud *o*, and with a spinning-frame spindle provided with the foot or pivot, whirl, and whirl-sleeve, arranged as described, of the removable bearing-tube E and step *s*, connected thereto and provided with oil-ducts *u* and *w* and the notch *p*, such notch, when in engagement with the stud, being to prevent the tube from revolving on the wick and to bring the oil-ducts *u* and *v* to open into each other, in order for oil from a wick to flow into the step, as explained.

257,910. DOOR-SPRING. JESSE W. WEBBEL, Freeport, Ill., assignor of one-half to P. S. Kahley, same place. Filed Oct. 19, 1881. (No model.)

Claim.—In a door-spring, the combination, with the door-frame and door, of the hinged intersecting levers C D and the chord-plate E, united by a common pivot, I, and the metal arch F, passing through the perforated ends of the levers C D, and the spiral springs G, substantially as and for the purposes specified.



257,911. CORSET. WILLIAM S. ALLEN, Hillsdale, Mich. Filed Aug. 25, 1881. (No model.)

Claim.—1. In combination with a corset having a side opening to entirely disclose the hip of the wearer, an adjusting-strap provided with an enlargement forming a flexible shield adapted to entirely cover said hip-opening, whereby said shield prevents the flesh of the wearer from protruding through the hip-opening, and at the same time prevents undue pressure thereon, substantially as and for the purpose specified.

2. In combination with a corset having a hip-opening, as described, the flexible shield B, adapted to entirely close said hip-opening, and provided with a slit, *c*, and terminating in an adjusting-strap, *b*, substantially as and for the purpose described.

257,912. STEAM COOKING, HEATING, AND BAKING APPARATUS. WILLIAM C. BAKER, New York, N. Y. Filed July 28, 1881. (No model.)

Claim.—1. The combination, in a steam cooking apparatus, of a double exterior casing packed with mineral wool or similar non-conducting material, an oven or ovens, ranges of steam-heating pipes outside the ovens and within the double casing, and sand or similar material around the steam-pipes, substantially as set forth.

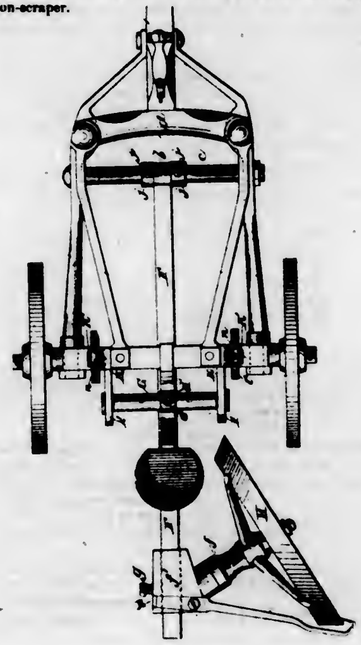
2. In combination with the oven in a steam cooking apparatus, the headers and steam-pipes above, below, and at the sides of the oven, and the connecting pipes and cocks, arranged, substantially as specified, to maintain a circulation of the steam throughout the range of pipes, as set forth.

3. In combination with the ranges of pipes and filling of sand in a steam cooking apparatus, a heating-chamber, B, resting upon the cooking apparatus and heated by the steam-pipes below it, substantially as set forth.

4. In a steam cooking apparatus, a case, *r*, in combination with a coil within the case and a cock to admit steam to pass at atmospheric pressure, or nearly so, through the coil, and become of the same temperature, or nearly so, as the surrounding steam under a higher pressure, substantially as set forth.

257,913. MARINE SIGNALING CODE. WILLIAM B. BARKER, Hoboken, N. J. Filed July 15, 1881. (No model.) Patented in England June 27, 1881.

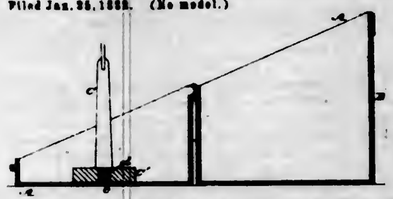
Claim.—1. The improved method of indicating the course of vessels at sea by eight predetermined sound-signals, each composed of systematically-arranged long notes of a vibratory or undulatory character and short notes of uniformly plain character, the four eastward signals commencing with a long vibratory or undulatory



sound, the four westward signals commencing with a short plain sound, the four northward signals ending with a short plain sound, and the four southward signals ending with a long vibratory or undulatory sound, as described, and adapted to be produced by means substantially as and for the purpose set forth.

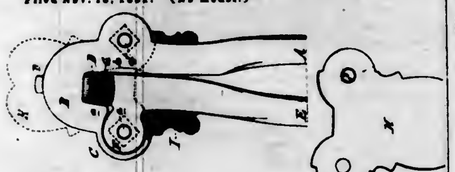
2. The improved method of signaling by sound to indicate the courses of vessels, adapted to be produced by means substantially as described, the north to north-east signal being composed of one long note of a vibratory or undulatory character and two short notes of a uniformly plain character; the north-east to the east signal one long vibratory or undulatory note and three short plain notes; the east to south-east signal one long vibratory or undulatory note, one short plain note, and one long vibratory or undulatory note; the south-east to south signal one long vibratory or undulatory note, two short plain notes, and one long vibratory or undulatory note; the south to south-west signal two short plain notes and one long vibratory or undulatory note; the south-west to west signal three short plain notes and one long vibratory or undulatory note; the west to north-west signal one short plain note, one long vibratory or undulatory note, and one short plain note; and the north-west to north signal four short plain notes, all produced with proper intervals of rest between each two distinct sounds or notes, as hereinbefore set forth.

257,914. SULKY-PLOW AND COTTON-SCRAPER. SAMUEL C. BAUCUM, Waco, Tex. Filed Jan. 16, 1882. (No model.)



Brief.—Beam is supported in the rear by a rod whose ends work in slotted arms, and adjustably connected at its front end to a transverse rod, whereby it may receive oblique adjustment. Said slotted arms are each operated by an independent lever. Disk supporting bracket is reversible to form a right or left hand plow. A substitutive bracket with two disks, to convert machine into a cotton-scraper.

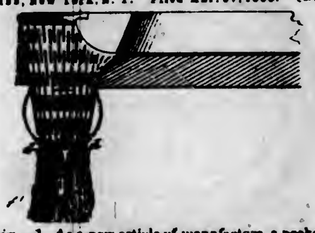
Claim.—1. The combination, with the beam F, having eye *b*, the bracket *f'*, and disk H, of the rod *c*, adjusting-collars *j*, rod G, support *d d'*, levers K, and slotted arms *k'*, all constructed and adapted to operate as described.



2. The combination, with the beam F, carrying disk H, of the rod *c*, collars *j*, rod G, support *d d'*, slotted arms *k'*, and independent levers K', substantially as described.

257,915. SHOW-BOX. ISIDORE BIRGE, Philadelphia, Pa. Filed Jan. 25, 1882. (No model.)

Claim.—The box A, having a glass, B, and an opening, *d*, through its bottom, in combination with the removable standard C, said standard being adapted to be sustained in the opening within or on the outside of the box, substantially as and for the purpose set forth.

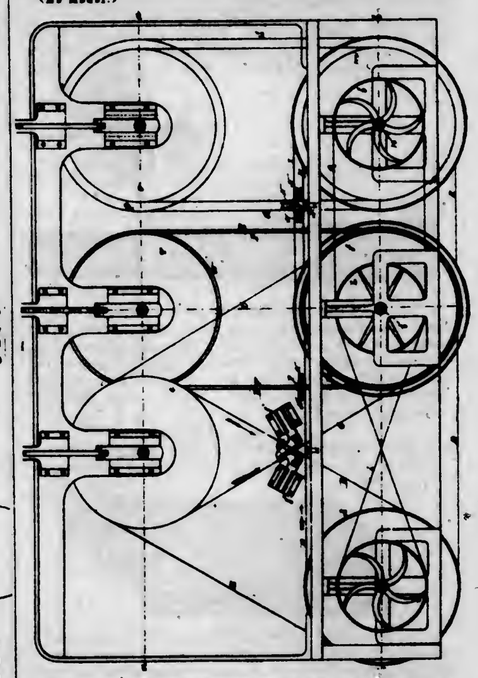


257,916. BOLT-CUTTER. ASEN BLOWERS, Cambridge, Mich. Filed Nov. 18, 1881. (No model.)

Claim.—1. In a bolt-cutting device, the handle A, with an overhanging head, B, ear C, and cutter D, in combination with the handle E, ear F, and cutter G, and suitable means for holding the parts together, the parts constructed, arranged, and operating substantially as and for the purposes described.

2. In combination, the handles A E, ears C F, and cutters D G, with the face-plates H I, and suitable means for securing the parts together and holding the plates in their respective places, all being constructed, arranged, and operating substantially as set forth.

257,917. BILLIARD AND POOL TABLE POCKET. HENRY BOECKEN, New York, N. Y. Filed Mar. 27, 1882. (No model.)



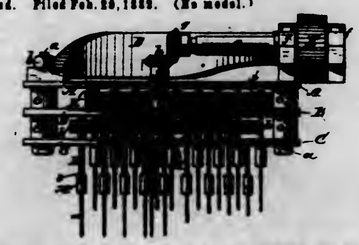
Claim.—1. As a new article of manufacture, a pocket for billiard and pool tables, constructed from a leather blank which is provided with longitudinal and alternating lines of short slits, whereby the pocket is capable of expansion and contraction when in use, substantially as set forth.

2. A blank for billiard and pool table pockets, provided with parallel longitudinal lines of slits, which slits alternate with each other, the blank having end fingers and strips of greater length at the middle than at the sides, substantially as set forth.

3. A blank for billiard and pool table pockets, having alternating longitudinal slits *a*, upper end strips or fingers, *b b' b²*, and lower fingers, *d*, having short slits *c*, substantially as specified.

4. A pocket for billiard and pool tables, constructed of a blank having alternating longitudinal slits, exterior longer strips or fingers, and interior shorter strips or fingers at the upper edge for attachment to the rail and irons, and slitted fingers or strips at the lower edge for attachment to the bottom ring, substantially as set forth.

257,918. MACHINE FOR SAWING BARREL-HOOPS FROM POLES. WILLIAM BOWERS, Somerville, assignor to himself and Robert Williams, Boston, Mass. Filed Jan. 23, 1882. (No model.)

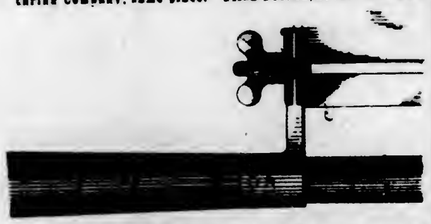


Claim.—1. The combination of two or more endless band-saws with a guide, *k'*, and a pressure-roller, N, located at and adapted to hold the work to each of such saws, substantially as set forth.

2. The combination of one or more sets of feed-rollers and a set of draft-rollers with two or more endless band-saws and a guide and pressure roller located at and adapted to hold the work to each of such saws, substantially as set forth.

3. Two next contiguous band-saws supporting pulleys provided with separate arbors, arranged in, or about in, line with each other, and having between them, and also between the two pulleys, a space, *e*, as described, a little wider than the band-saw to run on one of such pulleys, all being substantially as shown and specified, and for the purpose set forth.

4. The three endless band-saws B C D and their pulleys *d*, *e*, *f*, *g*, and *h*, the latter arranged in pairs, as shown, the pulley *f*, supporting the two saws C and D, the whole combined and arranged for simultaneously making three cuts in the pole, as set forth and described.



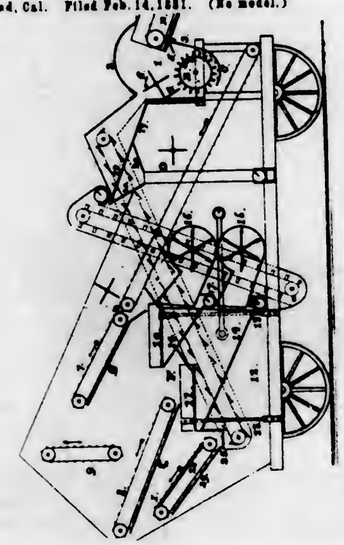
257,919. BORING-MACHINE. WATSON N. BROWN, Madison, Ind. Filed Feb. 20, 1882. (No model.)

Claim.—1. In a boring-machine, the combination, with the plates A B C, arranged as shown, of the two sets of shafts K L, having detachably connected thereto suitable drills, and the cog-wheels *i k*, secured to said shafts as a means of imparting motion thereto, substantially as and for the purpose set forth.

2. In a boring-machine, the plates A B C and hanger D, in combination with the shafts *d e*, provided with gear-wheels *g*, shafts F G, with gear-wheels A H I, and the two sets of spindles K L, having connected to them the cog-wheels and drills, substantially as and for the purpose specified.

257,920. SAW-HANDLE. WILLIAM CLEMMER, Middletown, N. Y., assignor to the Wheeler, Madden & Clemmer Manufacturing Company, same place. Filed Feb. 11, 1882. (Model.)

Claim.—The combination, with the saw-handle and socketed shank secured thereto, said shank being provided with longitudinal grooves in its sides and bottom, with an enlargement, C, having convex surfaces and provided with intersecting holes, of a clamping-bolt, a fastening-nut, and a sleeve provided with a concave bearing that fits the convex surfaces of said enlargement C, substantially as set forth.



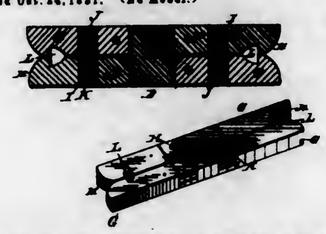
257,921. METHOD OF ORNAMENTING TEXTILE FABRICS. PARLEY A. DAILEY, New York, N. Y. Filed July 18, 1881. (Specimens.)

Claim.—1. As a new article, a fabric of fibrous material having interposed spots composed of threads passing through from one face to the other of the fabric, with the ends spread and interlocked with the fibers of the fabric, substantially as specified.

2. The method herein specified of spotting textile fabrics, consisting in passing threads through the fabric, cutting off such threads at or near the surface of the fabric, and causing the fibers to expand and interlock, so as to hold the spotting-threads in place, substantially as specified.

257,922. THRASHING-MACHINE. HENRY M. DALTON, Oakland, Cal. Filed Feb. 14, 1881. (No model.)

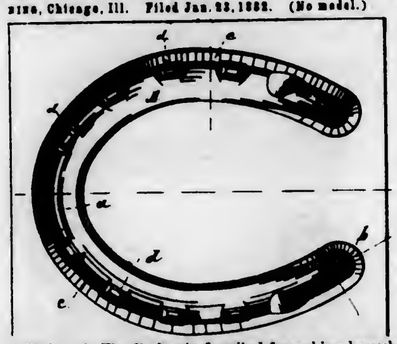
Claim.—1. In a thrashing-machine, the combination of the thrashing-cylinder, a closed chamber having a removable top and front plate, the feeder projecting a short distance into the chamber, a rotating beater revolved in the same direction as the motion of the thrashing-cylinder, and a fixed rear stop-plate to prevent the return of the thrashed material, substantially as set forth.



2. In a thrashing-machine, the combination of the means, substantially as described, for presenting an upright surface, 9, the straw-carrier, and the shoe or separator 11, substantially as set forth.

3. In a thrashing-machine, the combination of the endless belt or draper presenting an upright surface and having a movement in one direction, of the straw-carrier 8 and the carrier 7, substantially as and for the purpose specified.

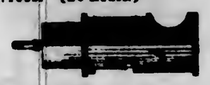
4. The combination of the sieves 10 and 11, the former being arranged above and back of the latter, so that the refuse from the former falls upon the latter, with the carrier 7 and incline *g*, for directing the heavier materials onto the sieve 10, and the carrier 8 and incline *g*, for directing the heavier materials gathered by it upon sieve 11, substantially as set forth.



5. In a thrashing-machine, the combination, with the upright slatted endless belt or draper 9, of the separator F, having the two sieves 10 and 11, the inclines 14 and 15, receiving-spouts 17, and fans 16 16, substantially as set forth.

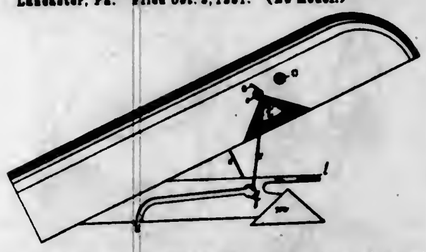
257,923. CAR-COUPLING. DANIEL DILL, Fletcher, Ohio. Filed Oct. 24, 1881. (No model.)

Claim.—As an improvement in coupling-links, the plate E, having recesses F F and pivoted arms G G G G, provided with beveled ends M, notches L, and recesses I, to receive the springs J, which are held in said recesses by vertical pins K, substantially as set forth.



257,924. DIE FOR MAKING HORSESHOES. GERARD DUBBINS, Chicago, Ill. Filed Jan. 23, 1882. (No model.)

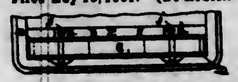
Claim.—1. The die herein described for making horseshoes, the same being constructed with the recesses *a* and *b* to form the heel and toe calks, and on its opposite sides with the recesses *c c* and projecting punches *d d*, to form the side calks and punch the nail-holes at the sides of the shoe, substantially as set forth, whereby a horseshoe can be constructed from a single piece of metal with the toe, heel, and side calks and nail-holes simultaneously formed at one operation.



2. The herein-described process of forming a die to be used in the manufacture of horseshoes, consisting, first, in heating a steel block and forcing into the same the former corresponding in size and form with the shoe to be made; second, in planing down the face of the block or partially-formed die, and then forcing the former again into the block, completing points in the die of sufficient length to form the nail-holes of the shoe, all substantially as herein specified.

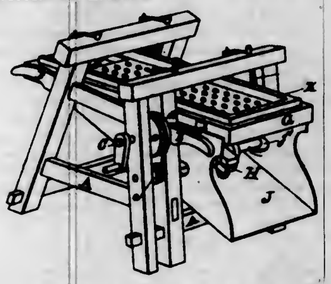
257,925. CIGAR-CUTTER. CHARLES A. FAAS, Brooklyn, N. Y. Filed Feb. 23, 1882. (No model.)

Claim.—The combination, with the square case, of a hollow square tube sliding endwise within that case, a spring within the sliding tube, a cutter at one angle of the sliding tube, and a cap on the case opening into the same and adapted to receive the cigar-tip, substantially as specified.



257,926. SEWING-MACHINE SHUTTLE. CHRISTIAN FATH, Lancaster, Pa. Filed Oct. 3, 1881. (No model.)

Claim.—1. The combination, in a shuttle, of an eyelet, *e*, triangular opening *f*, and corresponding triangle *m*, all substantially as and for the purpose set forth.

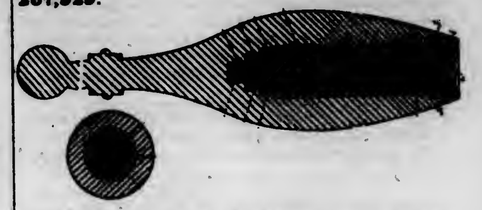


2. In a shuttle, the combination of a tension-spring, *A*, having a triangle, *m*, firmly attached thereto, with an opening, *f*, and eyelet *e*, all substantially as set forth.

257,927. CARPET-SWEEPER. BENEDICT FIORA, San Francisco, Cal. Filed May 18, 1881. (No model.)

Claim.—The combination, with the driving-wheels, of the grooved partition and plate A, having journals *g*, integral therewith, fitting in said grooves of the partition and fastened at the bottom to the under side of the partition, substantially as described.

257,928. SIFTER. GEORGE T. FIELDY, Webster, Pa. Filed Apr. 8, 1882. (No model.)



Claim.—1. The combination of the inclined suspended screen-frame and screen with the chute, oppositely inclined and having perforated sides and secured to the screen-frame, and means for their operation, substantially as shown and described.

2. The combination of crank-shaft C, rod H, bar I, frame G, chute J, and screen K, with means for their operation, substantially as shown and described.

257,929. EXERCISING-CLUB. EDGAR M. FOLK, Brooklyn, N. Y. Filed June 25, 1881. (No model.)

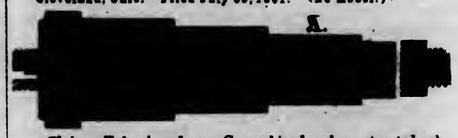
Claim.—1. The combination, in a chambered club, of concentric weights and heads for the chamber, provided with annular recesses adapted to secure and hold in position the weights, substantially as set forth.

257,929.

2. In a chambered club, a chamber-head provided with internal elastic packing, substantially as described.

3. The combination of the threaded head *i* and ring *j* with rubber plate *k*, as herein shown and described.

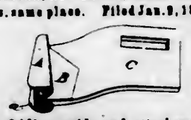
257,930. MANUFACTURE OF GLUCOSE OR GRAPE-SUGAR. EDWARD FOX, New York, N. Y., assignor to ANDREW ALBRIGHT, Newark, N. J. Filed Mar. 27, 1882. (No model.)



Claim.—1. The method herein specified of extracting starch from grains—such as corn—consisting in agitating such material and water by the action of atmospheric air in a digesting-vessel, then passing the digested material through filters to retain the gluten, substantially as set forth.

2. The method herein specified of treating starch or grain for its conversion into glucose or grape-sugar, consisting in agitating the same by currents of air under pressure and heating the same to the proper temperature by steam in a converting-vessel in the presence of acid, neutralizing any surplus acid and removing the same and any impurities, then concentrating the syrup by the action of currents of air or steam, or both, forced through the liquid, and then crystallizing or granulating the material in filter-bags, through which the syrup is forced from the converter by the pressure of air in such converter, substantially as set forth.

3. The combination, with the converting-vessel and the delivery-tube, branch pipes, cocks, and filter-bags, of an air-pipe connected to the converting-vessel and serving to admit air under pressure for forcing the contents of the converter directly to the filters, substantially as specified.

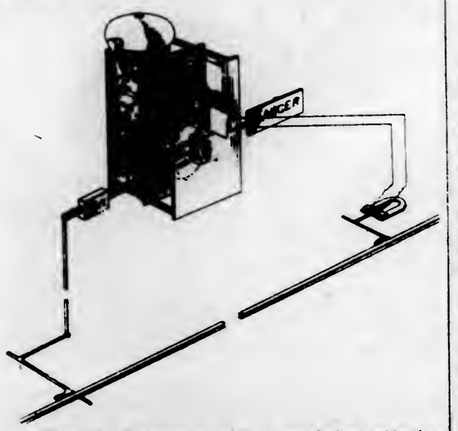


257,931. STEAM-GENERATING TUBE. ALLAN E. FRANCIS, Cleveland, Ohio. Filed July 30, 1881. (No model.)

Claim.—Tube A and core C, combined and constructed substantially as shown, the tube A having its interior smallest at its inlet end and made with varying but increasing widths from inlet to exit to accommodate the expansion of water and steam, and core

O having its exterior smallest at the end nearest the inlet and its external surface so arranged that when in position in tube A a narrow space is left between the external surface of core O and the internal surface of tube A, said space expanding in area from inlet toward exit, and in which space steam can be generated or heated.

257,932. GUIDING ATTACHMENT FOR SEWING-MACHINES. EDWARD J. PRITCHER, New Haven, Conn., assignor of one-half to Julius Twiss, same place. Filed Jan. 9, 1882. (No model.)



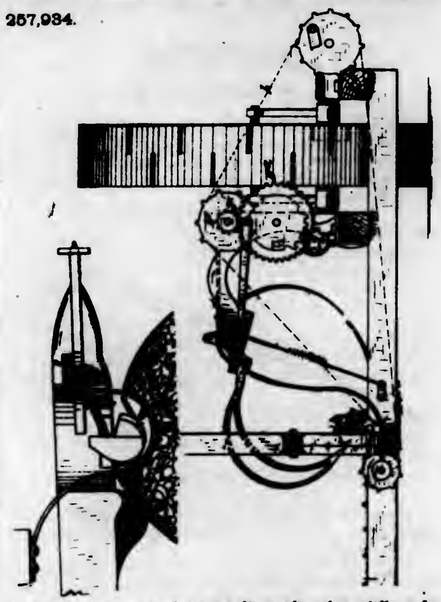
Claim.—1. A folding guide and attachment for sewing-machines, composed of two separate exterior scrolls, A *a*, turning in reverse directions and united to and supported by an interior looped plate, B, attached to or forming part of the bed-plate C, substantially as and for the purpose described.

2. The combination of the two scrolls, A *a*, the looper-plate B, to which they are united, and the plate C, by which the device is adjustably attached to the bed-plate of a sewing-machine, substantially as described.

257,933. AUTOMATIC RAILWAY-SIGNAL. WESLEY W. GAY, Boston, Mass. Filed Sept. 14, 1881. (No model.)

Brief.—The bell-striking train is set for action by a passing train and its controlling detent is released through an electro-magnet which is vitalized by a magneto-generator actuated by a moving train.

Claim.—1. In an automatic railway-signal, the combination of a bell-striking train, means for setting or adjusting the same for action from passing trains, a detent controlled by an electro-magnet to prevent the operation of the striking-train, and a magneto-generator for the purpose of releasing the gear-train, and means, substantially as described, for operating the electro-magnet from passing railway-trains.



2. In a railway-signal, the combination of a bell-striking train of gear, a weighted lever connected therewith by a pawl and ratchet or equivalent clutch, and means, substantially as described, whereby the weight may be raised by passing trains.

3. In an automatic railway-signal, the combination of a geared bell-striking train, and appliances, substantially such as shown, whereby said gear is set for action by a passing train, an electro-magnet for releasing the gear-train, and a magneto-generator connected with said magnet and arranged to be operated by a passing railway-train.

257,934. GRAIN-BINDER. WILLIAM GAUSS, Kokomo, Ind., and JOHN F. SHRAUDING, Akron, Ohio, assignors, by direct and mesne assignments, to said Satterlee. Filed Mar. 10, 1881. (Model.)

Claim.—7. In a grain-binder, mechanism for removing the grain from the platform and delivering it to the binding devices, in combination with shifting devices for automatically throwing said mechanism out of action when the binding mechanism is thrown into action, and vice versa, whereby said raking and binding mechanisms are made to act alternately, substantially as described.

257,934.

2. In a grain-binder, mechanism for raking or discharging the grain from the grain-platform and delivering it to the binding devices, in combination with shifting-levers for automatically throwing the binding devices out of action when the needle-arm is raised into position to admit a bundle and simultaneously throwing the raking mechanism into action.

3. The pendent fingers against which the grain is crowded by the action of the raking mechanism, in combination with means for automatically throwing the binding mechanism into action simultaneously with the throwing of the raking mechanism out of action, substantially as described.

4. The alternately and intermittingly operating binding and raking mechanism, operated by means of the endless chain which drives the reel with a continuous motion.

5. The combination, with the needle-arm, of the compressing-arm connected to and moving with said needle-arm, and having a slotted connection with the shaft of said arm, whereby it is adapted to receive a vibratory movement independent of said needle-arm.

6. The compressing-arm L, having a slotted connection with the shaft of the needle-arm, in combination with the slotted link and cam or equivalent devices for imparting a vibratory movement independent of the needle-arm to said compressing-arm.

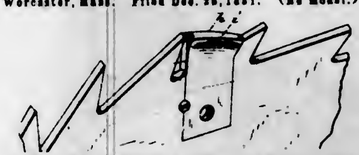
7. The concave-convex shield or guard around which the bundle is compressed, in combination with band-uniting devices operating within said shield within the circle of the bundle operated upon, substantially as and for the purpose described.

8. The knotter consisting of the sliding shank having the fixed jaw, in combination with the moving jaw having a longitudinal movement relatively to the shank of the fixed jaw, and adapted to be operated upon by the tension upon the ends of the band.

9. The sliding knotter-shank provided with the hub or collar, in combination with the cam-projection on the needle-arm for giving said shank a longitudinal movement.

10. The rock-shaft carrying the pendent fingers *m*, between which and the needle-arm the grain is grasped and carried to the band-uniting devices, provided with the heel-projection having the cam-ledges, in combination with the friction-roller on the needle-arm shaft for depressing said fingers and discharging the bound bundle, substantially as described.

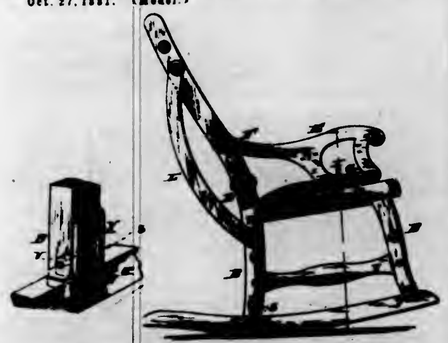
11. The needle-arm shaft provided with the slotted angular crank-arm, in combination with the slotted plate *e*, for guiding the pin and giving to the needle and compressing arm a varying speed and power, substantially as and for the purpose set forth.



12. The needle-arm provided with the vibrating needle N', having the band-holding spur *n*, in combination with the spur *n'* on the needle-arm for forcing the ends of the band into the cutter when the needle is vibrated.

257,935. PROCESS OF UTILIZING SPENT HOPS IN THE MANUFACTURE OF MALT LIQUORS. JULIUS GERSTARD, New York, N. Y., assignor, by direct and mesne assignments, of five-eighths to Sol. Hoffpern and John S. Lockwood, both of same place. Filed Feb. 18, 1882. (No specimens.)

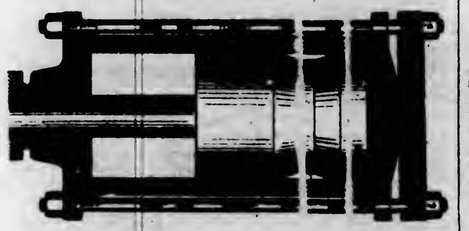
Claim.—1. The process of utilizing the spent hops from one brewing, which consists in steeping the same in a solution of sulphite of soda and water and adding the mixture to the mash of a subsequent brewing, substantially as described.



2. The process of utilizing the spent hops in one brewing in a subsequent one, which consists in introducing them into the mash-tub in each subsequent brewing, by which a further extraction is had, at a temperature below the boiling-point of the wort, substantially as described.

257,936. PLANER-TOOTH FOR SAWS. JOHN B. GENIN, Worcester, Mass. Filed Dec. 28, 1881. (No model.)

Claim.—The combination, with a circular saw, of the planer-teeth B, formed with cutting-edges A *i*, curved as shown with relation to the saw-teeth—that is, the front edge of the planer-tooth being inside the extremity of a saw-tooth and curving backward and outward to near the outer end of the succeeding saw-tooth—substantially as and for the purpose set forth.

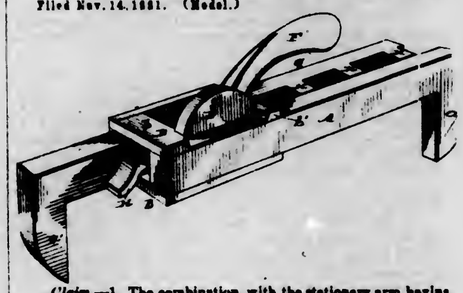


257,937. CHAIR. LEWIS D. GRAWIS, Terre Haute, Ind. Filed Oct. 27, 1881. (Model.)

Claim.—1. The combination, substantially as described, of the seat A, having angle-plates G, provided with slots *g*, the hinged-back frame, and the arms E, pivoted thereto, and provided with bolts H and nuts I, whereby the slotted angle-irons provide the bearings for said bolts and nuts, and a surface to take the wear of the arms in moving, as set forth.

2. In a chair, the combination, with the legs B, having transverse slots S, of the angle-plates U, having upward-projecting transverse legs V, pivoted in said slots, and laterally-projecting flanges W, the rockers T, secured to said angle-plates, and the latches Y, pivoted to the legs, as set forth.

257,938. STEAM ROCK-DRILL. GEORGE H. GUNNING, Brooklyn, N. Y. Filed Sept. 30, 1881. (No model.)



Claim.—1. The combination, with the piston, cylinder, and heads in a rock-drill, of bolts for holding the cylinder-head, having bends in such bolts to allow the same to spring or yield longitudinally, for the purposes and substantially as set forth.

2. The combination, with the cylinder and piston in a rock-drill, of a convex head having a central bearing, a cross-bar resting upon the same, and bolts passing through the ends of the cross-bar, for the purposes and substantially as set forth.

3. The combination, with the cylinder and piston in a rock-drill, of a head having a central bearing, a cross-bar, bolts having the bodies bent into curved lines, and nuts, substantially as set forth.

257,939. ADJUSTABLE CLAMP. CHARLES H. GOVE, Norwalk, Ohio, assignor of one-half to Charles E. Gove, same place. Filed Nov. 14, 1881. (Model.)

Claim.—1. The combination, with the stationary arm having a recess or seat formed therein, and a movable arm having teeth on one side and adapted to be loosely secured to the said stationary arm by any suitable means, of the disk having the lever and cam secured thereto and adapted to rest in the seat or recess in the stationary arm and be held therein against displacement by the removable arm, substantially as set forth.

2. The combination, with the stationary arm provided with means for loosely holding the movable arm, and with a recess or seat, and a sliding arm having teeth thereon, the latter being shaped substantially as described, of a disk having a cam and lever rigidly secured thereto, the said disk adapted to fit in said recess or seat and be partly rotated therein, so as to enable the cam to be moved between the said teeth, substantially as set forth.

3. The combination, with the arm A, provided with the jaw *a*, recess or seat D, and bearing B, and the movable arm G, provided with the jaw *a'* and teeth H, of the disk C, adapted to loosely fit in the said recess D, and provided with the cam E and lever F, substantially as set forth.

257,940. SEWING-MACHINE. GEORGE GRIEBL, San Francisco, Cal. Filed Sept. 28, 1881. (No model.)

Brief.—For sewing together stalks of tule-grass or similar plants for making mats, &c. Consists in the mechanism for feeding the stalks with accuracy to a gang of needles, as embraced in the claims.

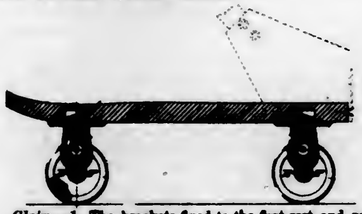
Claim.—1. In a machine for sewing together stalks of tule-grass and other like plants, the combination, with a reciprocating needle, of a pair of grooved feeding and clamping rollers, arranged relatively to the needle substantially as described, and having an intermittent rotation, for the purpose set forth.

2. In a machine for sewing together stalks of tule-grass and other like plants, the combination, with the reciprocating needle-bar carrying a gang of needles, of the sets of grooved feeding-rollers L L', having an intermittent rotation and a simultaneous movement together, by which a length of stalk is brought regularly for-

ward in line with and beneath the needles of the gang for simultaneous penetration, substantially as hereinbefore described.

3. In a machine for sewing together stalks of tule and other like plants, the combination, with a set of grooved feeding-rollers, L L', having an intermittent rotation, of a vibrating or oscillating feeding-finger applied to operate substantially as described, for the purpose set forth.

4. In combination with the vibrating or oscillating arm Y, the yielding finger W, having a turning movement in the backward motion of its arm, but a rigid position at the forward motion, substantially as described, for the purpose set forth.



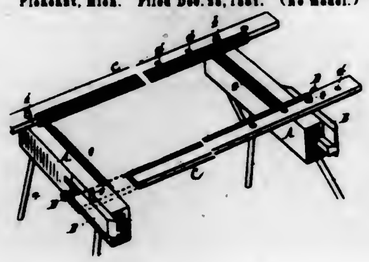
5. The feeding-finger W, pivoted on the end of its operating-arm Y, and having a spring to hold and to return it to its working position with respect to the arm, and an adjustable stop, substantially as described, for the purpose set forth.

6. The combination, with the intermittently-rotating feeding-rollers and the vibrating feeding-fingers, of the inclined guides *x*, substantially as described, for the purpose set forth.

7. In a machine for sewing together stalks of tule and other like plants, the combination, with the work-supporting table or surface, of the grooved feed-rollers L L upon the shaft F, held in bearings above the said table, the similarly-grooved rollers L' L' upon the shaft G, beneath the table, the gears connecting the said shafts together, and the mechanism for giving said shafts intermittent rotation simultaneously toward each other, consisting of the ratchet-wheel, the pawl, and its operating-lever, and the cam on the shaft, substantially as described, for the purpose set forth.

8. The herein-described machine for sewing together in parallel rows stalks of tule-grass, consisting of the work-supporting table or surface, the standards at each end, the motor-shaft, the shafts operated with an intermittent rotation for actuating the sets of feed-rollers, the grooved feed-rollers arranged in pairs upon said shafts, the rock-shaft carrying and operating the vibrating feeding-fingers, and the needle-operating shafts and the horizontal needle-carrying bar, combined to operate in the manner and for the purpose set forth.

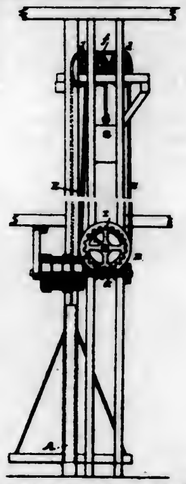
257,941. ROLLER-SKATE. CHARLES HEBNER, Philadelphia, Pa. Filed Mar. 6, 1882. (Model.)



Claim.—1. The brackets fixed to the foot-rest and provided with depending cars, in combination with rotating spindles rising from the bosses of the axial pins of the rollers and fitted between said depending cars and the springs, substantially as and for the purpose set forth.

2. The fixed brackets, in combination with the rotating spindles, whose upper ends are guided in said brackets, substantially as and for the purpose set forth.

3. The fixed brackets, in combination with the rotating spindles, whose upper ends are guided in said brackets and provided with heads which bear against the brackets, substantially as and for the purpose set forth.



4. The rollers and spindles, in combination with the brackets formed with upwardly-projecting bosses, substantially as and for the purpose set forth.

257,942. QUILTING-FRAME. PETER S. NICKMAN, Mount Pleasant, Mich. Filed Dec. 28, 1881. (No model.)

Claim.—The horses A, having pins *b* and dovetail guides, the side rails, C, having holes *d*, the adjustable slides B, having pins *c*, and the set-screw D, all constructed, combined, and adapted to serve together as and for the purposes set forth.

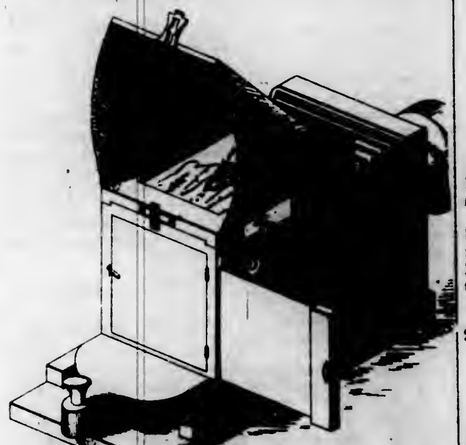
257,943. ELEVATOR. PHILIP HIEBLE, San Francisco, Cal. Filed Sept. 27, 1881. (No model.)

Claim.—1. In an elevator, the combination, with the hoisting-drum B, of the cage A and rope C thereof attached to one side of the drum B, and the overbalance-weight G and rope E thereof attached to the opposite side of the drum B, substantially as set forth.

2. The combination, with the drum B and ropes C and E, attached to the opposite sides thereof and suspending the cage and overbalance-weight, respectively, of the power-shaft J, provided with the worm, as described, and the worm-wheel I, mounted on the same shaft with B, as set forth.

257,944. FENCE. JACOB HOFFMAN, Chippewa Falls, Wis. Filed Jan. 14, 1882. (No model.)

Claim.—A portable fence constructed of panels A, consisting of vertical posts C, horizontal bars or rails B, having lap-joints F G, wires D, formed with eyes J and hooks K, engaging them of the adjoining panel, and hooks and staples H I, substantially as and for the purpose set forth.



257,945. STRAP SPLICE OR CLASP. WILLIAM L. HOOVER, Norway, Iowa. Filed Mar. 16, 1882. (Model.)

Claim.—1. In a means for splicing harness or similar straps, a metallic plate formed with a longitudinal elongated button-slot in one end and a fixed button or locking stud in the other end adapted to co-operate with a similarly-constructed plate, substantially as set forth.

2. A metallic casing, A, formed with side walls and provided with an elongated button-slot in one end and a button-stud in the other end, in combination with a metallic plate, B, serving as a clasping means, formed with a longitudinal elongated button-slot in one end and a fixed button-stud in the other end, substantially as described.

257,946. PHOTOGRAPHIC CAMERA. ALFRED HOFFHEIMER, Philadelphia, Pa., assignor of two-thirds to John S. S. Nagle and William F. Bacon, both of same place. Filed Mar. 28, 1881. (No model.)

Claim.—1. A photographic camera provided with a dark chamber to receive the sensitized plate while the object is being focused, combined with a hooded focusing-glass and a reflector to throw the image upon the focusing-glass, and adapted to be operated to admit the light through the lens upon the sensitized plate after the focus is obtained, substantially as shown and described.

2. The combination, with a photographic camera, of a movable reflector connected to the sides of the box by flexible opaque material, and adapted to convert that portion of the camera in which the sensitized plate is arranged into a dark chamber while the focus is being obtained, and to open such chamber to the transmission of light through the lens upon the sensitized plate thereafter, substantially as shown and described.

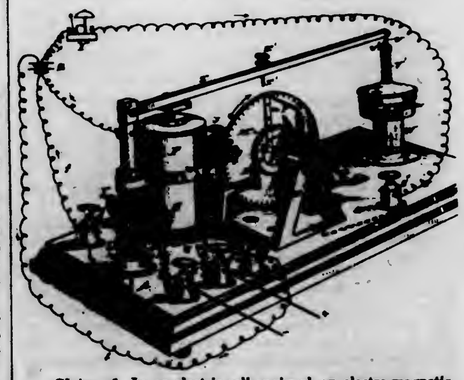
3. The combination of a camera-box having a focus-glass, a hood thereon, and a leaf hinged in said box and provided with a reflector, whereby the focus is obtained upon said glass, substantially as described.

4. The combination of a focus-glass, a hood thereon, a reflector, and a dark chamber to receive the sensitized plate, whereby the object is focused and the sensitized plate protected from the light during the focusing, with means to cut off the light from and through the focus-glass and direct it through the lens upon the sensitized plate, substantially as described.

5. The combination, substantially as shown and described, of a dark chamber, a leaf therein, and means to hold said leaf in position to admit light into said dark chamber.

257,947. OILING-BOX FOR ROLLS AND PINIONS. JAMES HUNTER and URI HAZEEN, Pittsburg, Pa., assignors of one-third to Samuel T. Owens, same place. Filed Jan. 27, 1882. (No model.)

Claim.—1. A bearing for the journals of rolls or pinions, having a cup or concavity in the top communicating to the neck of the roll by a suitable hole or passage, said bearing having also a hole or passage through the lower part to lead the oil down upon the collar of the adjacent roll, substantially as and for the purpose described.



2. A bearing for the journals of rolls and pinions, having an oil cup or concavity in the top and a lip extending laterally at its upper edge, which, when the bearing is in place, projects beyond the face of the housing for filling said oil-cup and catching the drip from the journal above, substantially as and for the purpose described.

3. Hollow housing-standards, in combination with an oiling hole or holes leading through the bearings to the necks of the rolls, substantially as and for the purposes described.

4. In combination with journal-bearings for rolls and pinions, having oil-holes extending into and down from the bearing-surface, a trough placed under the lower roll or pinion and a channel leading from the bearing-surfaces of the journal-boxes to said trough, substantially as and for the purposes described.

257,948. ELECTRIC SIGNAL. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Oct. 18, 1881. (No model.)

Claim.—1. In an electric call or signal, an electro-magnetic core and means to magnetize and demagnetize it with the line-circuit, in combination with two armatures arranged one at each end or pole of said core, one of which armatures is provided with retaining devices and the other with circuit-closing devices, and a contact-wheel having a conducting-point on its periphery, one of said armatures operating to intermittently retain said contact-wheel and the other of said armatures operating to close a local circuit through said contact-wheel.

2. In an electric call or signal, two electric coils or helices, means to actuate or electrify one of them by the line-circuit and the other by a local circuit, in combination with an alarm-bell, a local battery, two local circuits, a contact-wheel, an armature actuated by one of said helices to intermittently retain said contact-wheel and complete at every stroke one of the local circuits through the other helix, and an armature operated by said helix in the local circuit to close the other local circuit through the alarm-bell.

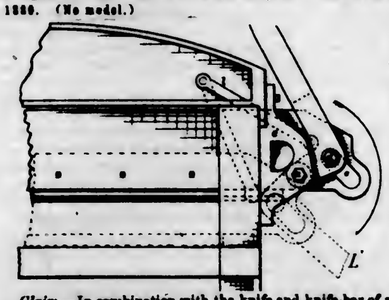
3. In an electric signal, two electric coils or helices, means in the line-circuit to control the passage of electricity through one of said helices, a contact-wheel, and an armature to retain said contact-wheel, and provided with means to close a local circuit through the other of said helices at every stroke, in combination with a second armature actuated by the local circuited helix to complete a local circuit through the alarm-bell, two local circuits, and a retarding device to prevent the latter of said armatures descending too rapidly to close the alarm-circuit.

4. In an electric signal, the combination of two electric coils or helices, a line-circuit through one of said coils and a local circuit through the other of said coils, and mechanism arranged to complete the local circuit through one coil upon a current, being passed through the other coil, with mechanism, substantially as described, to complete a single local alarm-circuit, said mechanism being operated and controlled by both of said helices jointly, substantially as and for the purpose specified.

5. In an electric signal, two helices, two armatures, a contact-wheel, an alarm, and three circuits, one of which is the main line and is circuited through one of said helices, the second a local circuit through the other helix, and the third a local circuit through the alarm, in combination with mechanism to close both the first and second of said circuits at every stroke of the key or closing of the line-circuit, and means to close the third of said circuits through the alarm upon holding said first and second circuits closed.

6. In an electric signal, the combination of core G, helix E E', of two diameters, armature H, with its spring-finger H', contact-wheel M, and armature T, independent of armature H, provided with contact-screw T', substantially as and for the purpose specified.

7. In an electric signal, the combination of core G, helix E E', armature H, with its spring-finger H', contact-wheel M, armature T, provided with contact-screw T', and a retarding device to prevent the armature T (said core G being the common attraction for both of said armatures H and T) from falling quickly.



8. A retarding device for electric signals, which consists of a cylinder having the small diameter W and large diameter w, in combination with a piston or plunger, V, adapted to vertical movement, a spring, V', or its equivalent, to hold said piston above or at the top of said small diameter of the cylinder, an armature-lever attached to said plunger and provided with a contact to complete a local circuit which is independent of the electro-magnet which actuates said armature, and an electro-magnet to actuate said armature-lever and force the plunger down into the small diameter of the cylinder.

9. In an electric signal, the combination of core G, helices E F, armature H, provided with a contact, I, bushing L, or its equivalent, and a contact-screw, J, said armature operating to complete a local circuit through helix F, substantially as and for the purpose specified.

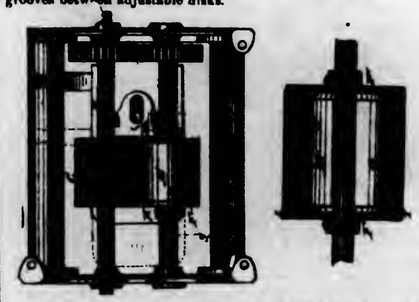
10. In an electric signal, the combination of helices E and F, core G, common to both of said helices, armature H, provided with spring-finger H', means, substantially as described, to complete a circuit through helix F every time a current is passed through helix E, contact-wheel M, armature T, provided with contact-screw T', and contact-screw J, in circuit with helix F, substantially as and for the purpose specified.

11. In an electric signal, a retarding device which consists of a vessel having two diameters, the smaller being at the bottom, and a plunger or piston which before action is above the small diameter and in the large diameter, so as to leave a clear passage-way for the liquid from above the piston to below the same after it has been fully raised, in combination with an alarm-circuit, a contact to close said alarm-circuit and controlled by said plunger and its operating electro-magnet, and an electro-magnet to actuate said plunger and force it down into the small diameter, substantially as set forth.

257,949. PAPER-CUTTER. HENRY JOHNSON, New York, N. Y., assignor to H. Nichols Johnson, same place. Filed Oct. 27, 1880. (No model.)

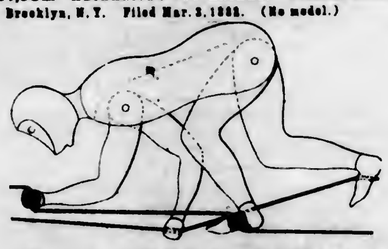
Claim.—In combination with the knife and knife-bar of a paper-cutter, having a diagonal cutting motion, the lever L, provided with a bent arm pivoted to the frame at its inner end, and connected to the knife-bar by a pin passing through an inclined slot in the knife-bar, substantially as and for the purposes described.

257,950. FAN. LOUIS JORDAN, New York, N. Y. Filed Mar. 31, 1882. (No model.)



Claim.—1. A circular folding fan-leaf pivoted to a suitable handle or frame, and having side pieces, *b c*, in combination with the hinged clasp *e*, the side piece *c* being connected to the frame or handle and immovable during the opening or closing movement of the fan-leaf, and the side piece *b* free to swing when disengaged from the clasp *e*, substantially as set forth.

2. In combination with a circular folding fan-leaf and frame or handle, substantially as described, the side piece *c*, plate *d*, side piece *b*, and clasp *e*, substantially as set forth.

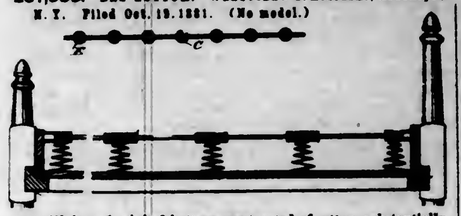


257,951. GRAIN-DRILL. JOHN F. KELLER, Martinsburg, W. Va. Filed Dec. 8, 1881. (No model.)

Brief.—The glass-surfaced feed-roller or ring is clamped in grooves between adjustable disks.

Claim.—In a seeder or fertilizer-distributer, the glass-surfaced feed roller or ring E, and the adjustable disks F, having a groove to receive the edge or projecting ends I of the roller, in combination with the elastic roller C, substantially as set forth and shown.

257,952. MECHANICAL TOY ANIMAL. WILLIAM KENNISH, Brooklyn, N. Y. Filed Mar. 3, 1882. (No model.)

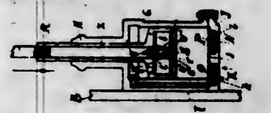


Claim.—1. In a mechanical toy animal, four limbs with independent action, having terminal passages for string, as shown.

2. In a mechanical toy animal, a continuous string, forming an upward and downward part, passing through terminal passages in the animal's limbs, as shown, and for the purpose specified.

3. In a mechanical toy animal, as described, a rocking bar for the purpose of giving a reciprocating motion to the string, as described and set forth.

4. In a mechanical toy animal, the combination of a body having four limbs with independent motion and terminal passages, with a string doubled to give the reciprocating motion, as shown and described.



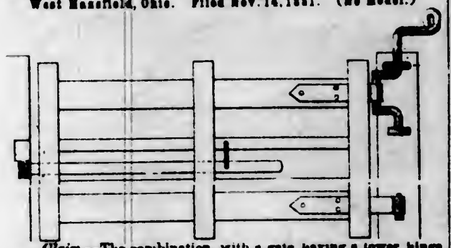
257,953. BED-BOTTOM. WLADYSLAW T. KOSINSKI, Brooklyn, N. Y. Filed Oct. 19, 1881. (No model.)

Claim.—1. A bed-bottom constructed of rattan, substantially as described.

2. The bed-bottom composed of a frame carrying on its upper part and on opposite sides of the rails tubes formed either solid or in skeleton form, as shown in Figs. 3, 4, and 5, and two or more similar tubes distributed symmetrically throughout the length or width of the bed-bottom, all said tubes being supported by spiral springs resting on slats and having rattan passed through them, in the manner shown and described.

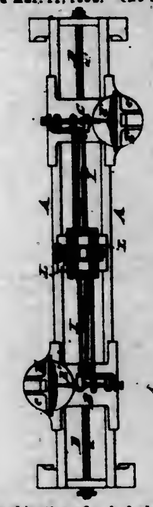
257,954. PUMP. EDWARD LEHNAY, Lima, Ohio. Filed Mar. 14, 1882. (No model.)

Claim.—In a double-acting submerged pump, the combination, with the barrel H I and the lower or suction valve system, J, and with the tubular combined piston and piston-rod Q R, of the separable piston-valve chamber T, having the horizontal ported disks W w W' w', connected in one integral casting by the upflared ported partitions U u U' u', forming the compartments t t' t'', that communicate respectively with the lower and upper portions of the barrel and with the piston-discharge neck, and of which the compartment t'' confines and affords double seat-bearing to the valve V v, in the manner set forth.



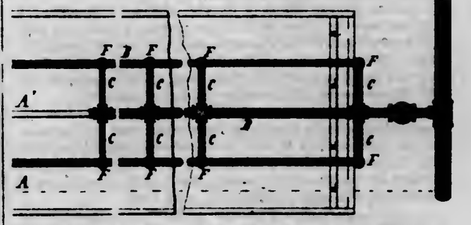
257,955. POLICE AND MILITARY HAT. CARL LEHMANN, New York, N. Y. Filed Mar. 1, 1882. (Model.)

Claim.—1. As a new article of manufacture, a military hat consisting of a body made of cork sections blocked into shape and united at the abutting edges by a suitable cement, of an outer layer or covering, and of an inner layer or lining, said covering and lining being applied to the blocked cork body by means of water-proof cement, substantially as set forth.



2. The method herein described of making hats for military and other purposes, consisting first in blocking the cork sections that form the body of the hat, uniting the abutting edges by cement, coating the exterior and interior surfaces of the cork body by a water-proof cement, and finally applying the covering and lining thereto, substantially as set forth.

257,956. AUTOMATIC GATE ATTACHMENT. JOHN F. LUERSS, West Mansfield, Ohio. Filed Nov. 14, 1881. (No model.)

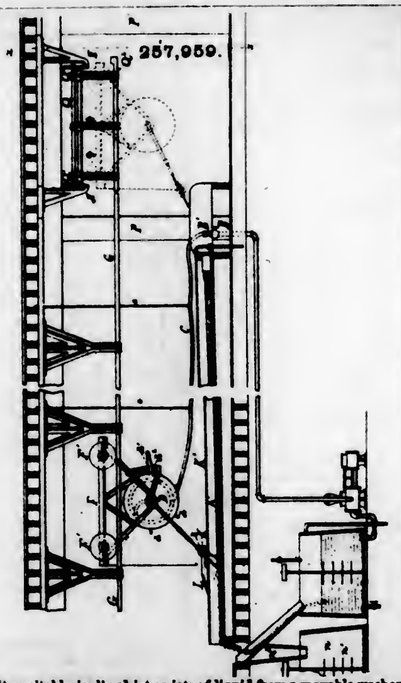


Claim.—The combination, with a gate having a tower hinge of any suitable kind, of an upper hinge consisting of a hinge-strap, and of a rod bent to form a double crank and a lever-arm, the crank passing through the hinge-strap and attached to the hinge-post above and below the double crank, while the lever-arm is extended above the post and provided with pulley cords or wires, whereby the gate may be opened and closed from a distance, substantially as described.

257,957. WOOD-CARVING MACHINE. GERHARD MATHIS, New York, N. Y. Filed Mar. 11, 1882. (No model.)

Claim.—The combination of a bed-plate, A, carriages B C, arranged to reciprocate in opposite directions to each other, upright standards E E', applied to the carriages for supporting model and blanks, one or more levers, H and I, which are fulcrumed to a forked axially-turning standard, G, and provided at the ends with a guide-pin and carving-tools, and means for transmitting rotary motion to the carving-tools, substantially as and for the purpose set forth.

257,958. WASHING OUT STARCH-TROUGHS. FRANK O. MATTHIESSEN, Irvington, N. Y., and EDWARD H. QUIMBY, Orange, N. J., assignors to the Chicago Sugar Refining Company, Chicago, Ill. Filed Mar. 23, 1882. (No model.)



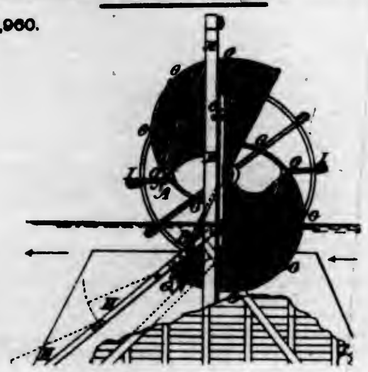
Claim.—1. In apparatus for washing out starch-troughs, a jet-pipe arranged over a starch-trough and having its lower portion perforated with rows of holes, substantially as shown, and provided at convenient distances apart with valves, and connecting-pipes connecting the jet-pipe with a distributing-pipe through which water or other liquid is supplied to the jet-pipe, the valves being arranged, substantially as shown, so that either one or more of the sections of the jet-pipe between the valves may be independently supplied with the washing-liquid, as and for the purposes set forth.

2. The starch-troughs A and A', in combination with the distributing-pipe D, the jet-pipes B and B', the connecting-pipes C, and the valves F, as and for the purposes set forth.

257,959. METHOD OF AND APPARATUS FOR EMPTYING STARCH-TABLES. FRANK O. MATTHIESSEN, Irvington, N. Y., and ARNO BEER, Jersey City, N. J., assignors to the Chicago Sugar Refining Company, Chicago, Ill. Filed Mar. 23, 1882. (No model.)

Claim.—1. The method of removing starch from starch-tables herein described, which consists in projecting upon the starch de-

257,959.



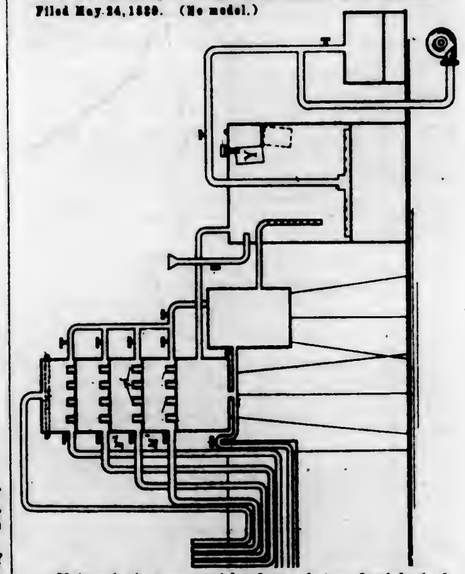
posit a suitably-inclined jet or jets of liquid from a movable washer supplied through a flexible pipe either with pure water or with a mixture of starch and water, substantially as and for the purposes set forth.

2. In apparatus for effecting the removal of the deposits of starch from adjoining starch-tables, the spraying or jet pipes I and their pipe-connections with suitable means for supplying them with water or other liquid, and the shields L, carried upon the shaft or axle K, provided with the wheels k, in combination with the sides of the starch-troughs A, preferably provided with the rails K', as and for the purpose set forth.

3. The elevated trunks G, the hose-carriage F, the drum D, provided with the hollow shaft D', the spraying-pipes I, and their pipe-connections with the opposite ends, respectively, of the hollow shaft D', in combination with the flexible pipe C, connected at one end with the hollow shaft D' of the drum and at its opposite end with the service-pipe B, as and for the purpose set forth.

4. The elevated trunks G, arranged longitudinally over the starch-tables, washing apparatus, substantially such as described, and the hose-carriage F and the transfer-carriage Q, provided with the rails Q', in combination with the transfer-rails *g*, for effecting the transfer of the washing apparatus from one group of starch-tables to another, substantially as set forth.

257,960.



257,960. FISH-WHEEL. WILLIAM R. McCONE, East Portland, Oreg., assignor to himself, S. B. Story, C. W. Prindle, and J. M. McCoy. Filed Jan. 4, 1882. (No model.)

Claim.—1. A fish-wheel, A, having baskets F in the form described, the sides secured to the wheel-arms, the diagonal pieces G, and the bottom made of the segments O, as described.

2. Pieces C and frames H', rising and falling, as shown, on guides D, in combination with the wheel.

257,961. PROCESS OF AND MECHANISM FOR DISTILLING HYDROCARBONS. THOMSON MCGOWAN, Cleveland, Ohio. Filed May 24, 1880. (No model.)

Claim.—1. As a new article of manufacture, desulphurized American petroleum-oil.

2. The herein-described process for the removal of sulphur from petroleum, consisting in introducing oxygen and an alkali simultaneously into the petroleum, substantially as set forth.

3. The herein-described process for the removal of sulphur from petroleum, consisting in introducing oxygen and an alkali simultaneously into the body of the petroleum during distillation and when the temperature thereof is 300° Fahrenheit or above, substantially as set forth.

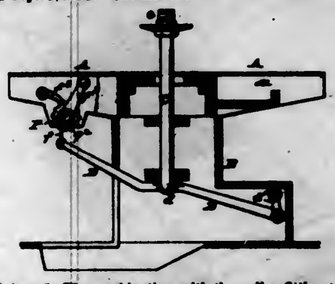
4. In an apparatus for the distillation of hydrocarbons, the combination, with an upright condenser divided into a series of horizontal compartments which collect different grades of hydrocarbon, of devices connecting respectively with the compartments to conduct said different grades of hydrocarbon to the receiving-house and to the still, substantially as set forth.

257,962. FIRE-ARMOR. CHARLES HOLSTON, Jersey City, N. J. Filed Mar. 8, 1882. (No model.)

Claim.—1. In a fire-armor, a mouth-piece provided with a flexible tube penetrating the outer wrap or garment, and adapted to take its supply of air from the inner protected side thereof.

2. The combination, with a fire armor or wrap, of eyeglasses provided with protecting-rims of asbestus, said glasses forming a part of the fire-armor, substantially as and for the purpose described.

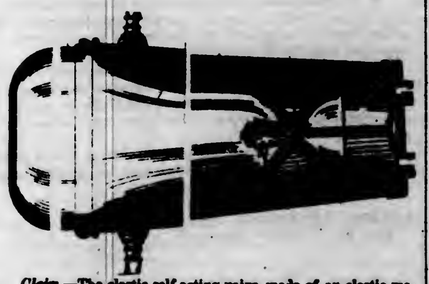
3. A fire-armor consisting of an outer wrap or garment of asbestus, in combination with a mouth-piece and eyeglasses protected by asbestus or its equivalent, substantially as described.



257,963. BENDING METAL PLATES. PHILIP MEDART, St. Louis, Mo., assignor of one-half to William Medart, same place. Filed Aug. 26, 1881. (No model.)

Claim.—1. The combination, in a machine for bending and crowning pulley-rims, of the rolls B C, crowned and dished as described, the adjustable bending-roll E, and the guide-plates F F, equally and simultaneously adjustable to and from the apex of the crown of the roll B, substantially as and for the purpose set forth.

2. The combination, in a machine for bending and crowning pulley-rims, of the rolls B C, crowned and dished as described, the adjustable bending-roll E, the guide-plates F F, equally and simultaneously adjustable to and from the apex of the crown of the roll B, and the anti-friction guide-roll D, substantially as and for the purpose set forth.



257,964. PULLEY-FITTING TABLE. PHILIP MEDART, St. Louis, Mo., assignor of one-half to William Medart, same place. Filed Sept. 5, 1881. (No model.)

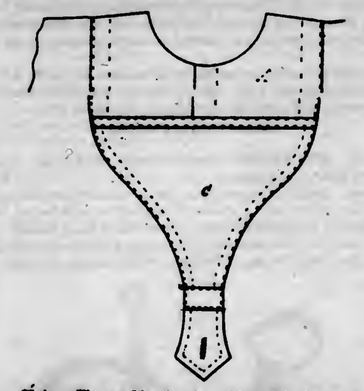
Claim.—1. The combination, with the pulley-fitting table A, of an adjustable rotary arbor, C, arranged in a plane at right angles to the face of the table, and provided with a spider-holding head, *c*, and an adjustable step-bearing, *d*, for the arbor C, substantially as and for the purpose set forth.

2. The combination of the table A; arbor C, lever D, with its step-bearing *d*, link *d'*, adjusting-drum F, and rope *f*, substantially as and for the purpose set forth.

257,965. CONSTANT-LEVEL LAMP. MONTGOMERY C. MEIGS, Washington, D. C. Filed Mar. 27, 1882. (Model.)

Claim.—The elastic self-acting valve made of an elastic material, capable, without injury, of being pushed through a narrow neck or opening into a font or vessel to contain oil in a constant-level lamp, having also a stiff stem with cross-piece or other enlargement to prevent its falling through the neck into the body of the font or oil-vessel, and expanding by its elasticity after being forcibly inserted, so as to act as a valve and control the flow of oil from the font, arranged and operating substantially as set forth and described.

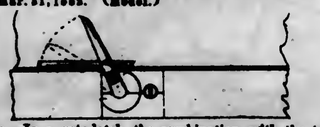
257,966. KINDLING-WOOD-SPLITTING MACHINE. HENRY MIDWOOD, Providence, R. I. Filed Nov. 11, 1881. (No model.)



Claim.—1. In a kindling-wood-splitting machine, the combination, with the knife D, of the yielding knives F F, substantially as and for the purpose set forth.

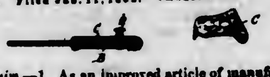
2. The combination, with the reciprocating knife D and the central knife, E, of the hinged knives F F, constructed to yield to the wood and split the same, as described.

3. The combination, with the reciprocating knife D, the knife E, and knives F F, pivoted at their upper ends, of the stripper H, set at an angle to the knife D, as described.



4. The combination, with the knife D, provided with the thrust-bearing for the knives F F, of the knives F F, pivoted to the knife D, and bearing against the thrust *g g*, the springs *i i*, and bar A, constructed to secure the knives and allow the same to move laterally to split the wood, as described.

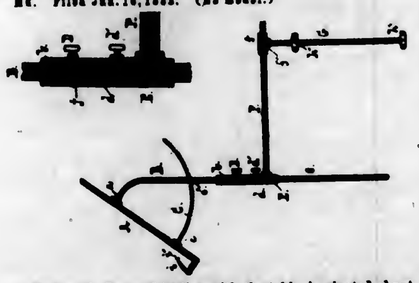
257,967. SHIRT-BOSOM. WILLIAM H. HOBB, Waterford, N. Y., assignor to the Waterford Manufacturing Company, same place. Filed May 20, 1881. (No model.)



Claim.—The combination, in a shirt, of the bosom A and independent facing C, the latter below the former and joined to the shirt-front and bosom at the bottom of the latter, and the lower end of the facing attached to the shirt-front with button-hole tab at the bottom of the facing, as shown and described.

257,968. GATE-LATCH. JAMES HOGGHAN, Westerville, Ohio. Filed Mar. 31, 1882. (Model.)

Claim.—In a gate-latch, the combination, with the tubular casing provided with a face-plate and having stops arranged thereon adjacent to the tubular opening to limit the movement of the wing of the latch, of the latch having its shank held in the tubular casing and its wing arranged to rest on the stop P and project beyond the edge of the post in position to be engaged and lifted by the gate in the act of closing, substantially as set forth.



257,969. CORSET-CLASP. Henry W. Moulton, Jackson, Mich. Filed Jan. 11, 1882. (Model.)

Claim.—1. As an improved article of manufacture, the metal shield C, provided with fastening-lips, and having an aperture larger than the head of the fastening-stud of a corset-busk, adapted to be applied to a corset over the fabric after the fastening-stud attached to the busk has been secured in place, substantially as and for the purpose specified.

2. The combination, with the busk B and the stud *b* thereof, of the shield C, made entirely separate from the busk and stud, and secured to the corset over the fabric and stud after the busk and stud have first been secured within said corset fabric, substantially as and for the purpose specified.

257,970. BOOK-SUPPORT. William W. Murray, Baltimore, Md. Filed Jan. 16, 1882. (No model.)

Claim.—1. In combination with the table A, pivoted about a horizontal axis in the end of a vertical swiveling rod, the sleeves *b* E and the rod *c*, provided with the pin *d*, as set forth.

2. In combination with the table, pivoted, as described, in the end of the rod B, the sleeve *b*, rigidly secured to the latter, and having screw D, the vertically-adjustable rod *c*, having groove *f* and pin *d*, and the sleeve E, secured to the horizontal arm, as set forth.

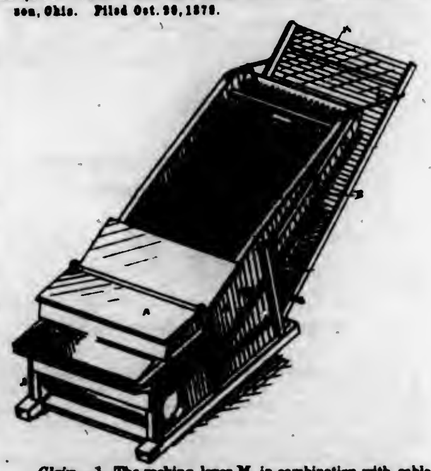
3. The book-support consisting of the table A, rod B, bar C, sleeves *b* E, and rod *c*, the tube F, sleeve *f*, and rod G, the said sleeves being provided with clamping-screws, as set forth.

257,971. SULKY-PLOW. Jacob Nixon, Winfield, Kans. Filed Mar. 2, 1882. (No model.)

Brief.—Draft is attached to the plow-standard below the beam. By an elbow-lever and a system of toggle-links and braces the plow is drawn backward out of the ground when being raised. A stop prevents the plow-standard from dropping below a fixed depth and another holds the toggle from going below a straight line.

Claim.—1. In a sulky-plow, the combination, with the tongue provided on one side with a hook or stop, of the plow provided with an extended standard, having on one side a loop-guide through which the tongue passes, and on its opposite side a stud or projection adapted to engage with the stop on the tongue, substantially as set forth.

2. The combination, with the axle, plow-tongue, and extended standard, of the lever I, pivoted at one end to the axle, and at its opposite end to the upper end of the standard, a lifting-lever, and suitable connections for raising and retracting the plow, substantially as set forth.



3. The combination, with the axle, plow-tongue, and plow, the latter being provided with an extended standard, of the lever I, pivoted at one end to the upper extremity of the standard and at its opposite end to the axle, the lifting-lever, and a toggle-connection provided with a stop, and pivoted at its rear end to the axle and at its forward end to the standard at a point above the mold-board of the plow, substantially as set forth.

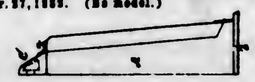
4. In a sulky-plow, the combination, with the standard and its toggle-connection J, of the draft-frame, substantially as shown, pivoted to the standard at its rear end, while its forward end is suspended loosely from the tongue and adapted to receive the coupling for the team, substantially as set forth.

5. In a sulky-plow, the combination, with the plow-tongue and vertically-moving standard, of the draft-frame pivoted at its rear end to the standard above the mold-board, while its opposite end is supported between swinging arms depending from the tongue, and provided with means for lateral draft adjustments, substantially as set forth.

6. The combination, with the plow-tongue, of a bracket adapted to be secured thereto, and provided with upwardly-projecting sides to receive the lifting-lever, the inner one of said sides being notched to form the holding-sector of the plow, substantially as set forth.

257,972. THRASHING-MACHINE. Solomon E. Oviatt, Hudson, Ohio. Filed Oct. 26, 1876.

Claim.—1. The rocking lever M, in combination with cable L, a stacker, K, and means for securing the cable in position, substantially as set forth.



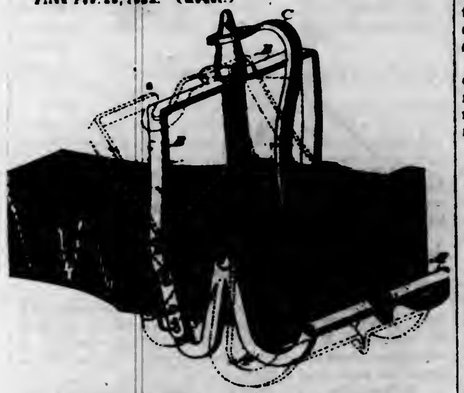
2. The combination of the stacker K, cable L, rocking lever M, and mechanism for paying out or taking in the cable L, substantially as and for the purpose shown.

3. The combination, with a screen of a thrashing-machine located and constructed to separate the straw from the grain, of the screen-frame D, its screen C, attached to said frame between its upper and under faces, substantially as set forth.

4. In a grain-thrashing machine, the combination of a screen-frame, D, a screen, C, located between the upper and under faces of said screen-frame, and broad hoe-shaped blades or scrapers F, connected with the under face of said screen-frame, substantially as set forth.

5. The combination, with the screen C, of the stationary grated surface H, located in the rear of said screen, substantially as set forth.

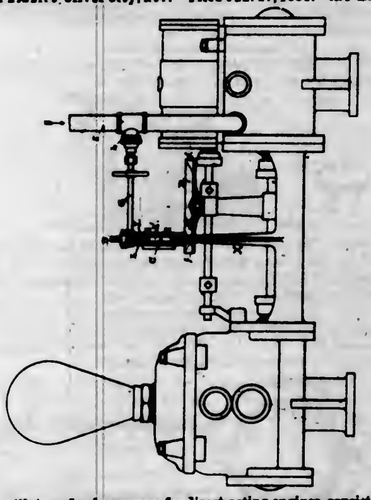
257,973. TOILET-CASE. Henry Pattberg, Jersey City, N. J. Filed Mar. 27, 1882. (No model.)



Claim.—1. A toilet-case, A, wider at the bottom than at the upper end, and provided with a hinged front or cover, B, hinged at the bottom, and secured at top by a suitable staple, *a*, in combination with a base-plate, *b*, projecting some distance from the front of the case, substantially in the manner and for the purpose described.

2. A toilet-case, A, in combination with a projecting part or ing, C, at its upper part, having a cavity, *d*, with opening *e* at the back, for the purpose substantially as set forth.

3. In combination with a toilet-case, A, the spring-blocks consisting of two blocks, D D, with suitable recesses, *c c*, joined together by a flexible material forming a hinge, in combination with spiral springs *e e*, substantially in the manner and for the purpose herein specified.



257,974. CAR-COUPLING. John H. Patterson, U. S. Army. Filed Feb. 28, 1882. (Model.)

Claim.—1. In combination, the pivotal abutting link-lifter A and pin-holder B, united by the link D, as shown and described, and for the purpose set forth.

2. In a car-coupling, the link-guide A, pin-support B, link-bars D, and pin-guide C, substantially as shown and described.

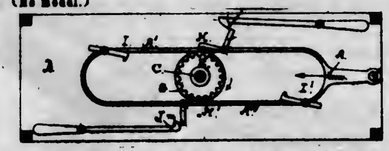
257,975. GOVERNOR FOR PUMPING-ENGINES. George C. Phillips, Silver City, Nev. Filed Jan. 27, 1882. (No model.)

Claim.—1. A governor for direct-acting engines, consisting of mechanism or a device having a step-by-step movement connected with the throttle-valve or governor-valve of the engine and operated by or from the movements of the piston by mechanism, substantially as described, for regulating the admission of steam to the engine according to the length of stroke, constructed and operating substantially as described.

2. A governor for direct-acting engines, consisting of the ratchet or teeth wheel D, adapted to be connected with a throttle or governor valve, and to produce by its rotation in one direction an increase of inlet area and in the opposite direction a decrease in the same, and means, substantially as described, connected with or operated by the reciprocations of the engine-piston, for producing alternate rotation back and forth of the said wheel and for changing the relative length or amount of the two movements of the wheel in degree corresponding to the variations in the length of stroke of the piston, substantially as described.

3. The combination, with a throttle or governor valve of an engine, of mechanism connected with and operated by or from the movements of the engine-piston to produce at some time in the stroke of the piston first an increase of the inlet-aperture and then a decrease of the said inlet through the valve, said mechanism, substantially as described, being adapted to increase the closing over the opening movement of the valve as the length of stroke of the engine increases or exceeds a given length, and to act oppositely upon the valve as the stroke falls behind each given length, substantially as described.

4. The combination, with the ratchet-wheel D, adapted to be connected with a governor or controlling valve, of the pawl-carrying bars C C′ and the tappet-plate B, with its inclines *e f f*, connected with or moved by the engine-piston, and having motion uniformly with such piston, substantially as described.



5. The combination, with the ratchet-wheel D, adapted to be connected with a governor or other controlling valve, of the pawl-carrying bars C C′, held in inclined slotted bearings *k*, the counter-weights at the upper ends, and the tappets or inclines *e f f* upon the plate B, which is connected with and to be driven by the engine-piston, substantially as described.

6. The combination, with the ratchet-wheel D, of the pawl-carrying bars C C′ and the reciprocating tappet-plate B, adapted to be connected with and having its motion produced uniformly by and with the engine-piston, as a means for producing rotation alternately in opposite directions of the ratchet-wheel from the stroke of the piston, substantially as described, for the purpose specified.

7. The plate B, having the tappets or inclines *e f f*, and adapted to be connected to or operated from the movements of the engine-piston to travel uniformly therewith, substantially as described.

8. The combination, with the pawl-carrying bars C C′, held in inclined slotted bearings, of the reciprocating plate B, having tappets or inclines *e f f*, and the cam plate or surface for producing from the reciprocations of the plate first a lateral movement of the upper end of the bar and then a perpendicular movement, substantially as herein described.

257,976. GOVERNOR FOR DIRECT-ACTING ENGINES. George C. Phillips, Silver City, Nev. Filed Mar. 16, 1882. (No model.)

Claim.—1. The combination, with the notched or toothed wheel E, keyed to the shaft C, which is connected with a valve governing the steam-supply, of the frame or elongated yoke A, having catches H H′ I I′, and connected with the engine-piston to travel uniformly therewith and with the same length of stroke, substantially as herein described, to operate as set forth.

2. The combination, with the elongated yoke A, adapted to be driven by or from the movements of the engine-piston and to travel with a reciprocating move ent over the notched or toothed wheel E, of the balanced catch H H′ I I′ and the latches J J, substantially as herein described.

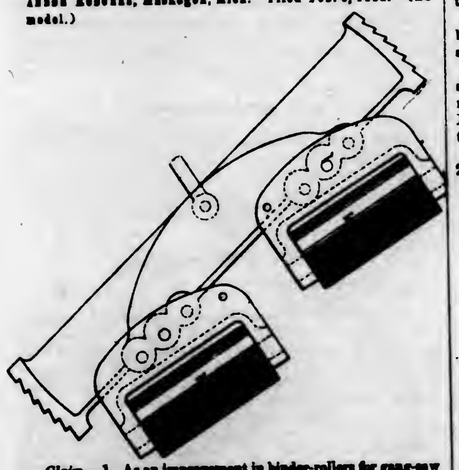
3. The combination together of the wheel E, keyed to the shaft C, the wheel G, turning loosely upon the shaft, the reciprocating yoke A, having catches H H′ I I′, and the face-plates B B, substantially as herein described.

4. The herein-described stroke-governing device for direct-acting engines, consisting of the face-plates B B, the shaft C, passing through the same, the notched or toothed wheel E, keyed to the said shaft, the wheel G, held loosely upon said shaft, the elongated yoke A, having the pivoted catches H H′ I I′ and the latches J J, combined for operation together substantially as described.

257,977. BEER-CHIP. Bernard Rich, Brooklyn, N. Y. Filed Nov. 1, 1881. (Specimens.)

257,977.

Claim.—A calendered beer-chip having indentations or grooves impressed upon its surface, whereby the superficies of the chip and its density are increased, as and for the purpose set forth.

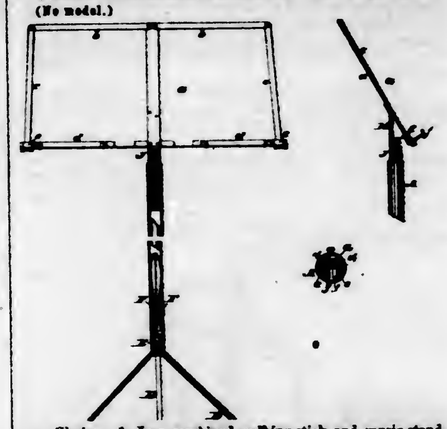


257,978. SAW-HANDLE. CHRISTOPHER W. ROBINSON, Saegertown, Pa. Filed Feb. 17, 1882. (No model.)

Claim.—1. The combination, with the handle and adjustable blade, of the clamping-collar having an adjusting-lever adapted to engage the blade and provided with a set-screw for holding it in position, as set forth.

2. The combination, with the handle provided with the U-shaped clamping-collar having an adjusting-lever pivoted between the arms thereof, and provided with a hooked or notched end and a set or adjusting screw, of the adjustable saw-blade having a series of serrations on its upper edge and a curved recess near its lower edge, substantially as and for the purpose specified.

257,979. PRESSER-ROLLER FOR GANG-SAW MILLS. ALEXANDER ROBERTS, Muskegon, Mich. Filed Feb. 8, 1882. (No model.)



Claim.—1. As an improvement in binder-rollers for gang-saw mills, the combination, with two separate rollers and their adjustable frames, of a swinging equalizing-beam and vertical guides for the ends of the same, all arranged substantially as and for the purpose specified.

2. In binder-rollers for gang-saw mills, the combination, with an equalizing-beam provided with ratcheted ends, of grooved guides having pawls for sustaining said beam in a stationary position when desired and adjustable roller-frames attached to said beam, substantially as and for the purpose described.

3. The combination of the equalizing-beam, the roller-frames and rollers pivoted thereto, with the pins e, for the purpose of converting said rollers and roller-frames from swinging attachments to said bar to rigid fixture thereto, substantially as and for the purpose described.

257,980. COMBINED WALKING-STICK AND MUSIC-STAND. WILLIAM H. HOLDSWORTH, Camden, N. J. Filed Aug. 16, 1881. (No model.)

Claim.—1. In a combined walking-stick and music-stand, folding legs hinged to a block, E, which is provided with upwardly-projecting retaining-springs F, substantially as and for the purpose set forth.

2. In a combined walking-stick and music-stand, a folding music-stand provided with a supporting-sleeve, J, made adjustable in the stick, and formed of an expansible or split tube, substantially as and for the purpose set forth.

3. The folding music-stand, in combination with the sleeve J and support H, said support rising from the sleeve at one side, leaving the shoulder H', and having the stand hinged or pivoted to said support above the bottom edge of the former, substantially as and for the purpose set forth.

4. The folding music-stand G, provided with angular fingers *f*, in combination with the inclosing-stick, substantially as and for the purpose set forth.

5. The folding music-stand having side bars or pieces, c, the bottom pieces, *d*, with eyes *e*, substantially as and for the purpose set forth.

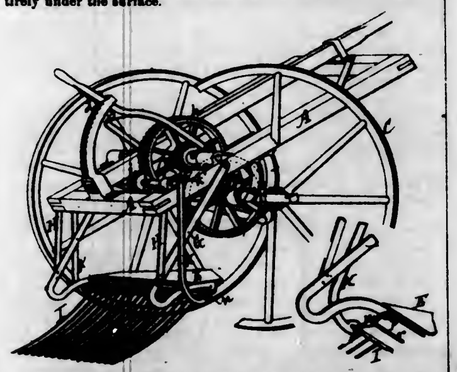
6. The combination, in a combined walking-stick and music-stand, of a stick, A, with removable head and ferrule, a folding music-stand, G, with an expansible sleeve, J, and the folding legs D, with the block E and upwardly-projecting springs F, substantially as and for the purpose set forth.

257,981. BENCH-PLANE. SOLON R. RUST, Pine Meadow, Conn. Filed Sept. 8, 1880. (No model.)

Claim.—The stock *a*, provided with ways *b* in the side plates thereof, the bed *c*, hung in such ways, the cutting-iron *j*, and the clamping-lever *k*, taking its fulcrum on bed *c*, all combined substantially as described, for the purpose set forth.

257,982. NIPPERS FOR OPENING BOTTLES. J. ALBERT SCHMIDT, New York, N. Y. Filed Mar. 16, 1882. (No model.) Patented in Germany Jan. 9, 1882, No. 16,578.

Claim.—As a new article of manufacture, a pair of nippers for cutting the cork-fastening wires and strings of bottles, the handles of which are bent into arc-shaped portions adjoining the nippers and provided with cutting devices concentric to the arc-shaped portions, substantially as set forth.



257,983. PIPE-COUPLING. LEVI T. SCOFIELD, Cleveland, Ohio. Filed Dec. 13, 1881. (No model.)

Claim.—A coupling for securing communication between a pipe and a vessel, or between two pipes, consisting of a hollow plug open at one end and closed at the other with a hexagonal cap, so that it can be turned with a wrench, the outer surface of said plug being a male thread of tapering form and provided with a hole on its side, so that when screwed tight in a valve, vessel, or socket forming a part of the coupling the opening will be the only communication between the pipes or pipe and vessel through the plug, said socket being provided with a grooved chamber encircling the plug at the opening, substantially as and for the purpose set forth.

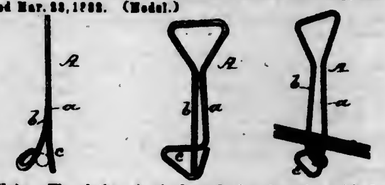
257,984. POTATO-DIGGER. CHARLES W. SHEARER, Hendon, N. Y. Filed Mar. 27, 1882. (No model.)

Brief.—Connecting-links have free turning movement in their bearings, and the ends of the cross-head of the shaker also have free movement in the end of the pitmen, the peculiar construction giving vibration only to the inner end of the grating or shaker, while its outer end rests on the ground and the shaker works entirely under the surface.

Claim.—The combination, with the scoop E and grating I, of the links *n n*, connecting the grating with the back of the scoop, and the pitmen K K, connecting the grating with the crank-shaft *k*, as shown and described, and for the purpose specified.

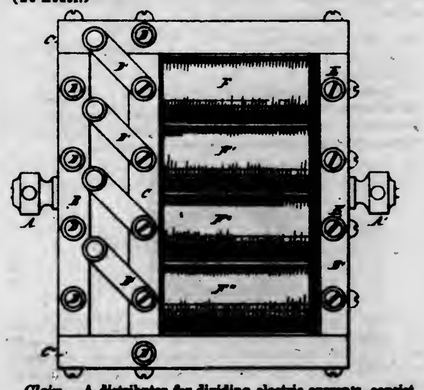
257,985. ARTIFICIAL FUEL. WILLIAM C. SIPPERD, Victoria, British Columbia, Canada. Filed July 8, 1881. (No specimens.) Patented in Canada June 13, 1881, No. 13,965.

LONGITUDINAL SECTION.



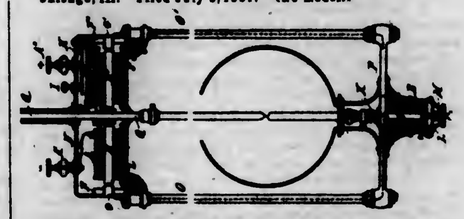
Claim.—An artificial fuel consisting of nine parts of coal-screenings, one of clay, one of sawdust, and a sufficient quantity of water, substantially as specified, whereby a cheap fuel shall be provided capable of producing the brilliant effects of a natural fuel, as set forth.

257,986. DOOR-CHECK. HENRY SENDERZY, Sparkbrook, near Birmingham, County of Warwick, assignor to William Henry Tonks and Edmund Tonks, Moseley Street, Birmingham, England. Filed Dec. 28, 1881. (No model.) Patented in England Feb. 21, 1881, No. 744.



Claim.—A door-chain or door-fastening consisting of a longitudinally-slotted link, *e f g*, with the locking-slot h, secured by a chain to the door-frame, and of a necked stud or pin, *e d*, fixed on the door, the slotted link being combined with the necked stud or pin, and the two parts used substantially as described, and illustrated in the accompanying drawings.

257,987. CLOTHES-PIN. SUTTON STROUP, Harmony, Ind. Filed Mar. 23, 1882. (Model.)



Claim.—The clothes-pin A, formed of spring-wire, with depending arms *a b*, the arm *a* being bent, substantially as shown, to form a triangular extension, *c*, while the arm *b* is bent and curved outwardly, substantially as and for the purpose set forth.

257,988. SHUNTING DEVICE FOR ELECTRIC LIGHTS. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed May 4, 1881. (No model.)

Claim.—A distributer for dividing electric currents, consisting of the frame B B' C C C', carrying the checks or coils F F F'' F''', all connected with the main line by posts A A', and the switches D' and posts D, substantially as described.

257,989. ELECTRIC-ARC LAMP. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed July 8, 1881. (No model.)

Claim.—1. In an electric lamp, a brake or stop constructed and adapted to alternately hold and release the carbon, in combination with suitable means for giving said brake or stop a rapidly-vibrating movement, substantially as and for the purpose specified.

2. In an electric-arc lamp, and in combination with a suitable device for normally holding the upper carbon, a stop or brake adapted to vibrate rapidly to or from the carbon-holder, whereby it will alternately hold and release the carbon only when it becomes necessary to feed the same, substantially as and for the purpose specified.

3. In an electric-arc lamp, and in combination with a suitable device for normally holding the upper carbon, a stop or brake constructed to vibrate rapidly and to alternately act on the carbon when feeding is necessary, and a suitable circuit-breaker, substantially as and for the purpose specified.

4. In an electric-arc lamp, and in combination with the upper carbon or carbon-holder thereof, the plate D, magnets A C, cores E E', and a vibrating stop, substantially as and for the purpose described.

5. In an electric-arc lamp, and in combination with the carbons thereof, the electro-magnets A C, means for passing a steady current through the magnet A and a rapidly-pulsating current through the magnet C, and devices actuated by said magnets for normally holding the upper carbon and gradually allowing the same to fall when feeding is necessary, substantially as and for the purpose specified.

6. In an electric-arc lamp, the carbon-holding rod Q, in combination with the plate D, embracing said rod, the magnets A C, the cores E E', the vibrating lever or stop G, and a suitable automatic circuit-breaker, substantially as and for the purpose specified.

7. In an electric-arc lamp, the carbon-holding rod Q, in combination with the plate D, core E, vibrating core E', vibrating lever or stop G, and a suitable circuit-breaker, as and for the purpose specified.

8. In an electric-arc lamp, and in combination with the cores E E' and the plate D, operating substantially as described, the screws *s s'*, whereby the position of the upper-carbon holder may be regulated.

9. In an electric-arc lamp, the combination of the lower-carbon holder, upper-carbon-holding rod, Q, plate D, cores E E', magnets A B C, lever or stop G, disks F F', spring-contact H, and suitable electric and magnetic connections between the various parts, substantially as described.

257,990. COMBINED ELECTRIC MOTOR AND GENERATOR.

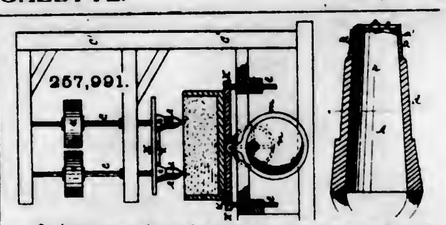
CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Apr. 8, 1881. (No model.)

Brief.—An armature has two systems of independent coils, one of which, being put in the circuit of a generator, acts to drive the armature as a motor. Currents are induced in the other coils, which may be utilized for lighting or other purposes.

Claim.—1. An electric motor the armature of which is wound with a primary and a secondary wire, the former to be used as the motive force and at the same time to induce currents of alternating directions in the latter when in operation, substantially as described.

2. In an electric motor and current-generating machine, and in combination with the field-magnets thereof, an armature consisting of insulated sections combined to form a wing or cylinder, each section being composed of a curved core and a primary and a secondary coil, all insulated from each other, substantially as described.

3. An electromotor the armature of which is wound with a primary and a secondary wire, in combination with an electric generator for supplying an electric current to said motor and circuit-connections for carrying off the current from the secondary wire, substantially as and for the purpose specified.



4. The combination, with a motor or motors provided with an armature or armatures having primary and secondary coils, of an electric generator producing motive power in said motor or motors and a lamp-circuit connecting with the secondary coils of said armature or armatures, as and for the purpose specified.

5. In combination with an electromotor and current-generating machine, a regulator or governor consisting of an insulated ring, F, and a series of fliers adapted to "short-circuit" the motor when the speed becomes excessive, substantially as described.

6. A governor for electric motors, consisting of a metal ring, F, supported and insulated from the motor by a non-conducting disk, *a*, and a series of fliers, F' F'', mounted on the shaft of the motor, both the ring and the fliers being suitably connected with the main circuit, substantially as specified.

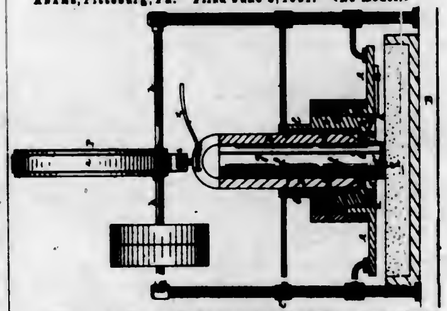
257,991. METHOD OF AND APPARATUS FOR FORMING MOLDS FOR CASTINGS. S. JARVIS ADAMS, Pittsburg, Pa. Filed June 3, 1881. (No model.)

Claim.—1. The herein-described method of forming cylindrical molds in a body of sand, consisting in at the same time rapidly rotating and gradually advancing a pattern into the body of sand, so as to compact and smooth the walls of the mold, substantially as and for the purposes set forth.

2. A rotary pressing tool or pattern for forming molds in sand, provided with a series of pressing-faces on its periphery, adapted to gradually press out the sand, substantially as set forth.

3. A rotary pressing tool or pattern for forming molds in sand, having a hollow passage extending axially through the entering end for the escape of sand, substantially as set forth.

4. A rotary pressing tool or pattern for forming molds in sand, provided with a central passage for the escape or removal of part of the sand, and a wire or knife across the mouth of the passage, substantially as and for the purposes set forth.



5. In combination with a rotary pattern for forming molds in sand, a vertically-moving flask-table adapted to advance the flask to the rotary pattern and withdraw it therefrom after the formation of the mold, substantially as set forth.

6. The combination of the rotary patterns A, vertically-moving flask-table K, guide-rods *l*, and cam or eccentric for imparting motion to the flask-table, substantially as and for the purposes set forth.

7. The combination of the rotary patterns A, flask-table K, long flask U, divided into separate compartments, and stop mechanism for holding the flask in proper relative position to the patterns, substantially as set forth.

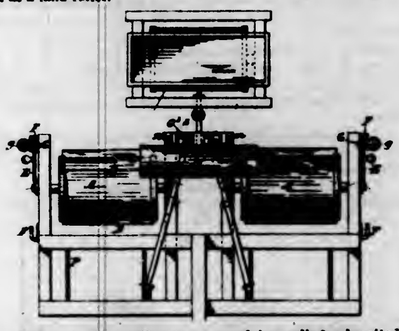
8. The combination of the long flask U, divided into separate compartments, and the bottom board, T, provided with the circular openings *t* under each compartment, substantially as and for the purposes set forth.

257,992. FORMING MOLDS FOR CASTINGS. S. JARVIS ADAMS, Pittsburg, Pa. Filed June 3, 1881. (No model.)

Claim.—1. The method herein described of forming cylindrical molds in a body of sand, consisting in first forcing the pattern into the sand by direct compression longitudinally of its axis, and subsequently rotating the pattern so forced in circumferentially of its axis to smooth or finish the mold, substantially as and for the purposes set forth.

2. A pattern, D, for forming molds in sand by compression, provided with a cope-head, *c*, for molding the cope-print above the mold, said cope-head having an annular downwardly-extending lip, *c'*, for compacting the sand at the top of the mold, substantially as set forth.

3. A pattern for forming molds, constructed in two parts, the pattern proper, *d*, adapted to be first advanced into the sand, and the cope-head *c*, adapted to be afterward advanced, and provided with an annular downwardly-extending lip, *c'*, to compress the sand against the pattern proper, substantially as set forth.



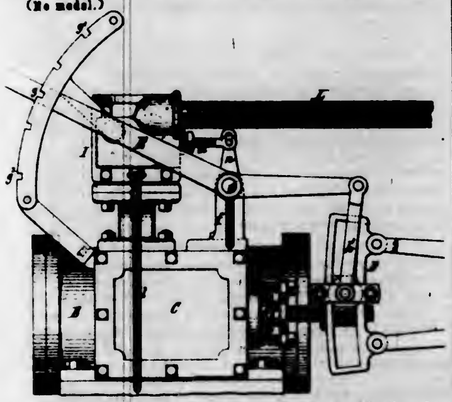
4. A pattern for forming molds in a solid body of sand by direct compression, provided with a passage extending longitudinally through the pattern, to permit a portion of the sand to enter the pattern as it is pressed into the sand and fall through or be withdrawn by the pattern, substantially as set forth.

5. A pattern for forming molds in sand by compression, provided with a central passage to permit a portion of the sand to enter the pattern, said central passage having an irregular face to hold the sand, substantially as and for the purposes set forth.

6. In machines for forming molds in sand by compression, the combination of the pattern D, templet-plate A, and cam I', or equivalent power apparatus, the pattern and templet-plate being so connected by a telescopic joint that both are advanced and retracted by the movement of the power apparatus, substantially as and for the purposes set forth.

257,993. STALK-CUTTER. JOHN Q. ADAMS, Marseilles, Ill. Filed Aug. 29, 1881. (No model.)

Brief.—Knife-holders attached to arms which have their bearings on a shaft eccentrically to the cylinder, said holders carrying detachable knives, whereby the machine may be converted into a land-roller or stalk-chopper at will. Devices for locking and releasing the crank-shaft and for flexibly and detachably connecting a rear supplementary roller when the machine is to be used as a land-roller.



Claim.—1. In a stalk-cutter, a revolving cylinder longitudinally slotted, in combination with a fixed crank-shaft on which it revolves, with knife-carrying arms having their bearings on the shaft eccentrically to the cylinder, with knife-holders H H', attached to the knife-carrying arms, and with knife-blades detachably set in the knife-holders, substantially as and for the purpose described.

2. The lever E, rigidly set on the crank-shaft D and provided near its free end with the slot *s*, in combination with the plates F, having the elongated slots *f*, and with the bolt G, provided at its inner end with the lug *g* and at its outer end with the parallel weighted arm *g'*, substantially as and for the purposes described.

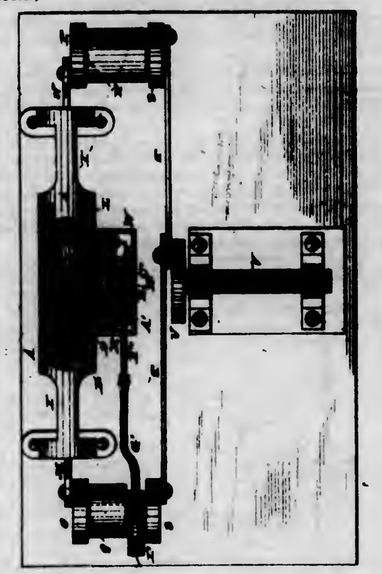
3. The knife-cylinders A, in combination with knife-blades detachably set therein, and with means for flexibly and detachably connecting said cylinders with a supplementary rear cylinder, substantially as and for the purposes described.

257,994. VALVE-GEAR FOR STEAM-ENGINES. ROBERT W. AITKEN and DAVID FARQUHAR, Buffalo, N. Y., assignors to the Pitts Agricultural Works, same place. Filed Mar. 16, 1882. (No model.)

Claim.—1. In a reversible steam-engine, the combination of a steam-distributing valve adapted to be operated forward and backward, a throttle-valve whereby the admission of steam to the steam-distributing valve is controlled, and mechanism whereby the motion of the steam-distributing valve and the position of the throttle-valve are controlled simultaneously, substantially as set forth.

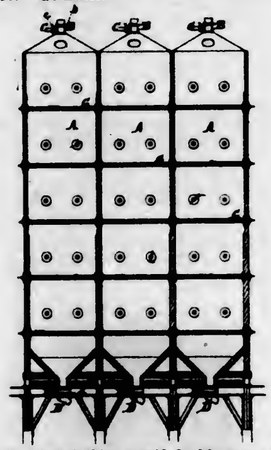
2. The combination, with the link D, whereby the motion of the steam-distributing valve is controlled, and a throttle-valve, J, whereby the admission of steam to the distributing-valve is regulated, of a reversing-lever, E, connected with the link D and the valve J, whereby both are adjusted simultaneously, substantially as set forth.

3. The combination, with the steam-valve C' and the throttle-valve J, of the link D, connected with the valve C', the reversing-lever E, mounted on a rock-shaft, *e*, and connected with the link D, and an arm, *n*, secured to the shaft *e* and connected with the throttle-valve J, substantially as set forth.



4. The combination of a valve-chest, I, connected with the steam-boiler by a pipe, L, and a drip-pipe, *l*, which descends from the valve-chest to the steam-boiler, and whereby the water of condensation is returned to the boiler, substantially as set forth.

257,995. LOCK. ELI ANDERSON, Carpentersville, Ind. Filed Mar. 16, 1882. (Model.)



Claim.—The combination of the tumbler having shoulders G I, cam K, having curved side L, and arm M, provided with notch N and spring O, the spring H, and the detent J, all arranged and operating substantially as set forth.

257,996. STEAM-ENGINE. JAMES ANDERSON and JOHN MCDONALD, Cambridgeport, Mass. Filed Mar. 2, 1882. (No model.)

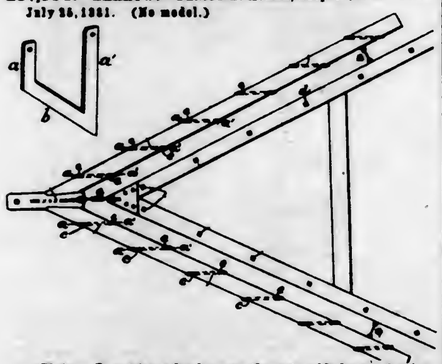
Claim.—As an improvement in steam-engines, the cylinder A, having counter-cuts I I, forming segmental ways for the cross-heads J K, pistons B B', connected by rods D, having flanges and nuts countersunk in said pistons, central piston, C, piston-rods G L, arranged as described, pitmen M N, crank-shafts Q R, having wheels O, P, and S, pitmen T, shaft V, having crank-wheel U, steam-chest W, having ports X Y, valve Z, having recesses A' C', channels D', and exhaust-port E', and the eccentric I', mounted upon shaft Q and connected with the valve Z, all constructed, arranged, and operating substantially as herein shown and specified.

257,997. GRAIN-BIN. EDWARD ARNAN, Brooklyn, N. Y. Filed Sept. 2, 1881. (No model.)

Claim.—1. Air-tight bins provided with valves for controlling the flow of air as well as of grain, substantially as herein specified.

2. The grain-bins A, formed with a strong and close main wall, an impervious flexible lining, and a further layer of overlapping material, as clapboards, combined substantially as herein specified.

3. The combination, with one or more grain-bins, of tight-abutting valves for the admission and discharge of the grain, and provisions for introducing cold air to fill the interstices of the grain, as herein specified.



4. In a grain-bin having provisions for the discharge of grain, a separate provision for the introduction of air, the apertures $d^{\times}$, arranged to induct the air without discharging grain, as herein specified.

5. The valve J, discharge-nozzle D, provided with the inclined apertures $d^{\times}$, valve e, and air-induction nozzle E, so arranged that the latter surrounds the former, as and for the purposes herein specified.

6. The nozzle B, for the entrance of grain, and the branch nozzle C, for the eduction of air, combined with each other and with the bin and adapted for joint operation, as herein specified.

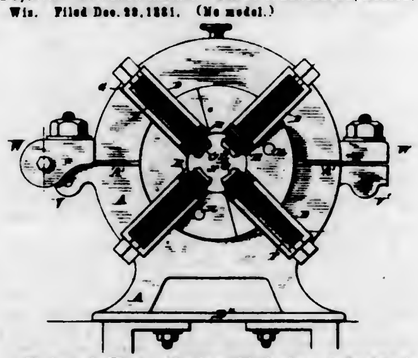
7. In an air-tight grain-bin having provisions for the introduction and removal of grain and of air, a safety-valve opening in two directions, adapted to prevent an excess of pressure either inward or outward, substantially as herein specified.

257,998. HARROW. DANIEL B. ASHER, Gosport, Ind. Filed July 25, 1881. (No model.)

Claim.—In a triangular harrow, the outer side beams, having their outer and inner sides formed with recesses c, in combination with the knives, constructed as shown, with the inclined cutting blade b and the vertical shanks a and a', said shanks being bolted in said recesses to bring the blades of the knives on lines parallel with the line of draft, as herein set forth and described.

257,999. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. CHARLES E. HALL, Philadelphia, Pa. Filed Feb. 25, 1882. (No model.)

Brief.—The armature-coils are composed of iron wire coated with a metal which is a better conductor of electricity than iron, the whole being insulated in the usual manner. The coated wire serves at the same time as magnetic core and generating-coil.



Claim.—1. An armature for dynamo-electric machines, having its coils composed of a wire of magnetic material coated or plated with a non-magnetic material of greater conductivity than the body of the wire, substantially as and for the purpose described.

2. An armature for dynamo-electric machines, composed wholly of a series of coils of wire of a magnetic material coated or plated with a material of a substantially non-magnetic character and of greater conductivity than the material of which the body of the wire is composed, both the wire and its covering being in and forming part of the electric circuit, substantially as described.

3. An armature composed of a series of coils of wire of magnetic material coated with a non-magnetic conductor and mounted on a suitable center, substantially as described.

258,000. TURNING-LATHE. HENRY C. BALDWIN, Hudson, Wis. Filed Dec. 29, 1881. (No model.)

Claim.—1. The combination, with the frame or bearing A, of the reversible revolving collar B, provided on each side with grooves for the detachable clamping-jaws C, substantially as and for the purpose set forth.

2. The herein-described revolving collar, consisting of two parts connected by a dovetail joint, tapering or wedge-shaped in direction of its length, and by a single tapering pin, substantially as set forth.

3. The frame consisting of the base R and hinged top S, with the interposed plates or washers A', in combination with the revolving reversible collar B, substantially as set forth.

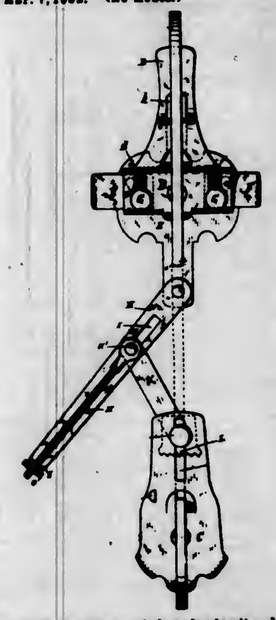
4. The slotted lug W, having sleeves C' fitted in its sides and projecting at the ends, in combination with the headed bolts or set-screws B', passing loosely through said sleeves and into the sides of lug V, forming a hinge, substantially as set forth.

5. The combination, with the reversible revolving collar, constructed and arranged substantially as described, of the frame consisting of two parts hinged together and having a set-screw adapted to enter a recess in the edge of said revolving collar, so as to hold it stationary, substantially as set forth.

258,001. PRESERVING COMPOUND. FREDERICK S. BARFF, Kilburn, County of Middlesex, England. Filed Mar. 21, 1882. (No specimens.) Patented in England Mar. 26, 1881, No. 1,329.

Claim.—As an agent for the preservation of organic matter, a compound of boracic acid and glycerine having the characteristics described.

258,002. GATE-HINGE. MARION J. BARROW, Barrow, assignor of one-half to Albert B. Proctor and George W. Fick, Rockhouse, Ill. Filed Mar. 10, 1882. (Model.)



Claim.—The combination, substantially as hereinbefore set forth, of the lower section provided with jaws b b, circular bearing

258,002.

b', and upwardly-projecting portion b^2, and the upper section formed with the shell or casing c, having its rim arranged to bear on the circular bearing b', and the under side of its top arranged to bear on the top of portion b^2, and provided with guide-rolls d' and rollers d^2, as set forth.

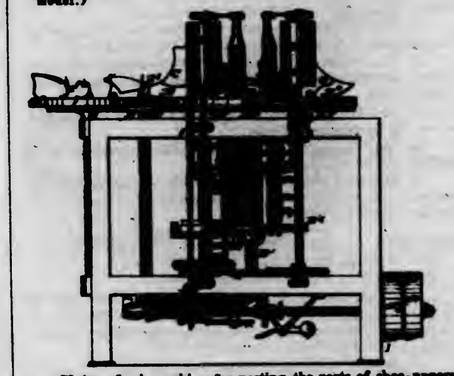
258,003. SKATE. JOHN BARNLEY, Oshawa, Ontario, Canada. Filed Mar. 7, 1882. (No model.)

Claim.—1. An improved skate having its sole and heel plates connected to a slotted lever carrying an adjustable screw-rod, substantially as herein shown and described, whereby the said sole and heel plates are adjusted simultaneously, as set forth.

2. In a skate, the combination, with the runner A, the toe-plate B, and the heel-plate C, of the longitudinally-movable sole-plate E, the transversely-movable sole-clamps F, and devices for moving and locking the sole-plate, substantially as herein shown and described, and for the purpose set forth.

3. In a skate, the combination, with the runner A, the toe-plate B, provided with slots d, and heel-plate C, of the longitudinally-movable sole-plate E, the transversely-movable sole-clamps F, provided with diagonal slots e, the pintles G, attached to the sole-plate E and passing through the slots e and d, and of devices for moving and locking the sole-plate E, substantially as herein shown and described, and for the purpose set forth.

4. The combination, in a skate, of a longitudinally-movable sole-plate, E, with the lever H, pivoted to the rear end of the same, and the lever K, pivoted to the lever H and to the sliding heel-clamp L, substantially as herein shown and described, and for the purpose set forth.



5. The combination, with a skate, of the longitudinally-movable sole-plate E, the clamps F, the longitudinally-slotted lever H, the lever K, the pintle K', the screw-rod N, and the nut O, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with a skate, of the movable sole-plate E, the lever H, having its end J bent downward, the clamps F, the lever K, the pintle K', the screw-rod N, and the nut O, substantially as herein shown and described, and for the purpose set forth.

7. The combination, with a skate, of the movable sole-plate E, the clamps F, the levers H K, and the stud P, projecting from the bottom of the heel-plate C, substantially as herein shown and described, and for the purpose set forth.

8. In a skate, the combination, with the runner A, the toe-plate B, provided with a slot, e, and the heel-plate C, of the longitudinally-movable sole-plate E, provided with a tongue, b, the clamps F, and the levers H K, substantially as herein shown and described, and for the purpose set forth.

258,004. MACHINE FOR PASTING SHOE-UPPERS. MARIA H. BRADLEY and S. LLOYD WIEGAND, Philadelphia, Pa.; said Wiegand assignor to said Bradley. Filed Sept. 26, 1881. (No model.)

Claim.—1. A machine for pasting the parts of shoe-uppers together, embracing the following devices in combination: a series of forms for receiving and holding the upper, a paste fountain and brush, a clamping device, and a discharging mechanism, all substantially as described, arranged to operate substantially in the manner set forth.

2. In a machine for pasting the parts of shoe-uppers together, the combination of gages and forms, substantially as described, for guiding the fitting of parts and determining the registration thereof, substantially as and for the purpose set forth.

3. In a machine for pasting shoes, the combination, substantially as described, of pasting-brushes with guards or stencils for restricting the spreading of paste or other cement, substantially as and for the purpose set forth.

4. In a machine for pasting together the parts of shoe-uppers, the perforated forms, in combination with clamps for holding the parts in position while drying.

5. In a machine for pasting together the parts of shoe-uppers, the combination of the scraping device with a pasting device, substantially as and for the purpose set forth.

6. In a machine for uniting the parts of shoe-uppers by pasting, the combination of a wheel for receiving and conveying the forms bearing uppers with the pasting and clamping devices, substantially as and for the purpose set forth.

7. In a machine for pasting the parts of shoe-uppers together, the combination of a throw-off or disengaging device driven with the driving-shaft and the feeding and clamping mechanisms, substantially as and for the purpose set forth.

8. In a machine for pasting shoe-uppers together, the combination of a tempering or stirring device, substantially as shown, with the paste-fountains, substantially as and for the purpose set forth.

9. In a machine for pasting the parts of shoe-uppers together, the combination of forms and clamps with the guiding and discharging mechanism, substantially as shown and described.

10. In a machine for pasting the parts of shoe-uppers together, the combination of guides and clamps, substantially as shown and described, for holding the vamps during the pasting operation.

11. In a machine for pasting the parts of shoe-uppers together, the combination of an intermittently-moving table, adapted to receive the forms bearing the quarter-pieces, with a reciprocating flier adapted to convey and apply molds or clamps containing the vamps, all substantially as and for the purpose set forth.

12. In a machine for pasting together the parts of shoe-uppers, the combination of the intermittently-rotating mold or table adapted to receive vamps in clamps or molds and deliver them to a flier, substantially as and for the purpose set forth.

13. In a machine for pasting the parts of shoe-uppers together, the combination of the flier for applying the vamps with the stop-motion to automatically stop the machine when the vamp fails to

apply properly to the quarters, as and for the purpose set forth.

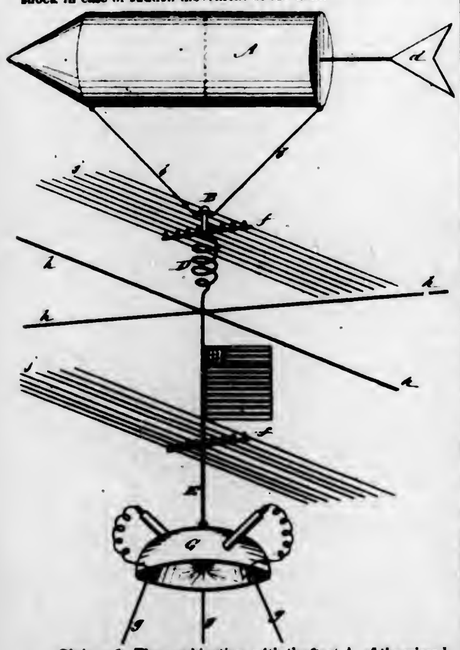
14. In a machine for pasting the parts of shoe-uppers together, the combination of the discharging mechanism with a registering mechanism, so as to register the uppers delivered, as and for the purpose set forth.

15. In a mechanism for pasting the parts of shoe-uppers together, the combination of two or more intermittently-moving tables, substantially as set forth, adapted to convey forms bearing the parts of the uppers to a pasting and a clamping mechanism, as and for the purpose set forth.

16. The form C, provided with springs C^2, substantially as shown and described, and for the purpose set forth.

17. The clamps C^1, provided with register-pins C^3 and springs G^2, substantially as and for the purpose set forth and shown.

18. The combination of forms and clamps, substantially as described, constructed and arranged to co-operate as and for the purpose set forth.



19. The adjustable stencils or guides constructed and arranged as and for the purpose set forth.

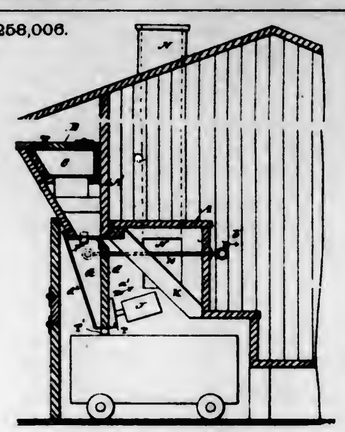
20. The disengaging and backing devices combined to co-operate as and for the purpose set forth.

21. The combination of the sliding bolts B^2 with the intermittently-moving table B and forms or clamps C, substantially as and for the purpose set forth

258,005. BALLOON-SUPPORT FOR TELEGRAPH-WIRES, &c. WILLIAM BENSON, Miles City, Mont. Filed Dec. 17, 1881. (No model.)

Brief.—A float which is stayed by guy-ropes holds the rod by which is supported an electric light, telegraph-wires, &c. A spring may be located between the rod and support to prevent any shock in case of sudden movement of the float.

Claim.—1. The combination, with the float A, of the wires *b*, the head B, and the rod E, substantially as and for the purpose set forth.



2. In combination with the float A, the head B, spring D, rod E, and the stay rods or wires *g g*, substantially as and for the purposes set forth.

3. The rod E, carrying the cross-pieces *f f*, and provided with the spring D and head B, in combination with the float A and stays *g g*, as and for the purposes set forth.

258,006. EARTH-CLOSET. HENRY J. BERNARD, New York, N. Y. Filed Feb. 8, 1882. (No model.)

Claim.—1. In an earth-closet, the combination, with the seat and a receptacle for powdered material, of a swinging hopper for

258,006.

conducting the powdered material upon the excrement, provided with a valve for opening and closing the bottom of the said receptacle, substantially as and for the purpose set forth.

2. In an earth-closet, the combination, with the receptacle B for powdered material, of the swinging hopper G and the valve slat or rail F in the top of the swinging hopper for closing the bottom of the receptacle B, substantially as herein shown and described, and for the purpose set forth.

3. In an earth-closet, the combination, with the receptacle B for powdered material, of the swinging hopper G, provided with a valve slat or rail, F, and of the rod H, for operating the swinging hopper G, substantially as herein shown and described, and for the purpose set forth.

4. In an earth-closet, the combination, with the receptacle B, of the swinging hopper G, provided with a valve for opening and closing the bottom of the said receptacle, the rod H, and the weight J, substantially as and for the purpose set forth.

5. In an earth-closet, the combination, with the swinging hopper G, of the receptacle B, the sieve C, and means for reciprocating the sieve, substantially as and for the purpose set forth.

6. In an earth-closet, the combination, with the receptacle B, of the swinging hopper G, and devices, substantially herein shown and described, for loosening the powdered material in the said receptacle, the said devices being operated by the movement of the said hopper, as set forth.

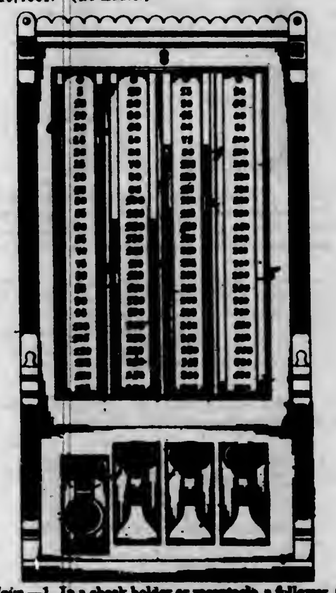
7. In an earth-closet, the combination, with the receptacle B for powdered material, of the swinging hopper G, the slat F, and of devices attached to the strip or slat F, for loosening the powdered material in the receptacle G, substantially as herein shown and described, and for the purpose set forth.

8. In an earth-closet, the combination, with the receptacle B, for powdered material, of the swinging hopper G, the slat F, the frames P and Q, pivoted to the top of the strip or slat F in the hopper G, and of the pivoted wires R S, for connecting these frames with the sides of the receptacle B, substantially as herein shown and described, and for the purpose set forth.

9. In an earth-closet, the combination, with the receptacle B, for powdered material, the hopper G, and the slat F, of the swinging frames P and Q and the fixed frames or projection O on the top of the strip or slat F in the hopper G, and of the wires R S, substantially as herein shown and described, and for the purpose set forth.

10. In an earth-closet, the combination, with the receptacle B and the swinging hopper G, of the check-block T, the projecting rail T', and the check-bar K, substantially as herein shown and described, and for the purpose set forth.

258,007. POCKET DOOR-FASTENING. ARTHUR BELOISE, Chicago, Ill. Filed Jan. 21, 1882. (No model.)



Claim.—1. In a portable or pocket door-fastening consisting of the grooved and slotted button A and hooked tongue D, provided with pin *d*, the slot C, inclined with reference to the bearing-face A', and laterally extended at one or both ends, substantially as described, and for the purposes set forth.

2. In combination with the hooked tongue D, the button A, having the groove B and the slot C, laterally extended at one end, and the recess *e'*, whereby the tongue may be folded against the back, with the hooks guarded, substantially as shown and described.

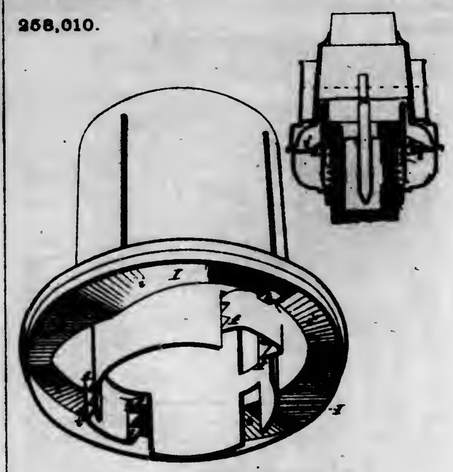
3. In the fastening described, the combination, with the tongue D, having holes d^1, of the plate E, provided with pins *e e*, fitted to the holes d^1, whereby the plate may be attached to the tongue for the purpose of giving greater thickness to the latter, substantially as described.

258,008. CHECK-REGISTER. JOSEPH RESNOR, Philadelphia, Pa., assignor of one-half to Henry Loth, same place. Filed Aug. 18, 1881. (No model.)

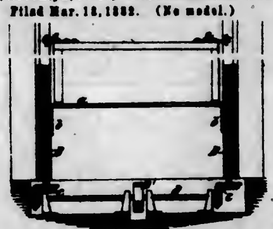
Claim.—1. In a check holder or receptacle, a follower, G, with pawl and rack, substantially as shown, for preventing the fraudulent insertion of checks through the ejection-opening, as set forth.

2. The combination, in a check-register having a check tube or holder with slotted or open front and a door which, when closed, forms a front to said tube, of a register strip or gage affixed to the inside of said door, and a follower located in said tube and having arms which embrace the edge of said strip, substantially as shown and described.

258,009. DRAWER-PULL. ELI J. BLACKMAN, Bridgeport, assignor to the Benedict & Burnham Manufacturing Company, Waterbury, Conn. Filed Apr. 15, 1882. (No model.)



Claim.—The herein-described drawer-pull, consisting of the socket by which the pull is secured to the drawer, a tube through its head, a U-shaped handle, its two ends resting against the corresponding ends of said tube, and a spindle through said tube, secured in the ends of said handle, substantially as described.



258,010. LAMP-BURNER. STURGIS BOILEAU, St. Louis, Mo., assignor of one-half to William Somerville, same place. Filed Jan. 16, 1882. (No model.)

Claim.—A lamp-burner having a vertically-sliding ring with spring-claws having notched studs connected thereto, and the cam I, with inclined portions *i* and *i'*, constructed and operating substantially as set forth.

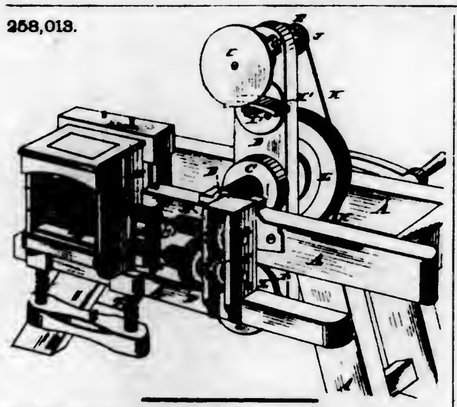
258,010.

258,011. HOISTING APPARATUS FOR ELEVATORS. SUSAN A. BOND, Brooklyn, N. Y., Administratrix of Edwin Bond, deceased. Filed Mar. 18, 1882. (No model.)

Claim.—1. The combination, with an elevator platform or car, of upright stationary nuts upon the uprights or guides between which said platform or car travels, upright shafts extending through said stationary nuts from end to end thereof, mechanism for rotating said shafts, and screws fitting said nuts and supporting said platform or car, and connected with said shafts each by a spline and groove, so that they may slide freely longitudinally upon said shafts as they are advanced by rotating in said nuts, substantially as specified.

2. The combination of the upright stationary nuts C, slotted at the front, the shafts B, arranged in and extending from end to end of said nuts, the screws *b*, connected with said shafts by splines and grooves, so as to slide freely thereon when advanced by rotating in said nuts, and the bar *a*, supported by said screws and working up and down in the slots in said nuts, substantially as specified.

258,012. REVOLVING HARROW. JOHN BRADFORD, Nelson, Ind. Filed Jan. 17, 1882. (No model.)

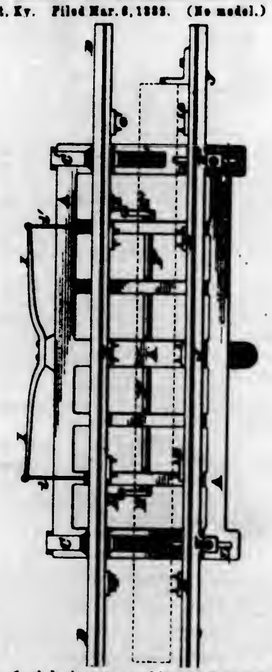


Claim.—As an improvement in revolving harrows, the combination, with the frame A, having sides B, provided with vertical slots D E, of the toothed cylinder F and the roller G, mounted in said slots, and the rigid crushing-bars H H, arranged respectively in front and in rear of said roller G, substantially as set forth.

258,013. FEED-CUTTER. AUGUST BRANDT, Fort Wayne, Ind. Filed Mar. 11, 1882. (Model.)

Claim.—The combination of the feed-rollers, the couplings B' C', the shafts Z, having intermeshing pinions A' and bevel-gear D', the shaft F', having pinion E' and friction-wheel G', and the main shaft having arms D, carrying the rotary cutters, and shoes H', provided with rubber blocks I', substantially as set forth.

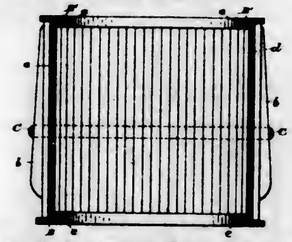
258,013.



258,014. BARBED FENCE. JACOB BRINKERHOFF and WARREN W. BRINKERHOFF, Auburn, N. Y. Filed Apr. 11, 1882. (Model.)

Claim.—In combination with a fence-wire of the class used for barb-fences, a metal barb divided at one end to form barbs and having at its other extremity a solid barbless base clamped upon the wire by bending said solid base thereon toward the divided end, substantially as shown and described.

258,015. LAYING-OUT MACHINE. JAMES A. BROWNFIELD, Newport, Ky. Filed Mar. 6, 1882. (No model.)

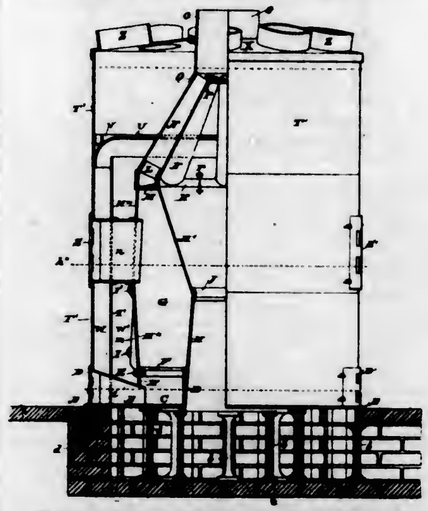


Claim.—1. A laying-out machine consisting of the table A, provided with a pair of grooves, B B', traversed by the slides C C' of reciprocating marker-rail D, which latter is operated by a treadle and rock-shaft in the manner described, another marker-rail, J, being secured to said table with locking devices K K' L L', so as to be adjusted parallel with reference to said rail D, both of these rails being furnished with shiftable cutter-heads armed with points, for the purpose specified.

2. In combination with the reciprocating marker-rail D of a laying-out machine, the rock-shaft F, having cranks H H' and links h h', which links are located at some distance from the center of said rail to prevent it springing.

3. A marker-rail having a longitudinal dovetail groove, *j*, to receive the tongue *n* of the shiftable cutter-head N, whose projecting base O is armed with the points P *p*, said head being secured in position by the set-screw R, as herein described.

258,016. FIRE-POT. VOLNEY BUSH, East Saginaw, Mich. Filed Apr. 8, 1882. (No model.)



Claim.—1. A fire-pot the walls of which are formed of a series of T-shaped sections, the parts *b* of which are of increasing depth from top to bottom, in combination with one or more binders, C, embracing the outer edges of parts *b*, as shown and described.

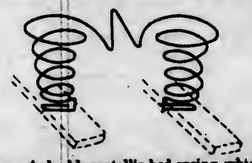
2. In a fire-pot, the sections A, provided with tongues *e* and grooves *d*, and parts *b*, of increasing depth, as described, in combination with one or more binders, C, as set forth.

3. In a fire-pot, the parts B B', of annular form or otherwise, as described, and provided with the flanges *e*, in combination with the sections A and one or more binders, C, as set forth.

258,017. AIR-HEATING FURNACE. VOLNEY BUSH, East Saginaw, Mich. Filed Apr. 25, 1881. (No model.)

Claim.—1. In an air-heating furnace, the annular fire-chamber G, constructed as described, in combination with the base-plate A, provided with openings A', and resting on the supporting-piers *b* and wall *d*, the central air-passage, W'', formed by the oppositely-inclined walls H H', the air-passage W', formed by the oppositely-inclined sections H'' H''' and vertical annular wall T, and the air-passage W, formed by the annular vertical wall T and jacket T', said jacket being provided with the deflector U and trough V, substantially as and for the purposes set forth.

2. In an air-heating furnace, the annular fire-chamber G, formed of the outwardly-inclined sections H H'', resting upon the annular supporting-walls B B', with the interposed ring E, the upwardly-inclined sections H' H'', provided with rings I' J, and united at their upper ends by radiator-head K and annular plate M, said plate being provided with openings *p* and holes *r'*, and the bolts *r*, substantially as and for the purposes set forth.

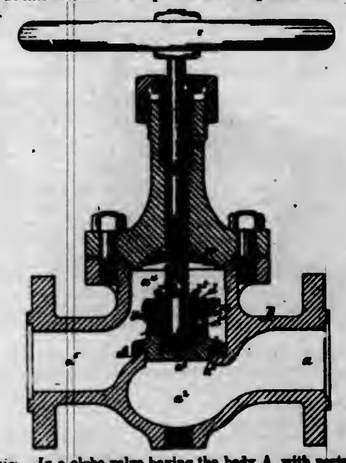


3. In an air-heating furnace, the annular fire-chamber G, constructed as described, and provided with the plate M and radiator-head K, having collars L, in combination with the conical pipes N, the stack O, provided with collars Q, annular flange R, and flange ring or washer R', the furnace-top X, and jacket T', substantially as set forth.

4. In an air-heating furnace, the combination of the sections H H' H'' H''' with the rings I J, substantially as described.

5. In an air-heating furnace, the sections H' H''', in combination with radiator-head K, having collars L, plate M, provided with openings *p* and holes *r'*, and bolts *r*, substantially as set forth.

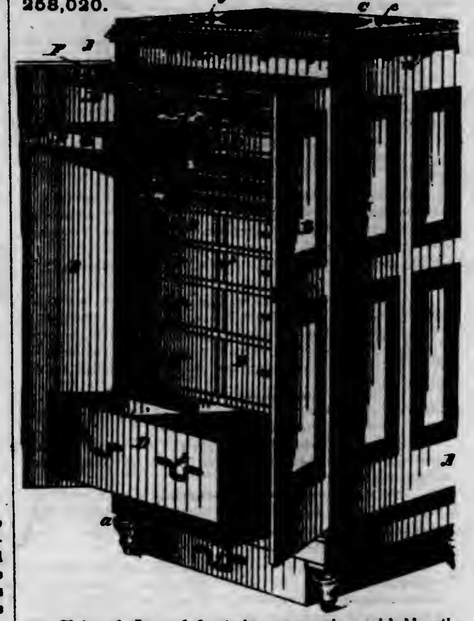
6. In an air-heating furnace, the grate F, composed of a series of radial bars with radial openings between said bars, the ring E and wall B B', in combination with the shaker-wheel *h*, shaft *i*, and wall T T', the latter wall, T', being provided with the sleeve Y, substantially as specified.



258,018. BED-SPRING. WILLIAM CHILDERS and MARTIN M. REBALY, Philadelphia, Pa. Filed Mar. 16, 1882. (No model.)

Claim.—A double metallic bed-spring, which consists of two spirals or springs connected together at their tops by a double-adjusting bridge made W shape to allow the spring to be adjusted without turning the spirals, and provided on the bottom of the spirals with double reversed hooks, as shown, their closed ends being toward each other, and the whole spring being made of one piece of wire, as set forth.

258,019. GLOBE-VALVE. JOHN CHRIST, Roboken, N. J. Filed Nov. 11, 1881. (No model.)



Brief.—When the valve is opened the projections on the top of cap D fit into recesses *d*' and prevent the escape of fluid around the stem.

Claim.—In a globe-valve having the body A, with ports and chambers, substantially as described, the centrally-recessed head B, provided with the convex plate *b*', together with the stem C, having flange *b*', and the screw-cap D, having central tapered aperture, *d*, said head B having annular recess *b*, adapted to fit upon seat *a*' of the valve, and said cap D having annular projection *d*', adapted to fit into the recess *d*' about the stem C when the valve is opened, as and for the purpose specified.

258,020. SAFE FOR PRESERVING FRUIT AND VEGETABLES. GEORGE A. COCHRANE, Liverpool, County of Lancaster, England. Filed Dec. 16, 1881. (No model.) Patented in England June 24, 1881, No. 2,756, and Dec. 24, 1881, No. 5,647; in France July 6, 1881; in Spain July 8, 1881; and in Canada July 21, 1881, reissued Mar. 20, 1882, Nos. 13,104, and 14,506.

258,020.

Claim.—1. In a safe for storing or preserving perishable articles, such as described, a chamber below and in communication with the storing trays or drawers for collecting the gases emanated from the articles stored, substantially as described.

2. In a safe for storing or preserving perishable articles, such as described, a chamber below and in communication with the storing trays or drawers containing an absorbent, such as earth or its equivalent, substantially as described.

3. In a safe for storing or preserving perishable articles, such as described, an inclosing case having air-passages at top only, a series of ventilated shelves, trays, or drawers, or a combination of such a chamber below and in communication with said shelves, trays, or drawers, containing an absorbent—such as earth or its equivalent—having a great affinity for the deleterious gases emanated from the articles stored, substantially as and for the purpose specified.

4. In a safe for storing or preserving perishable articles, such as described, an inclosing case having air-inlets at top only, a water-chamber through which the air admitted is caused to pass, a series of carriers or supports for the articles to be stored in communication with said chamber, and a receptacle below the carriers and in communication therewith, containing an absorbent—such as earth or its equivalent—having a great affinity for the gases emanated from said articles, substantially as and for the purpose specified.

5. In a safe for storing and preserving perishable articles, such as described, a water and acid proof lining the side plates of which are provided with steps, in combination with perforated shelves or drawers, or a combination of such, also made of water and acid proof material, whereby the said shelves or drawers, or both, are made adjustable vertically in the safe, and ventilation is secured between them, as and for the purpose specified.

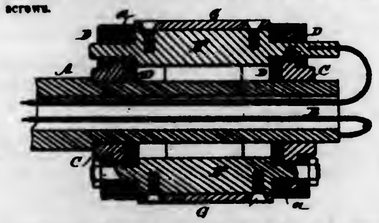
6. In a safe for storing and preserving perishable articles, such as described, a glass lining, the side plates of which have steps, in combination with perforated glass shelves, and coils for the reception of the articles to be stored on said shelves, of the same or equivalent material, whereby the shelves are made adjustable vertically in the safe, and coils of varying dimensions may be employed and ventilation established between the coils and shelves throughout the safe, as and for the purpose specified.

7. In a safe for storing and preserving perishable articles, such as described, a lining composed of an acid and water proof material, and shelves or drawers, or both, adapted to be ventilated, and made of like material, adjustably connected with the lining, in combination with an inclosing case with which said parts are removably connected, substantially as and for the purpose specified.

8. In a safe of the class described, a lining made of acid and water proof material, the side plates of which are stepped, and a partition-plate of like material stepped upon its opposite faces, in combination with an inclosing case with which said parts are removably connected, substantially as and for the purpose specified.

9. In a safe for storing or preserving perishable articles, such as described, the combination of an inclosing case, A, having a door or doors, B, and lid C, the chamber a', having perforated bottom a^2, air-passages a^3, a series of ventilated removable shelves, trays, or drawers, or a combination of such, and a gas-chamber, G, all arranged to operate substantially as and for the purpose specified.

10. In a safe for storing or preserving fruit or vegetables, an inclosing case lined with glass, a series of ventilated shelves or trays, or drawers adapted to be ventilated, and made of or lined with the same material, in combination with ventilated cells or pockets of glass also, substantially as and for the purpose specified.



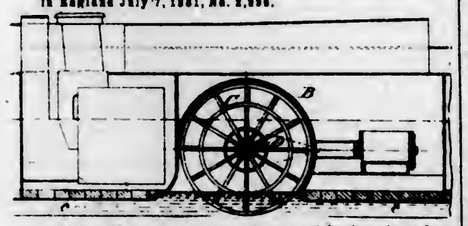
11. In a safe of the class described, the combination, with an inclosing case, of a lining made of an acid and water proof material, composed of a back plate, L, side plates, M, having steps m, a top plate, a', and a bottom plate, N, all constructed and arranged for removal from the inclosing case, substantially as and for the purposes specified.

258,021. RUBBER COMPOUND. CHARLES CONNER, New York, N. Y. Filed Mar. 16, 1882. (No specimens.)

Claim.—The herein-described composition of matter, consisting of rubber, soda, lime, camphor, and sulphur, in about the proportions specified.

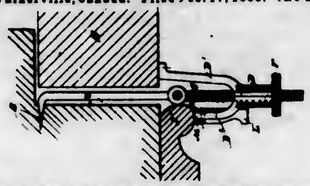
258,022. COMMUTATOR FOR DYNAMO-ELECTRIC MACHINES. CHARLES A. COOLEY, New Britain, Conn. Filed Mar. 14, 1882. (No model.)

Brief.—The commutator-bars are carried by, but insulated from, flanges mounted on the shaft of the machine. The armature-wires are connected to the outer ends of these bars through the hollow shaft, and removable wearing-plates are fastened to the bars by screws.



Claim.—1. In commutators, the flanged hubs C, insulating-washers D, rods F, and copper segments G, combined on the shaft A, substantially as described.

2. The recessed insulating-washers D, in combination with the flanged hubs C of a commutator, substantially as described.

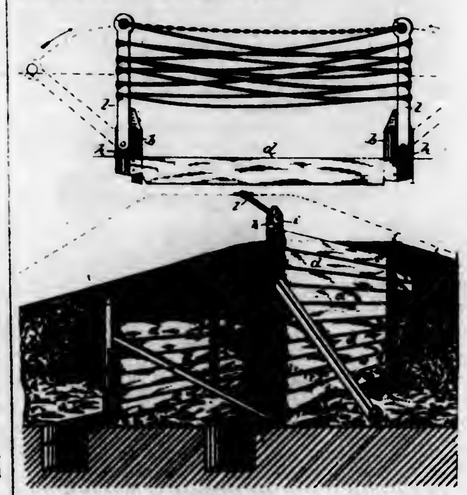


3. In commutators, the rods F, having enlarged middle portions, in combination with the flanged hubs C and washers D, substantially as described.

258,023. PROPULSION OF SHIPS. WILLIAM COPPIN, London, England. Filed Feb. 23, 1882. (No model.) Patented in England July 7, 1881, No. 2,996.

Claim.—The combination, with a vessel having channels c between keels a for the whole length of the vessel, of the median air-tight paddle-boxes B, opening into the channels c, and the paddle-wheels C, having their shafts journaled in air-tight bearings, whereby compressed air may be employed to force the water in said boxes to a level just above the paddles, and thus permit said paddles to utilize a maximum of the power, while the water will be so condensed as to produce a maximum of resistance, as described.

258,024. PORTABLE DOOR-SECURER. CHARLES A. CROSSMAN, Detroit, Mich., assignor to himself and George W. Rusch, Walkerville, Canada. Filed Feb. 17, 1882. (No model.)



Claim.—1. In a portable door-securer, the combination of the strip A, having a bent end, B, and the rod C, screw-threaded at its outer end, pivoted thereto, with the tube D, having arms O' O^2, the latter provided with an extension-leg, L, and the nut F, substantially as and for the purpose described.

2. The strip A, having hook end B, combined with a screw, C, connected therewith, a nut, F, working on said screw, and a tube, D, having shank D', as and for the purpose described.

3. In a portable door-securer, the U-shaped fastening D for the holding device, provided with arms D' D^2, the latter having a jointed leg, whereby the securer is adapted to be used at will on a casing with or without a molding, substantially as described.

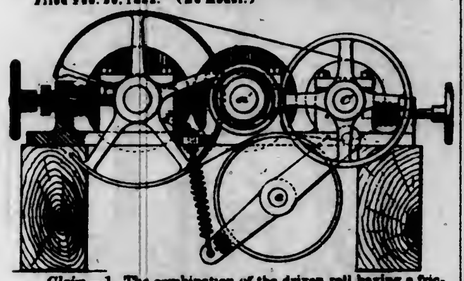
258,025. LEVEE. JOHN W. CRUMP, West Point, Miss. Filed Apr. 3, 1882. (No model.)

Brief.—Within the embankment are two or more parallel fences or walls, each of less height than the adjoining one from the rear toward the water-front, the tops of posts of the highest fence having pivoted levers, to be raised when desired to heighten the levee to prevent a wash or repair a break.

Claim.—1. A levee with two or more continuous parallel walls, the rear wall being highest and the others diminishing successively in height toward the river-front, all the walls resting on the ground under the levee and covered by it, substantially as described, and for the purpose set forth.

2. A levee provided with the two or more continuous parallel lines of piles b b, extending its entire length, braces e e, and boards d d, secured to the piles, all resting on the ground under the levee and covered by it, substantially as described, and for the purpose set forth.

3. The combination, with the piles b b, covered by the levee and provided with the right and left shoulders h h, of the pivoted angular arms l l, substantially as described, and for the purpose set forth.



258,026. SASH-FASTENER. JOHN A. CURTIS, New Britain, Conn. Filed Apr. 6, 1882. (No model.)

Claim.—The sash-fastener herein shown and described, the same consisting of the bolt G, composed of the parts b, c, d d, and e, arranged as described, spiral spring D, and plate E, constructed and combined substantially in the manner and for the purpose herein shown and described.

258,026.

258,027. ROLLER-MILL. JOHN R. DAVIS, Jr., Neenah, Wis. Filed Feb. 25, 1882. (No model.)

Claim.—1. The combination of the driven roll having a friction-wheel on its shaft, a shaft on one side thereof, mounted in movable bearings and carrying an opposing friction-wheel and a pulley, a companion roll on the other side, having also a pulley on its shaft, and a belt connecting the two pulleys.

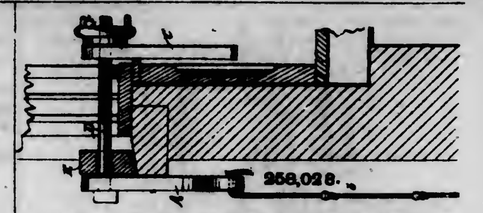
2. The combination of the driven roll having friction-wheels at or near each end of its shaft, the friction-shaft on one side thereof, mounted in movable bearings and carrying opposing friction-wheels, and having pulleys at its ends, the companion roll on the other side, having also pulleys on its shaft opposite to those on the friction-shaft, and belts connecting said pulleys.

3. The combination of the driven roll, the friction-shaft on one side thereof, the companion roll on the other, the friction-wheels connecting the driven roll and friction-shaft, the pulleys and belts connecting friction-shaft and companion roll, and the tightener acting upon said belts.

4. The combination of the driven roll, the friction-shaft on one side thereof, the companion roll on the other, the friction-wheels connecting driven roll and friction-shaft, the pulleys and belts connecting friction-shaft and companion roll, the tightener acting upon said belts, and means for adjusting said tightener as to the pressure it exerts.

5. The combination of the driven roll, the friction-shaft on one side thereof, the companion roll on the other, the friction-wheels connecting driven roll and friction-shaft, the pulleys and belts connecting friction-shaft and companion roll, and screws or equivalent devices arranged to move the bearings of the friction-shaft toward the bearings of the driven roll.

6. The combination of the driven roll, the friction-shaft on one side thereof, the companion roll on the other, the friction-wheels connecting driven roll and friction-shaft, the pulleys and belts connecting friction-shaft and companion roll, the screws arranged behind the bearings of the friction-shaft, and springs interposed between said screws and bearings.



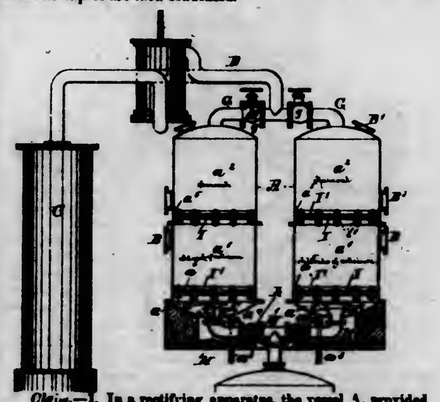
7. The combination of the driven roll, the friction-shaft on one side thereof, the companion roll on the other, the differential friction-wheels connecting driven roll and friction-shaft, and the pulleys and belt connecting friction-shaft and companion roll.

8. The combination of the driven roll, the friction-shaft on one side thereof, the companion roll on the other, the differential friction-wheels connecting driven roll and friction-shaft, and the differential pulleys and belt running thereon, connecting friction-shaft and companion roll.

9. The combination of the driven roll mounted in stationary bearings, the friction-shaft mounted in sliding bearings on one side thereof, the companion roll mounted in sliding bearings on the other side thereof, the friction-wheels connecting the driven roll and friction-shaft, the pulleys and belt connecting friction-shaft and companion roll, and the tightener acting upon the belt to draw both sets of movable bearings toward the bearings of the driven roll.

258,028. FIRE-ESCAPE. HELEN H. DOREN, New York, N. Y. Filed Mar. 14, 1882. (No model.)

Brief.—A screw-rod having a hand-wheel passes through a clamp-plate on the inside of the window and through a plate on the outside, to which the ladder is attached, also through a supporting-block which rests on the window-sill.



Claim.—1. The fire-escape herein shown and described, consisting of the plate A, to which the ropes b b of the ladder are attached, the clamp-plate C, and the screw-rod D and hand-wheel F, substantially as set forth.

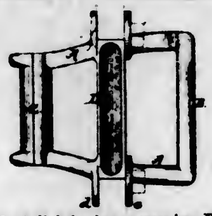
2. In combination with the plates A and C, rod D, and wheel F, the block E, substantially as and for the purposes set forth.

258,029. APPARATUS FOR THE MANUFACTURE OF ALCOHOL. AUGUST DREHSEN, Berlin, Germany. Filed Nov. 1, 1881. (No model.) Patented in Germany June 30, 1880, No. 13,940; in Belgium June 16, 1881, No. 54,027; in France Oct. 21, 1881, No. 145,401; in England Oct. 31, 1881, No. 4,761; in Italy Nov. 21, 1881, No. 71, (XXVII;) and in Austria-Hungary Jan. 4, 1882, Nos. 35,384 and 48,542.

Brief.—Eliminates the aqueous vapors from the alcohol by passing the mixed vapors through chloride of calcium, and then eliminates the deleterious constituents carried over with the alcohol vapors by passing the mixed vapors through charcoal. The alcoholic vapors are then condensed.

Claim.—1. In a rectifying apparatus, the vessel A, provided with the diaphragms I I' and the layers of chloride of calcium and charcoal, substantially as and for the purpose specified.

2. The distilling and rectifying apparatus hereinbefore described, composed of a still, F, the twin rectifying-vessels A A, constructed and arranged to contain each a layer of calcium chloride and a layer of charcoal, substantially as described, a condenser, an air-pump, and suitable valved connecting-pipes between the elements described, whereby either one or both the rectifying-vessels may be used, substantially as and for the purpose specified.



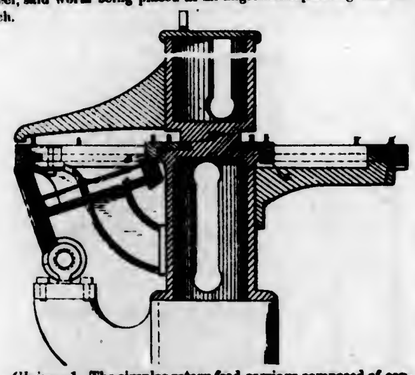
3. The vessel A, having chamber a and discharge-pipe a^2, in combination with the valved pipe H H', projecting within said chamber and carrying the hood or shield H^2, substantially as and for the purpose specified.

4. The vessel A, having chamber a and discharge-pipe a^2, the valved pipe H H', projecting within said chamber and terminating in a flaring mouth, h', in combination with the hood or shield H^2 and the rectifying-column F, all arranged and operating substantially as and for the purpose specified.

5. The vessel or vessels A A, provided with internal flanges, a^3, and having inlet and outlet pipes H G, discharge-pipe a^2, charging-gates B E', and discharging-gate H^2, all capable of being hermetically closed, in combination with two diaphragms composed of a perforated metallic plate, I, and a wire-cloth I', secured to said flanges and dividing said vessels into three chambers, u a' a^3, all constructed, arranged, and operating substantially as and for the purpose specified.

258,030. ATTACHMENT-LINK FOR CONVEYERS. JAMES H. DOREN, Chicago, Ill. Filed Apr. 6, 1882. (Model.)

258,030.

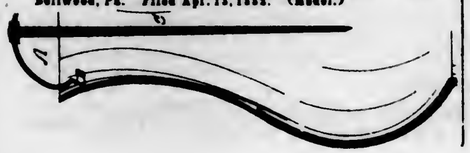


Claim.—1. A link having a cross-bar, D, and flight attachments, the said cross-bar being of a width not greater than that of the flight designed to be mounted over and on it, and being shaped so as to extend down to the level of the lower edge of the flight to be applied to it, and to form a continuation thereof, as set forth.

2. In combination with a link having a cross-bar, D, and flight attachments, as specified, of a flight, E, cut out at its lower edge to let in the cross-bar D, the whole being constructed and operating substantially as specified, for the purpose described.

258,031. SPOKE-THROATING MACHINE. WILLIAM H. DOANE and GEORGE W. BUSHER, Cincinnati, Ohio, assignors to J. A. Fay & Co., same place. Filed Feb. 17, 1882. (No model.)

Brief.—The central standard is cast in one piece, the inner collar of the rotating table being divided to permit of such construction. Suitable guides are provided for this table at the outer edge, and it is driven by a worm engaging directly with a bevel-wheel, said worm being placed at an angle corresponding with its pitch.

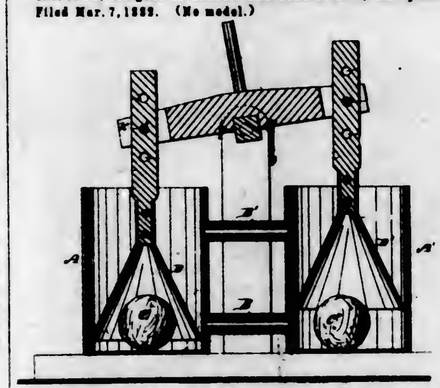


Claim.—1. The circular rotary feed-carriage composed of connected inner and outer rings, the inner ring being made of sections, in combination with the central housing having a neck to support the inner ring of said carriage, substantially as before set forth.

2. The combination, substantially as before set forth, of the central housing composed of an upper and a lower trunk cast in one piece with a solid connecting-neck and the circular rotary feed-carriage, of which the inner ring is made of sections laterally applied to and fitted around the solid neck of the housing.

3. The combination, substantially as before set forth, of the circular rotary feed-carriage, the central housing having a neck to support the inner ring of the carriage, the spider for supporting the outer ring thereof, and the gib for confining said outer ring to a recess in the rim of the spider.

4. The combination, substantially as before set forth, of the inner and outer rings of the circular rotary feed-carriage, the cogs on the outer ring thereof, and the worm for driving the outer ring through an intermediate bevel-wheel the axis of which lies in a vertical plane parallel to a line intersecting the axis of the worm at the angle of the pitch.



258,032. LAMP-CHIMNEY PROTECTOR. WHEELER H. DUNN, Bellwood, Pa. Filed Apr. 13, 1882. (Model.)

Claim.—1. A protector for lamp-chimneys made, substantially as herein shown and described, of two curved metal strips pivoted to one end of a rod, as set forth.

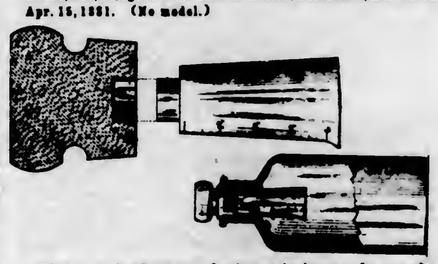
2. In a lamp-chimney protector, the combination, with the metal rod or wire C, of the crossed curved metal strips A, having the ends B bent outward, substantially as herein shown and described, and for the purpose set forth.

258,033. WASHING-MACHINE. WILLIAM F. DENALL, Blanchard, Iowa, assignor to himself and John D. Kite, same place. Filed Mar. 7, 1882. (No model.)

Claim.—1. The combination, with two cylinders having a tubular connection, of a reciprocating beater or pounder and a wooden ball in each cylinder, as and for the purpose described.

2. The combination, with two beating or pounding devices, of the two cylinders A A', connected by an upper tube, B', as well as by a lower tube, B, as and for the purpose set forth.

3. The connected cylinders A A', funnel-shaped beaters D D', wooden balls C C', in combination with means for reciprocating the beaters, substantially as described.

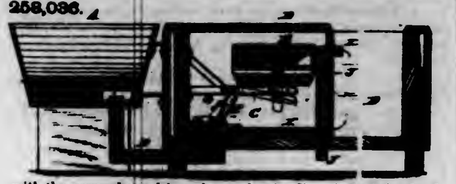


258,034. CASE FOR EMBROIDERY. EDWARD JOHN VAVASOUR EARLE, Berners Street, Oxford Street, County of Middlesex, England. Filed Oct. 26, 1881. (Model.)

Brief.—A specimen of the trimming is permanently secured to the cover of the case.

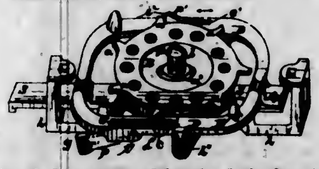
Claim.—The combination of a box or case having a longitudinal slit or opening with a flexible strip covering said slit or opening, and a roller journaled in said box or case and adapted to have a strip of goods wound upon it, substantially as specified.

258,035. MEASURING BOTTLE-STOPPER. JOHN J. EASTMAN, Media, Pa., assignor to Wilmer L. Keller, Baltimore, Md. Filed Apr. 15, 1881. (No model.)



Claim.—A bottle-stopper having at its inner or lower end a measuring-extension and an annular groove surrounding the base of the said extension, substantially as and for the purpose specified.

258,036. APPARATUS FOR WATERING STOCK. JOHN MARVIN EISTON, Marysville, Ohio. Filed Feb. 1, 1882. (No model.)



Claim.—In an apparatus for watering stock, the combination,

258,036.

with the reservoir or cistern A, supply-pipe B, and pivoted valve *b*, and receiver D, having valve-chamber C, of the float-valve E and pivoted bell-crank lever F, arranged in said chamber C and pivotally connected at one end to said float, and its free end adapted to engage said valve *b* for closing it, substantially as and for the purpose herein shown and described.

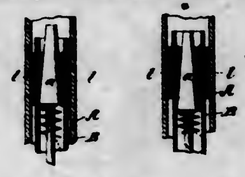
258,037. CORN-PLANTER. AUSTIN O. EVANS, Springfield, Ohio. Filed Nov. 14, 1881. (No model.)

Claim.—1. In a rotary seed-dropping device for a two-horse planter, the combination, with a seed-hopper, its supporting-frame, and the reciprocating slide having vertically-moving pawls, of a detachable seed-disk, which may be removed edgewise from either side of the hopper, as set forth.

2. In a rotary seed-dropping device for planters, the combination, with the hopper-bottom A', having cap *n*, with hole *e* therein, and the supporting-frame provided with a central hole in its top *n'*, of the loosely-fitted center pin, *b*, extending through said cap and frame and having the interposed detachable seed-disk B pivoted thereon, as and for the purpose herein set forth.

3. In a rotary seed-dropping device operated by a slide-lever, the combination of the detachable disk, the supporting-frame over which it is pivoted, the loosely-fitted center pin, and the seed-hopper in which said disk is operated, having an open slot on either side to permit its removal edgewise therefrom, as set forth.

4. A rotary seed-dropping device for a two-horse planter, in which a rigidly-attached hopper having an open slot on either side is supported upon a bearing-frame, with an interposed seed-disk pivoted upon a loose center pin extending through the cap, disk, and bearing-frame, said disk being driven by a slide-lever and a system of pawls engaging with teeth upon the edge of the same and being removable edgewise through a slot on either side of the hopper by the withdrawal of the center pin without disturbing the other elements of the device.



5. In a rotary seed-dropping device for planters operated by a slide-lever, the combination, with the hopper-bottom, the supporting-frame, and a removable seed-disk loosely pivoted between them, of a loosely-pivoted center pin, on which said disk is pivoted, having a head resting upon the crown-plate or cap of the hopper-bottom, and held in place by gravity, so as to be easily and quickly withdrawn for the purpose of removing the seed-disk edgewise therefrom, as set forth.

6. In a rotary seed-dropping device for planters operated by a slide-lever, as specified, a center pin held in its place by gravity, and a removable seed-disk with its engaging-teeth on the edge thereof and having its bearing upon said pin, whereby the disk is made removable edgewise by the withdrawal of said pin, as set forth.

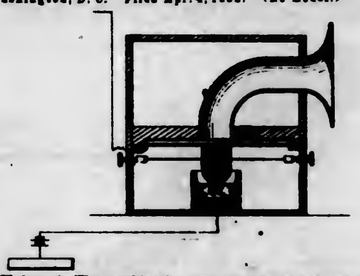
7. In a rotary seed-dropping device for planters, the combination, with the oblong frame D, bolted to slide-lever S and operated thereby, and having slots *d'* on each side, of the weighted upward-acting push-pawls *p p'*, having the upper cut notches, *d*, in their ends, and provided with a jaw, C, extending therefrom on the under side beyond the opening of said slot, whereby the upward movement is arrested at the engaging end of said pawls, as hereinbefore set forth.

8. In a rotary seed-dropping device for planters, as hereinbefore described, the combination of the hopper-bottom A', having cap *n*, with hole *e* therein, removable disk B, the loose center pin, *b*, on which said disk is pivoted, having head *b'*, resting on said cap, the supporting-frame A, having top *h'*, with a central hole for the lower end of the pin *b*, the slide-bar S, with the oblong frame D, having slots *d'*, and the pawls *p* and *p'*, pivoted thereto and operating upon the teeth *a* of the disk outside the circle of seed-holes, as hereinbefore set forth.

258,038. EXTENSION LAMP-FIXTURE. JOHN A. EVARTS, Meriden, Conn., assignor to Bradley & Hubbard Manufacturing Company, same place. Filed Dec. 19, 1881. (No model.)

Claim.—1. In an extension-fixture, the combination of the outer and inner tube or parts, A B, the inclined slide *a*, the clamps *l l*, the spring to force said clamps asunder and into contact with the inner surface of the outer tube, and means, substantially such as described, to relieve said clamps from the force of the inclined slide, substantially as and for the purpose described.

2. The combination of the outer stationary tube, the inner movable tube, the clamps *l l*, arranged in recesses in said inner tube, the inclined slide *a* and its spring arranged to force said slide between said clamps and said clamps into frictional contact with the outer tube, and a connection, substantially such as described, from said slide to near the bottom of the fixture, whereby said slide is withdrawn from between the clamps, substantially as described.

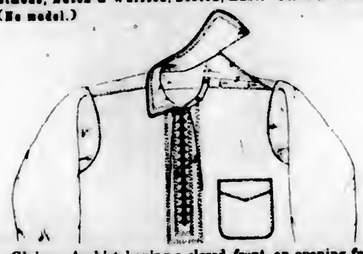


258,039. CAR-COUPLING. WILLIAM L. EVERITT, New Haven, Conn. Filed Jan. 16, 1882. (No model.)

Claim.—1. The combination of the bolt D, the latching-lever G, and its latch H with the bar F, arranged transversely across in front of and below the bolt, constructed with inclined seats below and engaged with the said latch-lever G, so that as the said latch-lever G is turned in one direction it will draw the bar toward it and up the inclines to raise the bar bodily, and in the opposite direction permit the bar to fall down the inclines, substantially as described.

2. In a car-coupling, the yoke L and adjusting-screw P, for the adjustment of the elevation of the coupler, substantially as described.

258,040. TELEPHONE-TRANSMITTER. CHARLES KWISO, Washington, D. C. Filed Apr. 4, 1882. (No model.)



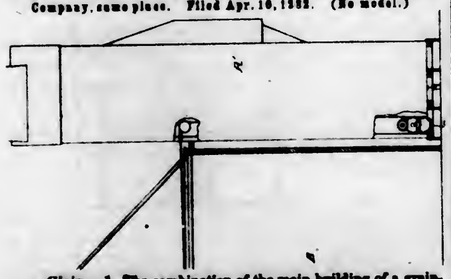
Claim.—1. The combination of a transmitting-diaphragm, a mercury electrode, and a carbon block or pencil suspended between and in contact with the diaphragm and mercury, substantially as set forth.

2. The combination of a transmitting-diaphragm, a mercury electrode, and a carbon block or pencil elastically suspended between and in contact with the diaphragm and mercury, substantially as set forth.

3. The combination of a transmitting-diaphragm, a mercury electrode, a carbon block or pencil suspended between and in contact with the diaphragm and mercury, the spring or other suitable device, such, substantially as described, for supporting the carbon, and the adjusting-screws.

258,041. SHIRT. GEORGE F. FAXON, Watertown, assignor to Simons, Hatch & Whittee, Boston, Mass. Filed Feb. 27, 1882. (No model.)

Claim.—A shirt having a closed front, an opening from the neck down along the shoulder, and a collar connected with the shirt from such opening entirely around the back of the neck and to the middle of the front, but disconnected therefrom, from the shoulder-opening thereof to, or near to, the middle of the front of the neck, the shirt being provided with buttons and button-holes or other suitable separable fastenings properly arranged for closing the opening at the shoulder and connecting the free part of the collar to the shirt, as occasion may require, all being substantially as set forth.

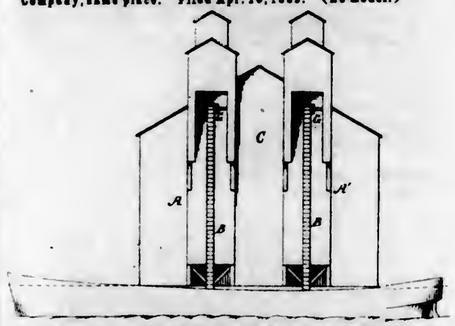


258,042. ANTI-FRICTIONAL BEARING. THOMAS R. FERRALL, Boston, Mass. Filed Mar. 15, 1882. (No model.)

Claim.—1. In an anti-friction bearing, the shells or cases *a*, having flanges *a'*, the revolving sleeve-bearing *c*, the series of rollers *b*, the regulators *c*, the connecting pins or rivets *d*, and the annular flanges *d'*, or their described equivalents, coacting with the parts specified to prevent the sleeve-bearing from moving longitudinally in the direction of the axis of the shaft, substantially as described.

2. The herein-described anti-frictional bearing, consisting of the case or shells *a a*, their annular flanges *a' a'*, the rollers *b b*, the regulators *c c*, with their rivets *d d d* and dividers *c' c'*, and the central bearing-sleeve, *c*, with its flanges *c' c'*, said flanges *c'* coacting with the parts specified to prevent the sleeve-bearing from moving longitudinally in the direction of the axis of the shaft, all constructed, arranged, and combined as and for the purpose set forth.

258,043. GRAIN-ELEVATOR. FRANK J. FIRTH, Philadelphia, Pa., assignor to the Erie and Western Transportation Company, same place. Filed Apr. 10, 1882. (No model.)

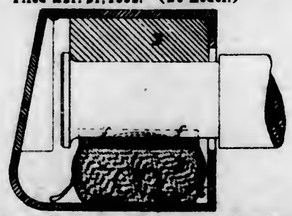


Claim.—1. The combination of the main building of a grain-elevator with an elevator-tower having wheels adapted to a track or tracks in front of the said main building, substantially as set forth.

2. The combination of the fixed elevator-tower A, the main building B, and the movable elevator-tower A', having wheels adapted to tracks in front of the main building, substantially as specified.

3. The combination of a movable elevator-tower having wheels adapted to tracks, with a rope or chain, M, anchored at both ends and passing round a pulley carried by the elevator, and with gearing through the medium of which the said pulley may be rotated, substantially as set forth.

4. The combination of the main building B, a movable elevator-tower, guy-ropes connecting the two, and mechanism whereby said guy-ropes may be tightened and loosened, all substantially as described.



258,044. GRAIN-ELEVATOR. FRANK J. FIRTH, Philadelphia, Pa., assignor to the Erie and Western Transportation Company, same place. Filed Apr. 10, 1882. (No model.)

Claim.—1. The combination of a fixed elevator structure or tower, A, an elevator-leg, B, hung to a vertically-adjustable frame in the said tower, and mechanism whereby the said leg may be adjusted laterally, all substantially as set forth.

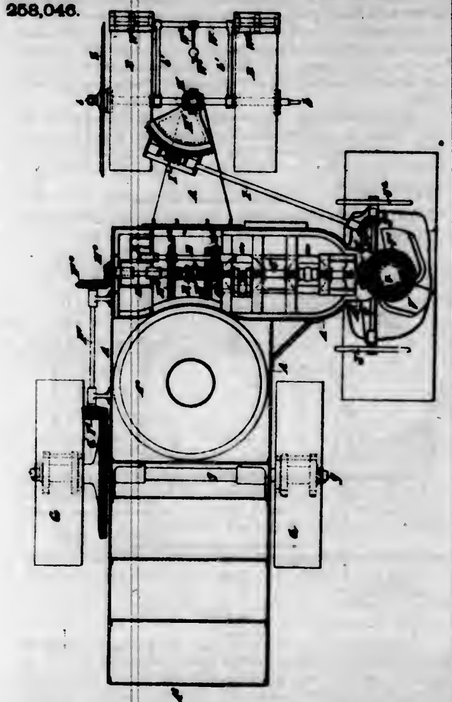
2. The combination of the main building C, two or more elevator structures or towers, A A', and a laterally-adjustable elevator-leg in one or more of the towers, substantially as specified.

258,045. CAR-AXLE LUBRICATOR. CHESTER D. FLYNT, Brooklyn, N. Y., assignor to himself and Frank B. Tracy, same place. Filed Mar. 21, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the pad formed of cotton-waste and hair, or equivalent absorbent and elastic material, and inclosed in a suitable foraminous envelope, the distributer of felt or equivalent material secured to the pad, and metal strips fastened to the distributer.

2. The combination, substantially as hereinbefore described, of the pad formed of cotton-waste and hair, or equivalent absorbent and elastic materials, inclosed in a suitable foraminous envelope, and the distributer of felt or equivalent material secured to the pad.

3. The combination, substantially as hereinbefore described, of the pad formed of cotton-waste or other equivalent absorbent material, and of hair or other elastic material, the foraminous envelope inclosing said pad, the springs secured in the envelope, and the distributer of felt or equivalent material secured to the pad.



4. The combination, substantially as hereinbefore described, of the pad of cotton-waste or other equivalent absorbent material, and of hair or equivalent elastic material, the foraminous envelope inclosing said pad, the springs secured in the envelope, the distributer fastened to the pad, and the metallic strips secured to the distributer.

258,046. STEAM-PLOW. JAMES H. FOGARTY, New York, N. Y. Filed Dec. 3, 1881. (No model.)

Brief.—Rotary plow upon a vertical shaft supported outside the track of the wheels. The steam-cylinder alongside the plow-shaft case. A lever and spring-pin may hold the plow elevated without the force of steam. Reversible scrapers, to operate when going in either direction, held at work by a gravity-ball. Two trains of gears from the main shaft, one rotating the plow-shaft and the other the carrying-wheels.

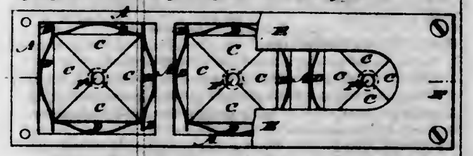
Claim.—1. In a steam-plow having capacity for moving in both directions without turning around, the arrangement of the

258,046.

revolving plow V and upright shaft *v* outside of the line of travel of the wheels, as and for the purposes herein specified.

2. The revolving plow V, mounted on the upright shaft *v*, in combination with the engine-shaft C, with its gear-wheel C', counter-shaft D, with its wheels D' D', wheels E' E', clutch R, and shaft E, with its gear-wheel E', and the train of connections therefrom to the driving-wheels G, as herein specified.

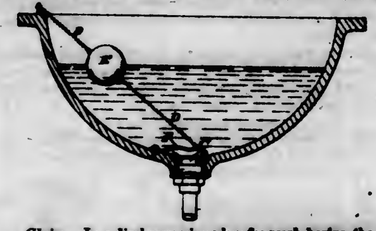
3. In a steam-plow, the lifting-cylinder L and piston-rod *l*, arranged alongside the telescopic bearing K, and connected by the arm K', and adapted to serve relatively to each other and to the plow V, and its operating means, as herein specified.



4. In a steam-plow, the latch O, lever P, and spring Q, in combination with the telescopic bearing K and the connected plow V *v*, as herein specified.

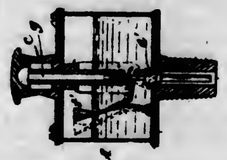
5. In a steam-plow, the scrapers W', carried on a rocking-shaft, W, supported and loaded as shown and serving relatively to the wheels B, as herein specified.

6. In a plowing-machine, the driving-wheels G G, plowing device V, operated outside of the path of the driving-wheels, and the cutter-wheel Z, mounted at one end of the machine, combined and arranged as herein specified.



258,047. CANE-STRIPPER. WILLIAM P. CARR, Parsons, Kans. Filed Mar. 23, 1882. (No model.)

Brief.—A set of triangular blocks having apertures at their apexes is placed in a recessed plate or frame and held forward by springs and secured in place by removable face-plate.



Claim.—The combination of the frame A, having the rectangular recesses B and apertures G, the removable cut-away plate F, the four equal triangular stripper-blocks C F, and the four unattached springs D, whereby the strippers and springs are removably held in the recesses of the frame, as shown and described.

258,048. DISCHARGE-PIPE PLUG FOR WASH-BASINS. JNO. H. GILBERT, New York, N. Y. Filed Feb. 21, 1882. (No model.)

Claim.—In a discharge-pipe plug for wash-basins, the combination, with the hinged plug C and its chain D, of a float, E, substantially as herein shown and described, whereby the said plug will be raised automatically when the water has risen in the basin to a fixed point, as set forth.

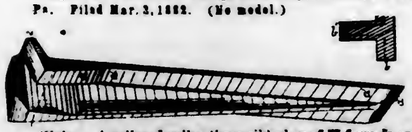
258,049. OIL-CUP. JOHN R. GILLIGAN, Niko, Nev. Filed Mar. 21, 1882. (No model.)

Claim.—1. The combination, with the plunger *c*, having valve *c'* and opening *c'*, of the plate-lever *f*, hinged to the lower side of casing and bent into a cup-shaped form on the side next the body of the oil, and connected to the plunger by rod *f'*, substantially as described.

2. The combination, substantially as hereinbefore set forth, of the plunger *c*, having valve *c'*, the hinged lever *f*, connected to plunger *c*, and the regulating-tube *g*, threaded and arranged to bear against shoulder formed on plunger *c*, and provided with slots *g'*, substantially as described.

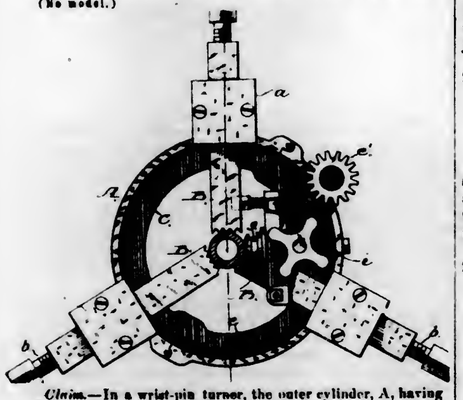
258,050. COMPOSITION FOR STAINING WOOD. ANTON F. GLOSER, Jr., and JOSEPH P. GLOSER, Columbus, Tex. Filed July 11, 1881. Renewed Mar. 24, 1882. (No specimens.)

Claim.—The herein-described stain, composed of water, Vandyke brown, carbonate of soda, acetate of soda, oxide of lead, and permanganate of potash, in the proportions set forth.



258,051. BREECH-LOADING FIRE-ARM. JOHN W. GOODALL, Hayes, Kans. Filed Jan. 30, 1882. (No model.)

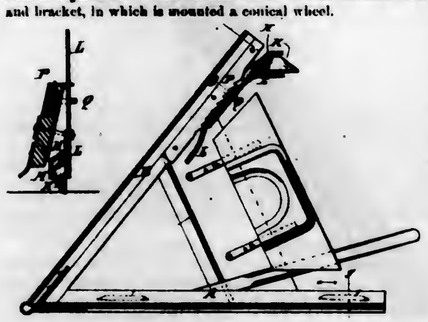
Claim.—1. The combination, with a breech-block having a loop or eye, *h*, and a catch, *c*, of the rod K, rigidly secured to the barrels, and provided with a transverse notch and a shoulder to receive the latch *c* and limit the movement of the barrels, substantially as described.



2. The combination of the rod K, the spring L, the barrels A, the notched and shouldered rod M, the breech-block provided with a loop, *h*, and a catch for retaining the barrels in contact with the breech-block, substantially as described.

258,052. RAILROAD-SPIKE. HOWARD GREER, Chicago, Ill., assignor of one-half to George H. Christy, Trustee, Sewickley, Pa. Filed Mar. 3, 1882. (No model.)

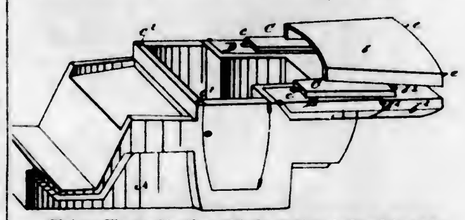
Claim.—A railroad-spike, three-ribbed or of T form in cross-section, wherein the side ribs constituting the T-head are made heavy and tapering at their upper ends, as at *a*, of uniform thickness, thence nearly to the point, as at *a'*, and thence tapering, as at *a²*, to the point, substantially as set forth.



258,053. WRIST-PIN TURNER. LAUCHLIN B. GREER, Washington, D. C., assignor to Charles W. Hayes, Chauncey F. Greer, and Marcus Greer, all of same place. Filed Dec. 28, 1881. (No model.)

Claim.—In a wrist-pin turner, the outer cylinder, A, having arranged at intervals interiorly-projecting pins *i*, pinion *d'*, and chuck-bars B, in combination with the inner cylinder, C, having a circle of cogs, *c*, the endless screw *f'*, provided with the sprocket-wheel *h*, the cutter-table D, having a cutter, *g*, and centering-bar P, substantially as set forth.

258,054. TRIANGULAR ROAD SCRAPER AND GRADER. ALEXANDER L. GRIFFITH, Bealleville, Ohio. Filed Dec. 28, 1881. (No model.)



Brief.—An inclined mold-board plank is located on one side of the scraper, and has on its upper edge a toothed plate and keeper, in which the upper end of a lever pivoted to the mold-board is held in adjustment. The lever has secured to it an inclined block and bracket, in which is mounted a conical wheel.

Claim.—1. In a road-scraper, the combination, with the inclined mold-board plank B, of the conical wheel K and the lever L, provided with the tapering block N, and pivoted to the inner side of the said inclined mold-board plank, substantially as shown and described, whereby the inclination of the said mold-board plank can be adjusted and the scraper held against lateral pressure, as set forth.

2. In a road-scraper, the combination, with the inclined mold-board plank B, provided with the toothed plate P and keeper Q, of the conical wheel K, and the pivoted lever L, provided with the bracket M, and the tapering block N, substantially as and for the purpose set forth.

258,055. CARRIAGE-TOP. CONRAD GROSS and GOTTFRIED GROSS, Richmond, Va. Filed Mar. 2, 1882. (No model.)

Claim.—The combination, with the carriage-body, of the posts D, hinged to said body, the top section, *b'*, hinged to said posts, the top section, *k*, and the posts C, hinged to section *b* and removably jointed to the body, as shown and described.

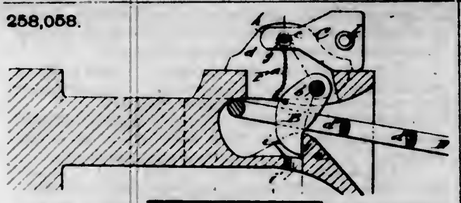
258,056. GAGE FOR SETTING SEWING-MACHINE GUIDES. JAMES F. J. GUNNING, New Haven, Conn. Filed Mar. 30, 1882. (No model.)

Claim.—The herein-described gage for setting the guide of sewing-machines, consisting of the plate A, constructed with an aperture, through which the needle will pass, and an edge, *b*, distant from the aperture according to the relative position required for the guide, substantially as described.

258,057. LEATHER SUBSTITUTE. EMIL C. F. GUSTHER, New York, N. Y., assignor to himself and Auguste Schwencke, same place. Filed Nov. 18, 1881. (No model.)

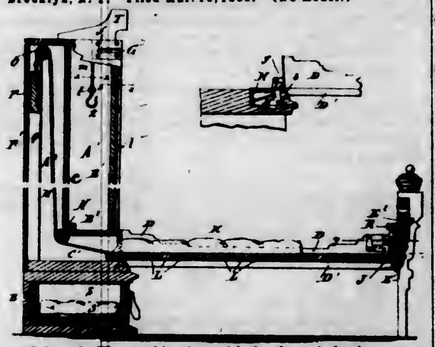
Claim.—1. As a new article of manufacture, a leather substitute consisting of covering layers of split leather and an intermediate layer of leather-shavings, united with the covering layers by a water-proof cement, substantially as and for the purpose set forth.

2. As a new article of manufacture, a leather substitute made of covering layers of split leather and an intermediate layer or layers of split leather or leather-shavings, united to the covering layers by a water-proof cement, substantially as set forth.



3. The method herein set forth of making a leather substitute from split leather and leather-shavings by impregnating the leather-shavings or split leather, or both, with a suitable water-proof cement, uniting it with covering layers of split leather by pressure, and finally allowing the article to dry slowly, substantially as specified.

258,058. CAR-COUPLING. WILLIAM HALSEY, Truro, Nova Scotia, Canada. Filed Jan. 6, 1882. (No model.)



Claim.—1. In a car-coupling, the pawl B, pivoted in a slot of the draw-head top, and the tumbler C, pivoted upon or above said top, said pawl and tumbler being flexibly connected, in combination with a draw-head having tin perforated projections *d*, carrying the cross-pins *b c*, and forming the passage F, as shown and described.

2. A draw-head having a throat with the enlargements *e e* rising from the mouth to the point of contact with the pawls, then cut away at *i* to form lips *j*, and then descending to form a cavity behind the pawl, as described.

258,058.

258,059. FOLDING BED AND CLOSET. MAX HALLHEIMER, Brooklyn, N. Y. Filed Mar. 16, 1882. (No model.)

Claim.—1. The combination, with the closet A, having a rear compartment, A', extending under the bottom of compartment A', of the flexibly-connected strips L, carrying a mattress, the end weighted straps, M, and the pulleys N O, as and for the purpose described.

2. The combination, with the closet A and the base B, having curved head *a*, of the side rails, D, having the inwardly-projecting flanges D' pivoted to the top front edge of base B, and having the curved recess *b*, whereby the flanges can be made to rest against the front and the rails against the sides of closet, as described.

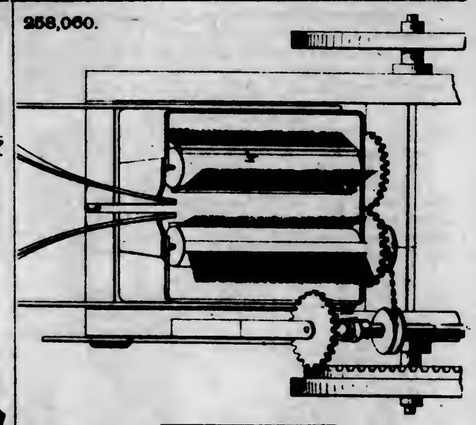
3. The combination, with each side rail and closet A, of the spring-catch hook F, having stud *e* passing through a plate on rail D and into a closet-groove, *g*, terminating in a deeper recess, *f*, as and for the purpose set forth.

4. The combination, with the base B, having recess H', and the rails D, of the swinging arms *g* and the springs H, arranged in said recess, whereby the side rails are partially counterbalanced, as described.

5. The combination, with the closet A, provided with front and rear compartments, A' A², of the hinged bedstead side rails, D, the sliding mattress K L, the straps M, the weight-block P', and the guides Q, substantially as herein shown and described, and for the purpose set forth.

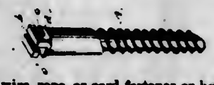
6. The combination, with the closet A, of the hinged bedstead side rails, D, the foot-piece E, hinged to the same, the sliding mattress K L, the foot-board J, attached to one end of the same and adapted to close the opening through which the mattress slides into the closet, and the latch R on the foot-piece E, for locking the board J to this foot-piece when the mattress is withdrawn, substantially as herein shown and described, and for the purpose set forth.

258,060. CLEANING ATTACHMENT TO COTTON-PICKERS. DANIEL B. HASELTON, Charleston, S. C. Filed Aug. 18, 1881. (No model.)



Claim.—1. The combination, in a cotton-cleaner, of the two cleaning-brushes placed upon an incline with their lower ends inward the front of the machine, with their operating mechanism, whereby the dirt, leaves, and insects are brushed from the growing plants previous to picking, substantially as specified.

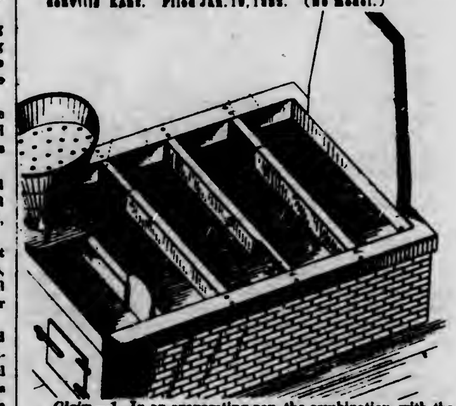
2. The combination, in a cotton-cleaner, of cleaning-brushes, with the receptacle above the same, and the sulphur-receptacle for containing burning sulphur or other poison to destroy living insects brushed from the plants, substantially as specified.



3. The combination, with the rotary brushes and their guards, of the receptacle above the brushes, having channels at each side for the reception of the dirt and insects brushed off the plants, substantially as specified.

4. In combination with the swinging frame and the main frame, the screw-rod and adjusting-nut for elevating the frame, substantially as and for the purpose specified.

258,060.



258,061. SCREW FOR FASTENING TELEGRAPH-WIRES. ANDREW J. KAVILAND, Fort Dodge, Iowa. Filed Mar. 3, 1882. (No model.)

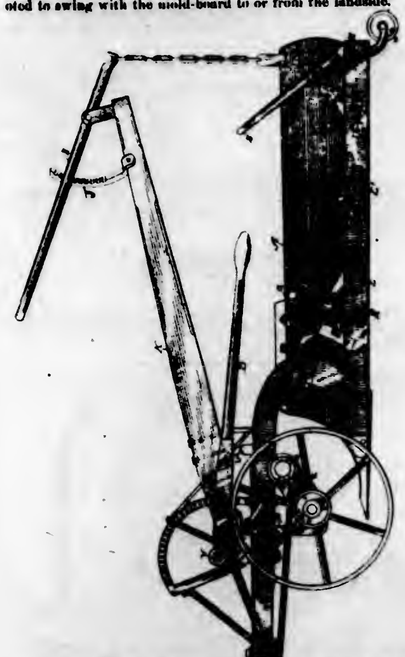
Claim.—A wire, rope, or cord fastener or holder consisting of a screw body, and a head provided with the slits *b*, *c*, and *c'*, substantially as described.

258,062. EVAPORATING-PAN. ALLEN E. HENTHORN, Burdenville, Kans. Filed Jan. 19, 1882. (No model.)

Claim.—1. In an evaporating-pan, the combination, with the hollow partitions, of metallic heat-retaining bars arranged within said partitions and secured to the sides of the pan, substantially as set forth.

2. The combination, with the furnace, of the pan provided with hollow partitions and flanges C and C', and the heat-retaining-bars E, arranged within said partitions and secured to the flange C, substantially as set forth.

258,063. BUCKBOARD-WAGON. FRANK A. HILL, Benicia, Cal. Filed Jan. 28, 1882. (No model.)



Claim.—1. The combination of the wooden side springs, A A, the V-shaped springs S S, and the center spring, B, the ends resting upon the side springs, substantially as described.

2. In combination with the wooden side springs, A, the braces G', hinged at e e', substantially as described.

3. The combination, with the side springs, A, and the springs resting thereon to support the body, of the elastic braces G, connected to the side springs, A, and to the hind axle, substantially as described.

258,064. DITCHING AND GRADING PLOW. FRANK A. HILL, Benicia, and MOSES J. CHURCH, Fresno, Cal. Filed Jan. 14, 1882. (No model.)

Brief.—Plow-beam suspended from a crank by which the plow is lifted at the front. At the rear a truck-wheel upon a lever is adapted to be let down as a carrier. An extension mold-board adjustable laterally and lifted by a lever. Its fulcrum-beam is pivoted to swing with the mold-board to or from the landside.

Claim.—1. In a ditching-plow, the combination of the carrying-wheels, the rock-shaft V, the plow having a permanent mold-board, the pivoted extension A, having independent vertical and lateral adjustment, and the lever K, pivoted to the rock-shaft and connected to the extension of the mold-board.

2. The combination, with the mold-board, of the extension A, pivoted at R, and having the pin and slot G, the support K, and the rack and lever J I.

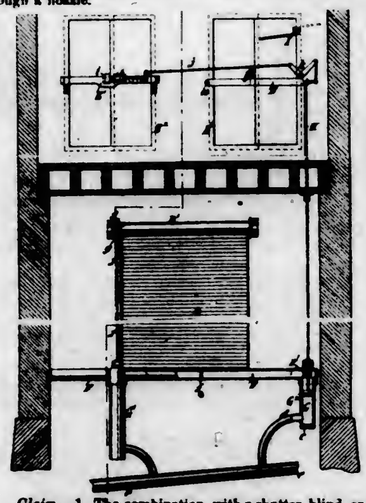
258,065. PACKING FOR UNDERGROUND STEAM-MAINS. JOSEPH G. HILL, Newark, N. J., and JOHN LAWRENCE LEE, New York, N. Y.; said Hill assignor to the American Heating and Power Company, New York, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. Lamp-black as a moisture-repellent packing material, substantially as described.

2. Underground mains or pipes jacketed with or enveloped in lamp-black as a heat-retaining moisture-repellent medium, substantially as described.

3. Underground mains or pipes for transmission of steam, hot water, or the like, laid in trenches and embedded in lamp-black, substantially as described.

4. The method of applying finely-divided lamp-black to steam and other pipes, where exposed to moisture or laid in trenches or placed under ground, by filling bags with the same and wrapping the bags around the pipes, substantially as described.



5. Steam or other pipes, where exposed to moisture or laid in trenches or placed under ground, surrounded by bags filled with finely-divided lamp-black, substantially as described.

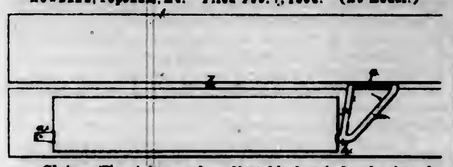
6. Woven envelopes filled with lamp-black for jacketing steam-pipes and other articles where exposed to moisture or laid in trenches or placed under ground, substantially as described.

7. A heat-retaining and water-repellent jacket for mains, pipes, and other objects, where exposed to moisture or laid in trenches or placed under ground, of lamp-black held in place by woven fabric waterproofed, substantially as described.

258,066. MEANS FOR UNLOCKING AND OPENING SHUTTERS. JACOB C. HEATON, New York, N. Y., assignor of one-half to Henry Wall and Sylvester P. Gilbert, same place. Filed Feb. 9, 1882. (Model.)

Brief.—A fluid-motor is arranged within the building and connected with a series of shutter-fasteners by means of a piston-rod, for the purpose of unlocking the shutters, and is operated by a supply of water or steam from the exterior of the building, applied through a nozzle.

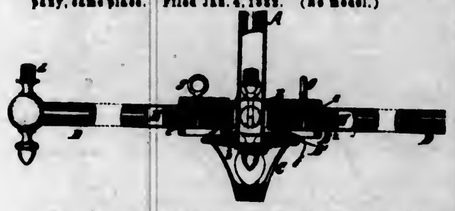
Claim.—1. The combination, with a shutter, blind, or door of a building, of a fluid-motor within the building, connected with said shutter, blind, or door, or its securing device for operating it, and a nozzle projecting from said motor or its supply-pipe and accessible from the exterior of the building for the attachment of a hose, substantially as and for the purpose specified.



2. The combination, with a shutter, blind, or door of a building, of a fluid-motor cylinder arranged within the building, a piston fitting said cylinder and connected with the operating or securing devices of said shutter, blind, or door, and a nozzle accessible from the exterior of the building and communicating with said cylinder, substantially as and for the purpose specified.

3. The combination, with a shutter of a building, of devices for holding it closed, a spring for throwing it open when released, a fluid-motor for operating said securing devices to release the shutter, and a nozzle leading from said motor and accessible from the exterior of the building, substantially as and for the purpose specified.

4. The combination, with the shutter or blind of a building, of a cylinder, (3, having a shoulder, c, and a waste-pipe, d, and arranged within the building, a nozzle, F', communicating with the cylinder and accessible from the exterior of the building for the attachment of a hose, a piston, (3', and connections between said piston and the operating or securing devices of the shutter, substantially as specified.

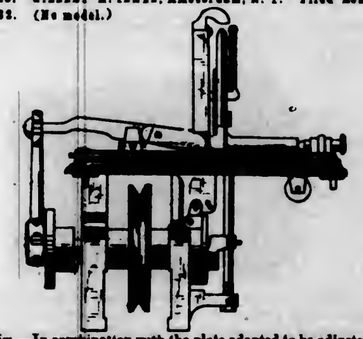


5. The combination, with the shutters of a building and their operating or securing devices, of a pipe, F, extending across the interior of a wall of the building, two or more cylinders, G (3', connected with said pipe, pistons (3', a nozzle or nozzles, F', accessible from the exterior of the building for the attachment of a hose, and connections between said pistons and the operating or securing devices of the shutters, substantially as and for the purpose specified.

258,067. BENCH-DOG. WILLIAM H. NEWLAND and JAMES E. NEWLAND, Topsham, Me. Filed Feb. 7, 1882. (No model.)

Claim.—The right-angular adjustable bench-dog having the laterally-projecting biting-lug A at one end and the downwardly-extending flange e at the other end, in combination with a bench having slide-groove b, substantially as specified.

258,068. CHANDELIER. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Ansonia Brass and Copper Company, same place. Filed Jan. 4, 1882. (No model.)

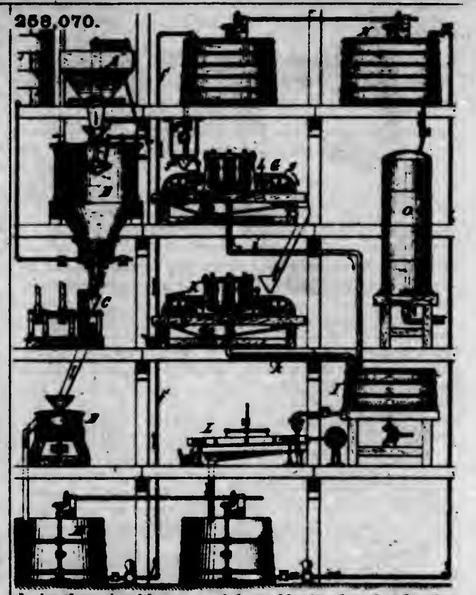


Claim.—1. The combination, with the body of a chandelier, composed of a disk and inner and outer flanges projecting from and formed integral with said disk, and each provided with holes radially opposite the holes in the other, of arms inserted into said holes, and pins, screws, or like devices inserted through said disk and transversely through said arms, substantially as herein described.

2. The combination, with the body of the chandelier, provided with sockets, of tubular arms containing plugs of wood and fitting in said sockets, and screws passing through the body and screwing into the plugs of wood in the said arms, substantially as specified.

3. The combination, with the body B B' B', provided with the sockets *e f*, of the arms D and screws *g*, substantially as specified.

4. The combination of the stem A, the body B B' B', screwed thereon, and the fulcrum-piece C, screwed on the stem below the body, substantially as specified.



258,069. TRIMMING ATTACHMENT FOR SEWING-MACHINES. GILBERT H. INMAN, Amsterdam, N. Y. Filed Feb. 21, 1882. (No model.)

Claim.—In combination with the plate adapted to be adjusted to the bed of the machine, the rock-shaft journaled in bearings in suitable standards on said plate, the bent lever adjustably secured to the rock-shaft and adapted to be connected with the operating mechanism of the machine, the stationary shear-blade secured to the plate and adapted to be adjusted longitudinally in line with its cutting-edge, and the vibrating blade secured to the rock-shaft, the whole arranged to operate substantially as specified.

258,070. METHOD OF AND APPARATUS FOR OBTAINING STARCH FROM GRAIN, &c. THOMAS A. JESS and WILLIAM T. JESS, Buffalo, N. Y. Filed Feb. 9, 1882. (No model.)

Claim.—1. As an improvement in the art of extracting starch from grain, the herein-described method, which consists in first reducing the grain with water, and then subjecting the reduced grain to pressure, whereby the starch-water is pressed out and separated from the bran and other coarse matter.

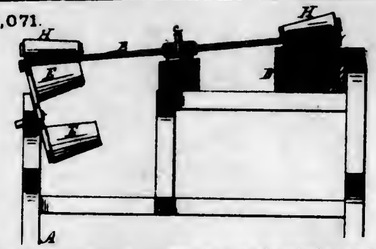
2. As an improvement in the art of extracting starch from grain, the herein-described method, consisting in first coarsely disintegrating the grain, then reducing the grain in a separate machine to the proper degree of fineness, and then separating the starch-water from the bran and other coarse particles by pressure.

3. As an improvement in the art of extracting starch from grain, the herein-described method, consisting in first reducing the grain with water, then separating the starch-water from the bran and other coarse particles by pressure, and then treating the starch-water for the production of the desired product, the material passing through the several stages of the process continuously and without interruption.

4. As an improvement in the art of extracting starch from grain, the herein-described method, which consists in first reducing the grain with water, then separating the starch-water from the bran and other coarse particles by pressure, and then separating the remaining impurities from the starch-water by sifting.

5. As an improvement in the art of extracting starch from grain, the herein-described method, which consists in first reducing the grain with water, then separating the starch-water from the bran and other coarse material, and treating the starch-water for obtaining the desired product, then regrinding the bran and other coarse material separately and extracting the starch from this ground material separately.

6. In apparatus for extracting starch from grain, the combination of a reducing mechanism whereby the grain is reduced to the desired degree of fineness with water, and a separating-machine composed of an endless perforate or porous apron and pressure-rollers, which receive the reduced grains, whereby the starch-water is separated from the coarse particles, substantially as set forth.



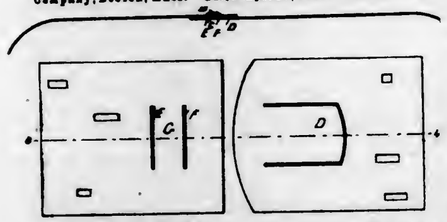
7. In apparatus for extracting starch from grain, the combination of a reducing mechanism whereby the grain is reduced to the desired degree of fineness, a separating-machine whereby the starch-water is separated from the bran, &c., and a subsequent separator, whereby the remaining impurities are separated from the starch-water, substantially as set forth.

8. In apparatus for extracting starch from grain, the combination of a steep, B, preliminary disintegrator C, grinding-mill D, receiver E, separator G, and subsequent separator I, substantially as set forth.

258,071. APPARATUS FOR MAKING PAPER VESSELS. HERBERT A. JOHNSON, Medina, N. Y. Filed Jan. 18, 1882. (No model.)

Claim.—1. In an apparatus for forming paper vessels from pulp, a circular felt in the form of a disk mounted centrally upon a journal or pin, so as to have a free rotation on its own axis, and

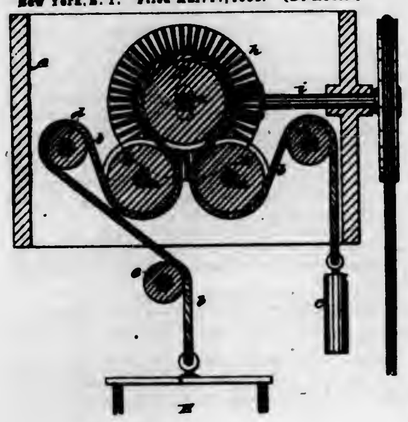
258,071.



serving by its rotation to transfer the pulp deposited upon it by the take-up roller to the forming-roller on another side of the felt, as specified.

2. In an apparatus for forming paper vessels from pulp, the combination of a circular felt mounted centrally upon a journal or pin, so as to have a free rotation on its own axis, a conical take-up roller on one side and under the felt, which deposits the pulp on the under side of the felt, a conical forming-roller on another side and under the felt, which removes the pulp from the felt and deposits it upon itself, and two pressing-rollers above the felt, resting over the conical take-up and forming rollers, as specified.

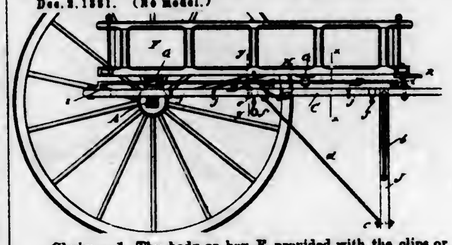
3. The combination, with the circular felt resting and turning on a central journal or pin, of the two conical forming-rollers mounted on a frame pivoted to the main frame centrally between the rollers, whereby either roller may be turned up beneath and in contact with the felt when the other roller is turned down, as specified.



4. The combination, with the circular rotating felt B, mounted on a central journal or pin, *c*, of the swinging frame I, carrying the pressing-roller H, and the band *p*, resting upon pulleys attached respectively to the roller H and shaft K, as shown and described, and for the purpose specified.

258,072. PERFORATED MUSIC-SHEET. WILLIS JOHNSON, Waterbury, Conn., assignor to the American Automatic Organ Company, Boston, Mass. Filed Apr. 28, 1881. (No model.)

Claim.—A perforated music-sheet having a tongue, D, on one end and transverse slots E F on the other end, to form the bar G, all substantially as described, and for the purpose specified.



258,073. ELEVATOR AND DUMB-WAITER. JOHN JOHNSTON, New York, N. Y. Filed Mar. 17, 1882. (No model.)

Claim.—1. In an elevator, the combination, with the framework of the well A and the suspension-rope *b*, of the rollers C D, of the same size and journaled in the same horizontal plane, and the large roller B, journaled above and between the rollers C D, the said rollers being grooved to the depth of the thickness of the rope to adapt them to revolve in contact with each other, substantially as herein shown and described, whereby the friction between the rollers is increased in proportion to the weight, and the car sustained at any point, as set forth.

2. In an elevator, the combination, with the frame A, the rope *b*, the weight *c*, and the car E, of the grooved rollers B C D, journaled in the said frame and revolving in contact with each other, the side guide-rollers, *d d*, and central guide-rollers, *e*, substantially as and for the purpose set forth.

258,074. HAND-CART. JOSEPH M. JOHNS, Paris, Ky. Filed Dec. 2, 1881. (No model.)

Claim.—1. The body or box F, provided with the clips or sleeves G, having the rollers m, in combination with the runners D on the side bars of the frame, substantially as and for the purposes set forth.

2. The buffers *i i*, in combination with the runners D and the sliding box or body F, substantially as and for the purposes set forth.

3. The sliding box or body F, provided with the chains *h*, in combination with the eyes, ring, or hooks *j*, secured to the side bars, C, of the frame, substantially as and for the purposes set forth.

4. In hand-carts, the runners D D, supported in the center by the bolts or similar device E, substantially as and for the purposes set forth.

5. In hand-carts, the hinged support or standard J, braced at the sides by the braces *b b*, and from the rear by the hooked rod *d*, the rod being adapted to be placed in the hook *f* and the standard to be placed in the hook *f'*, substantially as and for the purposes set forth.

6. The sliding box or body F, provided with the handles or hand-grasps *h*, substantially as and for the purposes set forth.

258,075. GENERATOR FOR STEAM HEATING APPARATUS. THADDEUS C. JOY, Titusville, Pa. Filed Feb. 2, 1882. (No model.)

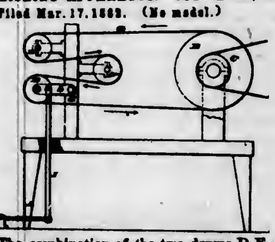
Claim.—1. An annular steam-generator composed of segments having downward flame-flues extending through them, in combination with an annular grate-section, which supports the segmental generator, and is beveled or cut away at the ends of the downward flame-flues to give exit to the flame, substantially as and for the purposes described.

2. A segmental steam-generator composed of hollow segments, each having a radial inward projection extending over the fire-chamber, the interior of both segment and projection constituting one chamber, the lower part of which acts as a steam-generator and the upper part as a steam-drum, substantially as and for the purposes described.

3. A segment of a steam-generator, having a tapering radial projection at its upper end, the lower side of which is tapered or cone-shaped, so that when in place it shall be exposed to the action of the heat arising from below, substantially as and for the purposes described.

4. A segmental steam-generator composed of hollow segments having inward radial projections which communicate with each other by ground and packed joints, substantially as and for the purposes described.

5. A segmental steam-generator having return-flues extending down between the segments, combined with segments having radial projections extending inward at the upper ends, which projections have cone-shaped or tapered under surfaces, so as to form between them the passages to the return-flues and to increase their heating-surface, substantially as described.

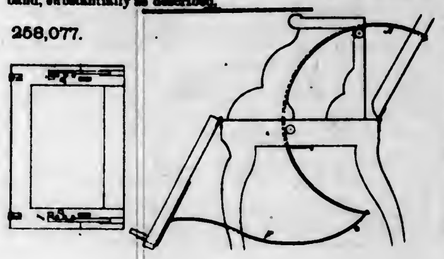


6. A segmental steam-generator having a vertical fire-chamber and return-flues, provided with holes or openings directly over the wall between the fire-chamber and return-flues, so as to permit the introduction through one opening of a brush or other device for cleaning the walls of both, substantially as and for the purposes described.

7. A segmental steam-generator having steam-generating chambers projecting from the annular water-chamber formed by the segments into the central fire-chamber, in combination with overhanging radial projections extending inward from the upper ends of the segments and nipples, making a direct vertical connection between the secondary generating-chambers and the radial projections, substantially as and for the purposes described.

8. A steam-generator having a central fuel-reservoir composed of sectional plates secured in or by supporting and retaining lugs on the steam-generating chambers which surround or are placed in the fire-chamber, substantially as and for the purposes described.

9. In a segmental steam-generator having secondary generating-chambers extending in from the main or segmental chambers, inverted T-lugs at the lower ends and vertical lugs at the upper ends of said secondary chambers, for supporting, and in combination with, fire-plates placed thereon and forming a fuel-reservoir in the center of said generator, substantially as and for the purpose described.

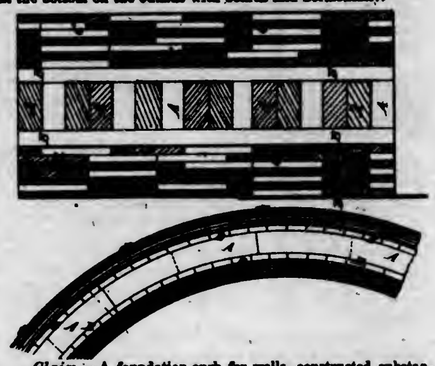


258,076. POLISHING APPARATUS. JOHN KARL, Wallingford, Conn. Filed Mar. 17, 1882. (No model.)

Claim.—1. The combination of the two drums D E, the intermediate drum, F, and the endless driven band *a*, having its surface coated with the grinding or polishing material and running around one of the said drums, D, thence around the intermediate drum, F, thence around the other drum, E, whereby the same working-surface of the band is presented between the two drums D E opposite to each other, with mechanism, substantially such as described, to impart to said drums a rapid revolution, and to the said band a corresponding rapid and constant movement, substantially as described.

2. The combination of the two drums D E, the intermediate drum, F, and the endless driven band *a*, having its surface coated with the grinding or polishing material, and running around one of the said drums, D, thence around the intermediate drum, F, thence around the other drum, E, whereby the same working-surface of the band is presented between the two drums D E opposite to each other, one or both of the said drums D E made adjustable to vary the distance between the working-surfaces of the band, substantially as described.

258,077.

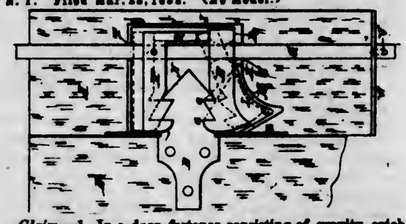


258,077. ADJUSTABLE CHAIR. JOHN D. KING, Elmira, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—The combination of the curved rod A with the hinged back of the chair rigidly attached to the same, and arranged, as described, so that moving in the arc of a circle it passes through the arm and seat; also, with the rod F, the hinged foot-rest, the rod F being pivoted to the hinged foot-rest, and a fastening device for securing it in any desired position, substantially as described.

258,078. FOUNDATION-CURB FOR WELLS. SPENCER A. KINGSLAND, Brooklyn, N. Y. Filed Sept. 1, 1881. (No model.)

Brief.—A central tier of horizontal timbers and an outer and inner tier of vertical timbers are spiked together and faced at the bottom on the outside with boards laid horizontally.



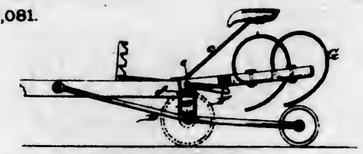
Claim.—A foundation-curb for wells, constructed substantially as herein shown and described, consisting of the central tier or core of curved horizontal timbers A, the outer and inner tiers of vertical planks B, and the outer and inner series of tiers of horizontal boards C, as set forth.

258,079. CIGAR. FRANCIS S. KINNEY, New Brighton, assignor to the Kinney Tobacco Company, New York, N. Y. Filed June 28, 1881. (No model.)

Claim.—A cigar having a label attached thereto by means of one or more prongs pressed or forced therein through its wrapper, substantially as described.

258,080. CAR-DOOR LOCK. JAMES W. KNAPPS, New York, N. Y. Filed Mar. 25, 1882. (No model.)

Claim.—1. In a door-fastener consisting of gravity-catches E F, bar G, and the notched bolt D, the pivot H for the catch E, formed on a base-plate, I, located in the recess N made in the wood for the said fastener, substantially as described.



2. The combination, with catches E F, bar G, and notched bolt D, of the pivot H and the rest R for catch E on base-plate I, substantially as described.

3. The combination, with the bar G, catches E F, and bolt D, of the staple V and plate W, the said plate being attached to the end of cleat A and provided with slots X and Y, and the staple being attached to bar G and in the described relation to plate W, substantially as described

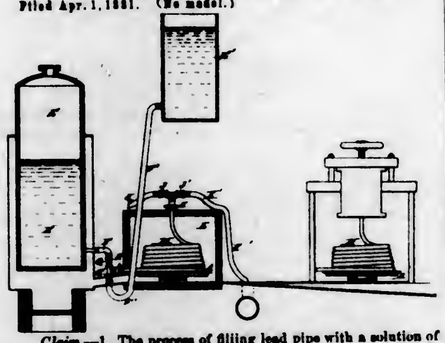
258,081. SULKY-HARROW. CHARLES LA DOW, Albany, N. Y. Filed July 26, 1881. (Model.)

Claim.—1. In a harrow, the combination of the main frame, the long and short independently and vertically vibrating tooth-

258,081.

arms hinged thereto, and spring-teeth connected to said arms, said teeth being constructed to yield rearwardly and recoil without side vibration, substantially as and for the purpose described.

2. In a harrow, the combination of a draft-frame, an arm attached thereto and adapted to conform to the surface traversed, and a flat spring-tooth adjustably connected to said arm, substantially as described, whereby the extent of vibration of the tooth can be varied.



3. The combination, in a harrow, of the main frame, with a vibratory tooth-arm hinged thereto, and the broad and flat spring-tooth carried by the vibratory tooth-arm, said arm being arranged to extend over the cutting-point of the tooth, substantially as and for the purpose described.

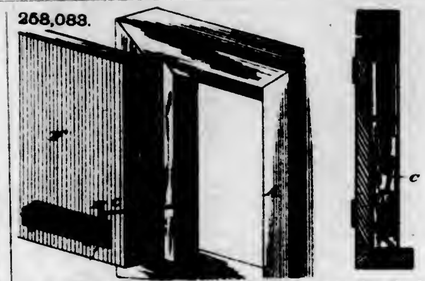
4. The combination, in a harrow, of the pole with the cross-bar B, the braces D, extending rearwardly from the cross-bar to provide supports for the main frame, and the spring-teeth G, secured to the hinged tooth-arms, substantially as described.

5. In a harrow, the combination of the pole, the cross-bar B, the braces D, the hinged tooth-arms, the flat spring-teeth G, secured to the latter, and lifting mechanism for raising and supporting the teeth, the points of the said spring-teeth being constructed and arranged to act on the soil in different vertical planes transversely to the line of draft, substantially as and for the purposes described.

6. In a harrow, the combination of the main frame, the independently-articulating tooth-arms hinged thereto and provided with slots, and the flat spring-teeth vibrating within the slots in the tooth-arms, said members being organized for operation substantially as and for the purposes described.

258,082. LEAD PIPE. PAUL LANGHAMMER, Denver, Colo., assignor to himself and Charles Stedler, Jersey City, N. J. Filed Apr. 1, 1881. (No model.)

Claim.—1. The process of filling lead pipe with a solution of sulphate of potassium and holding it therein under pressure at a temperature of about 257° Fahrenheit, so as to produce the highly-metalline sulphate composed of four atoms of lead to one of sulphur in the inner and lining portion, as set forth.



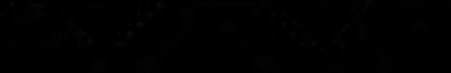
2. The apparatus described, having the boiler E, hose F, cock G, clamps H I, cock J, hose K, and oven L, for subjecting the interior of the pipe M to a solution at high temperature and under pressure, in combination with the reservoir or main E', hose F', cocks G' J', and hose K', for conveniently removing the uncombined particles of the solution, as herein specified.

258,083. COMBINED WEATHER-STRIP AND DOOR-SPRING. ANDERSON LATHROP, Van Hornesville, N. Y. Filed Mar. 14, 1882. (No model.)

Brief.—A hinged strip on the bottom of the door is connected by a cord passing through staples with a spring on the door-post, whereby the door-spring lifts the weather-strip upon opening the door.

Claim.—1. The combination, with the gravity weather-strip on the door, of the spring device secured to the door-frame and adapted to raise the weather-strip when the door is opened, as set forth.

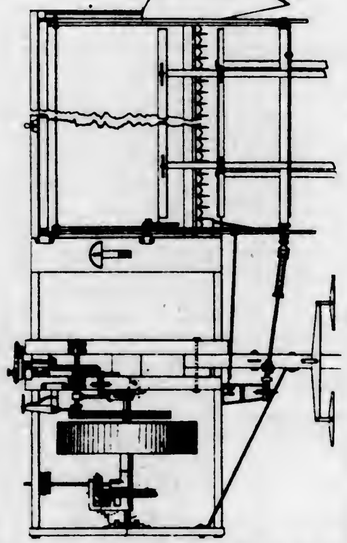
258,083.



2. The combination of the spring device secured to the door-frame, and having connecting-cord C, adjustably secured to one end of the weather-strip, with the weather-strip hinged to the door at the bottom thereof, as herein shown and specified.

3. The combination of the spring device secured to the door-frame, the connecting-cord secured to the lower end thereof and passing down through staples or their equivalent affixed to the frame and door, its lower end being secured to the weather-strip, and the metallic plate forming the weather-strip, substantially as and for the purpose specified.

258,084. ORNAMENTAL CHAIN. BENEDICT B. LUDEMAN, Providence, R. I. Filed Jan. 23, 1882. (No model.)

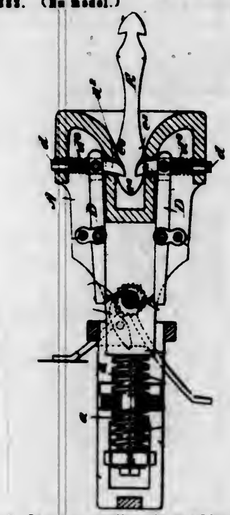


Brief.—A tube has notches cut therein to receive the connecting-link.

Claim.—1. As a new article of manufacture, a chain made up in part or whole of pieces of tube, having notches cut into the sides thereof, placed transversely to the chain and secured together along the sides of the tubes, as described.

2. In an ornamental chain, the combination, with the tubular links E E, placed transversely to the line of the chain and having notches cut into the sides thereof, of the rings F F, arranged to connect the tubular links together, as described.

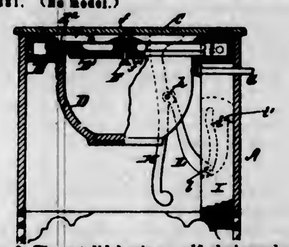
258,085. HARVESTER. CHRISTOPHER W. LEVALLEY, St. Paul, Minn. Filed Jan. 26, 1882. (No model.)



Claim.—1. In a harvester, the combination, with the main axle and the main frame, of the cogged yokes, bevel-gears, bevel-pinion, and counter-shaft, substantially as set forth.

2. In a harvester, the combination, with the main axle, the bevel gear and pinion, and the counter-shaft, of the swinging keeper, substantially as set forth.

3. In a harvester, the combination, with the main frame and main axle, of cogged yokes, a gear on the main axle, a counter-shaft arranged at right angles to the axle, and a gear mounted on said counter-shaft and engaging with the gear on the main axle, substantially as set forth.

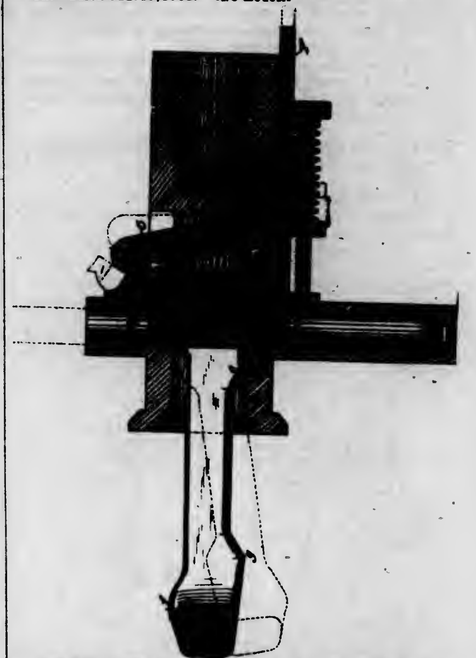


258,086. CAR-COUPLING. LUCIUS LOSS, Sublette, Ill. Filed Feb. 14, 1882. (No model.)

Claim.—1. In a car-coupling, the combination of a coupling-bar, E, formed, as above described, with a draw-head, A, provided with levers D, having pivoted hooks or studs d^2 and springs d^3, substantially as and for the purpose herein set forth.

2. In a car-coupling, the pivoted and spring-pressed levers D, provided with the pivoted hooks or studs d^2 on their outer ends, in combination with the draw-head A, and means, substantially as herein shown and described, for operating the said levers, as and for the purpose set forth.

258,087. COMMODE. HENRY LOVE, Philadelphia, Pa. Filed Sept. 9, 1881. (No model.)



Claim.—1. The pot-lid having a self-closing valve, F, with stem *f* projecting above said lid, whereby said valve is adapted to be opened by the pressure or impact on its stem of the commode-cover, substantially as shown and described.

2. The combination of a pot having a lid with self-closing valve F with a commode having a cover which, when down or closed, opens said valve to admit air to the pot, substantially as shown and described.

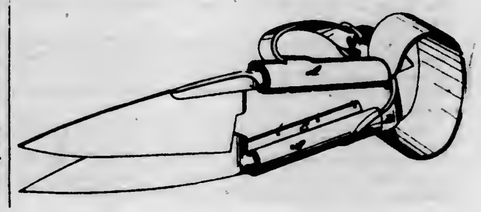
3. The combination, with the commode-body A, having buttons K and pivoted levers I, with recesses *f'* and grooves *f''*, of cover C, having arms H and pivoted braces L, said parts being constructed and combined for operation substantially as shown and described.

4. In a commode having openings on either side of the hole or seat-opening for the passage of the arms when the lid or cover is turned down or closed, the combination, with said openings, of hinged bars for closing up or occupying said side openings when said lid or cover is raised, substantially as shown and described.

258,088. CAR-COUPLING. CHARLES E. HAGARTEY, Forsyth, Ga. Filed Jan. 26, 1882. (No model.)

Claim.—1. The combination, with a draw-bar having a tubular projection above the pin-hole and a headless pin, of a latch-bar pivoted in said tubular projection, and having one end extending across the pin-hole, and a vertical trigger-bar pivoted in the bottom of the draw-bar, and having its upper end formed with a hooked catch adapted to engage the latch and hold it horizontal to retain the pin in an elevated position and to lock the pin down, as described.

2. The combination, with a draw-bar and a headless pin, of a pin-receiver attached to the bottom of the draw-bar about the pin-hole, as and for the purposes described.



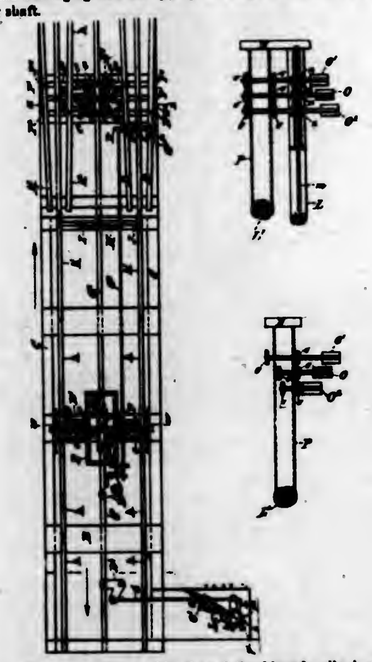
3. The combination, with a draw-bar and a headless pin, of a pin-receiver attached to the bottom of the draw-bar about the pin-hole and made in the form of a tube with an open lower end and adjustable stop at its lower end to permit the pin to be retained or removed, as described.

4. The combination, with the pin-receiver, of the stop-bolt c, permanently connected to the pin-receiver by a slot and pin, and provided with a spring-catch, z, as and for the purposes described.

5. The combination, with a draw-bar and a headless pin, of means for holding the pin in elevated position, a slide for holding the pin in the coupled position, &c., and a subjacent pin-receiver arranged about the pin beneath the slide, as and for the purposes described.

6. The link, formed with projections *f f* on one side and *g g* on the other, one of said sets of projections being nearer the end of the link than the other, as and for the purpose described.

258,089. SHEAR-PAD. ALFRED P. MANN, Kearney, Nebr. Filed Feb. 27, 1882. (Model.)



Claim.—1. The combination, with the casings A, provided with the covering B and adapted to be secured on the shanks of shears, of the straps D, for connecting these casings, substantially as herein shown and described, and for the purpose of holding the shears in the operator's hand, as set forth.

2. The combination, with the casing A, of the covering-layer B, of cloth or leather, held on the casing A by the overlapping longitudinal edges C of the casing, substantially as herein shown and described, and for the purpose set forth.

258,090. RAILROAD-SWITCH. MARTIN MARSHALL and HUGH J. MCDEVITT, Philadelphia, Pa. Filed Sept. 24, 1881. (No model.)

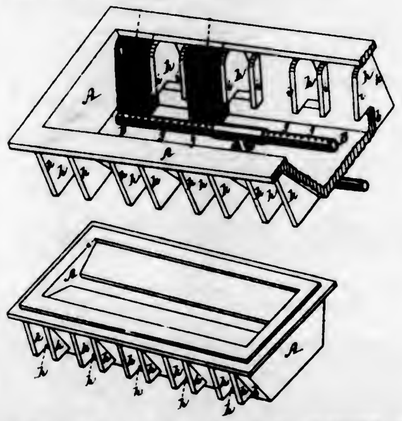
Brief.—In approaching the switch on the main line it is set to the desired siding through pivoted swinging levers at the side of the track operated from the train, said levers controlling the position of fingers or keys on a sleeve of a rotary shaft, the weight of the train depressing jointed rails, causing said fingers to be operated, whereby a partial rotation of the shaft shifts the switch-rails through pinion-and-rack connection. In approaching the switch on either siding it is set through jointed sections of the siding-rails being depressed by weight of passing train actuating levers bearing against the appropriate fingers or keys on the rotating shaft.

Claim.—1. The combination of the hinged rails A with the switch-rails A', having a rack, I, by means of the intermediate levers, D, rods F, springs e, and rod G', having a toothed wheel, H, whereby the said rails A, when caused to descend from their inclined to their normal horizontal position by the weight of a train passing over them, shall so move the said intermediates as to operate the switch-rails A', substantially as described.

2. One or more levers, O, constructed substantially as described, and so arranged as to be in reach of the brakeman of a passing train, in combination with the tube P, or equivalent device, having a rod or rods, p, and arm h, for setting switch-keys, substantially as described.

3. The key-levers O, in combination with the vertical rods or posts L L' and tube P, substantially as described, the levers being arranged in such proximity to the railroad as to be operated by an employé on a passing train, substantially as and for the purpose set forth.

4. The combination of the vertical rod or post L, provided with levers O, O', and O², and rod or post L', having a tube, P, provided with cross-rods p, p', and p², and an arm, h, with the rod G, bell-crank lever D², and rod G', having a three-pronged key, K, substantially as described, and for the purpose set forth.



5. The combination of the bell-crank levers D D, rods F F, and springs e e with the key K and jointed inclined rails A, substantially in the manner and for the purpose set forth.

6. The combination of the longitudinal rod G², having a gear-wheel, H, with the rod G', having a key, K, and a switch having rails A' A' and toothed rack I, substantially in the manner and for the purpose above set forth.

7. The combination of the bell-crank levers D', D², and D³, rods F', F², and F³, and springs e', e², and e³ with the rod G², having a key, K², and the inclined rails A, A², and A³, substantially as described, for operating the switch when the train is passing from the connected track onto the main track.

8. The combination of the rod G² with the rod G', having a key, K, and the rod G², having rods e, e', and e², substantially in the manner and for the purpose set forth.

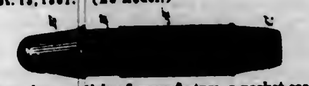
258,091. STOVE OR FURNACE FOR BURNING HYDROCARBON AND OTHER OILS. PHAAL MARTIN, Medford, assignor to the Boston Petroleum Heating Company, Boston, Mass. Filed Jan. 14, 1882. (No model.)

Claim.—1. In an oil stove or furnace, the combination, with a fire-pot, A, having its sides grooved for the reception of wicks, of a series of air-inlet apertures, h, located in its sides between or at the sides of the wick-grooves, and so arranged that each aperture h on one side of the fire-pot will be directly opposite to or in line with a wick-groove, s, on the other side of the pot, substantially as and for the purpose set forth.

2. In an oil stove or furnace, the combination, with the air-inlet apertures h in the sides of the fire-pot A, of the projecting wings or plates i h, adapted to increase the surface area of the sides of the air-apertures, for the purpose of imparting additional heat to the air entering the fire-pot, substantially as described.

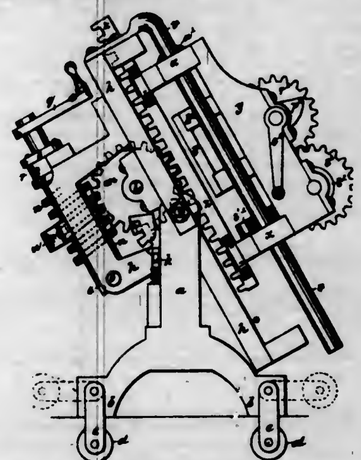
3. In an oil stove or furnace, the combination, with a fire-pot having its side or sides grooved for the reception of wicks and a series of air-inlet apertures located in its sides between or at the sides of the wick-grooves, of a deflector so arranged as to intercept and deflect the incoming currents of air down to the bottom of the fire-pot into close proximity with the perforated oil-pipe, substantially in the manner and for the purpose set forth.

4. In an oil stove or furnace, the combination, with a fire-pot provided with air-inlet apertures in its sides and a deflector placed thereover, of a perforated oil-pipe, B, located above the bottom of the pot to allow of the passage thereunder of the currents of air projected downward by the deflector, substantially as and for the purpose described.



258,092. RADIATOR. JOSHUA HASON, Paterson, N.J. Filed Feb. 20, 1882. (No model.)

Claim.—1. The combination, in a radiator, of an upper and a lower water or steam chamber or head, outer and inner upright tubes, the former of which connect the two water chambers or heads and the latter of which pass through the former and through both chambers or heads, and a central tube communicating with the upper chamber or head and having an inlet at the lower end thereof, substantially as and for the purpose specified.



2. The combination of the lower head or chamber, A, constructed with the passage or conduit a, the upper head or chamber, B, the outer and inner tubes, C D, and the central tube, F, substantially as specified.

258,093. CIGAR-CASE. EDWARD S. MAY, Detroit, Mich. Filed Oct. 19, 1881. (No model.)

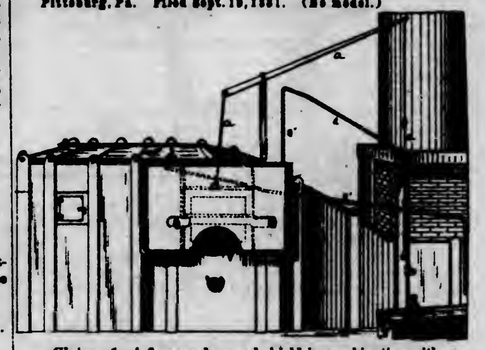
Claim.—As an article of manufacture, a pocket-case consisting of tubes A B, telescoped together, and the detachable thimble E, substantially as and for the purpose set forth.

258,094. ROCK-DRILL. JOSEPH L. MCCLOSKEY, Ozark, Mo. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination, with a rock-drill frame secured to the upper ends of its legs, and legs e, provided with curved feet b, of the swinging roller-frames e d, pivoted to the feet, whereby the rollers can readily be swung under the feet when it is desired to move the machine, and when the latter has reached the desired position the roller-frames can be swung into a horizontal position, with the feet of the drill resting on the ground, substantially as described.

2. The combination, with the frame A, provided with the guide-rods v v, and frame y, adapted to slide on said guide-rods and provided with the guide-bolts a' a', of the roller-frame b', carrying the drill-bolt h', coiled spring m', and crank-shaft n', provided with a tappet, g', substantially as described, and for the purpose set forth.

3. The combination, with the frame y, provided with the guide-bolts a' a' h', and spring m', of the frame b', carrying the roller g', shaft n', carrying the tappet g', pinions r' d', worm t', and worm-wheel f', substantially as described, and for the purpose set forth.

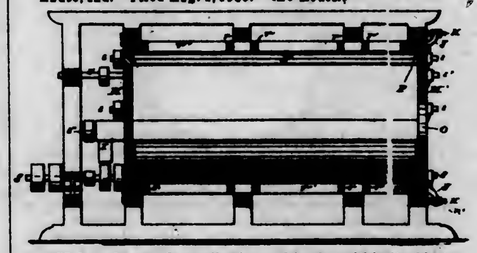


4. The combination, with the frame y, provided with guide-bolts a' a', having nuts on their ends, of the plate c', having a central hole for the passage of the drill and thimble d', substantially as described, and for the purpose set forth.

5. The combination, with the frame b', carrying the drill-bolt h' and nut n², of the spring a', encircling the lower end of the bolt and lying between the upper cross-bar, b², of the frame b' and the nut n², substantially as described, and for the purpose set forth.

6. The combination, with the shaft l, carrying the pinion m, and frame y, carrying the rack-bar n, of the worm n, adapted to be thrown in or out of engagement with the pinion, substantially as described, and for the purpose set forth.

7. The combination, with the shaft l, carrying the pinion m and worm n, journaled at its lower end in the rock-bar c, and having its upper bearing in a hole, p, open on one side, of the jointed clamp r and pin t, substantially as described, and for the purpose set forth.



258,095. FURNACE DOOR AND SHIELD. HUGH MCDONALD, Pittsburg, Pa. Filed Sept. 19, 1881. (No model.)

Claim.—1. A furnace door and shield in combination with a water-supply to one and a discharge therefrom to the other, substantially as described.

2. The band d, having cross-bar d', as a means of attachment to a shield to be moved simultaneously by the same motion, substantially as described.

258,096. DUST-COLLECTOR. FRANCIS H. MCELFRESH, Terre Haute, Ind. Filed Aug. 4, 1880. (No model.)

Claim.—1. In a dust-collecting reel having within it a blast-chamber and a still-air chamber, separated by the inclosing boards of a hopper, the rotating closing-strips D D', arranged to simultaneous bear upon the hopper-boards and the traveling cloth to prevent the blast from entering the hopper, substantially as described.

2. The combination, with the traveling cloth and the still-air chamber, of the rotating brush E, arranged in contact with the cloth and within the still-air chamber, substantially as described, and for the purpose stated.

3. The combination, with the rotating reel B, having ribs r, of the non-rotating heads H H' and adjusting devices for regulating the relative positions of said reel and heads.

4. In combination with the frame A and reel B, the head H', provided with the brackets J, the threaded rods K, fixed frame, and the nuts n and n', constructed, arranged, and operating substantially as described, and for the purposes set forth.

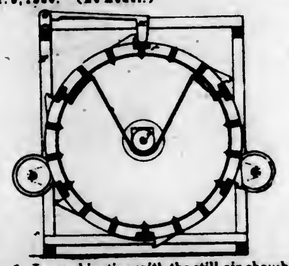
258,097. WHEEL-CULTIVATOR. ALFRED HEISENBUTTE, Munster, Ill. Filed Oct 31, 1881. (No model.)

Claim.—The combination, with the arms b e f, secured to the opposite sides of the rear end of the plow-beam and bent outwardly, substantially as set forth, and provided with adjusting-holes in their downwardly-projecting ends, of the arms h l m n, secured to the arms b f, and bent as shown, and threaded bolts o r, serving the double purpose of braces for the arms and a means of laterally adjusting the teeth, substantially as described.

258,098. WATER-BACK FOR STOVES. WILLIAM HILLER, Cincinnati, Ohio. Filed Feb. 21, 1882. (No model.)

Claim.—1. A tubular lateral extension applied to the upper

258,098.



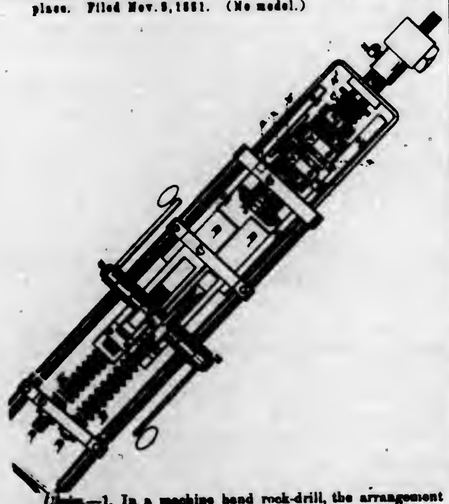
part of a water-back and supporting the panels or long centers of a range or stove or other cooking or heating apparatus, substantially as described.

2. The communicating shells E E' F, of which the upper one, E', is provided with a hollow lateral extension, G, as and for the purpose described.

3. A fire-box lined on each side with a water-back having a hollow extension that supports the panels or long centers of the cooking or heating apparatus containing said fire-box, substantially as described.

4. As a new article of manufacture, a tubular back or fire-box lining provided with a hollow lateral extension, for the purpose specified.

258,099. DUST-COLLECTOR. JONATHAN HILLS, Chicago, Ill. Filed Apr. 6, 1880. (No model.)



Claim.—1. In combination with the still-air chamber and the moving cloth of a dust-collector, the conveyer W, substantially as and for the purposes set forth.

2. A rotating reel bearing a dust-cloth, in combination with a blast-chamber and a still-air chamber within said reel, as described.

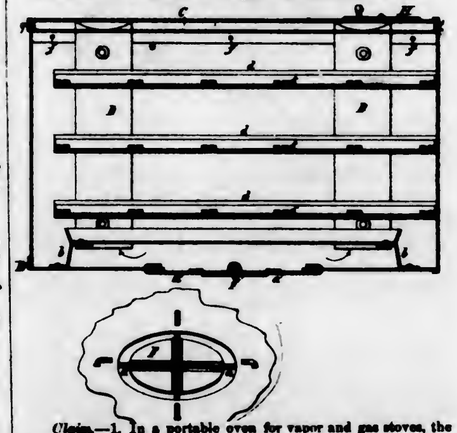
3. In combination with a reel bearing a dust-cloth, a hopper arranged within the reel to separate the general interior thereof into two unconnected chambers, substantially as and for the purposes set forth.

258,100. MACHINE HAND ROCK-DRILL. EUGÈNE MOREAU, San Francisco, Cal., assignor to Theodore W. Sterling, same place. Filed Nov. 9, 1881. (No model.)

Claim.—1. In a machine hand rock-drill, the arrangement and combination of the hammers D D, provided with arms or stirps L, having lugs *a*, and the loosely-journaled drill-bolding spindle H, with its head J and spring C, substantially as and for the purpose herein described.

2. In a machine hand rock-drill, the combination and arrangement of the hammers D D, having arms or strips L and cams U, and the loosely-journaled drill-holding spindle H, with its sleeves V, having lugs *r*, springs *s*, and pawls W, and the feathered ratchets X, substantially as and for the purpose herein described.

3. In a machine hand rock-drill, the combination and arrangement of the hammers D D, having lugs *a* and cams U, and the loosely-journaled drill-containing spindle H, with its head J, spring C, loose sleeves V, with their lugs *r*, springs *s*, and pawls W, and the feathered ratchets X, substantially as and for the purpose herein described.



4. In a machine hand rock-drill, the combination and arrangement of the hammers D D, lifting-cams F F, having their points curved to the arc of a circle, as shown, arms L, with their cams U, and spindle H, with its sleeves V, lugs *r*, and pawls W, and the feathered ratchets X, substantially as and for the purpose herein described.

5. In a machine hand rock-drill having a striking hammer, the combination of the loosely-journaled drill-holding spindle H, threaded rod M, and a means for receding said rod M as the drill advances, consisting of the arm T, attached to the hammer, and having a pin or lug, *w*, the fulcred lever R, with its pawl S, the ratchet Q, gears *q'* and *q*, and the actuating-nut N, substantially as and for the purpose herein described.

6. In a machine hand rock-drill, the combination of the loosely-journaled drill-holding spindle H, supporting rod M, and intermediate mechanism to cause said rod to recede as the said spindle advances, substantially as and for the purpose herein described.

7. The combination herein of the threaded rod M, actuating-nut N, and locking device, consisting of the pivoted lever P, with its cam *p*, substantially as and for the purpose herein described.

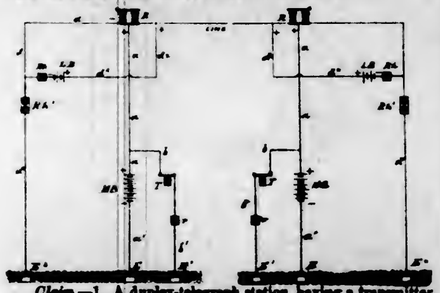
258,101. PORTABLE OVEN FOR GAS AND VAPOR STOVES. J. L. HORGAN, Decatur, Ill. Filed July 30, 1881. (Model.)

Claim.—1. In a portable oven for vapor and gas stoves, the radiator or disk, corrugated to prevent warping as well as to allow the wires to pass through it flatwise, and the wires for the purpose of suspending the disk in its position above the flame, substantially as shown and described.

2. In a portable oven, the conducting-tubes D, secured to the side walls of the oven at equal distances from the ends thereof, the side walls of the oven forming one side of the tubes and the tubes being of the same depth as the flanges B of the oven.

3. In a portable oven provided with flanges B, the combination, with the conducting-tubes secured to the sides of the oven and being of the same width as the flanges of the oven, of the brackets *d d*, secured to the sides of the tubes D, substantially as set forth.

4. A portable oven having a door-front or opening formed of the extended turned-down portions of the sides, top, and bottom of said oven, substantially as described, the overlapping corners of said turned-down portions being secured together by rivets.

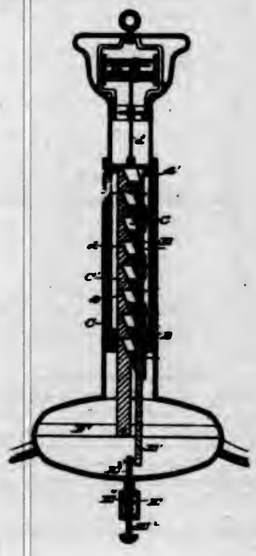


5. In a portable oven for vapor and gas stoves, the combination of the following elements, viz: the corrugated radiating-disk F and bottom part of the oven and the sub-radiator or drip-pan E, the conducting-tubes D, and air-chamber C, having the valve or damper H, the brackets *d d*, and grate G, all arranged substantially as herein shown and described.

6. A sheet-metal shelf or grate having two side bars and a number of cross-bars, the side bars being bent longitudinally and embracing and overlapping the cross-bars, which are bent transversely at their extremities, and the cross-bars at each end being secured to the side bars by rivets, substantially as described.

258,102. WITHDRAWN.

258,103. DUPLEX TELEGRAPH. GARDNER S. HOTT, Philadelphia, Pa. Filed Mar. 25, 1882. (No model.)



Brief.—The transmitting-batteries are normally short-circuited through their own transmitters, and each relay has a local circuit permanently closed through both coils. The relay-coils are not necessarily differentially wound. When a current is sent to line its influence is overcome on the line-coil of the relay by the local, and that coil is entirely nullified as to its effects, while that of the artificial line is doubled, thus leaving the home instrument silent, while the balance is disturbed at the distant station.

Claim.—1. A duplex-telegraph station having a transmitter, relay, resistances, and circuits, substantially as described, with a main battery which goes to line through one portion of the relay, and has a ground-connection through the other portion of the relay and a rheostat, and a local battery permanently in circuit through both portions of the relay, substantially as set forth.

2. A duplex-telegraph station having a transmitter, relay, resistances, and circuits, substantially as described, with a main battery having a local circuit through the transmitter, and a magnetic coil, m, between the connection of the wires *a' b'* of this local circuit and the ground, as and for the purpose set forth.

258,104. CHANDELIER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a chandelier, the combination, substantially as set forth, of the following elements, namely: the upper stationary tube-section, a cord-winding mechanism attached to said stationary tube-section, a horizontal and inwardly-projecting supporting-stop at the lower end of said stationary tube, a lower sliding tube-section, a series of locking lugs or spurs carried by and concealed entirely within the lower section and arranged to be moved laterally relatively thereto, a cord attached to said series of locking lugs or spurs and to the winding mechanism in the stationary section, means, substantially as set forth, to move said lugs or spurs laterally relatively to the supporting-stop to throw them into engagement therewith, and the means which withdraw them to permit them to pass vertically through the supporting-stop.

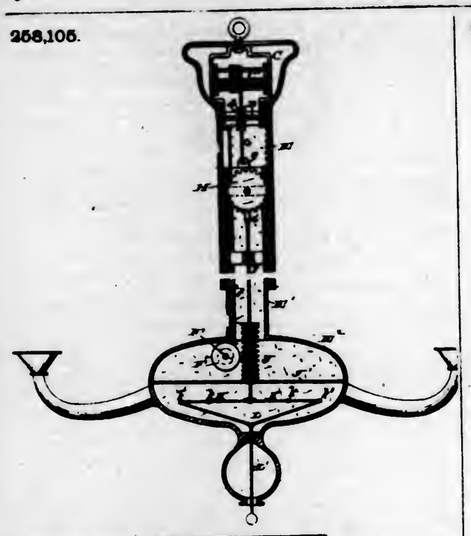
2. In a chandelier, the combination of an upper stationary tube-section, a supporting-stop attached to said section, a lower sliding tube-section, a series of vibrating locking-dogs carried by the sliding section and arranged to engage with the supporting-stop on the stationary section, and two opposing wedges, of which one is connected by a cord to the stationary section and the other is connected to the sliding section, said wedges being operated by the weight of the chandelier to crowd the vibrating locking-dogs into engagement with the supporting-stop on the stationary section to provide a positive support for the sliding section, substantially as set forth.

3. In a chandelier, the combination of an upper stationary tube-section, a supporting-stop attached to said section, a lower sliding tube-section, a series of vibrating locking-dogs carried by the sliding section and arranged to engage with the supporting-stop on the stationary section, and two opposing wedges, connected respectively to the stationary section and to the sliding section and operated by the weight of the chandelier to crowd the vibrating locking-dogs into engagement with the supporting-stop on the stationary section to provide a positive support for the sliding section, substantially as set forth.

4. In a chandelier, the combination, with the upper tube-section having an inwardly-projecting shoulder or supporting-surface, B, of the slotted tube-section C', provided with inclined faces *d*, the vibrating locking-bar E, and devices, substantially as described, which throw said bar inward when it is moved upward relatively to the sliding tube-section, substantially as set forth.

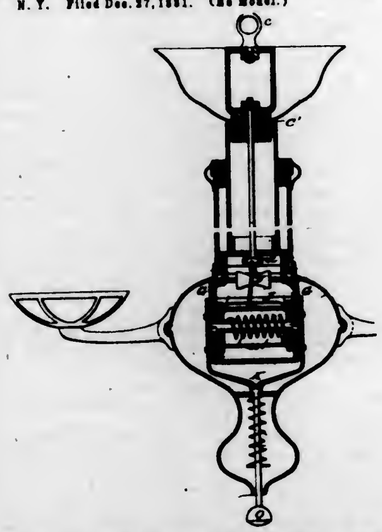
5. In a chandelier, the combination, with the stationary tube-section, the sliding tube-section, and the vibrating locking-bar E, of the devices which are operated by the weight of the chandelier to move said locking-bar outward, and the stem E', projecting through the bottom of the sliding portion and arranged, substantially as set forth, to permit the vibrating locking-bar to be pushed upward relatively to the sliding portion, substantially as set forth.

6. In a chandelier, the combination, with the stationary section having a stop, and the sliding section, of a locking-bar carried by the sliding section, and having a series of stops upon one slide and one or more wedges formed upon the opposite side, and wedging devices attached to the sliding section and arranged to crowd the locking-bar outward by engaging with the wedge or wedges on said bar, substantially as set forth.



258,105. CHANDELIER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a chandelier, the combination, substantially as hereinbefore set forth, of the following elements, namely: the upper stationary tube-section, a lower sliding tube-section carrying the bulb F', a spring cord-winding mechanism mounted in the upper tube-section and carrying a cord attached to the sliding tube-section, a spring cord-winding mechanism mounted in the sliding part of the chandelier, having a cord attached to the stationary tube-section, and a locking mechanism carried by the sliding tube-section at its upper end and concealed within the tube-sections, and arranged to permit the passage of the cord which is wound in the sliding tube-section.

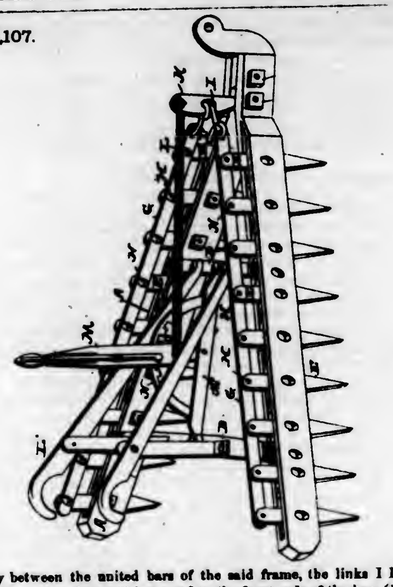


2. The combination of the upper stationary tube-section, the lower sliding tube-section, the devices which prevent the rotation of the lower tube-section relatively to the upper, a spring winding mechanism mounted in the upper tube-section and having a flexible connection with the lower tube-section, a spring winding mechanism mounted in the lower tube-section, and having a flexible connection with the upper tube-section, and a locking mechanism carried by the sliding tube-section and adapted to engage with the stationary tube-section, shell E, carried by the sliding tube-section, and a stem or lever projecting from the bottom for operating the stops, substantially as set forth.

3. In a chandelier, the combination, with the stationary section provided with the rack E, and the sliding section provided with the toothed wheel H, of the locking-rod I, carrying the detent *i*, the levers K K, and the stem L', substantially as set forth.

258,105.

258,106. CHANDELIER. STEPHEN S. NEWTON, Binghamton, N. Y. Filed Dec. 27, 1881. (No model.)



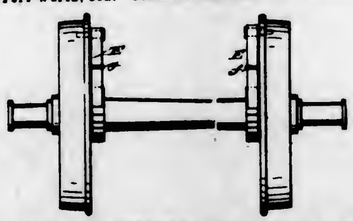
Claim.—1. The combination of the stationary tube-section, the sliding tube-section, the ratcheted spring-drum in the sliding tube-section, the frame G for supporting the drum, the thumb-piece projecting through the bottom of the sliding section, the cross-bar J, having detents to engage with the ratcheted drum, the U-shaped or forked yoke K, carrying said cross-bar J, and guides secured to the drum-frame to support the U-shaped yoke, substantially as set forth.

2. The combination of the upper stationary tube-section, the lower sliding tube-section, the cord connected at one end to the upper tube-section, the cord-winding mechanism supported in the lower tube-section, the frame G, the yoke K, carrying detent *f*, and the ratchet-teeth carried by the drum, substantially as set forth.

258,107. HARROW. PETER B. PASCHELL, Ashmore, Ill. Filed July 29, 1881. (Model.)

Claim.—The combination, with the rigid triangular harrow-frame, its pivoted teeth, and the bars G, to which the upper extremities of these teeth are pivoted, of the lever K, pivoted con-

258,107.



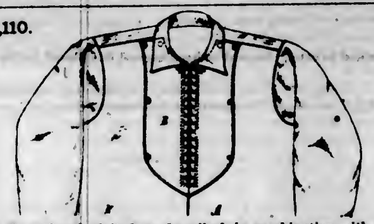
trally between the united bars of the said frame, the links I I, loosely connected to said lever and to the front ends of the bars G, the rod L, pivoted to the upper end of the lever K, the hand-lever M, having rod L pivoted to it, the centrally-arranged bar M', the cross-bars D D, the notched segment, and the locking-lever, all arranged in the manner substantially as described.

258,108. DECORATING GLASS, &c. ANDREW C. PAUL, Boston, and JOHN H. ROHDE, Somerville, Mass. Filed Sept. 12, 1881. (Specimens.)

Claim.—1. The within-described process of decorating glass, the same consisting in applying to the rear or inner surface of the glass, through the medium of an adhesive coating, a uniform backing of the within-described powdered or fragmentary mineral substances, substantially as and for the purpose described.

2. The process herein described of decorating glass, the same consisting in applying uniformly throughout the rear or inner surface of the glass, through the medium of a coating of adhesive substance, a backing of mineral substances, consisting essentially of powdered or fragmentary metallic chips or filings, silicious substances, glass, and sand, substantially as described.

258,109. CAR AXLE AND WHEEL. WILLIAM S. PRESLETON, Fort Worth, Tex. Filed Oct. 25, 1881. (No model.)



Claim.—The combination, with a car-axle having a fixed ratchet-wheel at each end, of wheels arranged loosely thereon, carrying spring-pawls E, and provided with the pins *f*, as and for the purpose specified.

258,110. SHIRT. ALBERT B. PERKINS, Newton, assignor to Simons, Hatch & Whitton, Boston, Mass. Filed Feb. 27, 1882. (No model.)

Claim.—1. A shirt-body, A, slit down the middle of its front from the neck to, or about to, the waist of such body, as described, in combination with two separate semi-fronts, B B, arranged with the slit *a* and sewed to the edges thereof, all being substantially as set forth.

2. A shirt-body slit down the middle of its front from the

258,110.

neck thereof and plaited, as described, in combination with two separate semi-fronts, arranged with the slit *a* and sewed to the edges thereof, all being substantially as set forth.

258,111. BRACELET. HENRY H. PERTHAM, Pawtucket, R. I. Filed Sept. 16, 1881. (No model.)

Brief.—The central plate is rigidly secured through its entire length to the band portion of the bracelet.

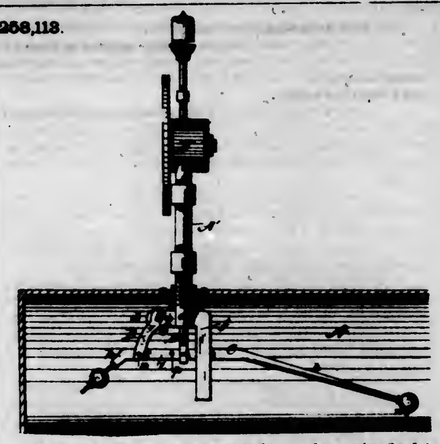
Claim.—1. The improved hand-bracelet herein described, consisting of a strip, A, of elastic material, and a box member, B, rigidly secured throughout its length to the exterior of the central portion of said strip and projecting above the same.

2. The strip or band A, having elastic end portions, combined with the box member B, rigidly secured throughout to the band, between its ends, substantially as shown and described.

258,112. HANDLE FOR POCKET-BOOKS, &c. CARL G. PFINGSTEN and EDWIN YOUNG, New York, N. Y., assignors to said Young. Filed Oct. 21, 1880. (No model.)

Claim.—1. The combination, with a book-holder, pocket-book, satchel, or similar article, of a handle pivoted to the book-holder, pocket-book, or similar article at its opposite ends, and adapted to swing beneath and be held in frictional contact with the lower edge thereof, substantially as and for the purpose shown and described.

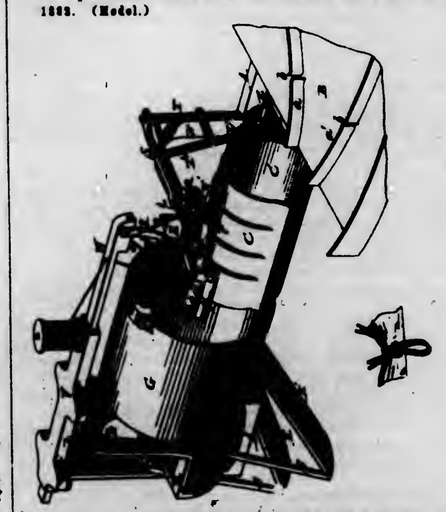
2. The combination, with the handle and with the book-holder, pocket-book, or other similar article, of two loops which engage with the handle and swivel in the ends of the book-holder or other article, substantially as and for the purpose set forth.



3. The combination, with the swivel-loops and with the book-holder or other article to which said swivel-loops are fastened, of a handle which is adapted to slide in said swivel-loops, substantially as and for the purpose described.

258,113. ATTACHMENT FOR STEAM-BOILERS. NAPOLEON B. PORTER, Charleston, W. Va., assignor of one-half to Delafield Du Bois, same place. Filed Jan. 28, 1882. (No model.)

Claim.—1. The combination, substantially as described, of the vertical tube or pipe A, the steam-chamber F, having an induction-port leading from the boiler and an eduction-port leading to the whistle, the peripheral ported valve I, arranged within the steam-chamber, and provided with connected actuating means, the indicating mechanism, the lever C, and the guiding and adjusting means, as set forth.



2. In an indicator for a steam-boiler, the combination, with a steam chamber having induction and eduction ports and a removable cap, of the actuated valve I, ported on the periphery, and the coil-spring *w*, surrounding the arbor of the valve, said parts being arranged within the steam-chamber, as shown and described.

258,113.

3. In an indicator for a steam-boiler, a tube or pipe fixed to the upper portion of the boiler and extending within the same, and formed with a side extension and a pin, in combination with a connected lever provided with a float at one end, and having pivotally-connected arms with notches, constituting, in connection with pin or side extension, an adjusting means for setting the position of the lever within the boiler, substantially as set forth.

258,114. GRAIN-BINDING MACHINE. JOHN R. PRESCOTT, Beaver Dam, Wis., assignor of one-half to Richard J. Andrews, same place, and Horace Foster, Sheldon, Ill. Filed Jan. 17, 1882. (Model.)

Claim.—1. In combination with a reaper, a grain bundling and compressing device composed of segmental sections C C', adapted and arranged to receive the grain at the end while closed, one of said sections being hinged to the other, and adapted to open to discharge the bundle, substantially as described.

2. In a reaper provided with a binding attachment, a grain-platform provided with curved guides *a a'*, approaching each other toward the delivery side of the platform, and provided with openings for the passage of the rake teeth or fingers, as set forth.

3. The compressor C, provided with hinged section C', in combination with lever F, connected with section C', and cam D, adapted to depress the lever, as explained.

4. In combination with the compressor, lever F and intermediate elastic section, F', connected with the hinged section C' in rear of its pivot.

5. In combination with the hinged compressor, section C', the operating-lever F F', and the chain connecting the section C' with the lever, as and for the purposes set forth.

6. In a grain-binder, the combination of a cylindrical compressor and an open-ended rotary cylinder adapted to receive and support the heads of the grain, and provided with a cord-carrying device, substantially as described, whereby it is adapted to pass the band about the bundle.

7. In combination with the compressor or bundle-former C, the open-ended rotary cylinder G, provided with a cord-holding device, and means, substantially such as described, for rotating the cylinder G alternately in reverse directions, as and for the purpose set forth.

8. In combination with the cylinder G, provided with a cord-holder and mounted upon a rock-shaft, straps or bands J, wound upon said shaft in reverse directions and attached respectively to levers K K', and cams L L', adapted and arranged to depress or actuate the levers alternately, substantially as set forth.

9. The herein-described method of binding grain, consisting in passing the band about the bundle of grain, then carrying the two strands of the band through an independent band of penetrable or perforated material and about the edge of the same, thereby introducing said material into the knot to prevent the slipping or drawing out thereof.

10. The method of securing the knots of grain-bands, consisting in introducing therein, substantially in the manner explained, an independent strip of material, through and around which the band is carried, as shown and described.

11. The cord-tying device for grain-binders, consisting of the pointed needle *f* and circular needle *n*, arranged and operating in connection with needle *f*, substantially as described.

12. In a grain-binding machine, the combination of a strip of penetrable or perforated material, a needle adapted and arranged to pass through said strip and to carry the strands of the band in the form of a loop through the same, and a second needle or finger operating substantially as described, whereby it serves to pass the outer ends of the strands through the loop.

13. In combination with the needle *f*, the steady-pin *e*, adapted and arranged to guide the needle and to hold the strip I' in place.

14. In combination with the rib or flange *d*, provided with the slot or opening *h*, the arm O, provided with needle *f*, and adapted and arranged to move straight out from the rib, and then to swing to one side to permit the placing of the strands of the band across the opening *h*, as explained.

15. In combination with the rib *d*, provided with hole *g* and slot or opening *h*, the arm O, provided with pin *e*, and needle *f*, adapted and arranged to move in a straight line from the rib and then to swing to one side, substantially as set forth.

16. The arm O, provided with needle *f*, and slotted as described, in combination with a stationary pin extending into said slot, and means for reciprocating the arm, whereby it is caused to move a given distance in a straight line, then to swing to one side, as set forth and shown.

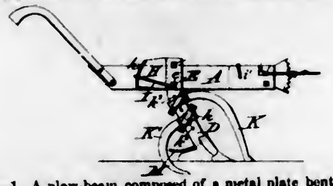
17. The combination, in a grain-binder, of the rib *d*, provided with slot or opening A, arm O, provided with needle *f*, bar S, and means, substantially as shown and described, for reciprocating said bar.

18. In a grain-binder, the combination of band-fastening mechanism, substantially such as shown and described, a sliding bar, W, connected with a feeding-dog, and provided with lugs or studs *k*, and cam-wheel M, working between said studs, as shown and described, whereby the bar is reciprocated and caused to actuate the feeding-dog to supply material to the feeding devices.

19. In combination with the needle or finger *n*, a pulley secured upon its shaft, and a band connected with the sliding bar W and passing about said pulley and about a second pulley in line therewith, whereby the needle or finger is rotated alternately in opposite directions.

20. In a grain-binder, the combination of a notched needle adapted to pass the strands of the band in the form of a loop through an interposed piece of material, and a circular finger or needle adapted and arranged to seize the strands above the loop and to carry them through the same, as set forth.

21. In combination with the notched needle *f* and slotted or recessed rib *d*, the notched circular finger or needle *n*, rotating in a plane at right angles to the movement of the needle *f*, whereby it is adapted to seize the ends of the strands and carry them through the loop formed by the needle *f*.



22. In combination with the needle *f* and circular needle or finger *n*, notched as described, a cord guide or eye located above and in line with opening *h*, and a cord-carrier arranged, substantially as described, to carry the second strand up to a position by the side of the strand coming from said eye or guide, whereby the strands are brought into position to be seized by the needle *f* and the finger or needle *n*.

23. In combination with the cylinder G, provided with the cord-carrier H, compressor C, and bed or plate N, projecting over the space between the cylinder and compressor, whereby it is adapted to catch the cord or band carried downward by the cord-carrier H.

24. The herein-described binding mechanism, consisting of needle *f*, arm O and its operating mechanism, circular finger or needle *n*, sliding bar W, cam M, strip P, and cord-carrier H, all combined and operating substantially as specified.

258,115. PLOW. ADDISON F. PURROY, Wake Forest, N. C. Filed Dec. 5, 1881. (Model.)

Brief.—The beam is of angle-iron, the horizontal base being narrowest. The standard clamp or staple has one arm passing over the beam, whereby it may rock with the standard when loosened in the arc-shaped recess. A sector-plate is bolted to the standard, which holds it at any pitch by the bent stop or bolt. The clevis-plate and beam have each an angular notch which register to insert the clevis-rod, when, by means of slots, the plate is moved forward, closing the slot. Provision is made to attach a depth-regulator with adjusting-grooves and various other implements to the standard.

Claim.—1. A plow-beam composed of a metal plate bent at its lower edge to form a flange, and provided with the angular slot *s'* and arc G, substantially as described.

2. The combination of a plow-beam, a standard attached to said beam by a pivot-bolt and clamp, as represented by E F, a toothed segment, H, fastened to said standard, and a stop-piece, I, for engaging the teeth of said segment, substantially as described.

3. The combination, with the plow-beam and standard pivoted thereto, of a toothed segment fastened to said standard and a separate stop-piece, I, adapted both to engage the teeth on said segment and to clamp the segment against the side of the beam, substantially as described.

4. The combination, with the plow-beam provided with the arc-shaped recess G, of the plow-standard attached to said beam by a pivot-bolt and clamp, E F, the part *f* of said clamp working in said recess, substantially as described.

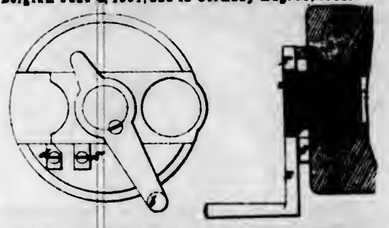
5. The means described for securing a colter, subsoiler, harrow, or other attachment to a plow-standard, comprising a bent attaching-plate, *k*, adapted to embrace the standard, a pin to enter holes in the said standard, and a double bolt for binding the whole together, substantially as described.

6. A depth-regulator comprising a shoe and an upright with oblique grooves, substantially as described.

7. The combination, with a plow and plow-standard, of a harrow attachment, K³, having the body *l* oblique to the attaching-plate *k* and secured in front of the standard, substantially as shown and described, so that the harrow-teeth are above and behind the point of the plow, substantially as described.

8. The combination, with a plow and plow-standard, of a harrow attachment, substantially as shown and described, secured in front of the plow-standard above the plow, so as to be vertically adjustable on said standard, as set forth.

9. The combination, with the flanged metal plate provided with notches in the flange, of the teeth, grooved and fitting within said notches, and bolts for holding the teeth in position, substantially as described.



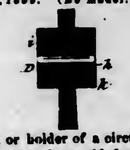
10. The combination, with a plow-beam, of a vertical toothed plate adjustably connected therewith, so as to be capable of a limited sliding movement lengthwise of said beam, and a detachable clevis provided with a toothed cross-bar, substantially as described.

11. A plow-beam having at the end an angular slot for securing the clevis, in combination with a plate, also slotted and capable of a limited movement lengthwise of the beam, so as to lock the clevis, substantially as described.

12. A clevis formed of a metal bar, bent and twisted, as shown, and provided with a toothed cross-bar, substantially as described.

13. The combination of a plow-beam made of a metal plate, bent at the bottom to form a flange, the vertical toothed plate bolted to the upright part of the beam, with its lower edge resting on said flange, and the clevis provided with a toothed cross-bar, said clevis being held in a slot in the beam, and said vertical toothed plate being capable of movement lengthwise of the beam, substantially as described.

258,116. BREECH-LOADING ORDNANCE. GEORGE QUICK, Chipping Camden, England. Filed Jan. 24, 1882. (No model.) Patented in England May 24, 1881, in France June 5, 1881, in Belgium June 6, 1881, and in Germany Aug. 30, 1881.

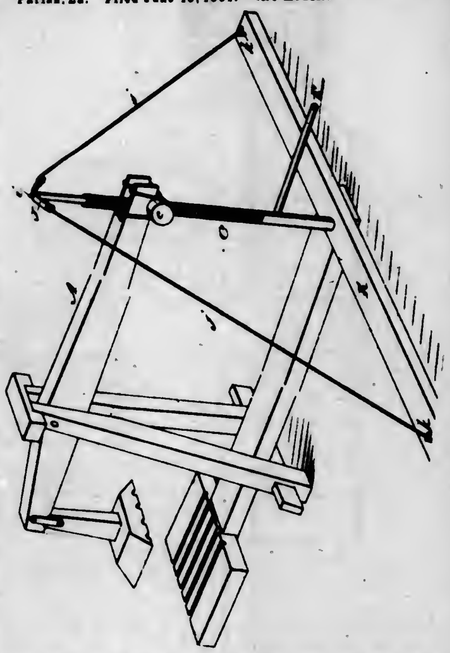


Claim.—1. The combination, with a gun having a horizontal open slideway extending transversely to the bore in the extreme breech of the gun, and provided upon its upper and lower sides with parallel grooves and lands, of a sliding carriage having corresponding lands and grooves fitted in said slideway, so as to leave a considerable space between said carriage and the powder-chamber, and having a loading-hole, and a breech-screw fitting in said carriage and adapted to be turned to close the powder-chamber, substantially as specified.

2. The combination, with the gun having a transverse slideway, the carriage fitting therein, and the breech-screw in said carriage, of an arm fixed upon the screw and a bearing or guide on the gun, with which said arm, or a pin or roller thereon, is adapted to engage to shift the carriage, substantially as specified.

3. The combination, with the gun having a transverse slideway in the breech, the sliding carriage, and the breech-screw fitting therein, of a gear-wheel fixed upon the screw, an arm, also fixed upon the screw and carrying a pin or roller, a pinion and lever or crank for turning said gear-wheel and screw, and a guide or lugs on the breech of the gun, with which said pin or roller may engage to shift the carriage, substantially as specified.

4. The combination, with a flared gas-check ring having a convex face and adapted to be flattened by the pressure of gas upon said convex face to expand it diametrically, of a breech-screw, in which said ring is secured, so as to leave a space between the ring and screw opposite the convex face, whereby provision is afforded for the flattening of the ring, substantially as and for the purpose described.



258,117. CIRCULAR BRUSH. BENJAMIN F. QUIMBY, Boston, Mass. Filed Jan. 24, 1882. (No model.)

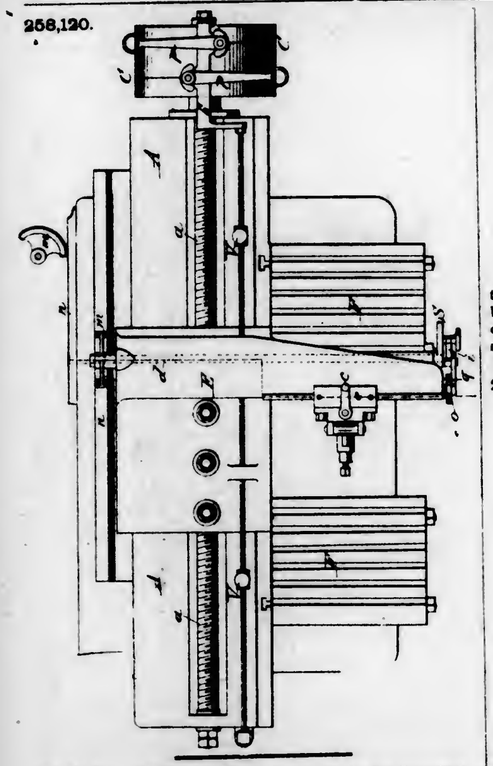
Claim.—1. A stock or holder of a circular brush, composed of two main or side portions, *i k*, provided with central openings, and united by a central tubular portion, *h*, formed integral with or separate from one of the side portions, in combination with a series of bunches of bristles or their substitutes interposed between the two side portions and secured in place by wire and glue or other adhesive substance directly upon the central tubular portion, *h*, the said two portions of the holder being without screw-threads, and their union consequently accomplished without screwing them together, and the employment of washers provided with a series of notches for holding the bunches being dispensed with, my said holder being constructed substantially as and for the purpose described.

2. The within-described method of making a circular brush for removing the inequalities in the surface of metallic or other articles, consisting first in bending or looping the bunches of bristles or their substitutes at their centers by passing them through perforations in a plate and through tubes B, inserted in said perforations, then removing the bunches from the plate with their tubes B surrounding them, then stringing the bunches on a wire and arranging them radially upon and around a central tubular portion of the holder D, and securing them thereto by wire and glue or other adhesive substance, next slipping the portion *k* of the holder over the tubular portion *h*, then removing the tubes B, which confine the bunches, then spreading the ends of the bristles or their substitutes so as to form a continuous brush having no intervals at its periphery, and finally applying pressure to securely and permanently unite the whole, as and for the purpose specified.

258,118. COTTON-PRESS. LEWIS F. B. REESELDS, Claiborne Parish, La. Filed June 18, 1881. (No model.)

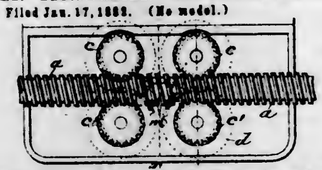
Claim.—In a cotton-press, the combination, with the main lever A and the screw-block *c*, of the vertical screw-shaft C, made conical at *i*, the collar J, secured at its middle upon the end of said screw, and the ropes *j j*, connecting said collar with the sill K, as shown and described.

258,119. MODE OF PLATING IRON OR STEEL. HERMANN RUDOLPH, Dillingen-on-the-Saar, Prussia, Germany. Filed Oct. 13, 1881. (No specimens.) Patented in France Sept. 20, 1881, No. 145,070; in England Oct. 13, 1881, No. 4,444; in Luxemburg Oct. 13, 1881, No. 164; and in Belgium Oct. 13, 1881, No. 55,966.



Claim.—The process of plating iron or steel with such metals or alloys of metals as can be drawn or rolled at a red heat, or the plating of the latter with one another, which consists in first applying to the surface or surfaces to be plated a metallic chloride vaporizable at a red heat, then covering the surface or surfaces so treated with tin-foil and applying the metal with which said surface or surfaces are to be plated, and heating the same to a red heat, and finally passing the heated metals between cold rolls, substantially as and for the purpose specified.

258,120. METAL-PLANING MACHINE. JOHN RICHARDS, San Francisco, Cal. Filed July 13, 1881. (No model.)



Claim.—1. In a metal-planing machine, the combination, with the frame A and carriage B, mounted thereon, and provided with screw *b* and tool-holder *c*, of the shaft *d*, having a quadrant, *m*, adapted to rock on an arm, *n*, attached to the main frame, at each reciprocation of the carriage, and suitable mechanism for transmitting motion from the shaft *d* to the screw *b*, whereby a transverse feed is imparted to the tool-holder, substantially as shown and described.

2. In a metal-planing machine, the combination of the frame A, carriage B, mounted thereon, and provided with arm or bracket E, longitudinal screw *a*, arranged to engage with the carriage, and provided with pulleys C C, tool-holder *c*, adapted to slide on the arm of the carriage, transverse screw *b*, for actuating said tool-holder, shaft *d*, having a quadrant, *m*, adapted to rock on an arm, *n*, attached to the frame, and the rocker-arm S, link *i*, pawl *o*, and ratchet-wheel *q*, for imparting motion to the screw *b* and regulating its speed, whereby the cutting-tool is adapted to receive a transverse feed during the longitudinal reciprocation of the carriage, substantially as shown and described.

258,120.

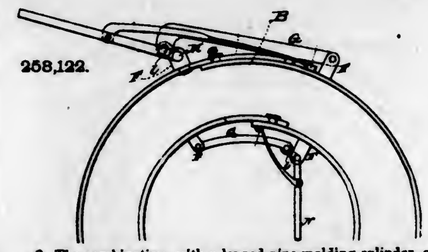
258,121. ENGINE-LATHE. JOHN RICHARDS, San Francisco, Cal. Filed Jan. 17, 1882. (No model.)

Claim.—1. In combination with the carriage of an engine-lathe, two or more tangent-wheels meshing into the lead-screw, substantially as shown and described.

2. In combination with the carriage of an engine-lathe, two or more tangent-wheels connected by spur-wheels, substantially as shown and described.

3. In combination with an engine-lathe carriage, an outer and inner train of gearing, connected and operating substantially as shown and described.

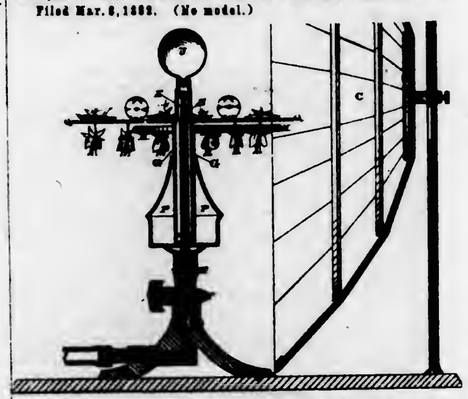
4. In combination with the carriage of an engine-lathe, two or more tangent-wheels connected with friction devices for retarding or arresting their motion, substantially as shown and described.



5. In combination with the carriage of an engine-lathe, a train of connected spur and tangent wheels and a friction-clutch, substantially as shown and described.

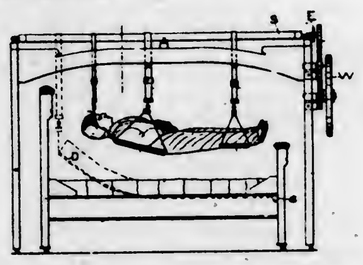
6. In an engine-lathe, the combination, with the carriage C, apron B, and lead-screw *a*, of the tangent gear-wheels *c c'*, meshing with said screw, and provided with shafts *i i*, carrying spur-wheels *d d*, the pinion *m*, gearing with the lower pair of spur-wheels, and provided with flange *n*, and the hand-wheel *f* and nut *g*, substantially as shown and described.

258,122. PIPE-MOLD. LEVI RICHARDSON and FRANK J. MEYLETON, San Gabriel, Cal. Filed Mar. 11, 1882. (No model.)



Claim.—1. The lapped pipe-molding cylinder having stud-and-slot connections in the lapped portion, bearing-lugs F, the rock-shaft M, its arms *l*, and the connecting-bars pivoted to the bearing-lugs on one side of the lap and to the arms of the rock-shaft on the other side, substantially as specified.

258,122.



2. The combination, with a lapped pipe-molding cylinder, of the bearing-lugs F, the rock-shaft M, its arms *l*, the connecting-bars pivoted to the bearing-lugs and to the arms of the rock-shaft on opposite sides of the lap, the lever-arm N, and the stop devices, substantially as specified.

258,123. SHOW-STAND. GILES S. ROATH, Greenville, Conn. Filed Mar. 6, 1882. (No model.)

Claim.—In a show-stand, the combination of a concavo-convex mirror, C, a gas-pipe provided with a revolving top, G, and suitable jets, H, for causing the top and the table Q, attached thereto, to revolve, the table being adapted to hold ornamental objects to be reflected in the mirror, substantially as shown.

258,124. APPARATUS FOR LIFTING AND TURNING INVALIDS. GEORGE W. ROBBINS, Fall River, Mass. Filed Feb. 17, 1882. (No model.)

Claim.—1. In a lifting apparatus, one or more slings, each sling having a yoke, to the ends of which a rest is secured by cords having the adjustable fastening T X, substantially as and for the purpose set forth.

2. A sling for a lifting apparatus, having a yoke, K, in combination with a rest, H', provided with rods *s* at its extremities, said rods being connected by detachable cords I with the yoke, substantially as and for the purposes described.

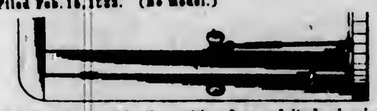
3. In a lifting apparatus, a sling having a yoke provided with cords I and I', in combination with a rest, H', provided with rods *s* at its extremities, and a central rod, *s'*, substantially as set forth and described.

4. In the lifting apparatus, the strip D, connected with the bedstead at or near the foot, said strip passing under the mattress, as shown, and having one end connected with shaft S, substantially as and for the purpose set forth.

5. In a lifting apparatus for invalids, in combination with the horizontal shaft operated by means of the hand-wheel W, one or more slings connected with the shaft and provided with yokes having rests detachably secured thereto, as herein set forth and described.

258,125. MECHANICAL MOVEMENT. CHARLES H. ROBERTS, Evansville, Ind. Filed Feb. 18, 1882. (No model.)

Claim.—1. The combination of the cross-head B and rods A and C with the shaft F, crank E, pin *e'*, and block D, substantially as described.



2. The combination of the cross-head B, strap H, and guide-rod G with the shaft F, crank E, pin *e'*, and block D, substantially as described.

258,126. HAND-STAMP. ARTHUR H. ROGERS, Springfield, Mass. Filed May 16, 1881. (No model.)

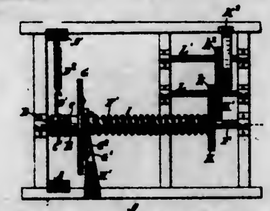
Claim.—A hand-stamp composed of a series of separate printing-characters, *a*, each having two perforations, *a'*, coinciding with those in the other characters, and two composing-rods, *b b*, of rigid unyielding material, passing through said perforations and holding the blocks together, substantially as set forth.

258,127. DOOR-CHECK. JOHN E. ROSENTHAL, St. Louis, Mo. Filed Feb. 16, 1882. (No model.)

Claim.—The combination, with a door and its knob-spindle, of the cam check or stop connected by a rod and lever or arm to the knob-spindle, substantially as and for the purpose set forth.

258,128. HAIR-FASTENER. BENJAMIN P. EVENS, Somerville, assignor of three-fourths to Charles P. Coffin, Boston, Mass. Filed Aug. 2, 1881. (No model.)

Claim.—1. In a hair-fastener, a catch having two or more hooks made in one piece, as shown and described.



2. The combination, in a hair-fastener, of a catch having two or more hooks in one piece, with an elastic cord or braid, as and for the purpose before described.

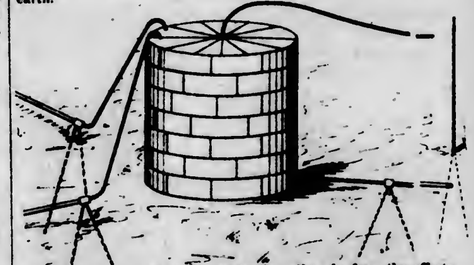
258,129. DEVICE FOR CONVERTING MOTION. WILLIAM H. RYDER, Northville, assignor of one-half to Clark & Co., Somonauk, Ill. Filed Feb. 18, 1881. Renewed Mar. 15, 1882. (No model.)

Claim.—1. In machinery for converting motion, a shaft arranged to turn in bearings, a wheel loosely mounted on the shaft, mechanism connecting the wheel with a reciprocating pitman, and a coiled spring surrounding the shaft, and fastened to it at one end and to the wheel at the other, all in combination, substantially as and for the purpose described.

2. The revolving shaft F, wheel H, loosely mounted thereon, reciprocating pitman B, mechanism connecting the pitman with

258,129.

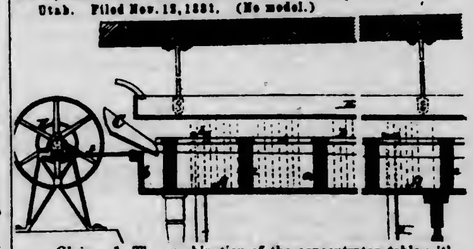
the wheel, sleeve F', arranged on the shaft, as described, and coiled spring I, surrounding the sleeve, and fastened at one end to the wheel H and at the other to the shaft, all in combination, substantially as and for the purpose described.



3. The pitman B, shaft F, drum E, loosely mounted on F, cord D, connecting F and E, and cord D' and spring D^4, connecting E with a fixed point, all in combination, substantially as and for the purpose described.

4. The shaft F, revolving drum E, loosely mounted thereon, flexibly connected with a reciprocating pitman and provided with a device for turning it back when the pull of the pitman ceases, wheel G, provided with the pawl G' and the spring G^3, ratchet-wheel H, mounted on the shaft F, and pawl H', all constructed, arranged, and operating in combination, substantially as and for the purpose described.

5. The pitman B, slotted at its lower end and perforated at b^1, in combination with the connecting-bar C, arranged to pass through the slot, pivoted in the lower end thereof, perforated at *c'*, and provided with the notch *c*, substantially as and for the purpose described.



258,130. MEANS FOR PROTECTING OIL-TANKS FROM LIGHTNING. FREDERIC G. SACKET, Knox, Pa. Filed Aug. 3, 1880. (No model.)

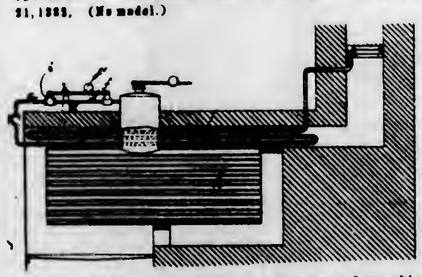
Brief.—The pipe-connections are insulated at a point near the tank and provided with conductors extending down into the earth.

Claim.—As a means for protecting oil-tanks from the effects of lightning, a pipe for conveying the oil into the tank, insulated at a point near the tank, and provided with a suitable conductor or conductors, whereby the electric fluid is arrested and conveyed away, substantially as shown and described.

258,131. ORE-CONCENTRATOR. JOHN F. HANBURG, Ogden, Utah. Filed Nov. 18, 1881. (No model.)

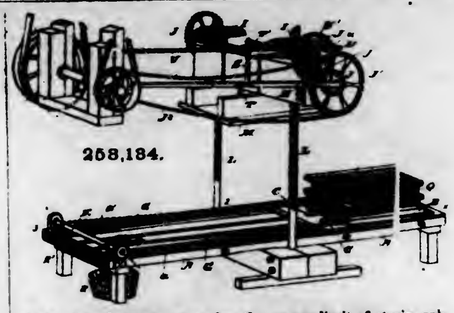
Claim.—1. The combination of the concentrator-table with mechanism *f F*, for moving it longitudinally, and with the rake D and mechanism A H, for moving said rake laterally, substantially as herein shown and described.

2. The concentrator-table A, combined with rake D, mechanism for moving said rake laterally and said table longitudinally, frame I, and perforated trough E, substantially as herein shown and described.



258,132. WINDOW-AWNING. JESSE SANDS, New Haven, Conn., assignor of one-half to Charles T. Ward, same place. Filed Apr. 8, 1882. (No model.)

Claim.—1. The herein-described awning-frame, consisting of the combination of the staff A, made adjustable as to length, the runner D, the ribs *e e*, hinged to the staff at its upper end and extending to the lower front angles, with braces from said ribs to the runner, and braces *i i*, extending from the runner to the upper angles, *l*, and a device, substantially such as described, to lock the runner in its lifted or open position, substantially as described.



2. The herein-described awning-frame, consisting of the combination of the staff A, made adjustable as to length, the runner D, the ribs *e e*, hinged to the staff at its upper end and extending to the lower front angles, with braces from said ribs to the runner, and braces *i i*, extending from the runner to the upper angles, *l*, and a device, substantially such as described, to lock the runner in its lifted or open position, with the rod F hung to the runner and adjustable as to length, substantially as described.

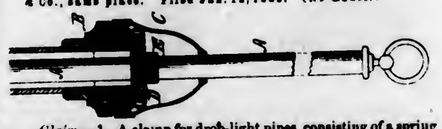
258,133. APPARATUS FOR INCREASING THE DRAFT OF CHIMNEYS. JOHN C. SCHAEFER, New York, N. Y., assignor of two-thirds to Klausmann & Mayer, same place. Filed Feb. 21, 1882. (No model.)

Claim.—The combination, with the boiler, steam-dome, chimney, and superheating-coil *b*, arranged above the boiler and connected at one end by a pipe, *a*, with the steam-dome and at the other with a steam-nozzle in the chimney, of the automatic regulator E, connected with the pipe *a* between the steam-dome and superheating-coil, and composed essentially of the pivoted lever *g* and valves *i* and *f*, connected with the ends of the lever, substantially as and for the purposes described.

258,134. CIDER AND WINE PRESS. MARCUS P. SCHENCK, Fulton, N. Y. Filed Oct. 15, 1881. (No model.)

Claim.—1. In combination with a cider-press, the double or extension platform A, provided with a sliding rack or carriage, B, for shifting the cheese from the place where it is laid up to the place of pressing, substantially as set forth.

2. The traveling rack or carriage B, traveling on ways C C, elevating it above the bed for draining and giving it a firm bearing thereon for pressing, substantially as described.



3. In a cider-press, a double or extension platform adapted for the laying up of a cheese at one point and the pressing thereof at another point, and with cleats *a a' a²*, and separate discharge-openings *r r'*, for delivering the juice into different receptacles.

4. The combination of the beam H, follower M, push-rods T T', lever S, alarm-bar U, and tappet-wheel J *j*, for sounding an alarm when the press approaches the proper limit of strain, substantially as set forth.

5. The combination, with a cider-press, of the automatic belt-shifting device for throwing the driving mechanism out of gear by the springing of the follower when the press reaches the proper limit of strain.

6. In a cider-press, the combination of a moving beam, H, and a counter-shaft, K, the latter running in swinging hangers K' and connected to the beam and its gearing by a strut, K³, and driving-chain J³, so that an equal tension of the said chain will be maintained in different positions of the beam.

258,135. DROP-LIGHT PIPE FOR CHANDELIERS. GEORGE P. SCHMUCKER, Philadelphia, Pa., assignor to W. J. Buck, Son & Co., same place. Filed Jan. 12, 1882. (No model.)

Claim.—1. A clamp for drop-light pipes, consisting of a spring collar or ring encircling said pipe, and located in a box or shell, with its longitudinal axis horizontal and transverse to the like axis of the sliding pipe, substantially as shown and described.

2. The combination, with sliding pipe A, of encircling spiral spring D, whose longitudinal axis is transverse to that of the pipe, and shell C, with threaded cap or nut B, adapted and designed to compress and flatten the coils of said spring, and thereby increase the pressure of the clamping-collar on the pipe, substantially as shown and described.

3. The combination, with sliding pipe A and encircling spiral spring D, having its longitudinal axis transverse to the like axis of said pipe, of the soft packing E, interposed between said spring and pipe to protect the latter from abrasion, as set forth.

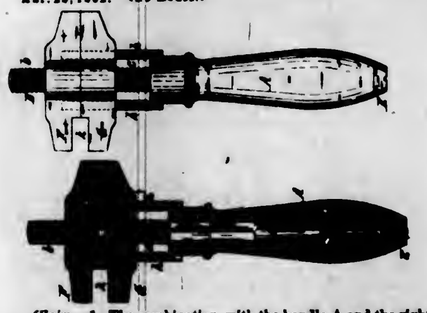
258,136. ELECTRIC GAS-LIGHTER. WILSON D. SCHOOLEY, Richmond, Ind. Filed Apr. 4, 1882. (No model.)

Claim.—1. The combination, with the gas-tube M, of the valve F, carried by the arm *f'*, having cam *f*, the lever G, arranged to act upon said cam, the armature arranged to actuate said lever, and the magnet arranged to control said armature, substantially as specified.

2. In an apparatus for turning on and off the supply of gas to a burner, the casing having two compartments, one of which is a gas-chamber connected with a burner and divided from the other chamber by a gas-tight partition, in combination with a gas-supply passage opening into said gas-chamber, a gas-valve located in said chamber and arranged to open and close said passage, an armature arranged also in said gas-chamber to operate said valve, and an electro-magnet arranged in the other chamber, and having its poles projecting into the gas-chamber through the partition for operating said armature, substantially as described.

3. The casing having two compartments, the upper of which is divided from the lower by a gas-tight partition, the upper compartment containing the gas-valve and the lower compartment containing an electro-magnet for operating said valve, the bottom plate of said lower compartment having the core or cores of the electro-magnet secured directly thereto, substantially as described.

4. The casing having the two chambers inclosing the parts of the apparatus and composed of the separable sections, combined with a gas-tight partition, substantially as described.



5. The combination, with the casing having the bottom B, supporting the binding-posts, of the cup-plate R, having passages for said posts, substantially as described.

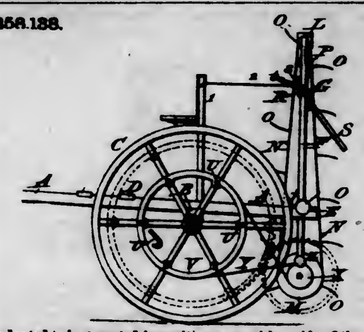
258,136.

6. The combination, with the gas-tube M, of the valve F, carried by arm *f'*, the lever G, arranged to act upon said arm, the adjustable armature arranged to actuate said lever, and the magnet arranged to control said armature, substantially as described.

258,137. WRENCH. JOSEPH SCHWEGLER, Buffalo, N. Y., assignor of one-half to Isidor Schwegler, same place. Filed Mar. 25, 1882. (No model.)

Claim.—1. The combination, with the handle A and the right and left hand screw B, secured thereto, of the jaws F G, provided with screw-threaded openings, through which the right and left hand portions *b* and *c* of the screw B work, and means whereby both jaws are retained parallel with each other, but permitted to move simultaneously toward and from each other, substantially as set forth.

2. The combination, with the handle A and right and left hand screw B, secured thereto, of the jaws F G, provided with screw-threaded openings, through which the right and left hand portions *b* and *c* of the screw B work, and guide-rods A, secured to one of the jaws F and passing through openings in the other jaw, substantially as set forth.



258,138. COMBINED HAY TEDDER AND LOADER. HAMILTON L. SHIELDS, Troy, N. Y. Filed Nov. 28, 1881. (No model.)

Claim.—1. In combination with the pieces A, extending rearward beyond the ground-wheels and provided in their top rear ends with recesses E, the bar H, with trunnioned ends removably secured in said recesses E, and uprights F of the elevator-frame, removably secured to the bar H, as and for the purposes hereinbefore described.

2. In combination with the pieces A, the elevator-frame composed of cross-bar H, which supports the entire elevator-frame, side vertical bars, F, adjustably secured to said bar H, cross-bars G I², and diagonal braces I, substantially as and for the purposes described.

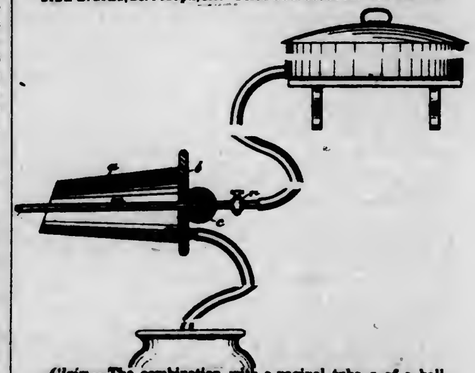
3. In combination with the cross-bar G of the elevator-frame, provided with a series of inclined holes therein, the deflector-blades S, placed in pairs adjacent to the toothed bands O, and adapted to be inserted in position upon either side of the cross-bar, for the purposes specified.

258,138.

4. In combination with the toothed bands, the top roller made with flat parallel faces or square in cross-section, and with circumferential grooves, substantially as hereinbefore described, for the purposes specified.

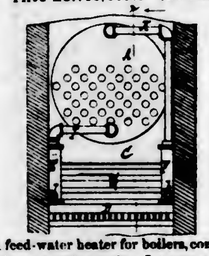
5. The elevating mechanism consisting of frame F G, supporting-bar H, top square roller, L, bottom large cylinder, M, and endless forked belts N O, substantially as and for the purposes described.

6. In combination with the frame A and axle B, the dividing-board I, for supporting the driver's seat, and, in connection with removable hooked braces 2, holding the top end of the elevating-frame in position, as hereinbefore described.



7. In combination with the ground-wheels C, the large grooved wheel V, removably secured to said ground-wheels, smaller grooved wheel X upon the lower cylinder, cord Y, and small grooved pulley Z, whose flanges overhang the edges of the pulley X at the point of contact therewith, substantially as and for the purposes described.

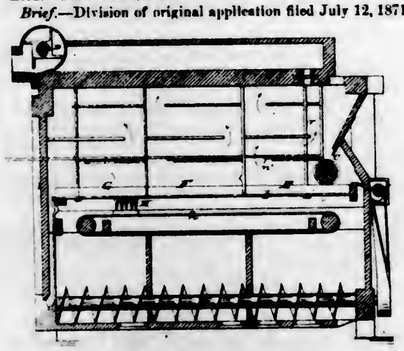
258,139. TRACE-CARRIER. HYRON B. SIMMONS, Rocky Ridge, Ohio, assignor of one-half to Allen S. McPherson, same place. Filed Mar. 23, 1882. (No model.)



Claim.—In a trace-carrier, the plate A, provided with loops B, C, D, and D', the hooks E E, spring F, and guards G G, substantially as described, and for the purposes set forth.

258,140. INSTRUMENT FOR WASHING THE VAGINA. WILLIAM B. SIMS, St. Joseph, Ill. Filed Feb. 15, 1882. (No model.)

Claim.—The combination, with a vaginal tube, *a*, of a ball-and-socket joint, *b c*, secured to the cover of said tube, and an adjustable delivery-tube, *x*, passing through the ball-and-socket joint, substantially as described, and for the purpose set forth.



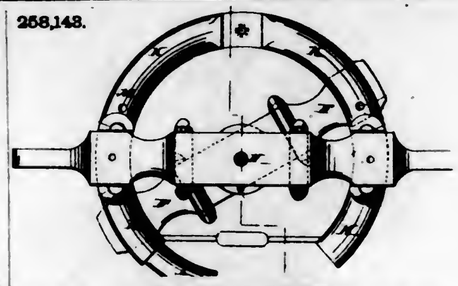
258,141. FEED-WATER HEATER. GEORGE W. SLOANE, Green Point, N. Y. Filed Mar. 16, 1882. (No model.)

Claim.—A feed-water heater for boilers, composed of the drum E, having at its lower portion a pipe, J, to connect it with a source of feed-water supply, and at its upper portion with a pipe, I, connecting said drum with the water-space of the boiler, a drum, E, having a pipe, K, connecting it with the boiler above the water-line thereof, and a tier of pipes connected with the drums and extending along the sides and rear of the fire-chamber, said members being combined and arranged for operation substantially as shown and described

258,142. MIDDLINGS-PURIFIER. GEORGE T. SMITH, Jackson, Mich. Filed Jan. 4, 1873.

Brief.—Division of original application filed July 12, 1871.

Claim.—1. In a middlings-purifier, a vibrating screen the cloth of which is formed in sections of increasing coarseness of mesh, and which is provided with supports for the cloth intermediate between its edges to maintain the cloth in plane, substantially as set forth.



2. In a middlings-purifier, a vibrating screen the cloth of which is formed in increasing coarseness of mesh, and which is provided with supports for the cloth intermediate between its edges to maintain the cloth in plane, in combination with a casing forming a wind-trunk, extending from the fan-case to the screen, so as to direct a current of air put in motion by the fan through the entire extent of the screen, whereby the middlings, if fed uniformly across the head of the screen, are subjected to the action of atmospheric currents substantially uniformly across the entire width of the cloth, and which increase in force as the meshes become coarser and coarser and the particles of middlings upon the screen become relatively coarser, substantially as set forth.

3. In a middlings-purifier, a vibrating screen the cloth of which is formed in sections of increasing coarseness of mesh, and which is provided with supports for the cloth intermediate between its edges to maintain the sections of cloth in plane, in combination with a casing which forms a continuous wind-trunk, extending from the fan-case to the screen, so as to direct a current of air put in motion by the fan through the entire extent of the screen, and a cloth-cleaner acting against the surface of the screen for keeping its meshes open, substantially as set forth.

258,143. FIFTH-WHEEL FOR VEHICLES. GROSSE W. SMITH, Darlington, Wis. Filed Nov. 11, 1881. (Model.)

Claim.—The center plates, B F, the former connected with head-block and the latter with axle, in combination with a king-bolt, H, having its head fitted in a square recess of plate F, the circle I, fitting cross-grooves of said plate, and the circle K, overlapping the sides of circle I, as shown and described.

258,143.

258,144. WATER-CLOSET. ROBERT D. O. SMITH, Washington, D. C. Filed Aug. 1, 1881. (No model.)

Brief.—A reservoir, L, contains the water, which is admitted to the bowl through the shell C. Running lengthwise of this shell is the valve-stem E, which is operated by the weight of the occupant by means of the rock-shaft and lever F.

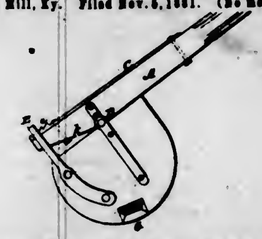
Claim.—1. In a water-closet or other similar receptacle, a water-connection wherein the devices for operating the valve are entirely within the water-way, with the valve-stem projecting therefrom into the hopper and actuated from within the hopper itself, substantially as set forth.

2. A valve, D, in the service-pipe, combined with a controlling-stem, E, entirely within the water-way, and a lever, F, within the hopper to engage with and actuate said stem, and mechanism whereby said lever F may be actuated, substantially as set forth.

3. In a water-closet or other receptacle, the combination of a stem entirely within the water-way and actuating mechanism within the bowl, and a water-connection provided with a valve, D, and a valve, m, both mounted on and simultaneously operated by the same stem, and an intermediate reservoir exterior to the closet, as set forth.

4. In a water-closet or other similar receptacle, a water-connection provided with valve D, combined with a valve, M, and an intermediate reservoir, closed at its top to form an air-chamber, and an air-valve which may be placed more or less near the top, substantially as and for the purpose set forth.

5. In a water-closet or other similar receptacle, a service-pipe provided with a valve, D, a valve, M, provided with a chamber, O, and a valve-stem, E, common to both of said valves, combined with a reservoir, L, intermediate between said valves, and a lever, F, actuated by suitable mechanism, as set forth.



6. In a water-closet or other similar receptacle, a water-service pipe provided with a valve, D, and its operative stem located entirely within the water-way, combined with the compound lever, whereof one member, F, is within the hopper A and the other member is outside of the same.

7. In a water-closet or other similar receptacle, a water-service pipe provided with a valve, N, and a valve, M, and a connecting operative device combined with a reservoir, L, intermediate as to said valves, and an air-valve, D, at the lower end of a tube de-

pending in said reservoir, whereby the air-compression may be modified, as set forth.

8. A valve-stem having the valves D and M, controlled by said stem, and an interposed reservoir, L, combined with the lever T, to engage with and actuate said stem at one extremity of the rock-shaft W and the lever Y at the other extremity, and coupled therewith the lever G, depressed by the weight of the user to operate said valves, as set forth.

258,145. SPROUT-PULLING MACHINE. STEPHEN C. SMITH, Poole's Hill, Ky. Filed Nov. 5, 1881. (No model.)

Claim.—1. The combination, with the lever A, provided with the bevel *b* and plate C, having notches *c* on its lower end, of the segmental block B, eccentrically pivoted to the lever A, and arm E, secured to the segmental block, and provided at its upper end with the right-angular jaw h, serrated on its under surface, substantially as described, and for the purpose set forth.

2. The combination of the beveled lever A, provided with the plate C, having notches *c*, segmental block B, eccentrically hinged to the lever, block G, let into the lower edge of the segmental block, guide F, projecting above the segmental block, and arm E, provided with the serrated jaw h, substantially as described, and for the purpose set forth.

258,146. GYMNASTIC APPARATUS. WILLIAM A. SMITH, Wilmington, Del. Filed Mar. 21, 1882. (No model.)

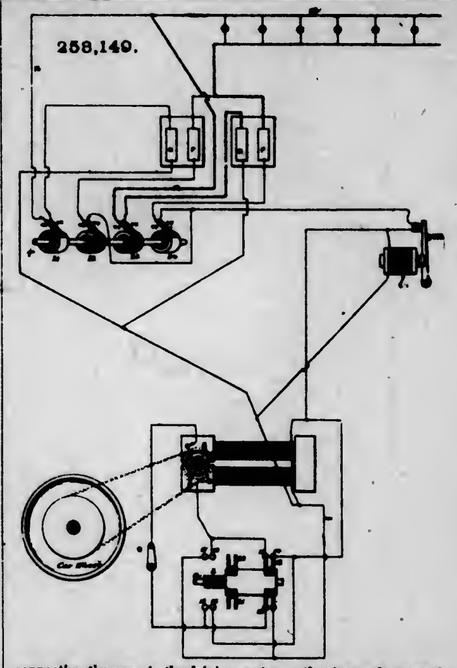
Claim.—1. A portable gymnastic or exercising apparatus consisting of two vertical bars, A A, having their upper ends provided with spurs B and their lower ends formed into hooks *a*, a horizontal connecting-brace, D, and a horizontal exercising-bar, C, substantially as herein described.

2. The combination, with the vertical bars A A, of the horizontal connecting-brace D, consisting of two bars having their outer ends pivoted to said bars A and their inner ends pivoted to each other, substantially as herein described.

258,147. DRESSING HOGS. JOSEPH H. SMITHSON, Chicago, Ill. Filed Feb. 28, 1882. (No model.)

Claim.—The within-described mode of treating the carcass of the hog, the same consisting in first scalding the carcass with hot water and scraping off the bristles, then singeing, and then scraping to remove the hair and outer cuticle, substantially as set forth.

258,148. BELT-FASTENER. WILLIAM H. SPEIL, Battersea, County of Surrey, England. Filed Nov. 13, 1882. (No model.)



Claim.—A belt-fastening consisting of a series of staples provided with a transverse strip of leather secured thereon as shown, said strip adapted to lie between the ends of the belt and the staples to pass through the ends of the belt, all substantially as set forth, for the purpose described.

258,149. LIGHTING CARS BY ELECTRICITY. WILLIAM A. STEDE and HENRY H. BYLLESBY, New York, N. Y., assignors of one-half to Thomas A. Edison, Menlo Park, N. J. Filed Jan. 16, 1882. (No model.)

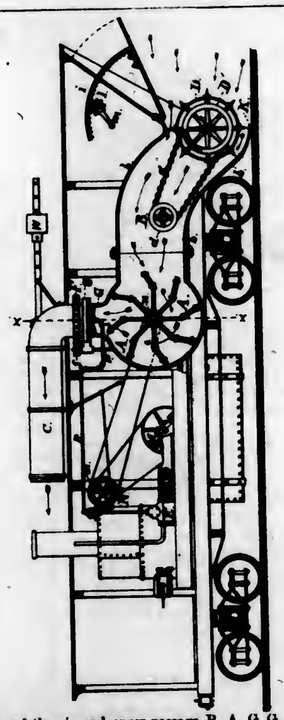
Claim.—1. The combination, in an apparatus for developing electric currents, of a dynamo-electric generator, mechanism for

258,149.

connecting the same to the driving-motor, so that it may be rotated thereby in either one direction or the other, an automatic circuit-changer operated by the shaft of the dynamo-generator, and the circuit-connections, substantially as specified, whereby the current is caused to pass in the same direction through the field-helices regardless of the direction of rotation of the armature and its helices, substantially as set forth.

2. The combination, with the armature and field-helices, of the nut and screw on the armature-shaft, and the circuit-closing springs and contact-points, brought into action in opposite directions by the movement of the nut and the circuit-connections to the field-helices, substantially as set forth, whereby the direction of current in the field-helices is not reversed when the direction of rotation of the armature is reversed, as set forth.

3. The combination, in an apparatus for lighting cars by electricity, of a dynamo-generator, means for revolving the armature thereof by a connection to the wheels or axle, automatic circuit-changing devices between the field-magnets and the armature, storage-batteries, circuit-changers between the lights, the storage-batteries, and the dynamo-generator, and an electro-magnetic circuit-breaker between the storage-batteries and the dynamo-generator, substantially as and for the purposes specified.



4. The circuit-reversing apparatus consisting of the wheels 31, 32, 33, and 34, composed of conducting and non-conducting material, the pairs of springs bearing on each wheel, and the shaft carrying each wheels and means for revolving each shaft, the dynamo-generators, storage-batteries, and lights or other working apparatus, and the circuit-connections to the same, for the purposes and substantially as set forth.

258,150. MACHINE FOR REMOVING SNOW FROM RAILROAD-TRACKS. HENRY T. STOCK, Toledo, Ohio. Filed Nov. 23, 1881. (No model.)

Brief.—In an air or snow passage secured to a car or truck is placed a steam-jet pipe connected to a boiler in the line of the snow-conduit, and a double fan on a single shaft is operated by a belt passing over a sheave connected with suitable motive power, both fan and steam-jet operating to force a blast through the air and snow conduit. The inlet pipe or conduit consists of a flaring or funnel-shaped mouth having converging sides, in which is secured a rotating cylindrical toothed rack. The outlet-passage consists of a horizontally-rotating pipe provided with a counter-weight. To the front of the machine is hinged an adjustable gate or guide.

Claim.—1. In a machine for removing snow from roads and ways by pneumatic force, the steam-pipe a, in combination with

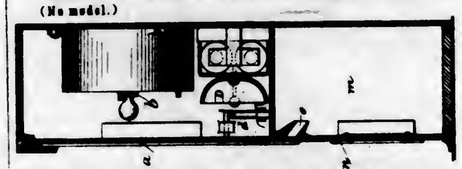
268,150.

the fan A and the air and snow passage B, A, G G, and C, substantially as shown and described, for the purposes specified.

2. In a machine for removing snow from tracks and ways by pneumatic force, the combination of steam-pipe *p* with the air and snow passage B, A, G G, and C, substantially as shown and described, for the purposes specified.

3. The combination of the steam-pipe *p*, fan A, inlet B *b b*, having flaring or funnel-like mouth, with converging sides, horizontally-rotating pipe C, and toothed skeleton cylinder D, substantially as shown, for the purposes specified.

268,151. SPRING-GEAR FOR VEHICLES. CASPER F. STERR, Pinckney, Mich. Filed July 26, 1881. Renewed Mar. 23, 1882. (No model.)



Claim.—1. In a spring-gear for vehicles, the combination, with longitudinal springs extending from the rear axle to the forward end of the vehicle, of a U-shaped spring having its extremities connected to the longitudinal springs and its central portion attached to the bolster, and a similar U-spring having its extremities connected with the longitudinal spring and its middle point attached to the rear axle, substantially as described.

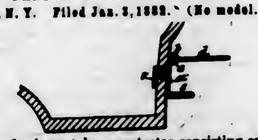
2. In a spring-gear for vehicles, the combination, with longitudinal springs extending from the rear axle forward to the front of the vehicle, of a U-shaped spring having its arms connected with the longitudinal springs between the axles and its middle portion attached to the rear axle, substantially as described.

3. In a spring-gear for vehicles, the combination, with longitudinal springs extending from the rear axle forward to the front of the vehicle, of a U-shaped spring having its extremities connected with the longitudinal springs between the axles, and its middle point attached to the bolster, substantially as described.

4. A spring-gear for vehicles, consisting of two parallel longitudinal springs extending from the rear axle to a cross-bar beneath the forward axle, cross-pieces E E', the U-springs F, and stay-bars G, substantially as described.

268,152. TELEGRAPH AND MESSENGER SERVICE BOX. CHARLES M. TALBOT, New York, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—The combination, in a box for telegraphic messenger service, of an electric calling device, *b*, within the box, a receptacle, *m*, for a message, a separate door, *n*, for said receptacle *m*, an opening, *o*, in the case, through which the message or card is passed into the receptacle *m*, and a door, *a*, that gives access to the electric calling device, and also covers the opening *o* when shut, substantially as set forth.



268,153. SEEDING-MACHINE AND FERTILIZER-DISTRIBUTER. CHARLES H. THOMPSON, Claremont, N. H. Filed Mar. 11, 1882. (No model.)

Claim.—1. The plow I, constructed with the shoulder or offset *i*, parallel concavities or grooves *l l*, and wing-shaped shears I' I', substantially as shown and set forth.

2. The combination, in a combined seeding-machine and fertilizer-distributer, of the plow I, constructed with the shoulder or offset *i*, parallel concavities or grooves *l l*, and wing-shaped shears I' I', seed-spout H, arranged in front of the shoulder *i* and between the concave grooves *l l*, and fertilizer-spout H', arranged between the flaring rear ends of wings I' I', substantially as and for the purpose herein shown and set forth.

268,154. PANTALOON-PROTECTOR. JUDSON L. THOMSON, Syracuse, N. Y. Filed Jan. 3, 1882. (No model.)

Claim.—1. A pantaloon-protector consisting essentially of a plate adapted to be secured to the back of a rubber shoe, and a spring-arm hinged on said plate and restrained from undue deflection below a horizontal position by a shoulder on the attaching-plate, substantially as set forth.

2. The combination of the plate *a*, formed with the loop *b*, and with the lateral extension *c* on the ends of said loop, the wire ball *d*, hinged in the loop *b* and restrained from deflecting below a horizontal position by the extensions *c* aforesaid, and the washer *e* and attaching-stud *r*, all as shown and described.

3. The combination of the plate *a*, provided with the stop *s* and with the loop *b*, the shoulders *c*, the ball *d*, hinged on the said loop, and the washer *e*, provided with rivets *r*, all as shown and set forth.

268,155. PANTALOON-PROTECTOR. JUDSON L. THOMSON, Syracuse, N. Y., assignor of one-half to C. Valletta Ranson, Detroit, Mich. Filed Feb. 9, 1882. (No model.)

Claim.—The within-described pantaloon-protector, consisting of the plate *a*, provided with the spurs *n*, and with the loop *b*, having the notches *c c*, the ball *d*, hinged in said loop, and the attaching-screw *u*, inserted through the lower portion of the plate, substantially as described and shown.

268,156. GLASS-ANNEALING FURNACE. CLEON TOWNSEND, Ithaca, N. Y. Filed Feb. 27, 1882. (No model.)

Claim.—1. The combination of the bars *d d'*, arranged side by side and alternately between each other, the set *d* supporting the sheets of glass, while the bars *d'* are pushed toward the lear or flattening-wheel *a*, and the set *d'* supporting the sheets of glass and moving them onward and through the tunnel, substantially as set forth.

2. The transmitting-bars *d'*, reciprocating between the alternate bars *d*, which receive the glass at the times described, in combination with the arms *d' d'''*, which by the lever *h''* and shafts *f* change simultaneously the elevation of the sets of bars *d d'* and the glass supported by each, as set forth.

3. The furnace *a* and tunnel *h'*, made with a continuous and straight chamber from the section *c''* of the flattening-wheel *a*, in combination with the bars *d d'*, so constructed that the bars *d'* shall enter the lear-furnace over the section *c''* of the wheel, as set forth.

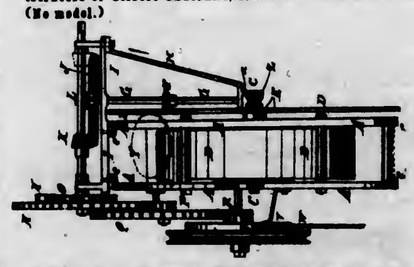
4. A furnace and tunnel made with a draft through both from the fuel-chamber *a'*, and with a draft-flue, *m*, and dampers *n*, in combination with the bars *d d'*, the several parts being constructed as set forth.

5. The furnace *a*, with flattening-wheel *a* and tunnel *h'*, constructed and adapted to the two sets of bars *d d'*, the bars *d'* being made by the wheels *e* to reciprocate and project alternately into the furnace over the segment *c''* and out of the exit *h*, whereby the sheets of glass are received by the furnace ends of said bars and discharged by their exit ends out of the tunnel without opening the furnace or tunnel, as set forth.

268,157. STEAM-PUMP. GEORGE B. M. TOWNE, New York, N. Y., assignor of one-half to Edward L. Lamble, Washington, D. C. Filed Feb. 9, 1882. (No model.)

Claim.—1. In a steam-pump, the combination of trunnioned steam and water cylinders, having inlet and outlet ports adapted to register with corresponding ports for admitting and exhausting steam, and admitting and discharging water from them, respectively, and pistons connected together and adapted to be moved simultaneously in opposite directions in their respective cylinders, and communicating oscillating movements thereto, substantially as and for the purpose specified.

2. In a steam-pump, the combination of trunnioned steam and water cylinders, having inlet and outlet ports adapted to register with corresponding ports for admitting and exhausting steam, and admitting and discharging water from them, respectively, pistons adapted to move in said cylinders, and crank or similar connection provided with a fly or balance wheel, connecting said pistons together, whereby they are adapted to be moved simultaneously in opposite directions in their respective cylinders, and communicating oscillating movements thereto, substantially in the manner as and for the purpose herein shown and described.



3. In a steam-pump, the combination of the supporting-frame A, having bearing-boxes B B, provided with caps *b b*, and inlet and outlet ports a^3 a^3, cylinders C D, and trunnions *c d*, having inlet and outlet ports *a a'*, pistons E F, and crank G, provided with crank-pin *g*, to which said pistons are connected, and fly or balance wheel H, the several parts constructed and relatively arranged to operate substantially in the manner as and for the purpose herein shown and described.

268,158. SNAP-HOOK. GEORGE B. M. TOWNE, New York, N. Y., assignor of one-half to Edward L. Lamble, Washington, D. C. Filed Feb. 9, 1882. (No model.)

Claim.—A snap-hook formed of a single piece of sheet metal, as shown, having the shank and hook of a single thickness, and the attaching-loop *a* of a double thickness, of material, and the spring-tongue *b*, consisting of a prolongation of the overlapped portion of the attaching-loop, as shown and described, for the purpose specified.

268,159. SPRING-MOTOR. JOHN D. UNDERHILL, Hoboken, N. J., and ELIZABETH UNDERHILL, New Rochelle, N. Y., Administrators of Gilbert Underhill, deceased. Filed Oct. 6, 1881. (No model.)

Claim.—1. A spring-motor constructed substantially as herein shown and described, and consisting of the frame A, the coiled spring or springs B, the regulating-wheel D, having spiral row of perforations E, the sliding spur-wheel F, the train of gear-wheels J K M P Q R, and the belt-pulley S, as set forth.

2. In a spring-motor, the regulating-wheel D, constructed, substantially as herein shown and described, with a spiral row of perforations to receive the spurs of a spur-wheel, as set forth.

3. In a spring-motor, the combination, with the spring B and the train of gear-wheels J K M P Q R, of the regulating-wheel D, having spiral row of perforations E, substantially as herein shown and described, whereby the power will be applied to the gear-wheels with a gradually-increasing advantage of leverage as the force of the uncoiling spring decreases, as set forth.

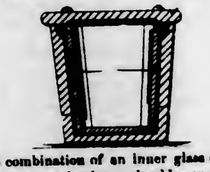
4. In a spring-motor, the combination, with the frame A and the regulating-wheel D, of the wheel Y, substantially as herein shown and described, whereby the said regulating-wheel is held against the push of the spur-wheel, as set forth.

5. In a spring-motor, the combination, with the regulating-wheel D, of the extra spur-wheel *c* and the extra shaft Z, substantially as herein shown and described, whereby the said regulating-wheel can be readily turned back to coil the spring, as set forth

258,160. CAR-COUPLING. WILLIAM T. VAN DORN, Lincoln, Nebr. Filed Feb. 13, 1882. (No model.)

Claim.—1. In a car-coupling, the coupling-bar having a catch at one end and a perforation near the opposite end, which opposite end is made heavier or larger than the first to balance the bar and hold the catch end in position for automatic coupling, substantially as shown and described.

2. The combination, with a coupling-bar having a lateral catch, of a vertical coupling-pin which is made with a beveled or inclined surface adapted to deflect the bar to allow the catch to pass behind the pin, and which is removable to release the catch, substantially as shown and described.



3. The combination, with a coupling-bar having a catch at the end, and a draw-head having means for engaging the catch, of a retaining device having means for increasing the tension of the same, substantially as shown and described.

4. In a car-coupling, the combination of a spring arranged in one side of the draw-head and a bolt connected thereto which passes through the opposite side of the draw-head, whereby the tension of the spring may be adjusted, substantially as shown and described.

5. In a car-coupling, the combination, with a retaining device for a catch-bar, of a safety-pin which is adapted to be inserted in a perforation to hold the retaining device in engagement with the catch-bar, substantially as shown and described.

258,161. COFFIN. CHARLES E. VAN DUSEN, Oneonta, N. Y. Filed Jan. 4, 1882. (No model.)

Brief.—A glass coffin is inclosed within a wooden case with a layer of cement or mortar between the glass and wood.

Claim.—The combination of an inner glass coffin, a layer of mortar, and an outer case having a shoulder or rest for a gasket to hermetically seal the glass cover, substantially as and for the purposes set forth.

258,162. WITHDRAWN.

258,163. PUMP. BENJAMIN C. VANDUSEN, Cincinnati, Ohio, assignor to John P. Martin, Newport, Ky. Filed May 26, 1881. (No model.)

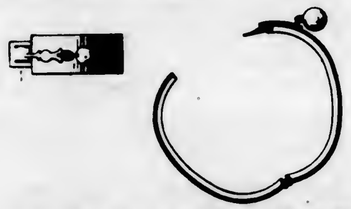
Claim.—1. The combination of the reversely-reciprocated pistons G I, the dome D, tube E, and the annular lips or collars J J', substantially as and for the purposes designated.

2. The combination of column N with interior loosely-suspended air-chamber Q, discharge-spout P, and the operating lever or handle O, substantially as set forth.

3. A pneumatic cushion or air-chamber consisting of a pipe, Q, open below into the water-pipe, and having the hermetically-closed expanded and flattened upper end for suspension within such water-pipe, in the manner and for the purpose stated.

4. The combination of the rods F H, the interiorly-located rubber tubes or sleeves J, arranged and operating as and for the purpose set forth.

5. In combination with the pipe N', the bed-plate Z, with integrally-cast projection *b* and separable cap *b'*.

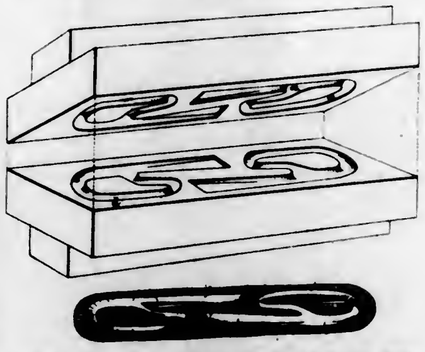


258,164. OPTICAL TOY. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 7, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a series of leaves in which each successive leaf bears a pictorial representation of an object in a different position, and means, substantially such as described, for securing said leaves together bookwise at one of their edges.

2. The combination, substantially as hereinbefore set forth, of a series of leaves of progressively increasing length or breadth, in which each successive leaf bears a pictorial representation of an object in a different position, and means, substantially such as described, for securing said leaves together bookwise at one of their edges.

258,165. BRACELET. JOHN B. VAN HOUTEN, Newark, N. J. Filed Aug. 8, 1881. (No model.)



Claim.—1. The combination, in a bracelet with one section provided with a spring-clip, of the lever pivoted upon said section and engaging at one end with said spring-clip, having a normal tendency to hold and holding the other end of said lever in engagement with said section, substantially as and for the purposes set forth and shown.

2. The combination, in a bracelet, with the spring-clip *a* and lever *d*, lying in close engagement with the body of the bracelet, of the hand-piece linked to the said lever, substantially as and for the purposes set forth and shown.

258,166. ART OF FORMING CHEEK-PIECES FOR BRIDLE-BITS. THOMAS E. VAN NESS and DANIEL MALONEY, Newark, N. J. Filed Dec. 10, 1881. (No model.)

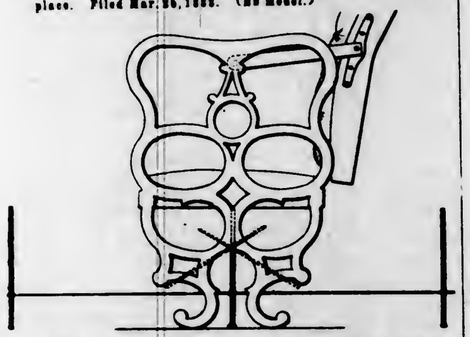


Fig. 4.

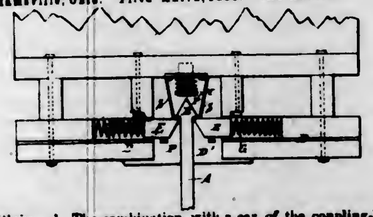
Claim.—1. As an improvement in the art of making cheek-pieces for bridle-bits, raising said cheek-pieces in relief on opposite surfaces of a plate or bar by dies that, while producing substantially the proper form and dimensions in cross-section, shall, by an irregular or distorted line of the raised portion thereof, give the ring or bow in one direction a reduced sectional area to bring the article in the ensemble within greatly-reduced limits, (whereby a saving in stock and in the cost of dies and in the power to operate the same is effected,) then trimming off the fins and intermediate plate of metal, and finally opening out said ring or bow to its proper form and dimensions, substantially as specified.

2. The dies, as described, and shown in Fig. 4, substantially as and for the purpose shown.

258,167. CAR-SEAT ATTACHMENT. ISAAC M. VAN WAGNER, Nyack, N. Y., assignor of one-third to Charles M. White, same place. Filed Mar. 16, 1882. (No model.)



Claim.—1. The combination of a car-seat with the swinging partition which is placed under the seat for the purpose of preventing drafts of cold air around the feet of the passengers, substantially as shown.

2. In a car, the combination of the seats with the partitions placed under them, and connected together by means of rods, cords, or wires in such a manner that the partitions can be raised and lowered, substantially as described.

3. The combination of the car-seats, the hinged or pivoted partitions placed under the seats, and the rubber strips I, the parts being arranged and combined to operate substantially as shown and described.

4. The combination of a car-seat with a suitable partition loosely attached thereto, and having an elastic material attached to its lower edge, the partition being adapted to be worked back and forth over the floor for the purpose of assisting in cleaning the car under the seat, substantially as specified.

258,168. CAR-COUPLING. FREDERIC A. R. VON NEERWITH, Sedamsville, Ohio. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination, with a car, of the coupling-bar A, provided with triangular heads B, the sliding spring-blocks E, the plate P, and the extension P' of the same, provided with vertical flanges S, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with a car, of coupling-bar A, provided with triangular heads B, the sliding beveled spring-blocks E, the levers J, pivoted to the blocks E, the pintle K, for pivoting the two levers to each other, and the slotted standard T, through which the pintle K passes, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with a car, of the coupling-bar A, provided with triangular heads B, the sliding beveled spring-blocks E, the pivoted levers J, pivoted to these blocks and provided at the ends with handles N, and the hooks O on the car, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with a car, of the coupling-bar A, provided with triangular heads B, the beveled spring-blocks E, sliding in a frame, D, at the end of the car, and the buffer H on the end of the car, substantially as herein shown and described, and for the purpose set forth.

5. A coupling-bar made, substantially as herein shown and described, with the upper and lower surfaces of the heads rounded or beveled for the purpose of facilitating automatic disengagement of the cars in case one of the cars is capsized, as set forth.

258,169. BALING-PRESS. JACOB A. WAGNER, Quincy, Ill. Filed Feb. 16, 1882. (No model.)

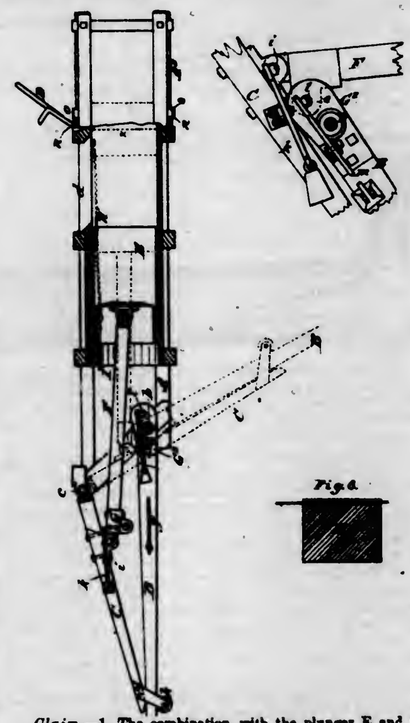


Fig. 6.

Claim.—1. The combination, with the plunger E and the main actuating-lever B, of the secondary or auxiliary lever C, the sliding connection A, and means, substantially as herein shown and described, for alternately connecting the said levers to the plunger, as set forth.

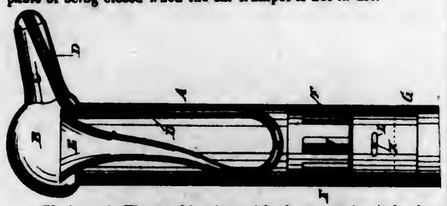
2. The combination of the connected levers B C on opposite sides of the press with the plunger E and plunger-rod F, having a cap-piece, G, constructed to provide for attachment of said rod to either of said levers, essentially as described.

3. The combination of the removable coupling-pins *i* and *I* with the connected levers B and C and the plunger-rod F, made capable of attachment either to the lever C in advance of its fulcrum *c* or to the lever B at a shorter distance from its fulcrum *b* and in rear thereof, whereby a compound lever-action to produce the necessary pressure is made readily convertible into a more powerful simple lever one, and both the forward and back motions of the main lever B are made available in the pressing-stroke of the plunger, substantially as specified.

4. The combination of the forked prongs H with the plunger E, and mechanism for automatically causing said prongs to project in front of the plunger during its travel past the feed-opening of the press, essentially as and for the purposes herein set forth.

258,170. POCKET-COMB. JOHN H. WALBRIDGE, New York, N. Y. Filed Apr. 6, 1882. (No model.)

Claim.—1. The combination of a comb having an enlarged or shouldered portion at one end with a case or sheath having formed within it a channel or channels in which said shouldered portion fits and slides, substantially as described.



2. The combination, with a comb and sheath formed and arranged as set forth, of a spiral spring or springs for causing and maintaining the protruding of the comb from the sheath, substantially as described.

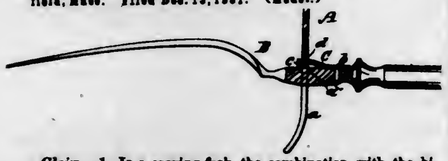
3. The combination, with a comb, a sheath, and spiral springs, as described, of a spring-catch for retaining the comb in its sheath, substantially as set forth.

4. The combination of the comb A, sheath B, springs D, and catch G, substantially as described.

258,171. COMBINED BAR-TRUMPET AND CANE-HANDLE. HENRY WALDSTEIN, New York, N.Y. Filed Mar. 8, 1882. (No model.)

Brief.—An ear-trumpet is contained in a cane-handle. This handle is provided with apertures for admitting the sound, and capable of being closed when the ear-trumpet is not in use.

Claim.—1. The combination, with the cane-tube A, having hollow head B and arm C, of the open tube D, commencing at the end of arm C, passing through said arm down into tube A, and then turned upward and carried with a flared end, E, into the head B, as and for the purpose described.

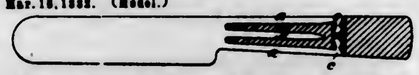


2. The combination, with a cane-handle provided with side apertures, of an ear-trumpet contained within the handle, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the tube A, provided with apertures or slots F, of the tube G, provided with apertures or slots J, and the ear-trumpet D E in the tube A, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the tube A, provided with apertures or slots F, of the tube G, provided with apertures or slots J and slots I, the transverse pintle K, and the ear-trumpet D E, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the tube A, provided with a hollow bulb or head, B, and a hollow arm, C, of the tube D, passing through the arm C and tube A, and provided with a mouth, E, within or directly below the head B, substantially as herein shown and described, and for the purpose set forth.

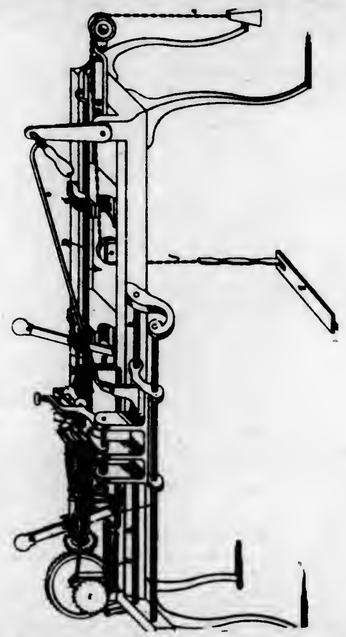


258,172. CARVING-FORK GUARD. STEPHEN S. WARD, Greenfield, Mass. Filed Dec. 13, 1881. (Model.)

Claim.—1. In a carving-fork, the combination, with the bifurcated guard A, provided with the slot *d*, of the spring C, secured to the fork, and provided with the lip *c*, taking over the bar *d'*, that forms the bottom of the slot *d*, substantially as and for the purpose set forth.

2. The combination, with the fork B, of the bifurcated guard A, provided with the slot *d*, and the spring C, secured to the said fork, and provided with the lip *c* and shoulders *e* on its outer end, substantially as and for the purpose set forth.

258,173. KNIFE. STEPHEN S. WARD, Greenfield, Mass. Filed Mar. 16, 1882. (Model.)



Claim.—1. The combination of the middle tang, *b*, with the two outer tangs, *a*, of the blade, substantially as shown and described.

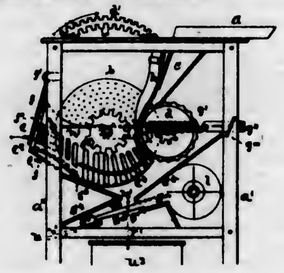
2. A knife or similar instrument provided with triple tangs, in combination with a handle and cast-metal filling, said handle having a central hole and edge grooves, as shown and described.

3. In a three-tang instrument, the two outer tangs, *a*, formed with hook-lugs *c* at their outer ends, substantially as described.

258,174. GREEN-CORN CUTTER. SOLOMON D. WARFIELD, Baltimore, Md. Filed Sept. 24, 1881. (Model.)

Claim.—1. In a green-corn cutter, the revolving shaft and the bar carrying the centers for supporting an ear of corn, provided with flaring centering devices adapted to yield and expose the said ear to the said centers as the ear is compressed endwise in the centering operation, substantially as and for purpose specified.

2. In a green-corn cutter, the centering prongs or devices for centering the ear of corn, connected to weighted pivoted levers, whereby they are susceptible of longitudinal movement on their respective shafts and bars by the force of gravity in excess of that imparted to them by the endwise compression of the ear, substantially as and for the purpose specified.



3. In a green-corn cutter, the longitudinally-moving knife for removing the grain from the cob, combined with a longitudinally-moving scraper adapted to bear on the cob with a yielding pressure, substantially as and for the purpose specified.

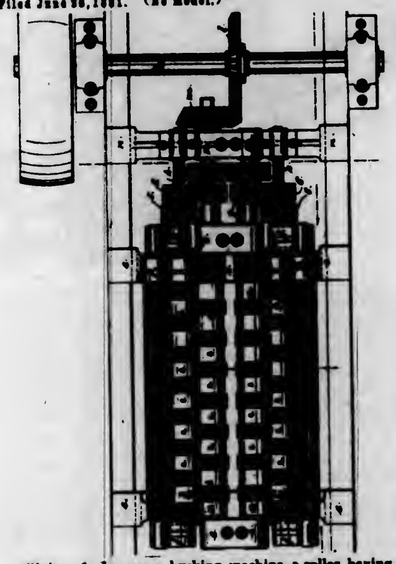
4. In a green-corn cutter, the longitudinally-moving knife for separating the grain from the cob, turned upward at its rear end to form a deflector for the severed grain, substantially as and for the purpose specified.

5. In a green-corn cutter, a chute or pan adapted to receive the grain and cob after their separation, provided with interior deflecting devices to conduct the cob to an exit-aperture distinct from that for the grain, substantially as specified.

6. In combination with the bar D, the weighted chain *e*, chain *f*, and treadle *g*, substantially as and for the purpose specified.

258,175. CORN-SHELLER. JOHN SAYLES WATERMAN, Ithaca, N.Y. Filed Oct. 26, 1881. (No model.)

Claim.—1. The described device for controlling the pressure-bar A, consisting of the spring *g'*, clamp *g''*, and clamp-screw *g'''*, projection *h'*, check-rod *a'*, check-rod clamp *a''*, and its set-screw *a'''*, in combination with the pressure-bar A and posts *a' a''*, the parts being constructed substantially as set forth.



2. The combination of the rag-wheel *b*, corn-returning lip *c'''*, and the tubular conveyor *c'*, the latter fitted to and covering the lower part of the toothed side of the rag-wheel *b*, and having a top or roof part, *i*, a side part, *i'*, and a floor part, *i''*, the said parts being provided with openings and bars which radiate transversely from the axis of the wheel *b* in their position next the bar *h*, and beyond that having bars and openings arranged perpendicularly to the line on which the emerging cobs are carried, said conveyor extending into the corn-returning lip *c'''*, and being also provided with perpendicular openings and bars, substantially as set forth.

3. The cob-conveyor *c'*, provided with the sifting-extension *c''* and with the corn-returning lip *c'''*, the said extension being made with bars and openings and operating as set forth.

4. The lip *c'''*, inclosing the extension *c''* of the cob-conveyor, composed of the floor or base *f*, sides *j j'*, and the extension *c''*, in combination with the apron *f'* and hinging-staples *f''*, said apron closing the outer margin of the exit *e*, as set forth.

5. The combination of the fan *l* with the blast-tube shown and described, constructed of the boards *c' c' c'*, and provided with an upper aperture, *a'*, and a lower aperture, *a''*, through which apertures the shelled corn passes, the lower aperture being covered by wires arranged side by side, as shown, and having their upper ends secured to the board *c'*, and their lower ends loose and elevated above and projecting over the end *c''* of the board *c'*, the said parts operating to winnow the shelled corn of its chaff, silk, and other impurities as it drops through the blast-tube, as set forth.

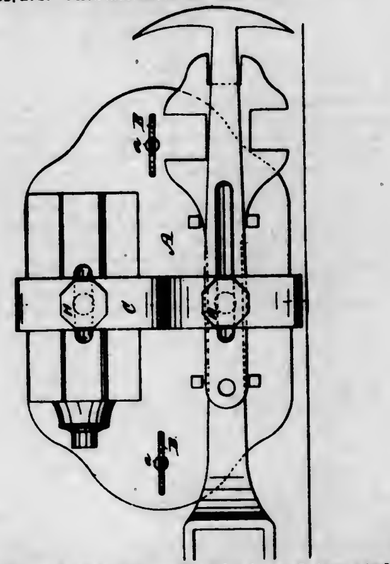
258,176. CORN-HUSKER. JOSIAH WEBBER, Jr., Brooklyn, assignor to the Champion Corn Husker Company, New York, N.Y. Filed June 30, 1881. (No model.)

Claim.—1. In a corn-husking machine, a roller having sections that are plain and intermediate sections that are larger and grooved longitudinally to form teeth, in combination with a second roller having similar toothed and plain sections, the plain sections being longer than the toothed sections, and the rollers placed together so that the toothed sections in one roller pass in between the toothed sections of the other roller and are adjacent to the plain sections, substantially as specified.

2. The combination, with a pair of husking-rolls, of a regulating-roller, *c*, grooved spirally, for the purposes and substantially as set forth.

3. In combination with the pairs of husking-rollers and grooved regulating-rollers, the lever-bearings *f* and the helical springs 5, acting against the lower end, substantially as set forth.

4. The combination, with the husking-rollers *a b* and regulating-rollers *c*, of the bearers *e*, *f*, and *n* and gear-wheels *l* as 7 9 8 6 5, substantially as and for the purposes set forth.



258,177. TOBACCO-POUCH FRAME. RICHARD I. WELLER, Washington, D. C. Filed Mar. 11, 1882. (No model.)

Claim.—1. A tobacco-pouch having a frame composed of the spring portion B, the spring force of which serves to keep the mouth of the pouch in a closed condition, the cross-arm C, by which the spring-pressure may be overcome at will, and the horizontal portion *c*, substantially as specified.

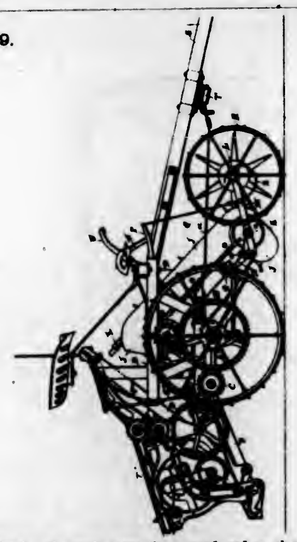
2. The frame A, formed into spring portion B, cross-arms C *c*, and having eyed portions, combined with the rings D and bag E, as specified.

258,178. TOOL-CARRIER. CHESTER L. WENTWORTH, Mount Vision, N.Y. Filed Mar. 16, 1882. (Model.)

Claim.—1. As an improved article of manufacture, a tool-carrier consisting of a frame composed of a plate, A, and bar C, adapted to be attached to a wagon seat or body, and provided with means for holding in place an oil-can and a tool or tools, substantially as herein described.

2. The combination, with the plate A and the bar C, provided with screw-threaded holes, of the set-screws H, for holding the tools in place, as shown and described.

3. The combination, with the plate A, provided with the holes *a*, of the thumb-screws B, for attaching the apparatus to a wagon seat or body, as herein shown and described.

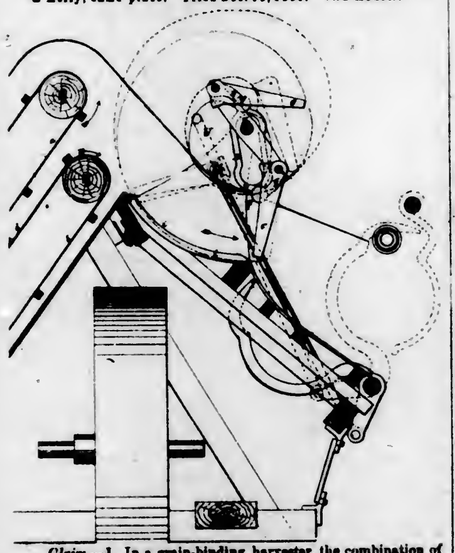


258,179. GRAIN GATHERING AND BINDING MACHINE. WM. H. WHITELEY, Springfield, Ohio, assignor to Whiteley, Fassler & Kelly, same place. Filed Jan. 3, 1881. (No model.)

Claim.—1. The pivoted arms M, provided with T-shaped ends *m*, and extending behind the elevator-shaft K, and supported at their forward ends by the gathering-cylinder shaft L, in combination with the pins *n* and arms N, arranged to form an adjustable joint between the gathering-cylinder and the elevator, substantially as described.

2. The foot-lever U, pivoted upon the main frame D and connected to the pole S by the rod W, in combination with the arm P, flexibly connected with the elevator-frame by the rods Q and the arms M, substantially as set forth.

3. In an independent gathering and binding machine, devices

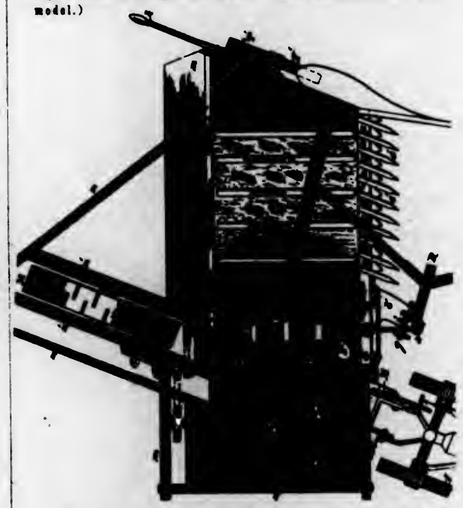


268,179.

for gathering the grain upon the ground and an elevator for raising the same therefrom, the elevator-shaft H, passing through bearings in the frame J and supported by the brackets I, in combination with the flexible tambling shaft G, pinion F, and main driving-gear B, substantially as and for the purpose specified.

4. An independent float, X, provided with curved guards Z, extending around the gathering-cylinder shaft L, in combination with the pivoted arms Y, connecting the float X movably to the frame J, substantially as and for the purpose set forth.

268,180. GRAIN-PACKER FOR BINDING-MACHINES. WM. M. WHITELEY, Springfield, Ohio, assignor to Whiteley, Fassler & Kelly, same place. Filed Dec. 15, 1880. (No model.)



Claim.—1. In a grain-binding harvester, the combination of a double-belt elevator, a revolving falling-tooth packer, and a controlling-cam, and means connecting said cam with the binder-arm shaft, whereby the position of the cam may be changed so that it may operate in one position to swing the revolving packer-teeth out to sweep the grain from the elevator-belt to the binder-arm, and in the other position it may operate to withdraw the packer-teeth endwise before they pass over the grain-receptacle.

2. The combination of the rotary rake-heads, linked together as described, and the movable cam with the connecting-rod R, for connecting the cam with the binder-arm shaft located at one end of the receptacle, whereby said cam and the operative parts connected with it are removed from the vicinity of the grain in the receptacle.

3. The double-belt elevator, in combination with the continuously-rotating rakes which sweep the grain from the elevating-belts and deposit it in proper position in the receptacle, a controlling-cam and a connecting-rod coupled with a crank on the binder-arm shaft.

4. A continuous rotating rake-packer and means for controlling its path of rotation directly by and in unison with the binder-arm, whereby its movements are so arranged as to always sweep the grain off the elevating mechanism, but to vary the time of grain-deposit in the grain-receptacle, so as to admit of the free working of the binder-arm on its return downward.

268,181. HARVESTER AND BINDER. WILLIAM H. WHITELEY and WILLIAM BAYLEY, Springfield, Ohio, assignors to Whiteley, Fassler & Kelly, same place. Filed Dec. 13, 1880. (No model.)

Claim.—1. An endless traveling conveyer, C, moving in an oblique direction to the line of travel of the machine to which it is attached, and a cutting apparatus, E, parallel with the conveyer, and provided with fingers *v'*, that stand parallel with the line of travel of said machine and obliquely to said cutting apparatus and conveyer, in combination with a revolving reel, R, the axis whereof is set obliquely to the line of progression, as set forth, the whole arranged and constructed for the purpose of straightening the grain during its travel upon said conveyer.

2. A combined harvesting and binding machine provided with a rear master-wheel, M, a vertically-adjustable forward truck, I I, a cutting apparatus, conveyer, and automatic binder mounted between said wheel and truck, and extended laterally in a direction oblique to the line of progression, and a vertically-adjustable grain-wheel, I', for the purpose of a better presentation of grain to the binding-machine.

3. A platform, m, carrying a cutting apparatus, E, a conveyer, C, a packer, P, and a binding apparatus at A, the whole mounted upon wheels, and the conveyer moving in an oblique direction to the line of travel of the machine, substantially as and for the purpose specified.

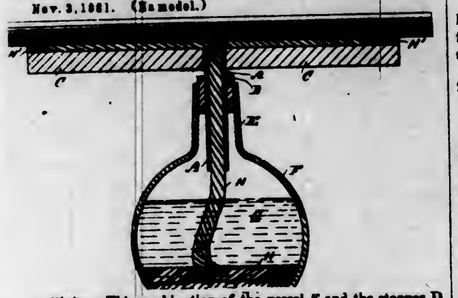
268,182. MANUFACTURE OF CHILLED CASTINGS. JOHN R. WHITNEY, Radnor Township, Delaware County, Pa. Filed Nov. 10, 1881. (No model.)

Claim.—1. The improvement in the art of manufacturing chilled castings, which consists in the suitable application to and distribution over the outer surface of the chill of a series of minute jets or currents of water or other cooling medium, substantially as set forth.

2. In an apparatus for the manufacture of chilled castings, the combination of a chill, a reservoir for water or other cooling

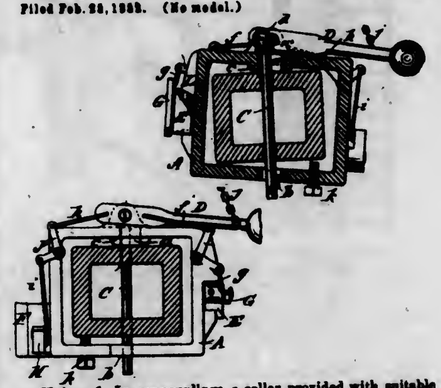
268,182.

medium, a valved supply pipe or pipes, and a discharge-pipe connected to said supply-pipe, and provided with a series of perforations or exit-nozzles, each adapted to discharge a jet or current of cooling medium upon the exterior of the chill, substantially as set forth.



268,183. BUTTER-TRAY. WILLIAM R. WILCOX and NORMAN E. BROWN, St. Joseph, Mich. Filed Apr. 1, 1882. (No model.)

Claim.—1. A butter-tray having at each end of the body portion the interrupted transverse scoring, consisting of the independent score-sections between the body portions and end laps, the middle score-section being set back from the lateral score-sections a distance equal to the thickness of the stock, substantially as specified.



2. A grocer's tray having the interrupted score and the lateral end laps folded upon each other and upon the middle lap and secured together, forming a triple fold connected and braced handle portion, substantially as specified.

268,184. OILER. WILLIAM H. WILLIAMS, Bristol, N. H. Filed Nov. 3, 1881. (No model.)

Claim.—The combination of the vessel F and the stopper D with the bearing C, the tube A, secured to the bearing and extending downward into the vessel, and the wick H, leading from the vessel to and extending along the inner bottom surface of the bearing, substantially as shown and described, whereby the vessel is adapted to be withdrawn from the stopper or the vessel and stopper withdrawn from the tube, as and for the purpose set forth.

268,185. CAR-COUPLING. JOSEPH D. WILSON, Kansas City, Mo., assignor of one-half to Frank J. Mitchell, same place. Filed Feb. 28, 1882. (No model.)

Claim.—1. In car-couplings, a collar provided with suitable locking devices, and adapted to have a partial rotation or rocking movement upon the draw-heads, for coupling and uncoupling the cars, substantially as described.

2. The collar A, provided with the hooked arm E upon one side and the catch F upon the other, in combination with the pivoted weighted lever D, for partially rotating or rocking the collar, substantially as described.

3. The collars A A, adapted to be attached to the ordinary draw-heads, and adapted to have partial rotation or a rocking movement upon the draw-heads, substantially as described.

4. The collar A, formed with the elongated holes *a* and *b*, and with the projection *c*, substantially as and for the purposes set forth.

5. The collar A, formed with the elongated openings *a* and *b*, and with the projection *c*, in combination with the shifting weighted lever D, as and for the purposes set forth.

6. The partially rotating or rocking collar A, provided with the set-screw *k*, and with the shifting weighted lever D, as and for the purposes set forth.

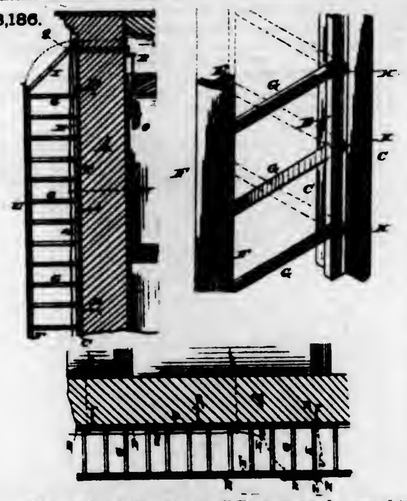
7. The combination, with the collar A, provided with the hooked spring-actuated arm E, of the lever G, pivoted to the arm E and attached to the weighted lever D by the rods *f g*, and bell-crank lever I, substantially as described.

8. The combination, with the collar A, provided with the hooked arm E, of the pivoted block H, attached to the weighted lever D by the rods *h i*, and bell-crank lever J, substantially as described.

9. The car-couplings herein shown and described, consisting of the rotating, or partially rotating, collars A A, each provided with the hooked arms E E and catches F F upon opposite sides, and each provided with the weighted shifting-levers D D and with the set-screws *k k*, the collars being adapted to be attached to the ordinary draw-heads, as described.

10. The collar A, adapted to be placed upon the draw-heads, in combination with the pivoted hooked arm E, and the spring *e*, for holding the collar and arm evenly upon the draw-head, substantially as described.

268,186. FIRE-ESCAPE. JOSEPH R. WINTERS, Chambersburg, Pa., assignor of one-half to Samuel B. Reed, New York, N. Y. Filed Mar. 16, 1882. (No model.)



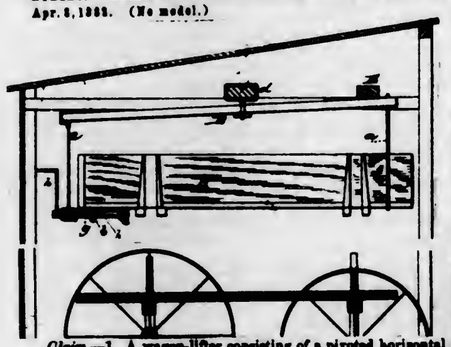
Brief.—The rungs are pivoted on alternate sides of the flange on the inner and outer rails, and when the ladder is folded it is inclosed in a shield secured to the outer rail. A platform at the base folds up with the ladder, and both are held by a latch provided with a releasing-wire. An alarm is connected to the jointed brace at the top of the ladder.

Claim.—1. The inner rail, B, having flanges C, and secured by means of bolts passing through said flanges, as set forth.

2. The combination of the permanent rail B, the pivoted rungs G, and the rail E, having shield or casing J, as set forth.

3. The combination, with the fire-escape ladder constructed as described, of the shield or casing J, secured to the outer rail, E, of said ladder, and having edges K, forming handles, as set forth.

258,186.



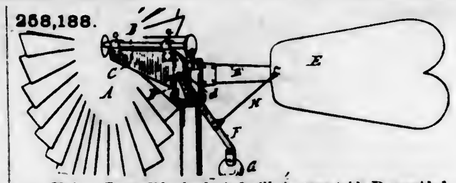
4. The combination, with the rail B, permanently secured to a wall, A, of the rail E and the pivoted rungs G, arranged alternately on opposite sides of said rails, as set forth.

5. The combination of the folding ladder B E G, having shield or casing J, the support L, and the releasing-wire M, having branches N, as set forth.

6. The combination of the rail B, pivoted rungs G, rail E, horizontal rods U V, secured respectively to the wall of the structure and to rail E, the diagonal braces W, and the pivoted rungs S, forming a folding platform, as set forth.

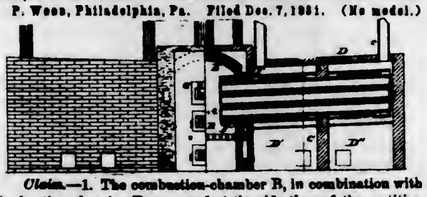
7. The herein-described improved fire-escape, consisting of the folding ladder B G E, having shield or casing J, jointed brace I, and folding platform R, the support L, releasing-wires M N, and alarm mechanism O P Q, all combined and operating substantially as and for the purpose set forth.

258,187. DEVICE FOR RAISING AND LOWERING WAGON-BODIES. WILLIS F. WITHERINGTON, Kenton, Tenn. Filed Apr. 8, 1881. (No model.)



Claim.—1. A wagon-lifter consisting of a pivoted horizontal bar, B, in engagement with a check-bar, E, over one end, and having at one end a rope or chain, *a*, and at the other a rope or chain, *c*, carrying a winding roller, *g*, and crank-handle, substantially as specified.

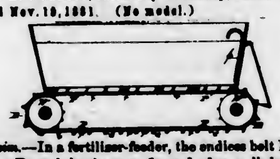
2. In a wagon-lifter, the combination, with the bearings *b* and *c* at the end of the wagon-bed, of the supporting-bar B, its front rope or chain, *a*, and its rear rope or chain, *c*, carrying a crank-shaft, *g*, adapted to engage said bearings and to be detached therefrom, substantially as described.



3. In a wagon-lifter, the combination, with the bearings *b* and *c* at the end of the wagon-bed, the supporting-bar, and the ropes *a* and *c*, of the winding roller or shaft *g* and the transversely-pivoted crank-handle h, substantially as specified.

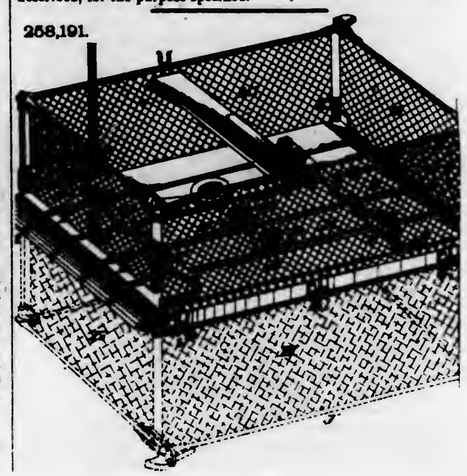
258,188. WINDMILL. HENRY J. WOLCOTT, Albion, Mich. Filed Sept. 14, 1881. (No model.)

Claim.—In a solid-wheel windmill, the turn-table D, provided with an arm, C, having two bearings, *c c*, and a smaller arm, *d*, having its outer edge at an angle of about forty-five degrees to the axis of the wheel, in combination with the wheel A, shaft B, supported in the bearings *c c* of the arm C, the weighted arm F, hinged to the angular edge of the arm *d*, the vane-arm E, hinged to the turn-table opposite to the arm *d*, and the rod H, connecting the weight-arm F and the vane-arm E, substantially as described.



258,189. APPARATUS FOR HEATING AIR BY STEAM. JAMES P. WOOD, Philadelphia, Pa. Filed Dec. 7, 1881. (No model.)

Claim.—1. The combustion-chamber B, in combination with the heating-chamber D, arranged at the side thereof, the partition C, which divides said heating-chamber into a nearer section and a farther section, the closed pipes A, extending from said combustion-chamber through the first section and into the other section of the heating-chamber, and an independent air-inlet and air-exit for each section of said chamber, substantially as set forth.



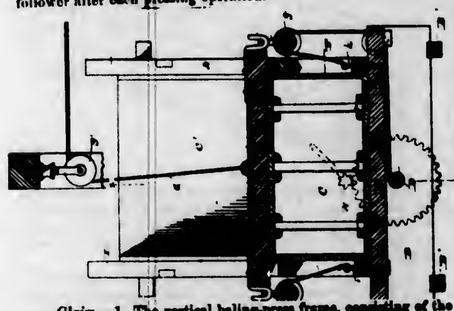
2. Two plates, F, having packing *g* interposed between them, and having openings to receive pipes A, in combination with said pipes, the combustion-chamber, and the heating-chamber, substantially as set forth.

258,190. FERTILIZER-FEEDER FOR GRAIN-DRILLS. ALFRED H. WOLBERT, Salisbury Township, Lancaster County, Pa. Filed Nov. 18, 1881. (No model.)

Claim.—In a fertilizer-feeder, the endless belt B, composed of the plates P, each having one flanged edge, *e*, linked together, all constructed, arranged, and operating substantially as shown and described, for the purpose specified.

258,191.

258,191. LIFE-RAFT. MARIA E. BRADLEY, Philadelphia, Pa. Filed Jan. 17, 1881. (No model.)



Brief.—A reversible life-raft having a hinged guard-railing so arranged as to project above the raft whichever side may be upward.

Claim.—1. The hollow rectangular metallic floats united by hinges, so as to present parallel flat surfaces of the floats to each other when either folded or extended, and with beveled ends adapted to ride with either surface upward.

2. In a reversible life-raft composed of hinged sections susceptible of folding and extension into a flat plane, the combination of a guard-railing attached thereto by hinges susceptible of turning with said railing through a sufficient arc of a circle to present the railing above either flat surface of the raft, substantially as and for the purpose described and shown.

258,192. HAY-PRESS. JEPTHA G. BOTLAND, Crawfordsville, Ind., assignor of one-half to Paul Hughes, same place. Filed Apr. 8, 1881. (No model.)

Brief.—A windlass is arranged beneath the bottom of the press-box and has its end bearings in the strong frame thereof. A master spur-wheel is keyed on one end of this windlass, which engages with a pinion on a winding-shaft having a crank-handle, by which the machine is operated. There is, further, a novel arrangement of ropes or chains passed about grooved pulleys and pulleys attached to swivel-links and to the vertically-movable follower of the press, and also a rope or chain centrally connected to the follower, and which passes over a pulley hung from the rafter of the building, and is carried off for use in elevating the follower after each pressing operation.

Claim.—1. The vertical baling-press frame, consisting of the housed-in receiving-box C', slotted vertically at its ends to receive the ends of the follower-beam, the press-box C, closed at both ends, slatted at one side, and provided with a removable door on the opposite side, the floor of the press-box provided with transverse slats, the broad sill-timbers B B, the intermediate floor-beam, E, and the subsills serving as supports and also ties for the timbers B B, the latter being firmly united to extensions of the corner uprights of the main frame, all substantially in the manner and for the purpose described.

2. The combination of the timbers B B, the corner uprights of the main frame of the superstructure secured rigidly to these timbers, the windlass D, having its end bearings therein, the subsills secured by tie-joints thereto, the press-box floor secured thereon, the beam E, the endwise-movable pulleys at the extremities of this beam, the ropes or chains h h, the loosely-hanging pulleys *g g*, the supporting-hooks at the ends of the follower-beam, and the eyebolts to which the said chains are attached, all arranged for joint operation substantially as described.

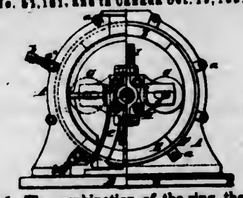
3. The combination, in an upright press, of a follower, a rope or chain, G', carried from the follower over a pulley applied to the rafter of the building in which the press is mounted, the ropes or chains secured to the sills of the main frame of the press, loosely-pendent pulleys applied to the follower-beam, endwise-movable pulleys arranged at the ends of the floor-beam of the press-box, a windlass arranged between these pulleys beneath the floor of the press-box, and the spur-wheels for actuating the windlass while depressing the follower, substantially as described.

4. In a vertical press of the kind described, the horizontal transverse windlass arranged on one side of the press-box center, beneath the press-box, the ropes or chains h h, secured to this windlass near its ends, the endwise-movable pulleys arranged on opposite sides of the press-floor beam under which said ropes pass, the loosely-hanging pulleys *g g*, attached to the ends of the follower over which the said ropes pass, and the eyebolts fixed centrally to the press-frame to which these ropes are secured, substantially as described.

258,193. FEED-REGULATING DEVICE. HENRY F. BROWN, Elkhart, Ind., assignor to himself and William Forward, same place. Filed Dec. 21, 1881. (No model.)

Claim.—1. In a feed-regulating device, the combination of the hopper, the pressure-board, the pivoted lever 9, the tension-spring 25, and the pivoted cut-off having an independent tension device.

2. In a feed-regulating device, the combination of a hopper, a cut-off, a pivoted lever, a pressure-board pivoted independently to the said lever, and a locking device.



3. In combination, the pressure-board, the pivoted lever-arm 9, having the serrated eye, the arm 11, having the correspondingly-serrated eye, the screw-bolt, and the locking-pin.

4. In combination, the pressure-board, the pivoted lever-arm 9, the cut-off, the standard 14, and the bolt 15, substantially as described.

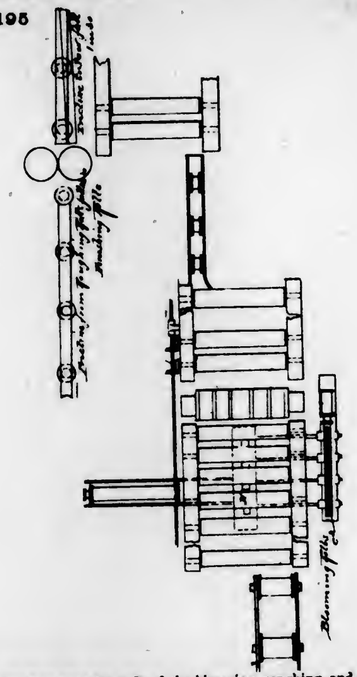
5. In combination, the pressure-board, the lever-arm 9, the pivoted cut-off, the spring 25, attached to screw-bolt 16, and the nut 19.

6. A feed-regulating device consisting of a hopper, an adjustable pressure-board, a pivoted lever connected to the hopper, a spring to return said lever and board to normal position, a pivoted cut-off, and a spring for closing the cut-off when the pressure-board is free.

258,194. GRINDING-MACHINE. RICHARD COOK, Sheffield, England. Filed Oct. 17, 1881. (No model.) Patented in England Oct. 18, 1880, No. 4,344; in Germany Mar. 14, 1881, No. 18,243; in France Mar. 18, 1881, No. 141,801; in Belgium Mar. 18, 1881, No. 51,161, and in Canada Oct. 19, 1881, No. 13,549.

Claim.—1. The combination of the ring, the rollers therein, the sieves or screens at the sides thereof, and the blades or fans J, arranged to agitate and fan the material being operated on and force the same against the screens or sieves, substantially as described.

2. The combination of a casing, A, a ring, E, a grinding-roller traveling within the ring, a driving-arm, H, supporting the roller, a shaft sustaining the driving-arm, a blade or fan, J, attached to said arm, and screens or sieves at the sides of the ring, substantially as and for the purpose described.

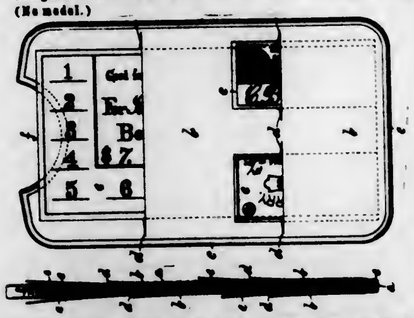


3. The combination, with the shaft D, of attached roller drivers or propellers, composed of plates H H, and the central piece, I, attached to the shaft and carrying the said plates, and rollers G, arranged between the ends of the latter and supported thereby, substantially as described.

258,195. METAL-ROLLING MILL. THOMAS CHYCHELOW, Steelton, Pa. Filed June 20, 1881. (No model.)

Claim.—1. In machinery for the manufacture of rails, beams and the like, substantially as herein set forth, the traveling carriage for manipulating the ingot, located in close proximity to the feeding-rolls, and provided with one or more vertically-operating plungers, as described, and for the purposes specified.

2. In machinery for the manufacture of rails, beams, and the like, substantially as herein set forth, the combination therewith of the succession of inclined feeding-trains situated in line with



258,195

the alternate opposite ends of the blooming, roughing, and finishing rolls, whereby a continuous feed of the ingot may be maintained, as herein specified.

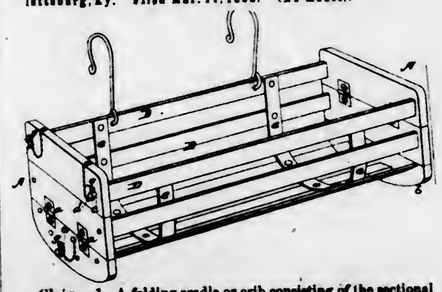
3. In machinery for the manufacture of rails, beams, and the like, substantially as herein set forth, the combination of the succession of inclined feeding-trains with the manipulating-carriage having vertically-operating plungers, whereby the ingot may be readily fed to the feeding-rolls and transversely moved thereon for the purposes specified.

258,196. TICKET-CASE. SAMUEL S. CROSS, Beverly, Mass., assignor to Daniel E. Cross, same place. Filed Feb. 17, 1882. (No model.)

Claim.—The herein-described portable ticket-case, consisting of central stiffener and divider, *a*, covers *b b*, having each one or more slits, *d d*, and united to the partition *a* by the continuous metal binder *c*, all arranged and combined substantially as and for the purpose set forth.

258,197. ROTARY WATER-METER. BENAIAH FITTS, Worcester, Mass., assignor to the Union Water Meter Company, same place. Filed Sept. 30, 1880. (No model.)

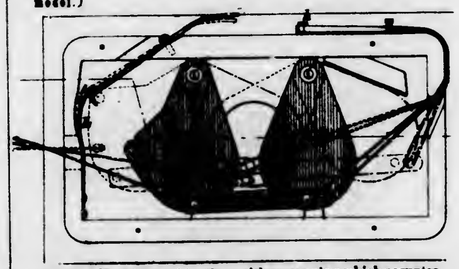
Claim.—1. A water-meter provided with a deflector arranged at the induction-opening within the meter-shell and projecting across the opening, but not extending throughout the depth of the piston-chamber, substantially as set forth.



258,197.

2. In combination with two coacting pistons provided with radial blades having at their ends segmental bearing-surfaces, a deflector arranged at the induction-opening within the meter-shell and projecting across the opening, but not extending throughout the depth of the piston-chamber, substantially as set forth.

3. A rotary piston having its ends provided with grooves or depressions K, to form a water-packing and to prevent sand or other sediment from wedging in between the ends of the piston and the adjacent wall of the meter-shell, for the purpose set forth.



258,198. CRIB. WILLIAM H. FITZWATER, Louisa, Ky., assignor to L. T. McClure, same place, and T. B. McClure, Catlettsburg, Ky. Filed Mar. 11, 1882. (No model.)

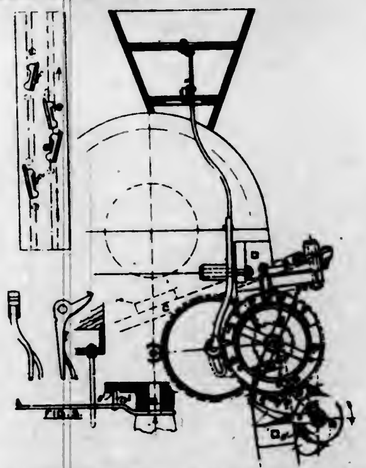
Claim.—1. A folding cradle or crib consisting of the sectional head and foot pieces A A, the series of slats D, forming the bottom and sides, their flexible connections *c*, and the fastening devices whereby the ends of the slats are secured to the sections of the head and foot boards, substantially as specified.

2. The combination, with the sectional hinged head and foot boards having the rocker-sections *b*, of the flexibly-connected series of slats forming the bottom and sides of the cradle, and the fastening devices connecting the ends of the slats to the sections of the head and foot boards, substantially as specified.

258,199. SHUTTER FOR PHOTOGRAPHIC CAMERAS. MATHIAS FLAMMANG, Newark, N. J. Filed Dec. 28, 1881. (No model.)

Claim.—1. The combination, with an opening which occupies, or is adapted to occupy, a position opposite the lens-tube of a photographic camera, of two shutters pivoted independently to a support, and means connected with said shutters for moving them upon their pivots over and past the said opening, substantially as specified.

2. The combination, with an opening which occupies, or is adapted to occupy, a position opposite the lens-tube of a photographic camera, of two shutters pivoted independently to a support and a connection between the shutters, substantially as specified.



3. The combination, with an opening which occupies, or is adapted to occupy, a position opposite the lens-tube of a photographic camera, of two shutters pivoted independently to a support, a connection between the shutters, means for moving said shutters

in one direction, and a spring for moving them in the opposite direction, substantially as specified.

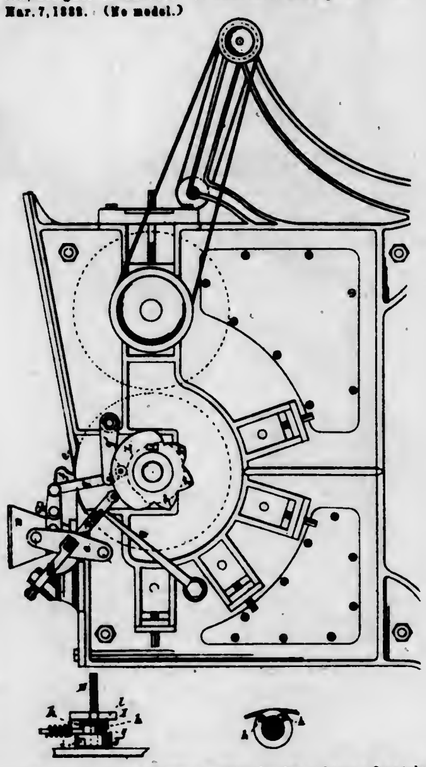
4. The combination, with an opening which occupies, or is adapted to occupy, a position opposite the lens-tube of a photographic camera, of two shutters pivoted independently to a support, a connection between the shutters, means for moving said shutters in one direction, a catch for holding the shutters in a certain position, and a spring for moving the shutters in the opposite direction when the catch is made to release it, substantially as specified.

5. The combination, with an opening in the front of a camera, of two shutters pivoted independently thereto rearward of the face, means connected with said shutters for moving them upon their pivots in one direction, and a spring for moving them in the opposite direction, substantially as specified.

258,200. AUTOMATIC FEEDING AND DISCHARGING MECHANISM FOR HOMINY-MILLS, &c. JAMES GOODYEAR, Yonkers, N. Y., assignor of one-half to Rudolf Hickemeyer, same place. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the mill-chamber, the valves or gates, the cam-wheel for opening and closing said gates, and mechanism, substantially as described, which causes a complete rotation of said cam-wheel for promptly opening and closing said valves, and permits it to rest after each rotation until the completion of operations within the chamber, as set forth.

2. The combination of one or more gate-levers, the cam-wheel, its continuously-rotating driving-gear, a pawl on said cam-wheel for connecting and disconnecting said wheel from its driving-gear, and an automatic stop for controlling and permitting the rotation of said cam-wheel at intervals, substantially as described.



3. The combination of one or more gate-levers, the cam-wheel, its two-fingered pawl, and the automatic stop, substantially as described, whereby the cam-wheel, when permitted to revolve, is limited to a single rotation, as set forth.

4. The combination, with one or more gate-levers, the cam-wheel for moving said levers and a stop for controlling the rotation of the cam-wheel at intervals, a spring for moving said stop in one direction, and a cam on a ratchet-wheel rotated step by step for moving said stop in the opposite direction, substantially as described, whereby during each slow rotation of said ratchet-wheel the cam-wheel is permitted in quicker time to make a single rotation, as set forth.

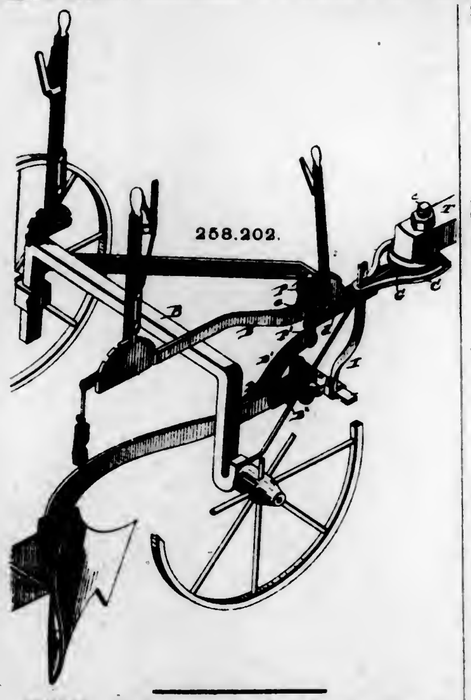
5. The combination, with one or more gate-levers, the cam-wheel, the stop, and the ratchet-wheel which automatically controls said stop, of a continuously-rotating driving-gear and a pawl-lever for said ratchet-wheel, which is adjustable as to the extent of its vibratory movement, substantially as described, whereby the time of rotation of said ratchet-wheel is varied for varying the movements of the stop, and thereby varying the intervals between the rotations of the cam-wheel and the operation of the gate-levers, as set forth.

6. The combination, with the gate-levers and the continuously-driven toothed wheel, of the cam-wheel outside of said toothed wheel, the spring-pawl mounted radially on the cam-wheel, for engaging with said toothed wheel, and an automatic stop for controlling the rotation of the cam-wheel by contact with and releasing said spring-pawl at intervals, substantially as described.

258,201. BRONZING-MACHINE. JOHN W. HEIBER, Chicago, Ill., assignor to Theodore F. Lawrence, same place. Filed Mar. 7, 1882. (No model.)

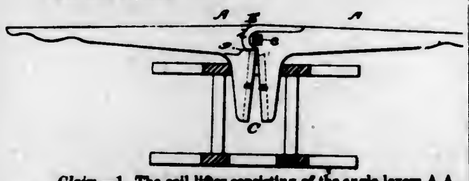
Claim.—1. In a bronzing-machine having a bronze-fountain provided with a longitudinal slot in its bottom, a longitudinal reciprocating agitator located in said fountain, and composed of a shaft and depending fingers, the latter being adapted to move in the slotted bottom of the fountain, substantially as and for the purpose described.

2. In a bronzing-machine, the combination of an agitator arranged in the bronze-fountain to reciprocate in a longitudinal direction with respect thereto, the bronze-pad, and the cross-bar connecting the latter with the agitator, and serving to simultaneously operate both the agitator and the pad, substantially as and for the purpose described.



3. In a bronzing-machine, an agitator located in the bronze-fountain and a bronzing-pad connected with the agitator, in combination with a disk, L, provided with cams *r*, bell-crank lever M, and bar P, substantially as and for the purpose specified.

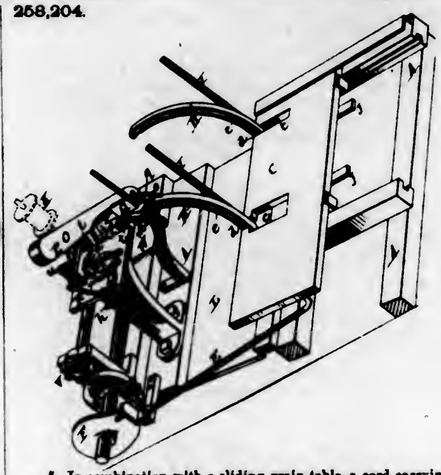
4. The head J of the gripper-shaft of the cylinder C, provided with the slots *i* and *j*, formed as shown and described, in combination with the pins *k* and *k'* upon the frame, whereby the grippers will act quickly when grasping the sheet and will open slowly when releasing the sheet, substantially as specified.



258,202. SULKY-PLOW. JOHN I. HORN, South Bend, Ind. Filed Feb. 20, 1881. (No model.)

Claim.—1. The combination of the clevis E', fixed to the plow-beam, the draft-clevis E and its extension E', pivoted to clevis E', the latch-arm I, the guide G, fixed to pivoted bracket G', and the open heart-shaped catch C, fixed to the pivoted tongue, substantially as and for the purposes described.

2. The combination of the pivoted heart-shaped catch C, having the draft-tongue rigidly secured to it, the guide G, the vibrating catch-arm I, and the pivoted clevis to which this arm is attached, substantially as described.



258,203. GRAPPLE. ANDREW PALM, Lawrence, Kans., assignor of one-half to the Lawrence Plow Company, same place. Filed Mar. 28, 1882. (No model.)

Claim.—1. The coil-lifter consisting of the angle-levers A A, having the bill ends C, meeting each other squarely to form a rounded projection to be inserted in the eye of the coil-spool, and pivoted together through laterally-lapping lugs E, extending beyond the meeting faces of the bill ends, substantially as specified.

2. The coil-lifter having its pivoted angle-levers A A provided at their angular portions with grooves *g* in the lateral shoulders *h* to engage the circular edges *h* of the projecting and lapping lugs E, thereby forming a laterally-braced joint, substantially as specified.

258,204. GRAIN-BINDING MACHINE. JOSEPH E. PRESCOTT, Beaver Dam, Wis., assignor of one-fourth to Richard J. Andrews, same place. Filed Jan. 17, 1882. (Model.)

Claim.—1. In a grain-binding machine, the combination of a sliding grain-table and one or more pivoted arms adapted and arranged to lie down close to the table while receiving grain, but to rise and throw the grain forward as the table advances, substantially as explained.

2. In combination with the sliding grain-table C, one or more pivoted arms, I, each provided with a foot, *f*, and a track or rail, J, located beneath said foot or feet, substantially as shown and described.

3. In combination with a sliding grain-table, a cord-carrying arm pivoted beneath the table and arranged to rise through an opening therein as the table advances.

4. In combination with the sliding grain-table and the cord-carrying arm H, arranged to rise and move forward with the table, the arm H', arranged to operate as and for the purpose explained.

5. In combination with a sliding grain-table, a cord-carrying arm mounted upon a shaft the ends of which are seated and arranged to slide in grooves, substantially as shown and described.

6. In a grain-binder, a cord-carrying arm pivoted beneath the grain-table and arranged to rise through an opening in the same and to move forward, substantially as explained.

7. In combination with the sliding grain-table C, the cord-carrying arm H, pivoted beneath the same and adapted and arranged to rise gradually as the table moves forward, and the arms I, arranged to rise at the commencement of said forward movement and to throw the grain in advance of the cord-carrying arm.

8. In combination with the sliding grain-table C, a pivoted binding-platform, L, and intermediate connections, substantially such as shown and described, whereby the binding-table is caused to fall as the grain-table moves back to its receiving position and to rise as the grain-table advances with a fresh supply of grain.

9. In combination with the rock-shaft S, provided with crank *w* and drum D, the pivoted binding-platform L, and sliding grain-table C, connected respectively with the crank and drum, substantially as and for the purpose explained

10. In combination with the pivoted binding-platform L and means, substantially such as shown, for positively tipping the same, a counter-weight *g*, or its equivalent, connected with the binding-table and adapted to return the same to its normal position when tipped or thrown down.

11. In a grain-binding machine, the combination of a gravitating arm carrying a cutter, and a reciprocating arm arranged, substantially as described, to raise and release the gravitating arm, whereby it is adapted to cut blanks from a strip for the formation of clips, substantially as explained.

12. In a grain-binding mechanism, the combination of a pivoted arm carrying a die, and a reciprocating arm adapted and arranged to elevate and release the die, substantially as described, whereby said die is caused to act upon the clip-blank, as explained.

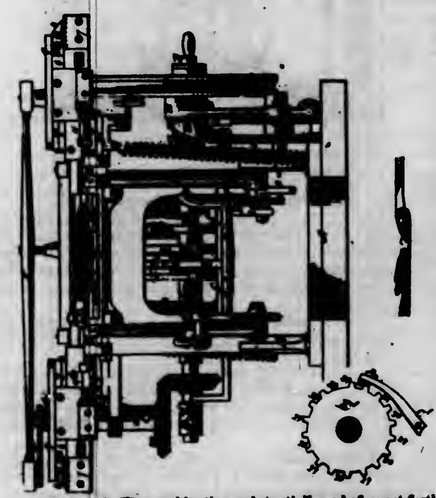
13. In combination with the pivoted arm O, the reciprocating arm H, provided with the inclined rib *e*, and the sliding plate Q, whereby the arm O is raised gradually and permitted to fall suddenly.

14. In a clip forming and applying mechanism, the combination of the formers N, arranged to separate from each other and sustain the ends of the blank, and subsequently to fold the same, and a die or hammer adapted and arranged to act upon the blank before and after the folding operation, first to bend it into U form and afterward to flatten down the ends, substantially as set forth.

15. In combination with the pivoted folding arms or formers N, having beveled lugs at their rear ends, the arm H, provided with a beveled projection to enter between said lugs and throw the forward ends together.

16. In a grain-binder, the combination of grain-table C, arms I, cord-carrying arm H, and clip-applying mechanism adapted and arranged to be actuated by the cord-carrying arm, substantially as shown and described.

17. The herein-described grain-binding attachment, consisting of table C, arms H and I, binding-table L, and their operating mechanism, arm O, provided with a cutter and a die or hammer, and the arms N, adapted and arranged to be actuated by the arms H.



258,205. TRACE-BUCKLE. HOLABIRD E. SHALER, Bluffton, Ohio. Filed Feb. 20, 1880.

Claim.—In a trace or harness buckle, the bail having a tag-bar, two side bars of an inverted-S shape, the subdividing cross-bar at a point past the center, and having a transverse recess or groove, and adapted to slide on the frame, in combination with a frame having its inner end provided with a tongue, substantially as and for the purpose set forth.

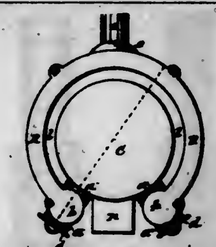
REISSUES.

10,112. KNITTING-MACHINE. WILLIAM H. ABEL, Laconia, N. H., assignor of one-half to E. W. Boardman, Lowell, Mass. Filed June 21, 1881. Original No. 187,696, dated Feb. 27, 1877; Reissue No. 8,778, dated July 1, 1879.

Claim.—1. The combination, substantially as before set forth, of the series of eye-pointed latch-needles, the covering-point, and the rocking bar by which the covering-point is engaged in and is removed from the eyes of the eye-pointed latch-needles.

2. The combination, substantially as before set forth, of the series of eye-pointed latch-needles, the covering-point, the rocking bar, and the pattern-wheel by which the times at which the rocking bar is operated are determined.

3. The combination, substantially as before set forth, of the series of eye-pointed latch-needles, the covering-point, the back sinker-bar, by whose action a loop is moved from an eye-pointed latch-needle to a covering-point, and the front sinker-bar, by whose action a loop is moved back from a covering-point to an eye-pointed latch-needle.



4. The combination, substantially as before set forth, of the series of eye-pointed latch-needles, the covering-point, the back sinker-bar, the front sinker-bar, and the pattern-wheel, by which the times at which the covering-point and sinker-bars are to operate are determined.

5. The combination, substantially as before set forth, of the series of eye-pointed latch-needles, the covering-point, the back sinker-bar, the front sinker-bar, the needle-bar, and the slide by which the needles of the end of the series are depressed and raised.

6. The combination, substantially as before set forth, of the series of eye-pointed latch-needles, the covering-points, the back sinker-bar, the front sinker-bar, the needle-bar, the slide by which the needles at the end of the series are depressed and raised, and the pattern-wheel, by which the times at which said needles are successively depressed are determined.

10,113. HOT-AIR FURNACE. JOHN F. PEASE, Syracuse, N. Y. Filed Mar. 13, 1882. Original No. 183,337, dated July 18, 1877.

10,113.

Claim.—1. In combination with the combustion-chamber C, the radiator R, consisting of two segments of cylinders of different diameters arranged concentrically side by side, united at the ends, and closed at the top and bottom, and communicating with the interior of the combustion-chamber at or near the feed-door, and provided with an exit for the products of combustion, substantially as set forth.

2. In combination with the combustion-chamber C, the radiator R, arranged around the exterior of the combustion-chamber, and consisting of two segments of cylinders placed concentrically side by side, closed at the top and bottom, and terminating with cylindrical enlargements *b b*, a flue extended from the cylinder *b* to the combustion-chamber, and an exit, *c*, in the radiator for the escape of the products of combustion after their circulation through said radiator, as set forth.

3. In combination with the combustion-chamber C, the radiator R, consisting of a deep narrow segmental flue arranged around the exterior of the combustion-chamber and communicating therewith, and the cleaning-flues *a a*, connected to the base of the radiator and provided with removable covers *d d*, as and for the purpose set forth.

4. The combination of the radiator R, constructed of two segments of cylinders of different diameters arranged concentrically side by side, united at the ends, and closed at the top and bottom by segments of annular plates, the horizontal flues *a a*, and interior passages formed by bridges *f*, substantially as shown and described.

5. The combination of the radiator R, constructed of two segments of cylinders of different diameters arranged concentrically side by side, and closed at the top and bottom by segments of annular plates, and formed with cylindric enlargements *b b* at its ends, the horizontal flues *a a*, and bridges *f*, all constructed and combined substantially in the manner described and shown, for the purpose set forth.

10,114. TOY LOCOMOTIVE. WILLIAM S. REED, Leominster, Mass., assignor to W. S. Reed Toy Company, same place. Filed Feb. 3, 1882. Original No. 183,466, dated July 24, 1877.

Claim.—1. A knockdown or combination toy vehicle mounted on wheels, in which one portion serves as a box or receptacle for containing the other detached portions thereof, substantially as set forth.

2. A knockdown toy mounted on wheels, in which one portion serves as a box or receptacle for the remaining detached portions of the toy, as set forth.

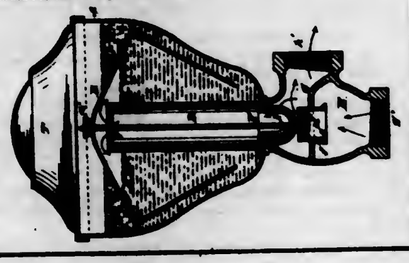
10,115. HAND-PIECE FOR DENTAL ENGINES. THOMAS S. PHILLIPS, Buffalo, N. Y., assignor, by mesne assignments, to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Jan. 11, 1882. Original No. 210,872, dated Sept. 23, 1879.

Brief.—A gripping spring-jawed rotating tool-holder is operated to look the tool through cam mechanism and suitable connections.

Claim.—1. The combination, substantially as herein before set forth, of the hollow spindle fitted to turn in an inclosing-casing, the gripping tool-holder contained within said spindle, and cam mechanism to give a longitudinal motion to the tool-holder.

2. The combination, substantially as herein before set forth, of the hollow spindle fitted to rotate in bearings in an inclosing-casing, a gripping tool-holder contained within said spindle, cam mechanism to give said tool-holder a slight longitudinal motion in one direction, and a spring to move said holder in the opposite direction.

10,116.

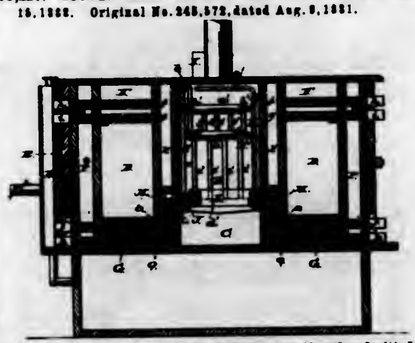


3. The combination, substantially as hereinbefore set forth, of a tubular casing having an opening in its side, a hollow spindle enveloped by said casing, a gripping or split tool-holder contained within said spindle, and a turning sleeve mounted externally upon the casing to move said tool-holder endwise in the spindle through intermediate connections, substantially as described.

4. A hand-piece having a chamber at the nose or front end thereof, said chamber being formed by the extension of the front section of the casing or nose-piece beyond the end of the tool-carrying spindle and its approach to without bearing upon the tool, substantially as described.

5. The combination, substantially as hereinbefore set forth, of the casing, the hollow spindle fitted to rotate in bearings in said casing, the gripping tool-holder contained in said spindle, and a detent mounted upon the casing and acting therethrough to prevent rotation of said spindle when the tool-holder is being operated.

10,116. GAS-REGULATOR. NATHANIEL SLENMAN, Birmingham, assignor, by mesne assignments, to National Gas Saving Company, Ansonia, Conn. Filed Apr. 17, 1882. Original No. 219,290, dated Sept. 23, 1879.



Claim.—1. In a gas-regulator, the combination, with the shell A, of the conical-sided and arch-topped float B and the annular valve C, mounted on rod F, located longitudinally of tube D, which has orifice *h'*, and having inwardly-beveled upper rim and sloping exterior flange on lower rim, to fit respectively on valve-seats on lower end of said tube D and in aperture *f'* of diaphragm G of globe E, substantially as and for the purpose specified.

2. In a gas-regulator, the combination of a shell, A, float B, tube D, stem F, and globe E, having diaphragm G, of the double annular valve C, substantially as described.

3. In a gas-regulator, the combination, with a float B, hemispherically-pointed tube D, provided with orifice *h'*, and diaphragm G, provided with aperture *f'*, of the annular double valve C, substantially as described.

10,117. STOVE. JAMES G. SMITH, Cleveland, Ohio. Filed Apr. 15, 1882. Original No. 245,572, dated Aug. 9, 1881.

Claim.—1. In a stove in which steam is directly admitted to the articles to be cooked, a steam generator and superheater located in the fire-chamber, in combination with an oven and means of communication, whereby steam generated by the heat of the stove fire is superheated by the same and is then passed to the oven, as set forth.

2. Steam-generator J, superheater K, and distributer L, in combination with oven D and means, substantially as described, for connecting the same, as set forth.

3. In a stove or range arranged for a greater or less supply of superheated steam, as required, two generators and a superheater connected to one of them, and means, substantially as described, whereby one of the generators can be converted into a superheater, as set forth.

4. The combination of the generator J, reservoir E, tank I, force-pump B', superheater K, distributer L, and means for conducting steam from the distributer to the pipe leading up into the building, as set forth.

5. A stove or range having as part of its structure a water-supply chamber and pump, as set forth.

10,118. MILLSTONE-DRIVER. LEWIS P. WEARSE, Jr., New Harmony, Ind. Filed Apr. 12, 1882. Original No. 252,557, dated Jan. 17, 1882.

Claim.—The combination of the L-shaped ring or band A, provided with the dowel-pins B, the top plate, C, the pivotal bolts D, and the driver G, made in two parts and having their ends bear against each other, so that the slightest movement of one part will react upon the other, substantially as described.

THE HELIOTYPE PRINTING CO 211 TREMONT ST BOSTON.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of Illinois.

GRAHAM v. MCCORMICK *et al.*

Decided March 13, 1869.

1. CONTINUOUS APPLICATION—PUBLIC USE.

Where a second application is filed for a certain part of an invention disclosed in a prior application the two applications will be regarded as a continuous proceeding, and public use of the invention, to defeat a patent granted upon such second application, must be shown to have occurred more than two years prior to the first application.

2. PUBLIC USE—EXPERIMENTAL USE AND SALE.

The law permits an inventor to make practical tests of his invention, and when an invention is used in public in the way of experiment or trial, or when a machine is sold on trial and warranted, it is not such a public use or sale as is contemplated by the statute.

3. TWO PATENTS FOR PARTS OF SAME INVENTION.

Where a person has within the meaning of the patent law made an invention which he has described in specifications, including other matter of invention, for which last a patent has been issued, he should not be precluded for that reason alone from applying for and obtaining a patent for that which was not claimed in the first patent.

4. LEGAL TITLE—EQUITABLE INTEREST NOT EXAMINED COLLATERALLY.

The legal title to the patent being in the plaintiff, it constitutes no defense to the action to make a showing of equitable interests in other parties.

5. IMPROVEMENT IN HARVESTERS—NOVELTY.

The Ball patent and the Zug machine examined and *Held* not to anticipate the combination in controversy.

Messrs. Banning & Banning for the complainant.

Mr. E. N. Dickerson, *Mr. M. D. Leggett*, and *Messrs. Offield & Towle* for the defendants.

[This case was argued before the circuit judge and Judge Dyer of the eastern district of Wisconsin, the parties having requested the latter to sit with the circuit judge in this case, inasmuch as a case involving the same questions under the patent had been heard by him at Milwaukee and was yet undecided. Judge Dyer did not officially sit in this case, but he heard the arguments and participated in the consultation, after which the following opinion was delivered, which, although given by the circuit judge, may be regarded as the joint opinion of both.]

DRUMMOND, *J.*:

This is a bill filed by the plaintiff as assignee of A. B. Graham, to whom a patent was issued on the 11th of February, 1868. The controversy arises only upon the first and second claims of that patent. Various objections have been made to the patent and to the right of the plaintiff to maintain suit thereon.

It is objected by the defendants that the Graham patent is invalid because the invention was in public use and on sale for more than two years prior to the application for a patent. The first conception in the mind of the patentee seems to have been in the winter of 1862-'3, and during the year 1863 he made an arrangement with certain parties under which some machines were constructed containing his invention, which, however, proved unsuccessful. Under an arrangement made with another person in the following year several other machines were constructed, parts of the old machines of 1863 being used in the construction of some of the new ones. Conditional sales were made of some of these machines, and with a few of them some grass or grain was cut. They were continually getting out of repair and could not be regarded as a success, and in some instances where money had been paid for the machines it was refunded in whole or in part. It is insisted on the part of the defendants that these facts constituted a sale and use of the invention for more than two years prior to the application for the patent, while on the part of the plaintiff it is claimed that it was nothing more than testing by experiment in various ways whether the invention was successful.

In order to a proper understanding of this part of the case it is necessary to consider the history of the application for the patent. That was first made on the 25th of February, 1864, by being placed in the hands of solicitors in New York, to be by them presented to the Patent Office. The application, however, for some unexplained reason, was not in fact filed there until the 2d of December, 1865. The patentee claims that instructions were given to the solicitors to file the application at once, and he supposed that it was so filed. It contained five claims, the first of which embraced the invention now in controversy. On the 30th of December, 1865, the first three claims were rejected, an offer being made at the time to allow the other two claims. This offer was not accepted, and on the 24th of March, 1866, an amended claim was filed in place of the first rejected claim. It is understood that this referred to the invention now in controversy. On the 4th of April, 1866, this claim was rejected. On the 11th of February, 1867, the first application being still pending, with the action of the Patent Office as stated, a second application was filed, containing, among others, the two claims now in suit. In June, 1867, the claims which embraced the invention now in controversy were withdrawn from the first application, and on the 23d of July, 1867, a patent was issued on the first application. As issued, that patent did not include the invention now in suit. A patent for the invention in controversy now was issued on the second application on the 11th of February, 1868. A description of the invention now under consideration was contained in the original specifications and drawings which accompanied the first ap-

plication. It is claimed by the plaintiff that under this state of facts the application for the patent embracing this invention, for the purpose of fixing the time when the two years should begin to run, should be considered as having been made on the 25th of February, 1864, when the patentee's first application was put in charge of his solicitors; or, if that be not so, that it should be considered as made when that application was filed in the Patent Office on the 2d of December, 1865, so that the two years would embrace the years 1864 and 1865. On the other hand, it is contended by the defendants that the two years began to run on the 11th of February, 1865, because the second application, upon which the present patent was issued, was filed on the 11th of February, 1867, and that the connection between the first and second applications was effectually broken under the circumstances, so that the two applications could not be considered one continuous proceeding.

The rule is well understood that if an invention has been in public use or on sale with the knowledge and consent of the inventor more than two years before his application for a patent, it will render the patent invalid; but it is clear that, in order to determine whether the case is within the rule, we must consider whether the particular devices which the inventor claims to have invented were perfect, so that they embodied a complete invention. We have some doubts, even upon the theory that the two applications should be considered as parts of one and the same proceeding, whether the patentee's first application can be regarded as made, within the meaning of the law, at the time it was placed in the hands of his solicitors, in February, 1864; but we think, under the circumstances which attended the efforts of the patentee to obtain a patent, together with the connection which the second application seems to have with the first, that, for the purpose of fixing the time when the two years began to run, the second application should be treated as a continuation of the first, and that both are part of one preceeding. In this respect this case is not wholly unlike that of *Smith* v. *Goodyear Dental Vulcanite Company*, (93 U. S., 500,) where the court held that the effort to obtain a new patent in 1864 ought not to be regarded as disconnected from the original application made in 1855, and that it was but one stage in a continuous effort. It is true in this case, unlike that, a patent was granted on the first application covering the claims which were not rejected, and the patent in suit was granted on the second application; but the subject-matter of the second application was embraced in the first, and the invention now in controversy was described in the specifications and the drawings which constitute part of the first application, and we think it may be said that the continuity of the proceeding which originated in the first application was not broken up to the time when the patent for the invention in suit was granted in 1868. See, also, *Blandy* v. *Griffiths*, (3 Fisher, 616.) In view, therefore, of the circumstances under which Graham made his second application and withdrew from the first the claims covering the invention now in suit, we cannot say that the proceeding should be severed so as to make the two years date back from the 11th of February, 1867, and we think that the two years within which the invention could be sold and publicly used without invalidating the patent began to run on the 2d of December, 1863, which was two years prior to the filing of the first application. It is manifest that the only machine made in 1863 which is distinctly proved to have been sold was delivered on trial and warranted, and should be regarded rather in the light of a use of the invention for such practical tests as the law permits an inventor to make than as such a public sale or use as is contemplated by the statute. At that stage of the inventor's work his invention was largely in experiment and trial. It could only be tested by practical use in the field, and it was essential that it should be so tested by farmers on their farms. The inventor was then struggling, as inventors often do, to establish the success of his invention. It was necessary that thorough experimental tests should be made and that he should have the assistance of others in making them, and it is manifest, we think, that the machines of 1863 were not yet so perfected as to be practical machines capable of successful work.

In the light of all the testimony we conclude that what was done by the patentee with reference to the use of the machines in 1863 was intended by him, and was, in fact, for the purpose of experiment and as a test of the machines with a view to their perfection. This part of the defense rests upon a claim of forfeiture of rights secured by the patent. To justify the court in sustaining it the proof should be clear and satisfactory. The right of the infringer to invalidate the patent for this cause should be undoubted. And in view of these considerations we think the patent should be held valid against this objection.

It is insisted further by the defendants that the plaintiff's patent is invalid because the first application for a patent included the invention which is the subject of the two claims in controversy covered by the patent of 1868; and because that invention was not allowed in a previous patent, but the previous patent was issued for other claims, that the second patent, of 1868, is inoperative. And it is said that instead of there being a new patent issued in the case there might have been a reissue of the original patent. And it is also insisted that the second patent was issued for something in addition to what was claimed in the previous patent, which claim was rejected, and the second patent is invalid on that account.

Admitting the facts to be as stated by the defendants, is the conclusion drawn from them correct? We think it is not. It was not a proper case for a reissue. There was no defective or insufficient specification. The inventor had not claimed more than he had a right to claim as new. The case as it is put is one where there was the description of an invention which was not claimed, the claims in controversy here having been withdrawn, and where we must assume that the person was entitled to a patent inasmuch as the Office subsequently granted him a patent for the invention described. On general principles, we think that where a person has within the meaning of the patent law made an invention which he has described in specifications, including other matters of invention, for which last a patent has been issued, that he should not be precluded for that reason alone from applying for and obtaining a patent for that which was not claimed in the first patent. The object of the patent law was to protect a party who made an invention which was useful, provided he complied with the terms of the law and a patent issued for the invention; and unless there is something in the law which declares a patent issued under such circumstances to be invalid, it is the duty of the courts to sustain a patent for an invention thus made. It is to be borne in mind that the application for the second patent, that of 1868, the one in controvery here, was made while that for the previous patent was pending, and before the prior patent had been issued. There were thus pending before the Patent Office two applications at the same time, where the claims were different, and we understand it to be in accordance with the practice of the Patent Office to allow applications to be made at the same time by the same party for different parts of the same machine.

It is also insisted by the defendants that the plaintiff cannot maintain the suit because the inventor had not the right to assign to him the whole interest in the invention under the patent of 1868.

On the 25th of November, 1865, A. B. Graham, the inventor, made a contract with W. B. & C. A. Werden that they should have the exclusive right to manufacture and sell the improvement in the machine, and that that right should continue until the patent about to be applied for expired, and Graham agreed that before the letters patent should issue for the invention he would make such necessary assignment that the patent might issue to all the parties jointly, each to have an undivided one-third interest therein. It will be observed that this was not of itself an assignment, but only an agreement to assign. On the same day that this contract was made what purported to be an assignment was executed by Graham. It stated that, whereas Graham himself and the Werdens had agreed to purchase from Graham all the right, title, and interest which he had in the invention through the grant of the letters patent therefor, therefore he, Graham, assigned to himself and the Werdens the full and exclusive right to said invention of all the improvements made by him, as fully set forth and described in the specification which he had prepared for the purpose of obtaining a patent. The circumstances connected with the application and obtaining the respective patents have been already stated. On the 23d of July, 1867, in pursuance of the contract and assignment already referred to, letters patent were issued to Graham and the Werdens. That patent is not the subject of controversy here. On the 11th of February, 1868, a patent was issued, which included the two claims in controversy here, to A. B. Graham alone. It is claimed by the defendants that these facts show that A. B. Graham could not assign to the plaintiff a right to enable him to maintain this suit in his own name on the patent of 1868.

The evidence tends to show that a controversy arose between A. B. Graham and the Werdens as to the contracts of November 25, 1865. The former insisted that the Werdens had not complied with their contract, and from that or some other cause there seems to have been no additional assignment made to the Werdens of any interest in the patent of 1868, and, as already stated, that patent was issued to Graham alone. We think that upon this state of facts, there being no controversy about the validity of the assignment by A. B. Graham to the plaintiff of the patent of 1868, the plaintiff must be considered as having the legal title to that patent, and consequently has the right to maintain this suit in his own name. Whatever equities there may be between the parties to the contract of November, 1865, can be adjusted in a controversy between themselves or their legal representatives. We do not think that the defendant can claim that the facts stated constitute a defense to this action.

The two claims of the Graham patent which are alone in controversy here are the first and second. The first claim is for a combination of the finger-beam with the gearing-carriage by means of the vibratable link, the draft-rod, and the two swivel-joints M and M', so that the finger-beam may both rise and fall at either end and rock backward and forward; and the second claim is the same as the first with this only added, that an arm is attached to the vibratable link, by which the rocking of the finger-beam is controlled by the driver. The object of this invention as set forth in these two claims seems to be mainly to produce the rocking motion of the finger-beam as described and by the method described. In the Ball patent, while there may be said to be something equivalent to the swivel-joint M of the plaintiff's machine where it is attached to the frame, and also something similar to the draft-rod and the arm, there is nothing to produce the rocking motion, which is the essential object in the first two claims of the plaintiff's machine, and consequently there is no swivel-joint M', as in the plaintiff's machine, so that there is nothing in the Ball machine to prevent the validity of the combination in the first two claims of the plaintiff's patent. The Zug machine has, if not a swivel-joint like that of plaintiff's at M, where connected with the frame, something which seems substantially similar. It has a vibratable link, and it has something which is equivalent to the draft-rod, the main difference being that it is attached beneath the shoe instead of above, but there is no swivel-joint M'. There is an arm which is attached to the draft-rod and shoe, by which it can be raised and lowered; but Zug claims in his patent that when the machine is in progress over the field, and when the finger-bar strikes any obstacle, there is a device in a box in which the forward part of the draft-rod is fastened by which the finger-bar yields to the obstacle, and that there is also a mode by which the vibratable rod is attached to the frame, called "joint 16," in his patent, and what has been termed an "open clevis" where the vibratable link is connected with the draft-rod, by which a motion is given to the finger-bar, and thus the finger-bar is relieved from the obstacle. Zug does not claim that the finger-bar in his machine has a rocking motion, but only that the mode by which the draft-rod is fastened and the motion given to the finger-bar prevents the obstacle which the machine may meet from doing damage to it. These seem to be the main differences between the two machines, and the question is, whether there is anything in the Zug machine to prevent the combination named in the first two claims of the plaintiff's patent from being valid.

The defendants' machine has the swivel-joint attached to the frame, the vibratable link in the same form as the plaintiff's, and the draft-rod attached forward in substantially the same way as the plaintiff's; but instead of having a swivel-joint at M', as stated in plaintiff's machine, forward of the shoe, the draft-rod has a swivel-joint at the rear end of the shoe, and there is an arm attached to a part of the vibratable link substantially like that of the plaintiff's; and the substantial difference, as it seems, between the plaintiff's device as described in the first and second claims and that of defendants' is that the draft-rod is attached to the rear part of the shoe, and not to the forward part, as in the plaintiff's patent. There are also other devices in the defendants' machine which may make it different from the plaintiff's; but as to the swivel-joint, the vibratable link, and the mode in which the motion is produced in the finger-bar there does not seem to be much difference in substance, and in both machines and by substantially the same means there is produced a rocking motion.

In this connection it is noticeable that the defendants, in the claims set forth in their specifications, make a rocking motion of the shoe and cutter a feature of their combination. In their second claim they say that they claim the combination of the—

> Shoe and the drag-bar extending over and in rear of the shoe, and its swivel-pin connecting it with the rear end of the shoe, whereby the drag-bar sustains the thrust of the shoe while leaving it free to rock on its hinges.

Again, in their fifth claim, they say that they claim the combination—

> Of the shoe, the forked coupling-arm, the drag-bar extending over and in rear of the shoe, the swivel-pin connecting the two, the rocking-lever and detent mounted on the drag-bar, and the adjustable link-connection between the lever and the coupling-arm, whereby the shoe readily may be rocked or adjusted.

And again, the motion which seems to be produced in the operation of plaintiff's machine is more distinctly described in the seventh claim made by the defendants in their patent, as follows: The combination "of the shoe, the drag-bar, the forked coupling-arm," and the other elements of mechanism before mentioned, "whereby the shoe is first rocked and then lifted by one continuous movement of the lever."

It must be confessed that the difference between the Zug machine and the first two claims of plaintiff's patent is not very marked; but in view of the description contained in the specifications of Zug's patent and in those of the plaintiff's patent, we are inclined to think that the plaintiff's patent may be sustained on the ground that there is a difference in the manner in which the draft-rod is attached to the shoe and the finger-bar to the shoe and to the vibratable link, and that there is also a difference in the manner in which the combination of the various parts are adjusted, and that there is an effect produced in the plaintiff's machine which does not exist in the Zug machine. In the plaintiff's machine there is a rocking motion, and not a mere vibratory motion, such as exists in the Zug machine in consequence of the open clevis. Neither is there in the plaintiff's machine the yielding of the draft-rod as described in the Zug patent; and it is obvious, too, that from the manner in which the parts are constructed in the Zug machine there is only a small vibratory action of the finger-bar, so that, on the whole, we think that the combination as described in the plaintiff's patent may be sustained.

Then, from what we have said, we do not see that there can be any substantial difference between the combination, as described in the plaintiff's machine, of the swivel-joints, draft-rod, and vibratable link with the frame and shoe and finger-bar, and that of the defendants' machine. The differences which have been stated between the two machines in this respect do not constitute any difference in principle. The one is substantially the same thing as the other. The additions which have been made to the defendants' machine, such as the device by which the pressure of the cutting apparatus upon the ground is regulated, and other devices which have been made, do not affect the combination

as claimed in the plaintiff's machine. The attachment of the draft-rod to the rear part of the shoe, instead of to the front part, which is substantially the only difference that there seems to be in the mode of construction, cannot constitute a difference in principle, and cannot prevent the defendants' machine from being an infringement of the plaintiff's patent.

It may be said that there are differences also between the defendants' machine and that of the plaintiff in the manner in which the arm is attached to the vibratable link, and also as to the mode in which the force applied to the arm may operate upon the finger-bar; but these are differences of form and not of substance.

U. S. Circuit Court—Eastern District of Wisconsin.

GRAHAM v. THE GENEVA LAKE CRAWFORD MANUFACTURING COMPANY.

Decided October 11, 1880.

1. GRAHAM v. MCCORMICK FOLLOWED.
   The rulings in *Graham* v. *McCormick* upon the validity of the patent and title of plaintiff approved and adopted.
2. INFRINGEMENTS—EQUIVALENTS.
   The various parts of the defendant's machine exhibit mechanical parts equivalent to those in complainant's machine and produce the same result, and therefore infringe, notwithstanding the two machines in various particulars are unlike in form.

Messrs. Banning & Banning for the complainant.

Messrs. Flanders & Bottum for the defendant.

DYER, *J.:*

This is a bill in equity to restrain the alleged infringement of a patent issued to Alvaro B. Graham, February 11, 1868, for an improvement in harvesters. The complainant is assignee of the patentee, and there are involved in the present controversy the first and second claims of the patent. These claims are as follows:

1. The combination, as set forth, in a harvester, of the finger-beam with the gearing-carriage by means of the vibratable link, the draft-rod, and the two swivel-joints M and M', so that the finger-beam may both rise and fall at either end and rock forward and backward.
2. The combination, as set forth, in a harvester, of the finger-beam, gearing-carriage, vibratable link, draft-rod, swivel joints and arm, by which the rocking of the finger-beam is controlled.

Several defenses are interposed, but before passing to their consideration it may be well to state that the validity of the patent was involved in the case of *Graham* v. *Gammon*, (7 Biss., 490,) and has also since been passed upon in the northern district of Illinois in the case of *Graham* v. *McCormick et al.*, (unreported,) which was heard by the circuit judge and the district judge by whom the present case is decided, sitting together; and most of the questions here involved have been passed upon, after most elaborate argument in the McCormick case.

Further, as preliminary to the consideration of the grounds of defense urged by the defendant, it is important to state, as part of the history of this patent, that the application for the patent was first made February 25, 1864, by placing it in the hands of solicitors in New York, to be by them presented to the Patent Office. The application was not, however, in fact filed until December 2, 1865. In its original form it contained five claims, the first of which related to the invention now in suit and the last four to other improvements. The first three claims were rejected by the Patent Office December 30, 1865, and an offer was then made to allow the other two claims. This offer was not accepted, and an amended claim was filed March 24, 1866, in place of the first rejected claim. This claim, which had reference to the invention now in controversy, was rejected April 4, 1866. While the first application was still pending, and on the 11th of February, 1867, a second application was filed, containing, among other things, the two claims now in suit. In June, 1867, the claims which embrace the present invention were withdrawn from the first application and a patent was issued on that application July 23, 1867; but that patent did not include the invention now in question. A patent for that invention was issued on the second application February 11, 1868. The original specifications and drawings, which accompanied the first application, contained a description of the invention now under consideration.

It is insisted, first, that complainant's patent is invalid because previous to its issuance the patentee had procured a patent to himself and others as his assignees in the specifications of which the invention now in question was delineated and described, and that therefore the prior patent (meaning the patent of 1867) can be reissued so as to cover all that was invented by the applicant for the patent in suit, and also that the inventor, A. B. Graham, prior to his application for the patent of 1868, applied for the patent of 1867, in which application he set forth, but did not claim, the invention now in controversy, and that by his failure at that time to make such claim he impliedly admitted his device to be old, and was thereby estopped from afterward claiming the same to be new in any subsequent application. In the McCormick case the court had occasion to consider this objection, and it was held untenable. It was there decided that it was not a proper case for reissue, that there was no defective or insufficient specification, and that the inventor had not claimed more than he had a right to claim as new. In the opinion delivered by Judge Drummond it is said:

> On general principles, we think that where a person has within the meaning of the patent law made an invention which he has described in specifications, including other matters of invention, for which last a patent has been issued, that he should not be precluded for that reason alone from applying for and obtaining a patent for that which was not claimed in the first patent. The object of the patent law was to protect a party who made an invention which was useful, provided he complied with the terms of the law and a patent issued for the invention; and unless there is something in the law which declares a patent issued under such circumstances to be invalid it is the duty of the courts to sustain a patent for an invention thus made. It is to be borne in mind that the application for the second patent, that of 1868, the one in controversy here, was made while that for the previous patent was pending and before the prior patent had been issued. There were thus pending before the Patent Office two applications at the same time where the claims were different, and we understand it to be in accordance with the practice of the Patent Office to allow applications to be made at the same time by the same party for different parts of the same machine.

In this connection, and as bearing upon this question, I refer to *McMillan et al.* v. *Rees et al.*, (17 O. G., No. 21, 1222.)

The further ground of defense is urged that the patent in suit is invalid because the alleged invention was with the inventor's consent and allowance in public use and on sale for more than two years prior to his application for a patent therefor. This defense was also interposed in *Graham* v. *McCormick*, *supra*, and we had occasion there to consider it. It was there held that for the purpose of fixing the time when the two years began to run the application for the patent in suit should be treated as a continuation of the first application, filed December 2, 1865, and that "the continuity of the proceeding which originated in the first application was not broken up to the time when the patent for the invention in suit was granted in 1868." From this conclusion it would follow that the two years within which the invention could be sold and publicly used without invalidating the patent began to run December 2, 1863, which was two years prior to the filing of the first application.

Some testimony bearing upon the defense under consideration has been taken in the case at bar, and in addition thereto by stipulation the testimony upon the same subject taken in the case of *Graham* v. *McCormick* has been submitted.

The only machine made in 1863 by Graham, the inventor, which is clearly proved to have been sold was delivered on trial, and the transactions of the inventor in that year, by which his then unperfected invention was brought into notice, as was stated by the court in *Graham* v. *McCormick*—

> Should be regarded rather in the light of a use of the invention for such practical tests as the law permits an inventor to make than as such a public sale or use as is contemplated by the statute. At that stage of the inventor's work his invention was largely in experiment and trial. It could only be tested by practical use in the field, and it was essential that it should be so tested by farmers on their farms. The inventor was then struggling, as inventors often do, to establish the success of his invention. It was necessary that thorough experimental tests should be made and that he should have the assistance of others in making them; and it is manifest, we think, that the machines of 1863 were not yet so perfected as to be practical machines, capable of successful work.

I am aware of the opinion of Judge Lowell in *Henry* v. *The Francestown Soap Stone Stove Company*, (17 O. G., No. 10, 569,) and of his disagreement with Judge Shepley, who delivered an opinion in the same case, reported in 9 OFFICIAL GAZETTE, 409; but upon consideration of all the testimony I conclude that what was done by the patentee, Graham—

> With reference to the use of the machines in 1863 was intended by him and was in fact for the purpose of experiment and as a test of the machines with a view to their perfection. This part of the defense rests upon a claim of forfeiture of rights secured by the patent. To justify the court in sustaining it the proof should be clear and satisfactory; the right of the infringer to invalidate the patent for this cause should be undoubted.

I must hold this defense insufficient to invalidate the patent.

Attack has been made upon complainant's title to the patent in question, and therefore upon his right to maintain this action.

In November, 1865, the inventor, A. B. Graham, made a contract with W. B. & C. A. Werden, granting to them the exclusive right to manufacture and sell the improvement in the machine in question, and providing that such right should continue until the patent about to be applied for should expire. By this contract Graham also agreed that before a patent should be obtained he would make such an assignment to the Werdens as would secure an issuance of the patent to all three of the parties jointly, each to have an undivided one-third interest therein. This, of course, was merely an agreement to assign, but at the same time—viz., November 25, 1865—an assignment was executed by Graham to the Werdens, by which the full and exclusive right to the invention described in specifications then prepared and executed preparatory to obtaining letters patent was granted to the Werdens, the same to be held and enjoyed by them "to the full end of the term for which the said letters patent may be granted, as fully and entirely as the same could have been held and enjoyed by him (Graham) if this assignment and sale had not been made." This, it is to be observed, occurred before either the first or second patent was obtained. It is nevertheless contended that the language of this assignment is so broad as to vest in the Werdens an interest in the invention covered by the patent of 1868, and therefore that the present action cannot be maintained by complainant. It is also to be observed that the patent of 1868 was issued to Graham alone, and that there was thereafter no further assignment of any interest in that patent made to the Werdens. There is evidence tending to show that the contract before referred to, made between Graham and the Werdens, was virtually abandoned by the latter, and that a controversy arose between the parties, which has ever since existed, upon the question as to whether the Werdens have not forfeited their rights and interest in even the patent of 1867. It is evident that there is a serious controversy between the parties upon that question, and without here determining what are its precise merits and what are the rights of the Werdens, if any, in either the patent of 1867 or 1868, I am of opinion, as was the court upon the same question in *Graham* v. *McCormick*, *supra*, that "whatever equities there may be between the parties to the contract of November, 1865, can be adjusted in a controversy between themselves." And as the patent of 1868 was issued to Graham alone, and as no additional assignment of any interest was thereafter made to the Werdens, and since, in view of the controversy between these parties, grave doubts may well exist as to whether the Werdens can claim any interest in the invention covered by that patent, I am of opinion that such controversy and doubt ought not in this suit to be resolved in favor of the Werdens, especially as the present objection comes from a third party, the present defendant, who is claimed to be an infringer of the patent.

The defendant further insists that the idea or principle involved in the patent in suit, and which is developed in a combination which enables the finger-beam of the harvester to both rise and fall at either end and rock forward and backward, is old, and is shown in the following letters patent, to wit: The Dolph patent, issued in 1857; the Zug patent, issued in 1859; the Dodge patent, issued in 1865; the Bartlett and Dodge patent, issued in 1862; the De Witt patent, issued in 1862; the Ball patent, issued in 1859; the Aultman patents, issued in 1858 and 1859; the Bramer patent, issued in 1865; the Ray and Grant patent, issued in 1865, and the Russell patent, issued in 1861. Of these the Dolph, the Zug, the Ball, and the Bartlett and Dodge patents were considered by Judge Blodgett in *Graham* v. *Gammon*, *supra*, and were held by him as not embracing the Graham device or combination. The Ball and Zug machines were also severally considered by the court in the case of *Graham* v. *McCormick*, *supra*, and it was there held that there was nothing in either of those machines to prevent or invalidate the combination named in the first two claims of complainant's patent; and by the conclusions thus arrived at in those cases with reference to these several patents I feel bound.

The Aultman patents, the last of which was a reissue, do not anticipate the Graham invention, because they do not, I think, provide for any rocking motion. They only provide for a movement by which the finger-bar may be raised and lowered at either end or folded over for transportation; and I cannot, from the specifications and drawings, find that they contain the Graham swivel-joints or the arm for rocking the finger-bar. The same must be said of the De Witt device, which is one for raising and holding a flexible cutter-bar so as to pass over an obstruction, and at the same time allow it to fall below the level of the wheels, and to render it firm, so that it cannot be depressed at any point of its elevation. The rocking feature, which is the essential element of the Graham machine, is wanting.

The nature of the Dodge invention, as stated in his specifications—

> Consists in a novel manner of constructing the main frame of the machine and of the arrangement of the gearing in connection therewith. It further consists in a novel arrangement of the devices for lifting the cutting apparatus, and also in a self-adjusting pair of pulleys to be used in connection with the reel.

I do not perceive that this patent can be regarded as at all anticipating or limiting the Graham claims now in suit.

In the Russell machine the finger-bar may be raised and lowered; but the character of the mechanism in respect of arrangement of parts is such, so far as I can judge, as to deprive the finger-bar of a rocking motion. I cannot discover that the drawings show either the swivel-joints in Graham's machine or the arm for controlling the motions of the finger-bar. Nor do I think that the Graham machine is anticipated by either the Ray and Grant patent or the Bramer patent.

The remaining, and, as I consider, the most important question in this case is, does the defendant's machine infringe complainant's patent?

The Graham invention, as it is covered by the first claim, consists of a combination composed of six parts, namely: the gearing-carriage, finger-bar, vibratable link, draft-rod, and swivel-joints M and M', and the arrangement of the combination is such as to permit the rising and falling at either end and the rocking forward and backward of the finger-bar. The second claim embraces the same combination with one additional part, which is the arm or lever by which the rocking of the finger-bar is controlled. As was stated by the court in *Graham* v. *McCormick*, "the object of the invention as set forth in these two claims seems to be mainly to produce the rocking motion of the finger-beam, as described and by the method described."

The complainant's mechanism consists of the so-called "vibratable link," which extends from the shoe to which the cutter-bar is attached backward and in the rear of the frame to a bracket or short arm which is fastened to the frame of the machine, and this vibratable link is connected with the bracket by means of a swivel-joint, identified in complainant's patent as M. Then there is a draft-rod extending from the forward end of the shoe to the forward beam of the main frame and running forward outside the wheel of the gearing-carriage. It is connected with the forward end of the shoe and with the vibratable link by what the patentee calls a "swivel-

joint," M', but which appears to be rather a hook than a swivel-joint connection. Then there is a vertical arm extending upward from the vibratable link, which is connected by a rod extending forward with a lever, by working which backward and forward the driver may control the tilting and rocking movement of the finger-beam, this movement being dependent upon the free play of the joints at M and M'.

Now, the question is, does the defendant, in order to produce the rocking motion in its machine, employ a combination of parts which is the same as or the equivalent of complainant's?

Defendant claims under a patent issued November 12, 1872, to Burdick and Le Roy. In the specifications of this patent it is stated that—

> The invention consists in a novel manner of constructing, attaching, and bracing the inner or main shoe; in a novel arrangement of devices for rolling the bar edgewise, in order to change the height of cut as may be necessary, as hereinafter more fully explained.

The machine, as appears from the specifications and drawings, consists of a solid frame, the main axle on which the frame is mounted, and the wheels, "all of which parts are constructed and arranged in the ordinary manner." Then there is a shoe which is placed forward of one of the wheels of the gearing-carriage, which is supported and held at its forward end by means of what the patentee calls a "transverse brace," E, and at its rear end by an arm on the side of what is described as a "head-block," F, this shoe being provided with two pairs of lugs on its top, between which the arm at the rear end and the brace at the forward end are pivoted. The brace E extends crosswise under the frame and has its outer end swiveled and mounted loosely on a horizontal rod, G, which is secured lengthwise under the outer side of the frame. It is stated in the specifications that the object of swiveling the end of the brace and mounting it on the rod is to permit it to move forward and back when the shoe is rocked or tipped.

The head-block F consists of a flat upright plate provided on its outer side with the arm to which the shoe is pivoted. The head-block is held by two longitudinal bars or braces, L and K, extending backward under the gearing-carriage, and also by a rod, R, extending forward and connected to the tongue of the machine. The lower brace, K, has its forward end pivoted to the lower front corner of the head-block and its rear end pivoted to a rigid depending arm on the under side of the frame immediately below the axle. The upper brace, L, has its forward end pivoted to the top of the head-block and its rear end passed through a slot in the rigid depending arm, and is pivoted to an upright hand-lever, the lower end of which is pivoted to the end of brace K, the latter being extended back of the arm before mentioned. As is stated in the specifications—

> The two braces serve to hold the head-block securely in position, so that it cannot move either forward or backward or laterally, while at the same time they permit a free vertical movement, in order that the shoe may rise and fall in conformity with the surface of the ground. By moving the hand-lever the upper brace, L, is moved lengthwise and caused to tip the head-block backward or forward, as the case may be, so as to rock the shoe and finger-bar and change the height of the fingers from the ground.

An examination of defendant's model and machine shows that by grasping the lever which extends upward from the horizontal brace L the movement of the finger-beam may be controlled and the desired rocking motion produced, which motion is, so far as I have been able to discover, the same motion as that produced in complainant's machine; and in the defendant's machine this motion is dependent upon the free play of the rear or swivel end of brace E where it is connected with the main frame, and with the free movement of the connection of the shoe at its forward end with brace E, and at its rear end with the arm on the side of the so-called "head-block," the free play of these last-named connections being facilitated by the two pairs of lugs on top of the shoe. It should be stated further that the rod R, extending from the head-block forward to its connection with the tongue, is connected with the head-block by means of a hook and a sort of staple or clevis, which has a loose and free connection with the head-block.

The mechanism of the two machines in various particulars is quite unlike in form, and this dissimilarity is more apparent from the fact that defendant's machine is one where the cutting apparatus is forward of the axle and wheel; but, as before stated, Graham provides in his specifications for a device as applicable to a forward cut as to a rear cut machine.

Upon careful consideration of the question I am of the opinion that the differences between defendant's and complainant's machines are differences of form and not of substance, and that defendant's machine really shows the various parts described in complainant's patent. The rod R in defendant's machine connecting the tongue with the head-block is the draft-rod in complainant's machine. Its connections are by a hook and not by a swivel-joint. But in its attachment to the head-block and the brace L, in connection with the arm, by which the rear end of the shoe has its connection with the head-block, it performs the functions of Graham's draft-rod, and is not, so far as I can see, materially unlike the same rod as shown in Sprague's machine, which was held to be an infringement of complainant's in *Graham* v. *Gammon*, *supra*. The brace E in defendant's machine is the vibratable link in complainant's. It is true that the connection at the rear end with the main frame is not described in defendant's patent as a swivel-joint, but it is described as having that end swiveled and mounted loosely on a horizontal rod, the object of this swiveling and mounting being to permit it to move forward and back when the shoe is rocked or tipped. Its connection with the bracket that is fastened to the frame is loose, and is certainly of the nature of a swivel-joint, and its connection with the shoe is of a similar character, and it clearly performs the functions of the vibratable link in the Graham machine. The formation of the parts which connect the rear end of the shoe with the machine, in connection with which are the longitudinal braces L and K, is such certainly as to permit a swivel-joint movement, although there appears to be in this respect greater complication of mechanism than there is in the Graham machine. Upon the operation of the upright lever the movement of the cutter-bar in the two machines appears to be identical, and this movement is produced by substantially, if not precisely, the same co-operation of parts in the two machines.

On examination of the model of the Sprague machine, which it is understood was used on the hearing of *Graham* v. *Gammon*, there can be no doubt that that case was correctly decided; and if the Sprague machine, unlike the Graham machine as it is in various points of construction, is an infringement of the latter, it is exceedingly difficult to see why the defendant's machine is not also an infringement. The various parts of defendant's machine may be said, I think, to exhibit mechanical parts equivalent to those in complainant's machine and producing the same result, and I am of the opinion, therefore, that an infringement is established.

A point was made upon the argument which has not been yet noticed, namely: that the proofs disclosed an agreement of some nature between Alvaro B. Graham, the patentee, and complainant by which the former may be interested in the result of this suit. The patentee has testified that he has the general management of the patent and of litigation connected with it, and that he has an arrangement by which he is to share in a certain percentage of any amounts recovered, and it was insisted, therefore, that this suit could not further proceed unless A. B. Graham was made a party complainant; but A. B. Graham has since filed in the cause, as I think he may be permitted to do, a waiver or disclaimer of all interest in any decree which may be here rendered, and in any sum or sums of money which may be paid by defendant pursuant to such decree for the past or future use of the invention in question, and I think he is now, if he was not before, estopped from making any claim against the defendant under the patent in suit, and hence that it is not necessary that he should be made a party complainant.

The case will be sent to a master to assess complainant's damages, and an injunction will issue according to the usual practice to restrain further infringement.

DESIGNS.

12,936.—HANDKERCHIEF.—*Henry Doherty* and *Joseph Wadsworth*, Paterson, N. J. Application filed April 11, 1882. Term of patent 3½ years.

12,937.—PARASOL.—*William A. Drown*, Abington, Pa. Application filed April 10, 1882. Term of patent 7 years.

12,938.—MONUMENT.—*Levi P. Graham*, Decatur, Ill. Application filed March 30, 1882. Term of patent 3½ years.

12,939 and 12,940.—ORNAMENTAL CHAIN-LINK.—*James L. Hosley*, Attleborough Falls, Mass. Applications filed April 22, 1880. Term of patents 7 years.

12,941.—FONT OF PRINTING-TYPE.—*Andrew Little*, New York, N. Y. Application filed March 21, 1882. Term of patent 7 years.

12,942.—BOX.—*Henry F. Moeller*, Davenport, Iowa. Application filed April 13, 1882. Term of patent 14 years.

12,943.—PICKLE-BOTTLE.—*George O. Sanborn*, Boston, Mass. Application filed April 15, 1882. Term of patent 7 years.

12,944.—MERCHANDISE-TAG.—*Sabin L. Sayles*, Killingly, Conn. Application filed April 12, 1882. Term of patent 3½ years.

12,945.—CARPET.—*Horatio Smith*, Kidderminster, England, assignor to *William Mansell Daintrey*, New York. Application filed March 14, 1882. Term of patent 3½ years. Registered in England November 27, 1881, No. 374,767.

12,946.—CARPET.—*Horatio Smith*, Kidderminster, England, assignor to *William Mansell Daintrey*, New York. Application filed March 14, 1882. Term of patent 3½ years. Registered in England February 22, 1881, No. 362,009.

12,947.—COACH-LAMP.—*Charles E. Thompson*, New Haven, Conn. Application filed April 8, 1882. Term of patent 3½ years.

12,948.—RING.—*Christopher J. Theuerner*, Newark, N. J., assignor to himself and *C. Fred. Church*, same place. Application filed April 11, 1882. Term of patent 7 years.

12,949.—TENONING-MACHINE.—*William H. Deane*, Cincinnati, Ohio, Application filed September 29, 1881. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,385.—WHEATEN FLOUR, GRAHAM FLOUR, BUCKWHEAT FLOUR, OATMEAL, AND VARIOUS MIXTURES OF FLOUR AND MEAL.—*Magdalen Cuirna*, Havana, N. Y. Application filed April 13, 1882.
"The word-symbol 'DALENAS.'"

9,386.—WINES.—*Chandon & Co.*, Epernay, France. Application filed April 19, 1882.
"A band of white paper forming the segment of a circle with double lines."

9,387.—WINES.—*Chandon & Co.*, Epernay, France. Application filed April 27, 1882.
"The words and sign 'MOËT & CHANDON.'"

9,388.—BAKING-POWDER.—*E. C. Orawford* and *J. W. Orawford*, Houston, Tex. Application filed September 7, 1881.
"A symbol composed of a five-pointed star imposed upon a circular disk."

9,389.—COVER-PAPER.—*Crocker Manufacturing Company*, Holyoke, Mass. Application filed April 14, 1882.
"The symbolic figure and the word 'KNICKERBOCKER.'"

9,390.—MEDICINES.—*James C. Davidson* and *Calvin C. Davidson*, Denver, Colo. Application filed April 13, 1882.
"The representation of the globe and the monogram 'W C C' and the letters 'Co.'"

9,391.—CANNED FRUITS, VEGETABLES, AND FISH.—*The Franco-Californian Packing Company*, San Francisco, Cal. Application filed April 18, 1882.
"The monogram 'W. D.' in a circular border, having at each side the representation of a griffin or dragon."

9,392.—BOOTS.—*Gramsfelder, Rosenthal & Co.*, Chicago, Ill. Application filed April 3, 1882.
"The word 'WHITNEY.'"

9,393.—MEDICAL COMPOUND FOR THE CURE OF INGROWING NAILS.—*Joseph A. Hincks*, New Orleans, La. Application filed April 18, 1882.
"The arbitrarily-selected word 'ONYXIS' and the monogram composed of letters 'J A H.'"

9,394.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"The pictorial view of the original south front of our place of business."

9,395.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"The pictorial illustration of the woodland scene."

9,396.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"The portrait of Dr. David Jayne, and the front and rear views of our place of business as it existed at the time of the adoption of our trade-mark."

9,397.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"The pictorial matter representing the group of women and children."

9,398.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"The medallion portrait of Dr. David Jayne."

9,399.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"Pictorial matter comprising certain figure views, together with front and rear views of our place of business."

9,400.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 8, 1881.
"The picture of our warehouse."

9,401.—MEDICINAL PREPARATION.—*Dr. D. Jayne & Son*, Philadelphia, Pa. Application filed December 10, 1881.
"The front view of our place of business and a medallion portrait of Dr. David Jayne, the whole being combined with and inclosed by an elaborately-ornamented and arched frame-work."

9,402.—MEASURING-TAPES.—*Kenfel & Esser*, New York, N. Y. Application filed April 10, 1882.
"The arbitrarily-selected word 'EXCELSIOR.'"

9,403.—CIGARS.—*Jayme Magi*, New Orleans, La. Application filed February 3, 1882.
"The words 'FLOR DE JAYME MAGI.'"

9,404.—SOAP.—*G. B. Marsh & Co.*, Lynn, Mass. Application filed April 5, 1882.
"The words 'PRIDE OF AMERICA.'"

9,405.—CERTAIN TOILET ARTICLES.—*Möllhens & Kropff*, New York, N. Y. Application filed April 27, 1882.
"The number '4711.'"

9,406.—OINTMENT.—*M. E. Peck*, Stamford, Conn. Application filed March 1, 1882.
"The fac-simile of registrant's signature."

9,407.—TOILET AND OTHER SOAPS.—*A. & F. Pears*, Bloomsbury and Isleworth, county of Middlesex, England. Application filed August 23, 1881.
"The representation of the statuette and the words 'YOU DIRTY BOY' on the pedestal, together with our firm-signature."

9,408.—SINGLE-VANILLA CHOCOLATE.—*Henry L. Pierce*, Boston, Mass. Application filed April 19, 1882.
"An elliptical figure inclosing the words 'W. BAKER & Co.'s' over a band connecting the arabesque circular figures."

9,409.—INFANT-SIRUP FOR SOOTHING AND QUIETING CHILDREN.—*Charles H. Ruth*, Reading, Pa. Application filed March 16, 1882.
"The cut or figure of an infant reclining in a shell floating on the sea and a ship at full sail."

9,410.—PICKLES.—*Sanborn Pickle Co.*, Boston, Mass. Application filed April 1, 1882.
"The word 'UNION.'"

9,411.—CIGARS.—*William Taylor*, Jersey City, N. J. Application filed March 15, 1882.
"The words 'BILLT (which may be spelled Billee) TAYLOR.'"

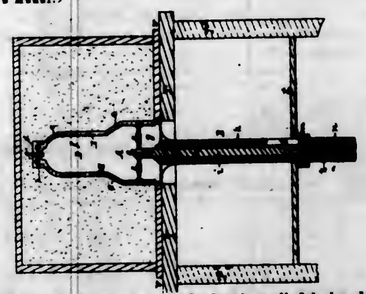
9,412.—ARTISTIC STATIONERY.—*Willy Wallach*, New York, N. Y. Application filed April 25, 1882.
"The leafy branches, the obelisk, its base bearing the letters 'W. W.,' and the eagle."

9,413.—MEDICINE.—*Jean F. Webb*, Lebanon, Ill. Application filed April 25, 1882.
"The representation of a lemon."

9,414.—RANGES AND STOVES.—*Wrought Iron Range Company*, St. Louis, Mo. Application filed April 21, 1882.
"The words 'HOME COMFORT.'"

9,415.—SHOE-LEATHER.—*Richard Young*, Brooklyn, N. Y. Application filed April 27, 1882.
"The word 'CAMELOPARD' or picture of a camelopard."

9,416.—PAINTS.—*Harrison Bros. & Co.*, Philadelphia, Pa. Application filed April 28, 1882.
"The words 'TOWN AND COUNTRY.'"



LABELS.

2,664.—Title: "ALEXANDER'S NUTRITIOUS ELIXIR WHEAT, SARSAPARILLA AND RYE CORDIAL."—*Daniel G. Alexander*, Woburn, Mass. Application filed April 14, 1882.

PATENTS

GRANTED MAY 23, 1882.

258,206. APPARATUS FOR FORMING MOLDS FOR CASTING. S. JARVIS ADAMS, Pittsburg, Pa. Filed July 2, 1881. (No model.)

Claim.—1. A rotary pattern for forming cylindrical molds in sand, provided with a cutter to cut a cavity of approximately the shape required, and finishing apparatus adapted to be advanced beyond the cutter and finish the mold, substantially as set forth.

2. In rotary patterns for forming molds, the combination of a cutter adapted to cut a cavity of approximately the shape required, and finishing apparatus pivoted to said cutter and adapted to be advanced beyond the edges of the cutter and finish the mold, substantially as set forth.

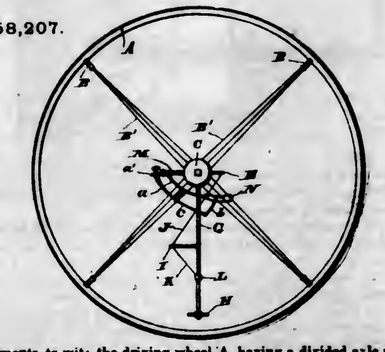
3. In rotary patterns for forming molds, the combination of the cutter D, finisher E, formed of the arms *e*, pivoted at the point of the cutter, and toggle A, substantially as and for the purposes set forth.

4. In rotary patterns for forming molds, the combination of the pattern A, formed of the cutter D and finisher E, the spindle B, carrying the pattern, and the sliding rod *i*, working longitudinally of the spindle for the operation of the pattern, substantially as and for the purposes set forth.

5. In rotary patterns for forming molds, the combination of the pattern A, formed of the cutter D and finisher E, the spindle B, carrying the pattern, the sliding rod *i*, working longitudinally of the spindle and provided with the ring *m*, and the horizontal plate *i*, substantially as and for the purposes set forth.

6. In rotary patterns for forming molds, the cutter D, secured to the spindle B, in combination with the finisher E, pivoted to the cutter, toggle A, and sliding rod *i*, adapted to advance and retract the finisher, substantially as and for the purposes set forth.

7. In rotary patterns for forming molds, the cutter D, in combination with the finisher E, provided with apparatus for the adjustment of the finisher to form different sizes of molds, substantially as set forth.



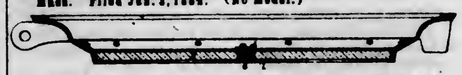
8. In rotary patterns for forming molds, the cutter D and pivoted finisher E, in combination with the block *o*, sliding blocks *r*, and the right and left hand screw-rod *p*, substantially as and for the purposes set forth.

9. In rotary patterns for forming molds, the combination of the cutter D, arms *e e* of the finisher pivoted to the cutter, and the toggle A, having adjusting-couplings *s*, substantially as and for the purposes set forth.

258,207. VELOCIPEDE. JOSEPH AHLERT, San Francisco, Cal. Filed Feb. 16, 1882. (No model.)

Claim.—1. In a monocycle, the combination of the following

258,207.



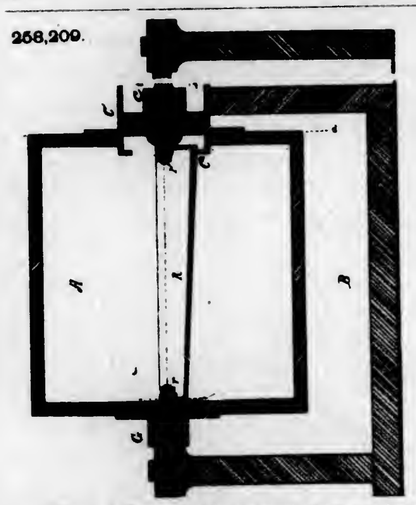
elements, to wit: the driving-wheel A, having a divided axle provided with internal crank-arms operated by stirrups or pedals sliding upon suitable guides and connecting-rods and vibrating lever-arms, and the seat or saddle supported by said divided axle, constructed, arranged, and operating substantially as described, for the purpose specified.

2. In a velocipede, the axle D of the main driving-wheel, provided with a left-hand screw-thread, in combination with the auxiliary steering or propelling roller-handle *f* and sustaining or balancing handle *g*, loosely journaled upon said handle *f*, when constructed and arranged to operate substantially in the manner and for the purpose specified.

3. In a velocipede, the hinged saddle N, pivoted to the rod *a*, rigidly attached to the rest or hand-rod M, and provided with a forwardly-projecting perforated lip, *a'*, rods *b* and *c*, catch-spring *d*, and spring-loop *e*, constructed, arranged, and operating substantially as described.

4. In a monocycle, the combination of the rim A, rim-bows B, stay-rods B', hubs or disks C C, divided axle D, having crank-arms E E', oscillating lever-arms I I, pedals or stirrups L L, and the connecting-rods J J K K, downwardly-projected rods or guides G G, foot-board H, and hand-rod M, carrying the saddle N, constructed, arranged, and operating substantially as described, for the purpose specified.

258,208. STOVE OR OVEN DOOR. DANA K. ALDEN, Sterling, Mass. Filed Jan. 3, 1882. (No model.)

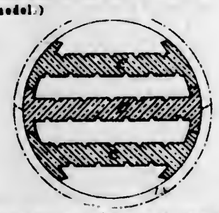


Claim.—1. The combination, with a stove or oven door, of a plate or panel of glass fixed therein and provided with a hole extending through it, (the said plate,) as and for the purpose as set forth.

2. The combination of an oven or stove door with a plate or panel of glass, perforated as described, and fixed therein, and with a covering-plate and screw-bolt and nut, arranged, substantially as set forth, with the perforation or hole of the said glass panel or plate, all being essentially and for the purpose as specified.

258,209. WASHER FOR PAPER-PULP AND OTHER FIBROUS MATERIAL. CHRISTIAN ANDERSON and THOMAS PATTEN, Neenah, Wis. Filed Jan. 25, 1882. (No model.)

258,209.



Claim.—1. In a washer for paper-pulp, the suspension of the receiver R by lugs *r* and *r'* from the gudgeons C and G, so that it will remain at rest independent of the revolutions of the washer A, substantially as described.

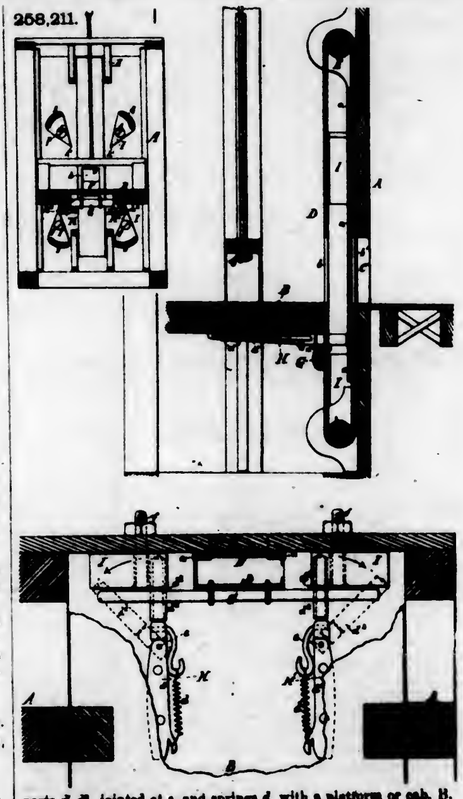
2. In a receiver suspended as above described, the detachable lugs *r* and *r'*, substantially as described, and for the purpose as set forth.

3. In a washer for paper-pulp, the discharging cylindrical opening through the gudgeon C, having near its inner end the internal flange, C', of sufficient width to cause an increased impetus to the water and prevent its tendency to return to the washer, substantially as described.

258,210. SUPPORT FOR UNDERGROUND TELEGRAPH-LINES. THOMAS S. ATTERBURY, Pittsburg, Pa. Filed Nov. 19, 1881. (No model.)

Claim.—As a new article of manufacture, a sectional wire-holder for insulating underground telegraph-wires, made of glass or other vitreous material, provided with grooves on each side and in reverse order, and with laterally-projecting wings at each end, as set forth.

258,211. SAFETY-ELEVATOR FOR HATCHWAYS. JOHN B. ATWATER, Chicago, Ill., assignor to Peter J. Singer, same place. Filed Jan. 25, 1882. (No model.)



Brief.—An endless belt is located at each landing with openings registering with the doorway. Spring-actuated hinged bars on the elevator engage a slat on the belt to operate it, and are released therefrom by inclined spring-actuated pivoted stops on the hatchway above and below the doorway.

Claim.—1. An elevator provided with one or more belts, as D, separate from the cab and having doorways through them, and with mechanical appliances whereby the belts are successively operated and caused to open and close the doorways from a hatchway to landings and from landings to a hatchway in either the ascent or descent of the cab or platform B of the elevator, substantially as described.

2. The combination of the belt D, having doorways through it and provided with an interlocking slat, G, a hatchway, A, provided with unlocking-stops I, and a cab or platform provided with interlocking bars H, having joints *e*, substantially as and for the purpose described.

3. The combination of the interlocking bars H, composed of

258,211.

parts *d'* *d²*, jointed at *e*, and springs *d*, with a platform or cab, B, substantially as described.

4. The combination of the unlocking inclined stops I, pivoted to the boarding or framing of the hatchway A, and springs *g*, substantially as and for the purpose described.

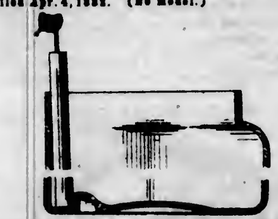
258,212. COMBINATION TOY HOUSE OR STRUCTURE. W. W. BARNES, New York, N. Y., assignor to McLoughlin Brothers, same place. Filed Apr. 6, 1882. (No model.)

Claim.—1. The combination of box A, having grooves *a a*, with a smaller box, B, of a length approximately equal to the width of the larger box, having grooves *b b*, and with panels C, capable of sliding lengthwise into the grooves *b b* and of sliding sidewise into the grooves *a a*, substantially as set forth.

2. The combination of two boxes, B B, with a larger box, A, having an internal length approximately equal to the sum of the external lengths of the boxes B B, and an external width approximately equal to the external length of each box B, and with panels C C, of a length approximately equal to the width of the box A, and a width approximately equal to the width of the boxes B B, substantially as set forth.

3. The combination of two boxes, B B, having grooves *b b*, and each having a side groove, *b*, with panels C C and box A, substantially as set forth.

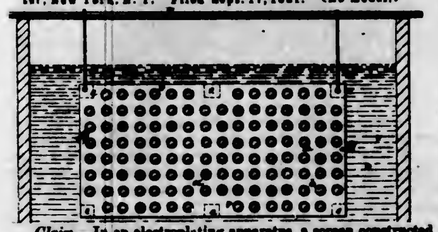
4. The combination of box A, cleats *d d*, fixed therein, brack-



ets F F, having grooves *g g*, strip J, and roof-board K, substantially as set forth.

5. The combination of box A, brackets F F, having slots *h h*, and grooves *f f*, boards G and G', and pins H, substantially as set forth.

6. The combination of box A, having holes *e e*, roof-supports L L, having pins *l l*, and roof-board K, substantially as set forth.



7. The combination of box A, having grooves *a a*, panels C C, adapted to slide sidewise into said grooves, and pilasters E E, having grooves in their side edges, substantially as set forth.

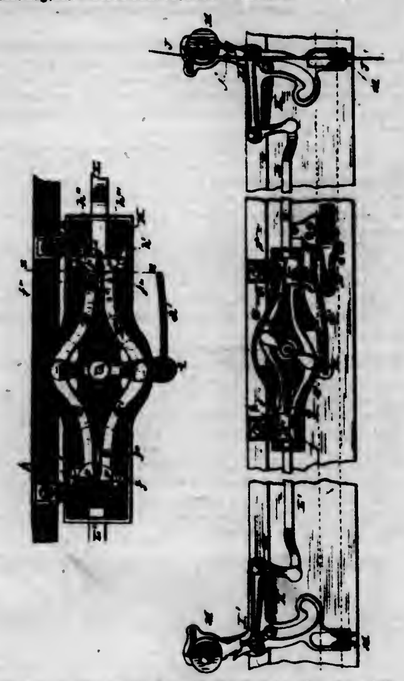
258,213. BATTERY-CELL. HORATIO J. BERWER, New York, N. Y. Filed Apr. 4, 1882. (No model.)

Claim.—A battery-cell having a bottom provided with a rib or elevation adapted to hold the bottom of the zinc away from the other pole, substantially as described.

258,214. APPARATUS FOR ELECTROPLATING. ALEXANDER BRUCKMANN, Astoria, assignor to himself and George H. Worcester, New York, N. Y. Filed Sept. 17, 1881. (No model.)

Claim.—In an electroplating apparatus, a screen constructed of two or more metallic plates, both having aligned perforations which are smaller in one plate than in the other, said plates being adapted to expose both ends of the articles to be plated to the solution, and being united by metallic posts or parts for metallic connection with the conductor of a battery, substantially as specified.

258,215. ADJUSTABLE HORSE-BLANKET FASTENER. E. E. BROWN, Portland, Me. Filed Mar. 24, 1881. (No model.)



Claim.—1. An improved fastener for horse-blankets, consisting of two or more transverse straps provided with end attaching devices and a longitudinal strap connected to said straps, the whole adapted to be applied underneath the belly of the animal and to be attached to each side of the blanket, substantially as set forth.

2. The combination, with a horse-blanket provided with suitable side receiving attachments, of the transverse straps connected by a longitudinal strap, the transverse straps provided with suitable end attaching devices, adapted to co-operate with the receiving attachments of the blanket, substantially as set forth.

3. The improved fastener for horse-blankets, consisting of the adjustable transverse straps, the adjustable longitudinal strap provided with end loops through which the transverse straps may slide, and the end attaching devices adapted to co-operate with suitable receiving devices upon the sides of the blanket, all substantially as set forth.

4. The combination, in a fastener for horse-blankets, of the rings *f*, transverse adjustable straps *d d*, with hooks *h h*, and adjustable strap *b*, all adapted to operate substantially as set forth.

258,216. CORN-PLANTER CHECK-ROWER. GEO. W. BROWN, Galesburg, Ill. Filed Jan. 21, 1882. (Model.)

Claim.—1. In combination with the push-bar L and head D, having arms F F' hinged thereto, a swinging plate located beneath the arms F F' and provided with cam-lugs adapted to lift said arms F F' alternately, and thereby permit the push-bar to slide beneath the lifted arm, substantially as and for the purpose specified.

2. In combination with the head D, having arms F F' hinged thereto, with cam-lugs *f'* on the ends of said arms, the plate H, having lugs adapted to coact with said lugs *f'*, whereby a swinging movement is transmitted to the plate H from a reciprocating movement of the arms F F', substantially as and for the purpose specified.

3. The swinging plate H, having cam-lugs h h, constructed substantially as described, in combination with the head D, having arms F F' hinged thereto, and provided with cam-lugs *f'*, substantially as and for the purpose specified.

4. In combination with the head D, with arms F F' hinged thereto, and swinging plate H, guides formed of the sides of the case C and the standard *g*, which cause the free ends of the arms F F' to move in straight and coincident paths, substantially as and for the purpose specified.

5. In combination with the push-bar L and head D, having arms F F' hinged thereto, which arms have lugs *f'*, constructed substantially as described, the swinging plate H, having lugs h h', adapted to coact with the arms F F' and lugs *f'*, substantially as and for the purpose specified.

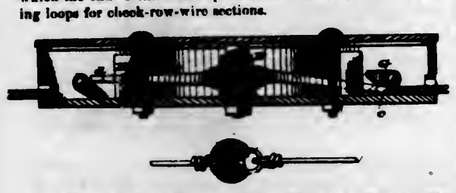
6. In combination with the swinging head D and arms F F', hinged thereto, the forked lever and push-bar L, adapted to impart movement to the arms F F' and head D, substantially as and for the purpose specified.

7. In a corn-planter check-rower, in combination with an oscillating bar, D, adapted to impart movement to the seed-slides, and having arms F F' hinged thereto, a push-bar, L, adapted to be actuated by a tappet-wire through the instrumentality of a forked lever, substantially as and for the purpose specified.

8. In a corn-planter check-rower, the combination of a head, D, connected with the planter seed-slides by suitable mechanism, and having arms F F' hinged thereto, swinging plate H, push-bar L, and bent lever I, adapted to be moved in one direction by the tappet-wire and in the opposite direction by a spring, substantially as and for the purpose specified.

9. In combination with the push-bars L L', forked levers I I', and tappet-wire for actuating them, devices for receiving motion

from the push-bars and imparting movement to the planter seed-slides, and adapted to receive motion from one push-bar without imparting movement to the other, substantially as and for the purpose specified.



10. The head D, with the arms F F', hinged to and projecting from one of its sides and arms G G' hinged to and projecting from its other side, in combination with push-bars, one of which is adapted to remain stationary while the other acts upon two of the hinged arms alternately, substantially as and for the purpose specified.

11. In combination with the head D, having a pair of arms projecting from each of its opposite sides, push-bars L L', and forked levers, springs adapted to retract the push-bars L L', whereby one push-bar may act on the devices for transmitting motion to the planter seed-slides while the other push-bar remains stationary, substantially as and for the purpose specified.

12. In combination with the push-bars, forked levers, and retracting-springs, the bar D, with a pair of arms projecting from each of its opposite sides, and lever E, connected to the bar D, whereby the planter seed-slides may be operated by the lever E without moving the push-bars or forked levers, substantially as and for the purpose specified.

258,217. CORN-PLANTER CHECK-ROWER. GEO. W. BROWN, Galesburg, Ill. Filed Jan. 21, 1882. (Model.)

Brief.—To either end of the centrally-pivoted head are attached duplicate arms, which are reciprocated by a push-bar, which strikes against the ends alternately. Hinged cam-tracks at either side and both ends of the case are for lugs on the arms to ride upon to avoid conflict with the push-bars in their return to be again acted upon. The tappets or knots are castings of spherical form, with a cavity and hole extending through the tappet, into and through which the end of the wire is passed and twisted upon itself, forming loops for check-row-wire sections.

Claim.—1. In a check-rower, in combination with the head B and sliding arms C C', the hinged cam-tracks G G', adapted to swing upwardly to allow the arms C C' to pass back below them, and to fall to form inclines up which the same arms slide to elevate them, substantially as and for the purpose specified.

2. In combination with the head B, with arms C C' hinged thereto, and push-bar F, adapted to act alternately on said arms C C', the hinged cam-track bars G G', adapted to swing upwardly to allow the arms C C' to pass beneath them, and to fall to form inclines for elevating said arms, substantially as and for the purpose specified.

3. In combination with the head B, having arms C C' hinged thereto, with lugs e on their free ends, the cam-tracks G G', adapted to swing to permit said lugs e to pass beneath them, and to form inclines up which said lugs e slide to raise the arms C C', substantially as and for the purpose specified.

4. A tappet-wire formed of tappets with a cavity in one side, which forms a seat for an eye on one section of the wire, which eye is held in the tappet, substantially as herein described, and interlocked with an eye on the adjacent section of the wire, which eye is held by coiling the wire, substantially as and for the purpose specified.

258,218. CLOG. JOHN CASSIDY, Cambridge, Mass. Filed Feb. 20, 1882. (No model.)

Brief.—The clog is provided with a magazine in the breast of the heel for explosives and a discharging device attached to the sole, and it is specially designed for clog-dancers.

Claim.—1. A clog having a holding device in the breast of the heel for explosives, and a discharging device attached to the sole, and adapted to operate substantially as and for the purposes specified.

2. In a clog, the rod B, knob x', spring y', and the studs z z, in combination with the cylinder C, having teeth or inclines upon each side, y y, substantially as and for the purposes set forth.

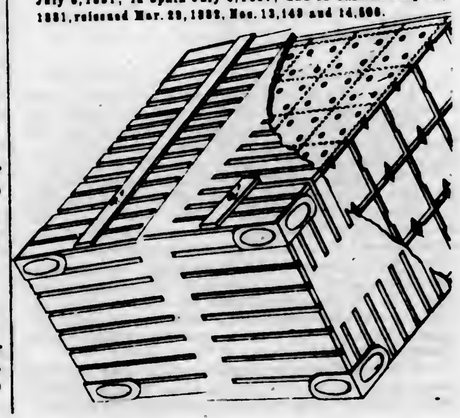
3. A clog provided with explosives arranged in a circular position upon the heel, in combination with a discharging mechanism attached to the sole of the clog, all adapted to be operated substantially as and for the purposes set forth.

4. The combination of the clog A, having a sole, h, and heel s, with the pyrotechnic-discharging device B, with button x', spring y', studs z z, and the bent end x, the said rod adapted to revolve in a stationary cylinder, C, said cylinder having a row of projecting teeth or inclines upon either end, placed to relatively operate upon the studs z z to turn the rod B, all arranged, combined, and operating substantially as and for the purposes set forth.

5. The combination of a clog provided with a holding device for explosives, and a discharging device attached to the clog, all operating substantially as and for the purposes set forth.

258,219. CHILD'S CARRIAGE. OSCAR CLOSE, Worcester, Mass. Filed Mar. 20, 1882. (No model.)

Claim.—1. In a vehicle, the frame-bars A A, supported upon and connecting the axles and arched over the body, as set forth.

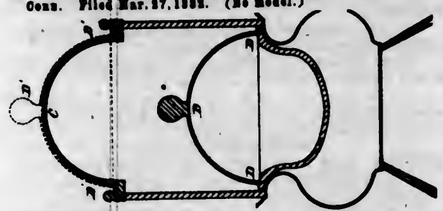


2. In a vehicle, the combination, with the frame-bars A A, supported upon and connecting the axles and arched over the body, of the handle B, which connects the free ends of said frame-bars, as set forth.

3. The combination, with the frame-bars A A, supported upon and connecting the axles, arched as shown, and having their free ends connected, of the body J, suspended under the said arched frame-bars by springs K, as set forth.

4. The combination of the arched frame-bars A A, supported upon and connecting the axles C E, the body J, the suspension-springs K, and the brace-springs N O, as set forth.

5. The combination of the arched frame-bars A A, the top or awning L, having hooks M, the body J, and the adjustable suspension-springs K, as set forth.



258,220. FRUIT OR VEGETABLE CRATE OR CARRIER. JOSEPH A. COCHRANE, Liverpool, County of Lancaster, England. Filed Dec. 16, 1881. (Model.) Patented in England June 24, 1881, No. 2,756, and Dec. 24, 1881, No. 5,647; in France July 6, 1881; in Spain July 6, 1881; and in Canada July 31, 1881, released Mar. 29, 1882, Nos. 13,149 and 14,566.

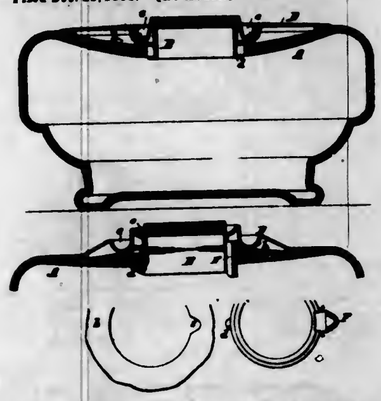
Claim.—1. A crate apertured on all sides, and provided with means for keeping every side of the crate apart from the floor and from other crates, in whatever position the crate is placed, whereby a vertical ventilation through each crate is secured, substantially as and for the purpose specified.

2. A crate apertured on all sides, and provided with means for keeping every side of the crate apart from the floor and from other crates, in whatever position the crate is placed, in combination with similarly-apertured trays and coils, whereby a vertical ventilation through such coils, trays, and crate is secured, substantially as and for the purpose specified.

258,221. COVERED DISH. AUGUSTUS CORNABY, Middletown, Conn. Filed Mar. 27, 1882. (No model.)

Claim.—1. In combination with a dish having a removable cover, a handle adapted to receive and support said cover upon its top and pass upward within it to retain it in place, substantially as described.

2. In a covered dish, the combination of the detachable cover D, the handle-bar C, adapted to project upward within it, and the supports E, attached to the handle, substantially as described.



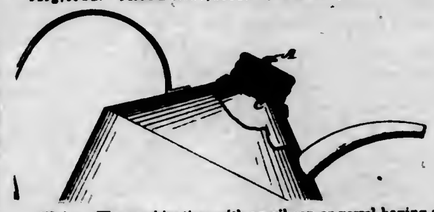
258,222. DRAIN-PIPE. BENJAMIN C. GROSS, Dewsbury, County of York, England. Filed Oct. 7, 1881. (No model.) Patented in England Feb. 26, 1881, No. 822.

Claim.—1. The socket D, having a flat bottom, in combination with the corresponding end of the pipe E, which also has a flat bottom, so as to form at F a flat part of the joint between the pipes, substantially as set forth and shown.

2. The pipe C, having a flat bottom which is of a thickness greater than the rest of the pipe, substantially as set forth and shown.

258,223. COAL-OIL LAMP. JOHN H. DEXTER, Elmira, N. Y. Filed Dec. 22, 1881. (No model.)

Claim.—1. The combination, with a lamp-reservoir, A, of a central tube, B, and means for connecting it detachably to the reservoir, and collar-plate D, screwing upon said tube, extending toward the sides of the reservoir and provided with a recess, c, substantially as set forth.



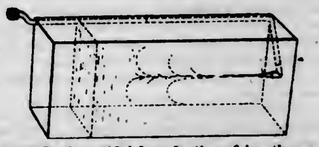
2. The combination of the reservoir having a centrally-depressed top, tube B, and a plate, D, having a recess, c, and downwardly-inclined screw-flange w, as set forth.

3. The combination of the reservoir, collar-plate, and packing h, as set forth.

4. The reservoir provided with an annular raised serrated seat for the packing, substantially as described.

5. The combination of the notched reservoir, tube B, having a lip, d, and shoulders f f, and detachable key F, substantially as set forth.

258,224. VENT FOR OIL-CANS. THOMAS FERGUSON, Parkersburg, Iowa. Filed Mar. 27, 1882. (No model.)



Claim.—The combination, with an oil can or vessel having a perforation through its top or side, of a vent consisting of the upright rod B, having at its upper end a valve, A, located upon the outside of the can or vessel, and at its lower end a removable weight, C, said vent adapted to be removed from the can or vessel and operating by the tipping of the same, substantially as and for the purpose set forth.

258,225. CALIPERS. HENRY FORSTER, Newark, N. J. Filed July 8, 1881. (No model.)

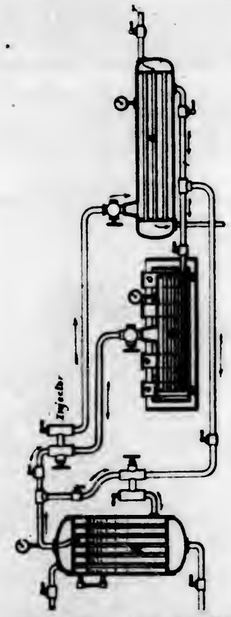
Claim.—The caliper-jaws A B, combined with the tubular pivot F and countersunk washers D E, the ends of said pivot being spread substantially as herein shown and described.

258,226. APPARATUS FOR MAKING CLEAR ICE. FRANK GREENE, Brooklyn, assignor to Etienne Gillet, New York, N. Y. Filed Oct. 25, 1881. (No model.)

Claim.—1. In the artificial production of ice, the method of treating water to remove the contained air by injecting a current of water therein, substantially as and by the means described.

2. The method of treating the water to be frozen in the freezing-vessels of ice-machines by withdrawing a portion thereof and returning it forcibly, so as to agitate the water to be frozen, substantially as described.

3. A freezing vessel or can for containing water to be frozen by artificial means, in combination with one or more pipes for injecting water into said vessel or can to agitate the water therein contained, substantially as described.



4. The combination of a series of freezing vessels or cans, one or more pipes for each vessel or can for injecting water therein, and a common pump connected with said pipes, substantially as described.

5. An apparatus comprising in combination the freezing-tank of an ice-machine, the vessels or cans for containing the water to be frozen, and means, as indicated, for forcing or injecting water into said vessels or cans to agitate the contents thereof, substantially as described.

6. The combination, with the freezing vessels or cans and the pipes for injecting water therein, of a pump without valves, substantially as described.

258,227. ICE-MACHINE. FRANK GREENE, Brooklyn, assignor to Etienne Gillet, New York, N. Y. Filed Nov. 28, 1881. (No model.)

258,227.

Claim.—1. The improvement in the artificial production of cold, consisting in aiding or effecting the volatilization or expansion of the liquefied or condensed refrigerant by making a vacuum or reduction of pressure above it through the action of a jet in an injector, substantially as described.

2. The improvement consisting in aiding or effecting the alternate volatilization or expansion and liquefaction or condensation of the refrigerant through the action of an injector, substantially as described.

3. The improvement consisting in creating, by means of an injector, a vacuum above the liquefied or condensed refrigerant in the refrigerator, in producing also by means of an injector, pressure upon the volatilized or expanded refrigerant in the condenser of an ice-machine, and in conducting the liquefied or condensed refrigerant from said condenser to said refrigerator, the volatilization or expansion, liquefaction or condensation, and return of the refrigerant being effected successively and continuously, substantially as described.

4. In an ice-machine operating by the alternate volatilization and liquefaction of the refrigerant, the improvement consisting in aiding or effecting the liquefaction of the said refrigerant by a jet acting through an injector, substantially as described.

5. The improvement in the artificial production of cold, consisting in heating a portion of the liquefied or condensed refrigerant so as to bring the same under pressure, supplying a jet of said refrigerant to an injector, and thereby aiding or effecting the volatilization or expansion of the liquefied or condensed refrigerant, and also the liquefaction or condensation of the volatilized or expanded refrigerant, or either of said operations of volatilization and liquefaction, substantially as described.

6. The improvement in ice-machines consisting in heating in a boiler a liquefied or condensed refrigerant to bring the same under pressure, supplying a jet of said heated material to an injector, so as to create a vacuum in the refrigerator, and thus to volatilize or expand the liquid or condensed refrigerant therein, forcing the volatilized or expanded refrigerant by the action of said jet, together with the material composing the latter, into a condenser, wherein the refrigerant is liquefied or condensed by the pressure, aided by a cooling medium, and supplying the liquefied or condensed material to said refrigerator and to said boiler, substantially as described.

7. The combination of the refrigerator, injector, and boiler, the injector having its inlet connected with said refrigerator and being supplied from said boiler, substantially as described.

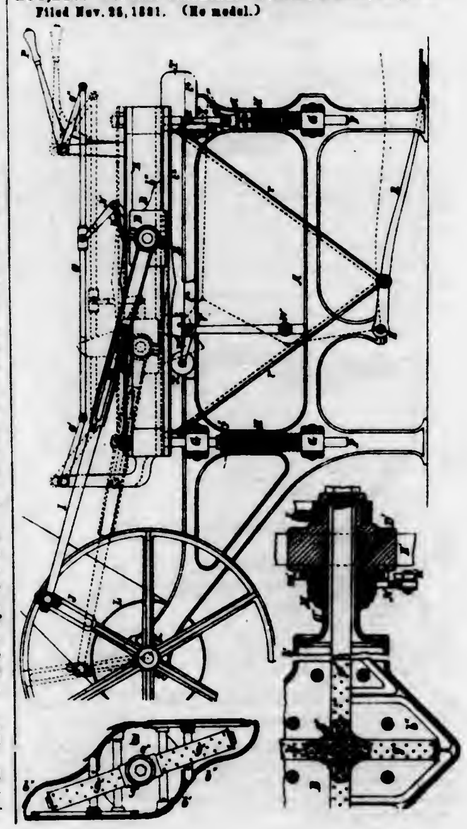
8. The combination of the refrigerator, injector, boiler, and condenser, the said injector having its inlet connected with the refrigerator and its outlet with the condenser, substantially as described.

9. The combination, with the refrigerator of an ice-machine, of an injector having its inlet connected with said refrigerator, and means, as indicated, for supplying a jet to said injector, so as to produce a vacuum or reduction of pressure in said refrigerator, substantially as described.

10. The combination, with the condenser of an ice-machine, of an injector having its outlet connected with said condenser, and means, as indicated, for supplying a jet to said injector, so as to force the refrigerant into said condenser, substantially as described.

11. The combination, with the refrigerator and condenser of an ice-machine, of an injector having its inlet connected with the refrigerator and its outlet with the condenser, and means for supplying a jet to said injector, so as to withdraw the refrigerant from the refrigerator and force it into said condenser, substantially as described.

12. The combination of the refrigerator, injector, condenser, and return-pipes, substantially as described.



13. The combination of the boiler, refrigerator, injector, condenser, and return-pipes, substantially as described.

14. The combination of the boiler, refrigerator, injector, condenser, return-pipes, and contrivance connected with the return-pipe to the boiler, substantially as described.

258,228. SOLE-EDGE PROTECTOR FOR BOOTS OR SHOES. WILLIAM GORDON, Boston, Mass. Filed Oct. 18, 1881. (No model.)

Claim.—A sole-edge protector composed of an elastic band adapted to encompass a sole-edge, and provided with means, substantially as shown, for keeping it in position laterally, as set forth.

258,229. IRONING-MACHINE. WILLIAM L. HALL, Troy, N. Y. Filed Nov. 25, 1881. (No model.)

Claim.—1. In an ironing-machine, the combination of an iron, the main portion or body of which is cylindrical, with two independently-operating wedge-shaped cam-like points projecting therefrom, each having one or more polishing-surfaces, mechanism, substantially as described, for bringing each end alternately into use and bearing them when not in use, trunnions upon which said iron is hung, sliding boxes carrying said trunnions, ways for said slides, and mechanisms, substantially as described, for longitudinally and transversely reciprocating, reversing, elevating or depressing, and regulating the stroke of said iron when desired, for the purposes set forth.

2. The combination of the swivel-plate Q, secured to ways E, having grooves g' and adjustable frog g'', the spur-wheel d' upon spindle C, engaging said grooves and frog, and the guides D D', with the iron B, having transverse movement between said guides, for the purpose specified.

3. The combination of iron B, having cam-like projecting points b'', with the roller X, in connection with arms a', rock-shaft V, toggle-levers W, cross-shaft S, and treadle R, for purpose specified.

4. In combination with the ironing-points b'', the independent polishing-surfaces, provided with pins and springs, constructed, arranged, and operating substantially as set forth.

5. The combination of the spring reversing lever P, horizontal rod O, and links o' o'', hung upon stationary standards attached to ways E, one of which links rotates upon a fixed pivot, the other being keyed to a rotary pivot, to which said lever P is also secured, the elbowed lever E, hung upon sleeve M, and hinged to the slide traveling upon said rod, the said sleeve and ratchet-wheel m' thereon, and the pawls d'' n', engaging said ratchet-wheel, with the feathered spindle C' and iron B, for objects set forth.

6. In combination with a reversible iron, the automatic device for regulating the combustion of gas and air within and alternately heating different portions of same, consisting of stationary main pipes or stem o', rotary branches g', and swivel-joint g'' with valve therein, substantially as shown.

7. The combination of the table T with the links Y, toggle-levers W, rock-shaft V, cross-shaft S, and treadle R, the cross-shaft and links being hung to frame-work, all operating in elevation and depression of said table, the same having inclining and receding tendency during latter movement, as hereinbefore described.

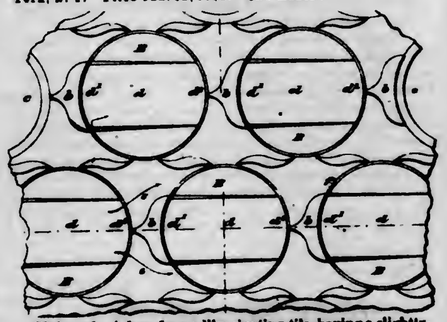
8. In combination with iron B, having centrally-projecting wedge-shaped points, the table with recess or socket correspondingly located in transverse head-rail, and shirt-board provided with steady-pin fitted to enter said socket, substantially as and for the purpose specified.

258,230. GRAIN-CRADLE. HENDON W. HARALSON, La Grange, Ga. Filed Mar. 20, 1882. (No model.)

Claim.—1. In a grain-cradle, the combination of the horizontal fingers D, intermediate horizontal wires, J, and twisted wires K L, connecting said wires J together and to the fingers D, as set forth.

2. In a grain-cradle having the fingers D and intermediate wires, J, the combination therewith of the twisted wire L, connecting said wires and fingers near the points of the latter, and caused by drawing the wires J taut to bulge inwardly between the fingers, as set forth.

258,231.



2. The combination of the long curved scrolls J, extending over in front of the gleaning-cylinder, and beginning near its axle and back toward the trailing-frame, with a curved support for said scrolls, secured at one end to the trailing-frame and having its other end free, and the gleaner arms or sprockets, substantially as and for the purpose specified.

3. The gleaner-cylinder, in combination with plate or scroll I, rigidly secured to the trailing-frame and partly encircling the gleaner-shaft, and arranged between two adjacent gleaning-hubs, and scrolls J, firmly secured to said plate I in front at a point below the center of said gleaning-shaft, substantially as and for the purpose specified.

4. The gleaning sprockets or teeth, in combination with curved plates I, having notches i, which, when two plates are placed side by side on opposite sides of the gleaner-teeth H, form openings I', substantially as shown.

258,232. ILLUMINATING-TILE. JOSHUA K. INGALLS, New York, N. Y. Filed Jan. 12, 1882. (No model.)

Claim.—1. A lens for an illuminating-tile, having a slightly-spheroidal upper portion to rest in a correspondingly-shaped socket, and a pendent portion united to the upper portion by a long sweep or curve, whereby the formation of a neck or abrupt angle is avoided, and an underlying flange or lip on the socket is rendered unnecessary, substantially as set forth.

2. A lens for an illuminating-tile, having slender ribs formed exteriorly on the portion of the lens which rests in the socket, whereby the said lenses may be the better adjusted to a uniform level, as set forth.

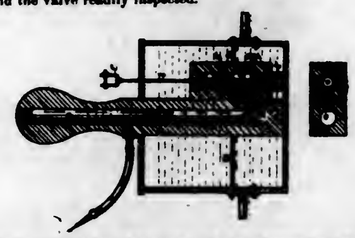
3. A lens for an illuminating-tile, having a pendent portion, one side of which stands nearly vertical and the other face inclined, said pendent portion having substantially the form of an angula, as set forth and shown.

4. A lens for an illuminating-tile, having a portion of its upper exterior face made into the form of an inclined plane, substantially as and for the purpose set forth.

5. A lens for an illuminating-tile, having a conical portion to rest in the socket in the socket-plate, and a pendent portion having a vertical face and a curved, oblique, or inclined face, substantially as and for the purpose set forth.

6. A lens for an illuminating-tile, having a conical portion, c, provided with ribs g and an inclined plane, d, and a pendent portion, h, having the form of an angula, substantially as herein set forth.

7. The combination of a lens having an inclined plane formed on a portion of its upper face only, and said plane being arranged obliquely to the vertical axis of the lens, with a socket-plate having the axes of its lens-sockets arranged at right angles to the general level of the plate, and provided with an elevation or stud arranged at the end of the inclined plane on the lens, substantially as and for the purposes set forth.



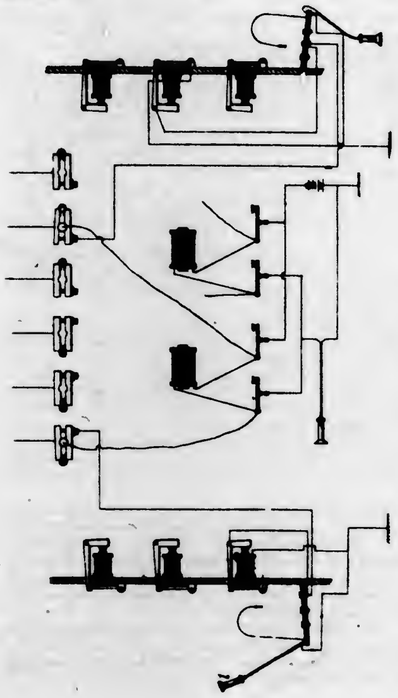
8. The combination, with the socket-plate provided with studs a a and pointed elevations b b, arranged as shown, of the lenses B, provided with inclined planes d and pendent angulas h, all arranged substantially as set forth.

258,233. GRAIN-BINDER. HOSEA G. HUBBARD, Norristown, Pa. Filed Feb. 3, 1882. (No model.)

Claim.—1. The combination of the revolving gleaning-cylinder, having a series of hubs provided with radial arms secured thereon, with a stationary plate or scroll arranged between every pair of hubs, partly encircling the shaft and filling the space between said hubs, substantially as and for the purpose specified.

258,233. WATER-ENGINE. HALE P. KAUFFER, Kalamazoo, Mich. Filed Dec. 16, 1881. (No model.)

Brief.—The spout has a central rib and ends of equal size. When the logs are separated the spout can be removed from the side and the valve readily inspected.



Claim.—1. The combination, with the plunger-log and the air-chamber log, of the spout having the central rib and ends of equal size, and the valve secured to the end of said spout, all substantially as described, for the objects set forth.

2. In a water-engine consisting of a force-pump and a portable tank, the tank having the rod located through it, serving the double purpose set forth, all substantially as described and shown.

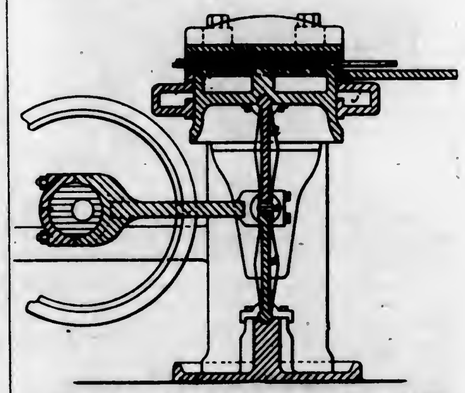
258,234. ANNUNCIATOR-BOARD AND CIRCUIT FOR TELEPHONE-EXCHANGES. MILO G. KELLOGG, Hyde Park, assignor to the Western Electric Manufacturing Company, Chicago, Ill. Filed Apr. 4, 1881. (No model.)

Brief.—Lines entering the central office pass first to the spring-jacks upon the switch-board, and from these they are grouped to separate annunciator-boards. The annunciator operators receive orders, each operator from a particular group of subscribers, by means of the usual telephonic devices, and connection between lines is made upon the switch-board. Clearing-out annunciators are interposed in connecting lines, and keys and circuits are provided whereby the switch-board operator can put his telephone or signaling-battery to line as desired. The circuits of the subscribers' annunciators are through the armatures and drops, so that the fall of a drop cuts its magnet out of the line and cuts off the ground-connection.

Claim.—1. In a telephone-exchange, two lines connected together for conversation, in combination with two keys, one of which, on being depressed, grounds the line through the central-office telephone, and the other of which, on being depressed, grounds the line through the central-office signaling-battery.

2. In a telephone-exchange, the combination of a switch-board at the central office, provided with spring jack-switches, one switch for each line which enters the central office, two or more annunciator-boards, upon which the lines are grouped, annunciators upon each of the annunciator-boards, one annunciator for each line of the group, and telephone-lines, each line passing first to its switch on the switch-board, thence to its annunciator of its group, and to ground, whereby an annunciator of a group is disconnected from its line when a line is connected at the switch-board with another line, substantially as shown and described.

3. In a telephone-exchange system, the combination of two lines connected together for conversation, a clearing-out annunciator in the circuit of said lines, and a battery and calling-key at the central office, so connected that when the calling-key is operated so as to signal to line the clearing-out annunciator responds or indicates that the signal has been sent.



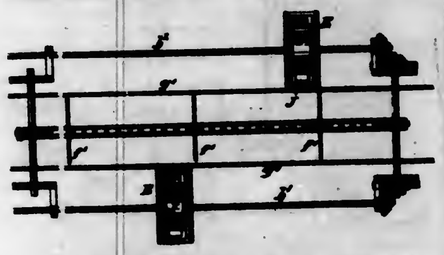
4. In a telephone-exchange system, the combination, at the central office, of a switch-board at which is performed the switching between all the lines which center at the office, two or more calling-annunciator boards, among which the wires are grouped and at which the calling-signals are received, and clearing-out annunciators, on which the clearing-out signals are received when the lines are connected together for conversation.

5. In a telephone-exchange system, the combination, at the central office, of a switch-board at which is performed the switching between all the lines which center at the office, two or more annunciator-boards upon which the wires are grouped, each annunciator-board having annunciators and contact plates, one annunciator and one contact-plate for each line of its group, operators telephones, one for each annunciator-board, each operator's telephone being grounded on one side and connected on the other side by a flexible cord with a metallic contact-peg, and telephone-lines, each line passing first to the switch-board, thence to its contact-plate on the annunciator-board, and thence to its annunciator-magnet and to ground, as and for the purpose specified.

258,235. INCRUSTATION-PREVENTIVE. HUGO KOLBE, Breslau, Prussia, Germany. Filed Jan. 6, 1882. (No specimens.)

Claim.—The herein-described composition of catechu of Pegu, English white caustic soda, dried pomegranate-shell, dried and coarse-pulverized chestnuts, and fresh water, in the proportions specified, and for the purpose substantially as set forth.

258,236. PULP-HOLDING MACHINERY. GEORGE W. LARAWAY and DWIGHT SLATE, Hartford, Conn., assignors to the American Paper Barrel Company, same place. Filed Feb. 7, 1881. (No model.)



Claim.—1. The combination of the piston, the resisting-surface opposed to the piston, and the laterally-removable matrix-case, all substantially as described, and for the purpose specified.

2. The removable matrix-case, made of sections hinged together, to the end that the case may be opened, substantially as described, and for the purpose set forth.

3. As a part of a pulp-molding machine, the removable matrix-case provided with a movable cover, substantially as described, and for the purpose specified.

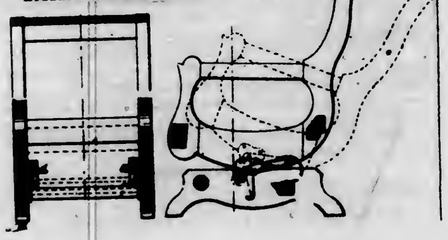
4. The combination of the eccentric, the toggle-arms, and the piston, all substantially as described, and for the purpose specified.

258,237. APPARATUS FOR UNLOADING VESSELS. MARTIN HAHN, Buffalo, N. Y. Filed Jan. 30, 1882. (No model.)

Claim.—1. An elevator, E, arranged upon a grooved shaft, *b'*, so as to be capable of both a horizontal movement back and forth along the shaft and a swinging movement as described, in combination with a conveyor arranged to move at right angles, or nearly so, to the movement of the elevator, and the operating mechanism of the several parts, substantially as specified.

2. The shafts *b' b'*, each provided with grooves C, and an elevator, E, and their operating mechanism, substantially as specified, in combination with a conveyor provided with a series of plates, *f'*, arranged within a trough, G *g'*, and their operating mechanism, substantially as described.

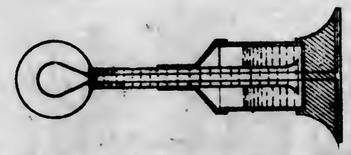
258,238. MECHANICAL MOVEMENT FOR CHURNS. ROBERT L. HARAWILLA, Rutland, Vt. Filed Feb. 11, 1882. (No model.)



Claim.—1. The combination of the frame A, lever D, pivoted thereto, and provided with the pin *d*, with the slotted lever E, pivoted inside of the frame to the cross-bar B, and adapted to support the body G of a churn, substantially as shown and described.

2. The combination of levers D and E, located outside and inside of the frame, respectively, frames A A, and cross-bar B, with the body G of a churn, provided with the spring-catch F, substantially as shown and described.

3. The lever E, slotted at *e*, and provided with the bearing *d'* and supporting-straps *d' d'*, in combination with the churn-body G and means for its oscillation upon the cross-bar B, substantially as shown and described.



258,239. BABE ROCKING-CHAIR. WILLIAM MCCABE and ROBERT MCCABE, Meadville, Pa. Filed Jan. 17, 1882. (Model.)

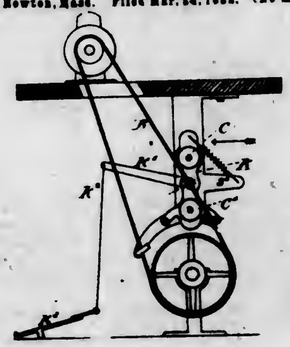
Claim.—1. In a babe rocking-chair, a spring attached to the base and projecting forward and provided with an inelastic arm having a slot therein, in combination with a rocking seat having a pin for holding the inelastic arm in place, and a downwardly-projecting hooked arm which catches upon a pin on the legs when the chair has been tilted.

2. In a babe rocking-chair, a base having a curved spring attached to its rear rung, and having an inelastic arm provided with a slot formed above the base, in combination with a rocking seat having a pin for holding the inelastic arm in place, and a downwardly-projecting hooked arm which catches upon a pin fixed to the base when the chair has been tilted, all arranged substantially as described.

258,240. ELECTRIC LAMP. JAMES J. MCTIGUE, Pittsburg, Pa. Filed Sept. 5, 1881. (No model.)

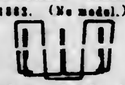
Claim.—1. The method of producing and maintaining an oxygenless atmosphere in electric lamps, consisting in inclosing the burner in a suitable globe, filling said globe with a vaporizable liquid devoid of oxygen, sealing the globe with said liquid, and finally passing the current through the burner, substantially as described, whereby the liquid is vaporized by the heat in the burner, and access of oxygen to the globe is prevented by the liquid seal.

2. The method of renewing or reintegrating a carbon electric-lamp burner by submerging it in a hydrocarbon liquid in a globe or vessel, excluding the atmospheric air therefrom, and then alternately admitting current to the burner and shutting it off therefrom, substantially as described, whereby the first admission of current to the burner heats and vaporizes the liquid, the following cessation of current allows the vapor to condense and saturate the burner, and the next admission of current again vaporizes the liquid and cokes the burner, and so on.



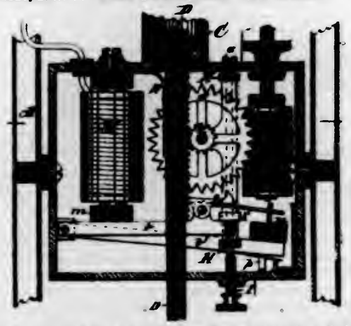
3. In incandescent carbon electric lamps, the combination of a containing-globe communicating at one end with the external atmosphere, a burner and its leading-wires, and a liquid hydrocarbon contained in said globe and sealing its open end, substantially as described.

258,241. COUPLING FOR ROPES AND ROUND BANDS. EDWARD W. HERRILL, Brooklyn, N. Y. Filed Sept. 16, 1881. (No model.)



Claim.—The coupling for ropes and bands, composed of two sockets swiveled together and each comprising two semi-cylindric jaws, between which the end of the rope or band is directly inserted, and rivets or other devices inserted transversely through said jaws for drawing them together and clamping them upon the rope or band, substantially as specified.

258,242. ATTACHMENT FOR BELT-IDLERS. BENJAMIN HERRITT, Newton, Mass. Filed Mar. 24, 1882. (No model.)



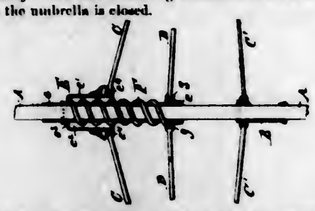
Claim.—The combination of the rocker-plate K, the idlers C C', and the arm H' with the stationary arm H and the bolt B, all operating together substantially as described, and for the purpose set forth.

258,243. MUSTACHE-GUARD. CHARLES MILLER, Reesville, Ms. Filed Jan. 10, 1882. (No model.)

Claim.—A mustache guard and trainer consisting of a wire spring-clamp adapted for adjustment upon the mustache, as herein set forth, and for the purposes herein described.

258,244. ELECTRIC-ARC LAMP. RICHARD B. MOFFATT, Brooklyn, N. Y. Filed Dec. 13, 1881. (No model.)

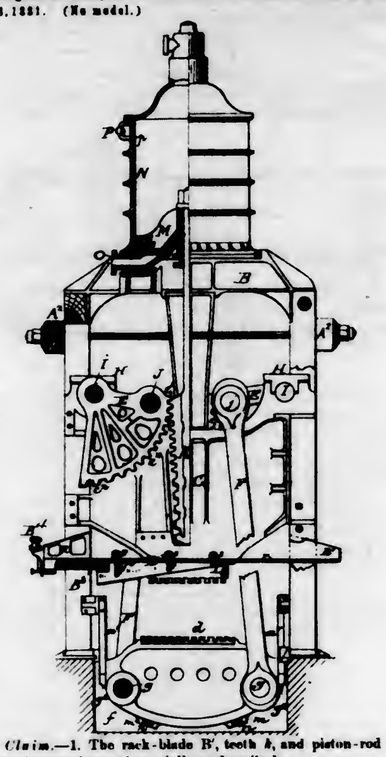
Claim.—1. In an electric lamp, the combination of the electro-magnet N, forming part of a derived circuit, its armature a, a device for breaking and closing said circuit, the moving frame H, escapement g, escapement-wheel c', pinion c, racked carbon-holder a, and means for allowing the armature to move a sufficient distance to insure the working of the escapement and the operation of the feed mechanism before breaking the circuit, and which also permit said armature to return to or near its normal position before closing said circuit, substantially as specified.



2. In an electric lamp, the combination of an electro-magnet, N, forming part of a derived circuit, its armature a, a device for breaking and closing said circuit by said magnet, mechanism for feeding the carbons, and means for moving and adjusting the magnet N for the purpose of increasing or diminishing the space between said magnet and its armature, substantially as specified.

3. In an electric lamp, the combination, with the carbon-holder D, of the moving frame H, guide-rods c c, wheel c', escapement g, armature-frame c, and the electro-magnet M, substantially as and for the purpose specified.

4. In an electric lamp, the combination of the carbon-holder D, the moving frame H, wheel c', guide-rods c c, armature-frame c, electro-magnet M, and the adjusting-screw I, substantially as and for the purpose specified.



258,245. UMBRELLA. BERNARD MOHR, St. Louis, Mo. Filed Jan. 4, 1882. (No model.)

Brief.—The sleeve-housing receives and conceals the spring when the umbrella is closed.

Claim.—In combination with the handle or stick A, having a movable slide, B, and wire spring a, the sleeve-housing E, consisting of the sleeve e, housing e', having collar e', the top ribs, C, the spring F, the middle slide-collar, g, carrying the middle ribs, D, the movable collar or slide B, carrying the lower ribs, C', the outer end of each middle and lower rib being secured to a top rib, all said parts being constructed and arranged to operate in the manner and for the purposes set forth.

258,246. COTTON-PRESS. EDMUND L. MORAN, St. Louis, Mo., assignor to Schuyler B. Steers, New Orleans, La. Filed July 26, 1881. (No model.)

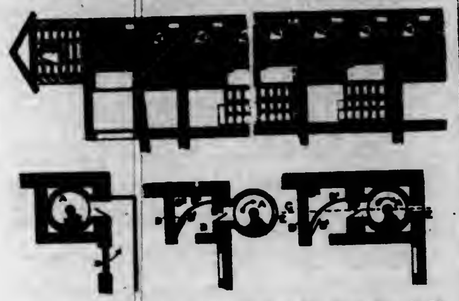
Claim.—1. The rack-blade B', teeth k, and piston-rod I, formed in one piece, substantially as described.

2. The rack-blade B', having the tooth k on each side thereof formed solid therewith, and the cog-racks K, having the last four teeth of gradually-increasing size as compared with the other teeth, said last tooth k being considerably larger than the largest tooth in said racks, substantially as and for the purpose set forth.

3. The combination of the rack-blade B', formed in one piece with the piston-rod I, and having enlarged lower teeth, the cog-racks K K, and the T-pieces for securing said cog-racks together and to the rack-blade, substantially as described.

4. The combination of the cog-sectors E, having greater spaces between the cogs at the longer than at the shorter ends, rack-blade B, having enlarged lower tooth and piston-rod formed therewith, and the cog-racks K K, having enlarged lower teeth, substantially as and for the purpose set forth.

5. The wrought rack-blade formed in one piece with the piston-rod, and the cast cog-racks K, said cog-racks being secured to said rack-blade by wrought T-pieces t, that are heated and then shrunk into the rack, substantially as described.



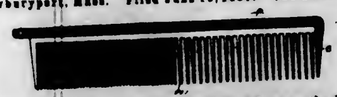
6. The wedge-brackets R' R', provided with a track, r, for the wedge-rollers s, and the wedge-brackets R R, for supporting the wedge-engine B', substantially as set forth.

7. The lower platen, constructed in two separate pieces, as described, each separate portion being composed of two ribs, having wide flanges at the bottom and small flanges at the top, and also having a greater width at the bottom than at the top, as and for the purpose described.

8. The combination, in a cotton-press, with the two-part lower platen, G, having recess e in its upper face, of a channeled plate, d, adapted to rest within said recess and extend across the two sections of said platen, and be removable therefrom to admit of plates of different degrees of thickness being substituted therefor without changing the plates or changing the length of the eye-bars, substantially as described.

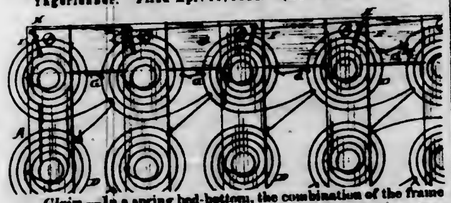
258,247. FIRE-ESCAPE. PETER A. NICHOLSON, Philadelphia, Pa. Filed Nov. 3, 1881. (No model.)

Brief.—The grooved spiral slide has numerous variations of inclination, and is entered by passage-ways from the different stories of the building, which passage-ways are provided with fire-proof doors and air-chambers.



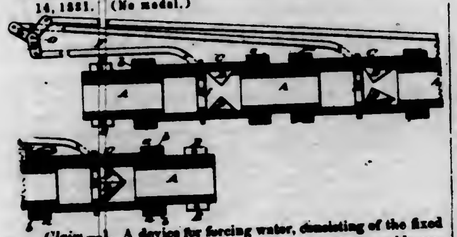
Claim.—1. A grooved or concave inclined slide formed of incombustible and rigid material, having numerous variations in inclination, adapted to retard persons descending thereon, substantially as set forth and described.

2. A grooved inclined spiral slide of varying inclination, having the outer side raised to adapt it to resist the centrifugal action of persons descending, substantially as set forth and described.



3. An inclined spiral slide, A, in combination with passage B, doors B' and B'' and air-chambers D, arranged substantially as described and shown.

258,248. COMB. WILLIAM MOYSE and WILLIAM H. MOYSE, Newburyport, Mass. Filed June 16, 1881. (No model.)



Claim.—As an improved article of manufacture, the herein-described comb, consisting of the toothed portion a, the metal back b, made from a solid rod or wire grooved to receive and hold the toothed portion a, and the metal guard-teeth c, rigidly fastened in the said groove, substantially as and for the purpose described.

258,249. SPRING BED-BOTTOM. WILLIAM A. OBER and JOHN YAGERLANDER, Nine Mile, Ind.; said Ober assignor to said Yagerlander. Filed Apr. 11, 1882. (No model.)

Claim.—In a spring bed-bottom, the combination of the frame A, having slats B, provided at their ends with staples H, the springs D, arranged and interlaced, substantially as described, and the wires I, connecting the staples H with the middle coils of the springs at the sides of the bed-bottom through which they are continuously laced, substantially as set forth.

258,250. PUMP. ENOCH OSSEON, Brooklyn, N. Y. Filed May 14, 1881. (No model.)

Claim.—1. A device for forcing water, consisting of the fixed and movable sections and devices for operating the movable sections, in combination with the double valves D D and valve-seats, the sections being adapted to operate successively, substantially as described.

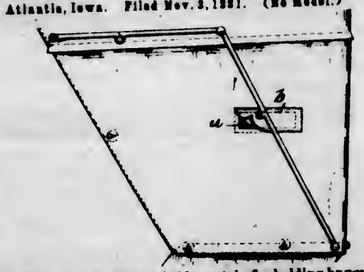
2. The combination of the fixed inner sections, A, the outer movable sections, C, and the valves D D, hinged in said outer sections, whereby when said valves are open they do not obstruct the flow of water, all substantially as described.

3. The combination of the fixed and movable sections and the valves with the crank-shaft, cranks set at different points on the shaft, and connecting-rods connecting cranks to the movable sections, whereby said sections are operated successively, substantially as described.

4. The double-acting valves D D, arranged in pairs on opposite sides of the seat, and combined with the alternately-operating catches, substantially as described.

5. The combination of two or more movable sections of a pump with fixed sections and with two or more sets of valves, said movable sections sliding upon said fixed sections, and being provided with mechanism, substantially as described, for moving them successively in proper order, all as set forth.

258,251. MACHINE FOR MANUFACTURING HONEY-COMB FOUNDATIONS. WILLIAM C. PULHAM, Mayesville, assignor to W. C. Pulham, Macon County, Ky. Filed Jan. 31, 1882. (Model.)



Claim.—1. A die-section for the manufacture of honey-comb foundations, consisting of a series of independent and separate dies, inclined relatively to the radius of the axis of the roller which carries said section, substantially as shown and described.

2. A die-roll for manufacturing honey-comb foundations, composed of a series of die-sections mounted on a spindle or shaft, the dies of the sections being independent and separate, and inclined relatively to the radius of the roller, substantially as shown and described.

3. In a machine for manufacturing artificial honey-comb foundations, the combination of a pair of matching die-rollers arranged in the same vertical plane, or nearly so, said die-rollers being formed of dies inclined relatively to the radius of the rollers, substantially as described.

258,252. SIDE CURTAIN FOR CARRIAGES. JAS. K. POWERS, Atlantic, Iowa. Filed Nov. 3, 1881. (No model.)

Claim.—An improved side curtain for holding buggy and carriage tops, having an aperture, a, and pendent cover or flap b, substantially as shown and described, for the purposes specified.

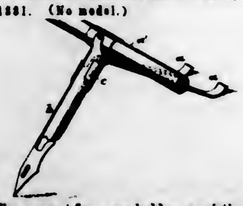
258,253. WAGON-BRAKE. CARSTEN F. QUAST, Greenfield, Ill. Filed Feb. 14, 1882. (No model.)

Claim.—1. In a wagon-brake, the plate or casting B, having pin or stud C and flanged bracket D, substantially as and for the purpose set forth.

2. In a wagon-brake, the combination, with the plate or casting B, having pin or stud C and flanged bracket D, of the brake-

258,253.

lever F, pivoted upon pin C, and having lever G, provided with a toothed arm, H, engaging bracket D, and mechanism for manipulating said latch-lever, as set forth.



3. In a wagon-brake, the combination of the plate B, having pin or stud C and flanged bracket D, the segmental guide-strip N, the brake-lever F, having finger M, and latch-lever G, provided with a toothed arm, H, and mechanism for manipulating said latch-lever, as set forth.

4. In a wagon-brake, the cross bar or brace T, secured transversely upon the reach, and having downward-projecting bails or brackets in which the brake-bar is supported, and means for pivoting the brake-lever to the outer end of said bar T, as set forth.

5. In a wagon-brake, the herein-described plates B B, having studs or pins C and flanged brackets D, and secured respectively to the side of the wagon-bed and to the end of a cross-bar, T, secured upon the reach, in combination with an interchangeable brake-lever, substantially as and for the purpose set forth.

6. In a wagon-brake, a brake-lever interchangeable between the wagon-bed and the running-gear, both of which are provided with suitably constructed and arranged means to engage and cooperate with the latch mechanism of said brake-lever, as and for the purpose shown and specified.

258,254. PEN-HOLDER. LEONARD SCHUYLERELL, Athens, Ga. Filed Sept. 7, 1881. (No model.)

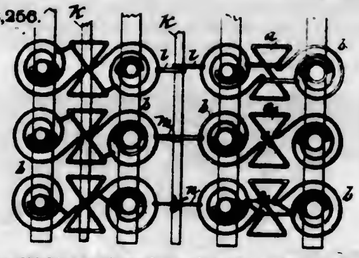
Claim.—1. The support for a pen-holder, consisting of diverging arms *a a*, connected with a clip, *c*, adapted for application to the shaft of the holder, and arranged on the clip to extend at or about right angles from the holder, as set forth.

2. The combination, with the shaft of a pen-holder, of diverging arms *a a*, extending at about right angles from the shaft, substantially as set forth.

3. A pen-holder in which are combined a shaft consisting of a shank and a bar at right angles thereto at the rear end of the shank, and arms *a*, forming a tripod with the shank, substantially as set forth.

258,255. CIGARETTE. HENRY H. SCHLUNDT, Rochester, N.Y. Filed Aug. 24, 1881. (No model.)

Claim.—1. As a new article of manufacture, the cigarette having its mouth-piece composed of a long strip or ribbon of soft absorbent wood of uniform, or substantially uniform, width, with the grain running transversely, coiled endwise upon itself into a cylindrical form, whereby it is adapted to absorb the nicotine and sustain the cigarette-body when moist.



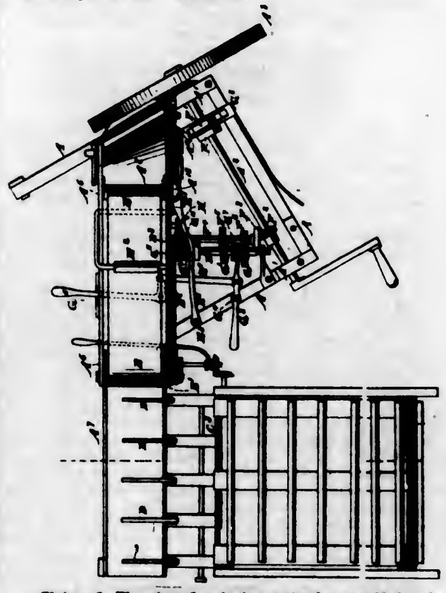
2. The mouth-piece of a cigarette, consisting of a thin ribbon of absorbent wood wound closely into cylindrical form, the grain of the wood lying lengthwise of the cylinder.

258,256. SPRING BED-BOTTOM. HARLEY L. SHERWOOD, Des Moines, assignor to H. E. Sherwood, Algona, Iowa. Filed Mar. 16, 1882. (No model.)

Claim.—1. A twin spring for bed-bottoms, having triangular-shaped sections *a a* formed integral with its upper coils, *h*, by means of bights *c c* and bends 1 2 3 4, substantially as shown and described, for the purposes specified.

2. The improved twin spring for bed-bottoms, having triangular-shaped sections *a* formed integral with its upper coils, *h*, by

258,256.



means of bights *c c* and angular bends 1 2 3 4, and an angular bend, *f*, in its lower coil, immediately over the loop *h* of a transverse extension, and clasp *h'*, for engaging a slat, substantially as shown and described, for the purposes specified.

3. The adjustable and detachable coupling device, composed of a rod or bar, *k*, and a series of bands, straps, or cords *l m n*, in combination with two series or rows of springs, substantially as shown and described, to operate in the manner set forth, for the purposes specified.

4. The improved bed-bottom, composed of a series of adjustable slats, a series of twin springs having triangular-shaped sections *a*, bights *c c*, and bends 1 2 3 4 in their top surfaces, adapted to retain adjustable stays, and bends *f* and loops *h* at their bottoms, adapted to receive keys or pins *i* and adjustable coupling devices *k l m n*, substantially as shown and described, for the purposes specified.

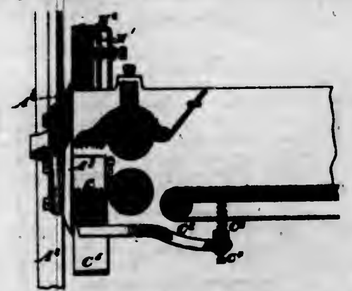
258,257. ENSILAGE-CUTTER. JOHN Y. SMITH, Pittsburg, Pa. Filed Sept. 14, 1881. (No model.)

Claim.—1. The pivoted swinging cutter-bar provided with arms for attaching it to the cutter-box, one of said arms being provided with cam-shaped projections for operating the mechanism which stops the movements of the feed-rollers, its construction being substantially as shown and described.

2. A knife to be used in connection with a machine for cutting food for animals, consisting of a curved plate of metal having attached to it a number of sections, each having upon it a curved cutting-edge of a greater degree of curvature than the one which succeeds it, and each of which projects beyond the plate to which it is attached to a greater distance than the one which succeeds it, substantially as and for the purpose set forth.

3. The combination of the pivoted swinging cutter-bar having upon its inner ends a cam-shaped projection, A^{12}, lever E', the clutch G^3, pulley G, belt B^3, and pulleys B^4 and B^5, whereby to arrest the motion of the feed-rollers in the event of any solid substance passing them and coming in contact with the knives, substantially as and for the purpose specified.

4. The combination of the cutter-box A^4, the automatically-moving stop E, having a roller, E^5, placed upon one of its arms, and lever E', the parts being arranged for operation substantially in the manner described and shown.



5. The combination of the elevator for carrying the material to be cut to the cutter-box, the receiver or holder for delivering the same in regulated quantities, and the cutter-box, or an extension thereof, substantially as set forth.

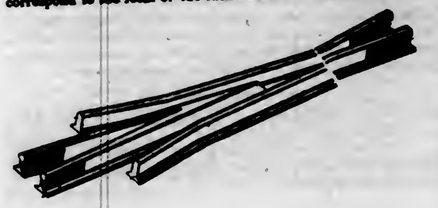
6. In combination with the feeding-rolls of a fodder-cutting machine and a belt for driving them, the worm F^6, pinion F^5, wheels G and G', clutch G^3, and wheels F^3 and F^4, their arrangement being substantially such as is shown and described, whereby they are made to regulate the length of the parts cut from the material in the cutting-box, as set forth.

7. The combination of a swinging cutter-bar having upon one of its arms a cam for operating a belt-shifter, and the belt-shifter G^2, the parts being arranged for joint operation, substantially as set forth.

8. The combination of a swinging cutter-bar having upon one of its arms a cam-shaped projection for throwing the feed-motion of the machine out of gear, and a lever pivoted to the frame of the machine for unclutching said feeding mechanism, the parts being arranged to operate substantially as set forth.

258,258. ENSILAGE-CUTTER. JOHN Y. SMITH, Pittsburg, Pa. Filed Sept. 14, 1881. (No model.)

Claim.—1. A cutter-bar for use in machines for cutting food for animals, having upon its surface a series of projections for preventing the rolling of the material, in combination with the cutting-knives, substantially as set forth, and for the purpose specified.

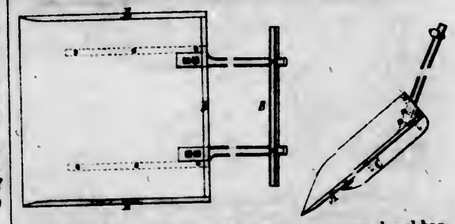


2. The combination of the curved cutting-knives A^3 and the grinding-roller H, mounted in an adjustable frame, the arrangement of the roller with reference to said curved knives being substantially such as is described and shown, whereby the action of the knives in passing it is made to cause a rotation or partial rotation thereof, thus causing it to sharpen the knives, substantially as set forth.

3. In a machine for cutting food for animals, and in combination with the cutting-knives, the cutter-bar C, having a series of projections upon its upper surface, and the vertically-moving cap covering the upper feed-roll, a portion of the under surface of which is provided with a series of projections, substantially as shown and described.

4. In combination with the cutting-box of a machine for cutting food for animals, a movable cap for covering the adjustable feed-roll, and an adjustable plate for directing the material to be cut to the feed-rollers.

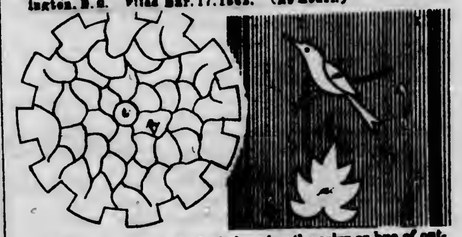
258,259. RAILROAD-FROG. JOSHUA STAPLES, Indianapolis, Ind. Filed Jan. 30, 1882. (No model.)



Brief.—Frogs are constructed by rolling in a solid piece in the form intended to be used, and have their ends planed out to correspond to the form of the rails and receive the fish-plates.

Claim.—1. As a new article of manufacture, a railroad-frog constructed of rolled metal, the several portions thereof being rolled all together and in a single piece, substantially as set forth.

2. A railroad-frog rolled in a solid piece in the general form in which it is intended to be used, having its ends planed out to correspond with the form of the rails to be used in connection therewith, in combination with said rails and angle-bars or fish-plates, which fit into said planed-out places and are secured therein, substantially as set forth.



258,260. SNOW-SHOVEL. HENRY W. STAPLES, Old Orchard, Me. Filed Feb. 20, 1882. (No model.)

Claim.—1. As an improved manufacture, a snow-shovel having attached to its blade end and side guards to project upward therefrom, and also having a pair of runners, C C, attached to the under surface of such blade, and having their front ends in rear of the front edge of such blade a distance of one-third the length of the blade, or thereabout, all being substantially as set forth.

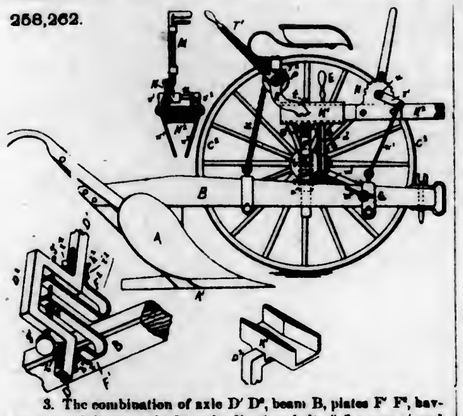
2. As an improved manufacture, a snow-shovel having a pair of runners, C C, attached to the under surface of the blade, and having their front ends in rear of the front edge of such blade a distance of one-third the length of the blade, or thereabout, all being substantially as set forth.

258,261. CHANGEABLE PICTURE. JOHN W. STOCKTON, Washington, D.C. Filed Mar. 17, 1882. (No model.)

Claim.—1. The method of changing the color or hue of outline transparent pictures by means of a revolving or sliding variegated disk at the back of a coated plate of glass or other transparency, the picture being formed by removing portions of said coating, substantially as described.

2. The combination of the plate A, provided with the outline pictures *a*, and the variegated plate or disk B, substantially as set forth.

3. The combination of the plate A, provided with the outline pictures *a*, the variegated plate or disk B, and the pin or bearing *c*, attached to the back C, substantially as specified.



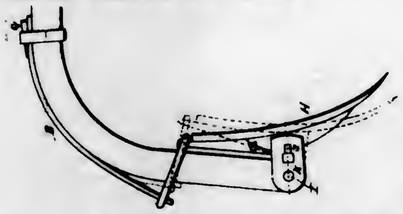
258,262. SULKY-PLOW. ORVILLE A. STONEMAN, Minneapolis, Minn. Filed July 16, 1881. (No model.)

Brief.—Beam suspended in arched portion of axle between two plates connected at upper ends by screw-bolt passing through arch of axle and having their lower ends upwardly and outwardly bent and secured to axle by bolts passing through slots therein, whereby the beam may be adjusted laterally and is allowed a limited vibratory movement. Tongue pivoted in sleeve having oppositely-inclined walls to allow limited lateral vibration. One of the draft-rods connecting forward end of beam to axle has slot-and-bolt connection therewith to admit of lateral adjustment.

Claim.—1. The combination, with beam B and axle D', having bend D^3, of the curved plates F' F^2, secured at their lower ends to axle D' and at their upper ends within the bend D^3 by a transverse adjusting-screw, *f'*, substantially as set forth.

2. The combination, with beam B and axle D', of the curved plates F' F^2, having curved lower ends, h' h^2, and admitting of lateral adjustment at their upper ends by means of a screw, substantially as specified.

258,262.



3. The combination of axle D' D², beam B, plates F' F², having curved lower ends, lateral adjusting-bolts i' i², screw g', and nuts g² g², substantially as specified.

4. The beam B, suspended in the crank portion D² of the axle D' between the plates F' F², in combination with the oaky-tongue H², pivoted in the sleeve H', having double inclined walls, and secured to the crank portion D² of the axle, by means whereof both beam and tongue may have a vibratory motion without communicating it to the axle, substantially as set forth.

5. The combination of axle D', beam B, and rods m' m², connecting the axle and beam, one of the rods being secured to the axle by a bolt passing through an elongated slot in the axle, by means whereof the axle and beam may be adjusted at right angle to each other, substantially as set forth.

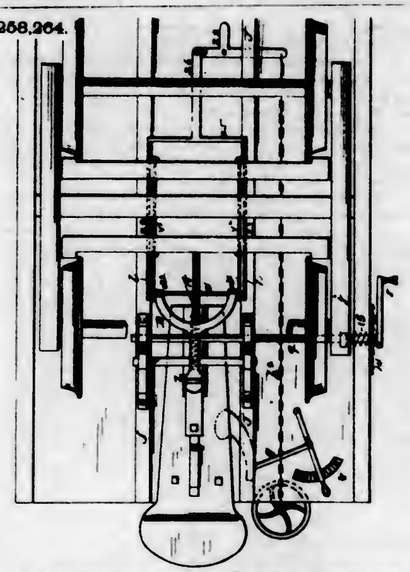
258,263. CULTIVATOR-TOOTH. WILLIAM D. STROUD, Oshkosh, Wis. Filed Feb. 14, 1882. (Model.)

Claim.—1. The combination of the cultivator-tooth H, key-seated wrist G, and gib S with the pivoted yoke K, substantially as shown and described.

2. The cultivator-tooth H, having a key-seated wrist, G, and gib S, in combination with the pivoted yoke K, link E, and spring B, substantially as and for the purpose shown and described.

258,264. CAR BRAKE AND COUPLING. NILS OLOF SWENSON, Terraville, Dak. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination of the automatic coupling mechanism, consisting of the spring-hooks pivoted within the draw-head, and the push-arm of an automatic braking mechanism provided with a head sliding between the coupling-hooks within the draw-head, substantially as described.

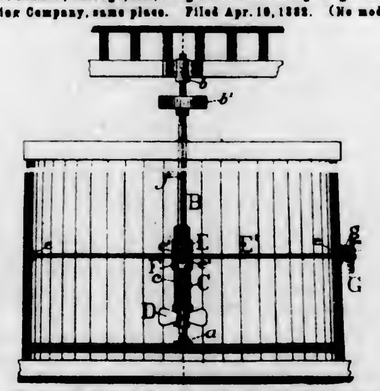


2. The braking mechanism consisting of the push-arm B, provided with projecting head b', and the forked end l, and controlled by action of a spring, in combination with the braking-lever D, brake-beams, and their connecting arms or rods, substantially as described.

3. The spring coupling-hooks 1 and 2, pivoted, as described, within the draw-head between the plates b c, in combination with said plates, the rod S, on which the rear ends of said hooks slide, the lever g, and rack-bar a, substantially as set forth.

4. The push-arm B, consisting of the two separable parts, the head b', extending above the surface of the hooks, within the draw-head, and through and below the draw-head, and the forked part l, having rounded portion o, substantially as described.

5. The swinging forked brake-lever D, in combination with frame and hand-lever, whereby to lower and raise the same, and the rods and brake-beams, substantially as described.



258,264.

6. The combination, with the draw-head, of spring-catch 29, attached to the top of said draw-head, and the beveled pin 28, provided with a hole to receive the said catch for the purpose of securing the link within the draw-head, substantially as described.

7. In combination with the draw-head, the box p, provided with a plug, p', to contain a spring and afford a support for the piece l of push-arm B, substantially as described.

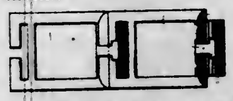
258,265. STIRRER FOR STARCH-SETTLING TANKS. JOHN J. TOBIN, Chicago, Ill., assignor to the Chicago Sugar Refining Company, same place. Filed Apr. 10, 1882. (No model.)

Claim.—1. The stirring-wheel D, affixed to the lower end of the hollow cylindrical rack C, adapted to slide upon the square shaft B, in combination with the pinion E, keyed to the elevator-shaft E', provided with the hand-wheel H and with the ratchet-wheel G, for engagement by the detent-pawl g, pivoted to the wall of the tank, as and for the purpose set forth.

2. A hollow cylindrical rack, carrying upon its lower end a stirring-wheel, and loosely fitted upon a square rotating shaft, in combination with the box F, supported by the rods f f, and the pinion E, keyed to the elevator-shaft E', and means for rotating the same, substantially as and for the purposes set forth.

258,266. CAR-WHEEL. NATHAN WASSERBURG, Allston, Mass. Filed Oct. 24, 1881. (No model.)

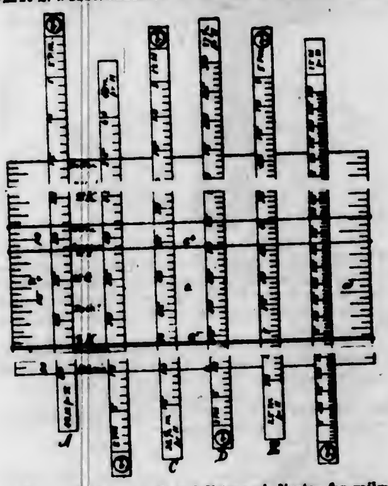
Claim.—1. The combination of the car-wheel body or rim and the two metallic rings, and their connecting-bolts arranged in such body or rim, substantially as set forth.



258,266.

2. The combination of the two metallic rings, their connection-bolts, and the series of spokes, with the rim and hub arranged with and cast upon them, as specified.

3. The combination of the two metallic rings, their connection-bolts, the series of spokes, and the steel tire with the hub cast upon the spokes, and with the rim cast within and against the tire and upon the rings and bolts, all substantially as set forth.

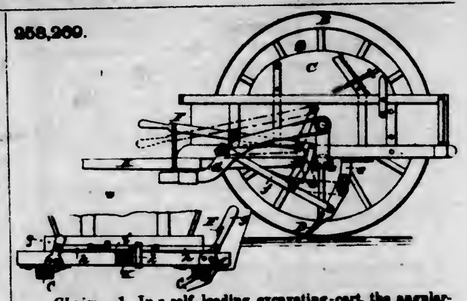


258,267. DRIVE-CHAIN. JAMES H. WEAVER, Chicago, Ill., assignor of one-half to Martin Boom, same place. Filed Feb. 13, 1881. (Model.)

Claim.—1. In a detachable chain, a link provided at one end with a hook having a bar or diaphragm connecting the point of the hook with the end bar, substantially as described, and at its opposite end with an open end bar.

2. In a detachable chain, a link provided at one end with a hook having a bar or diaphragm, substantially as described, and at its opposite end with an open end bar, in connection with a transverse bar intermediate the hook and end bar, and rigidly connecting the side bars of the links.

258,268. RAILWAY TIME AND SPEED PER-INDICATOR. JAMES R. WELLS, Auburn, N. Y. Filed July 11, 1881. (Model.)



Claim.—A time, speed, and distance indicator for railways, composed of a base-plate provided with a series of longitudinal channels, and having its edges graduated to indicate miles, and a series of movable slides placed in the channels in the base-plate, and having their upper faces graduated to indicate the time and speed of the train, substantially as set forth.

258,269. SELF-LOADING EXCAVATING-CART. GEORGE W. WHITSON, Asheville, N. C. Filed Feb. 25, 1882. (No model.)

Brief.—The buckets are formed of two angular-shaped pieces of metal united by lips and secured to the tire and felly of the wheels, and formed highest next to the felly. A deflecting-board on the cart adjacent to each wheel is formed with a yielding portion. The false shafts are secured in carrying position by cams on levers connected by links on a cross-bar. One of the cam-levers is notched to engage the lever of the plow-operating mechanism. The plows are connected by a torsional axle, which moves in slotted hangers. A bent spring is located beneath the main axle, its ends resting on the torsional axle. Temper-screws are placed between the main axle and the bent spring. A bar with bifurcated ends is also secured to the main axle and cart-body.

258,269.

Claim.—1. In a self-loading excavating-cart, the angular-shaped buckets for the wheels formed highest next the felly, substantially as set forth.

2. In a self-loading excavating-cart, the buckets b', formed of two angular-shaped pieces of metal, having coincident lips or flanges and adapted to be secured to the felly and tire of the wheel, substantially as set forth.

3. In a self-loading excavating-cart, the combination of the cam-levers g, the cross-bar, the false shafts, and the links h h and i, substantially as set forth.

4. In a self-loading excavating-cart, the combination of the cam-lever g, provided with a notch or notches in its handle, the lever F, plow D, and intermediate links, f f', substantially as set forth.

5. In a self-loading excavating-cart, the combination of the twisted torsional axle I, the brackets c, and plows, substantially as set forth.

6. In a self-loading excavating-cart, the combination of the axle I, the bent spring H, slotted brackets c, and plows, substantially as set forth.

7. In a self-loading excavating-cart, the combination of the axle I, the bent spring H, temper-screws, slotted brackets c, and plows, substantially as set forth.

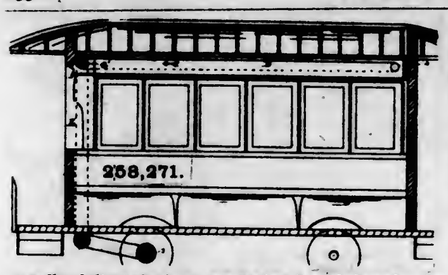
8. In a self-loading excavating-cart, a shield or guide consisting of a rigid and a hinged section, substantially as set forth.

9. In a self-loading excavating-cart, the shield or guide consisting of the rigid part C and the hinged section C', in combination with the springs e' and e', substantially as set forth.

10. In a self-loading excavating-cart, the supplemental bar, having bifurcated or forked ends bolted to the cart-body and chain to secure it to the bent axle-bar, substantially as set forth.

258,270. SHILD'S CARRIAGE. CHARLES WITTENBERG, Indianapolis, Ind., assignor to Norman B. Byram and Edward S. Cornelius, both of same place. Filed Sept. 29, 1881. (No model.)

Claim.—1. The parallel rods a a, secured to the body of a carriage substantially in the manner described and shown, and combined with supports for a canopy secured adjustably along said rods, in the manner and for the purpose set forth.



2. The combination of the stub-standards o o, the rods a a, and a carriage-body, substantially in the manner and for the purpose set forth.

258,271. FARE-COLLECTOR FOR STREET-CARS. EDWARD W. ANDREWS, Detroit, Mich., assignor of one-third to John H. Eakins, same place. Filed Mar. 4, 1882. (No model.)

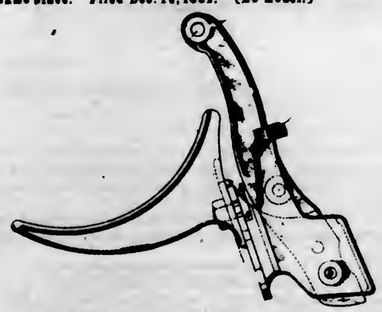
Brief.—An endless belt is arranged above the windows of the car and connects with the fare-receiving box. The belt is actuated by gearing connected with the car-axle.

Claim.—1. The combination, with a car and the fare-receiving box thereof, of an endless belt, arranged and operating substantially as and for the purposes set forth.

2. In a car, and in combination with the receiving-box thereof,

an endless belt running in an open-top box situated above the windows of said car and actuated by the rotation of the car-axle, substantially as and for the purposes specified.

258,272. ART OR METHOD OF MANUFACTURING PAPER BAGS. DANIEL APPEL, Cleveland, Ohio, assignor to the Eastern Paper Bag Company, Hartford, Conn. Filed Sept. 23, 1881. (No model.)



Claim.—The herein-described improvement in the art or method of manufacturing satchel-bottom paper bags from a tubi, which consists in first forming the diamond fold, then cross-folding the leading corner of the diamond fold, and subsequently completing the satchel-bottom by cross-folding the rearmost corner of the diamond fold, and together with it the main body of the bag-blank, on the line of this second cross-fold, substantially as and for the purpose described.

258,273. CORNSTALK-FODDER. FRANK H. BACON, Plainfield, N. J., assignor to himself, Joseph Fowler, and Garman Parse, same place. Filed Sept. 12, 1881. (No model.)

Claim.—A bale of cornstalks in a crushed condition, cut to length, pressed, and tied for transportation, substantially as specified, as a new article for fodder.

258,274. GRAIN-BINDER. WILLIAM R. RAMM, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Dec. 16, 1881. (No model.)

Claim.—1. The combination of the sustaining arm or bar, a section of a compressing and tripping arm pivoted thereto, and a second section adjustably connected to the first so as to increase or diminish the grain-receiving space.

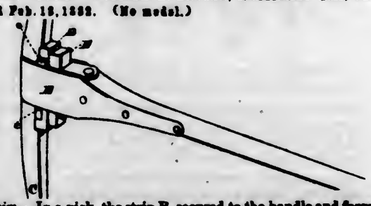
2. The combination of the sustaining-arm, the lower section of the tripping-arm pivoted thereto, and the upper section of said tripping-arm adjustable along the other.

3. The combination of the sustaining-bar, the lower section of the tripping-arm pivoted thereto and having heel-extension and eye, and the upper section adjustable along the top of the lower.

4. The combination of the lower section of the tripping-arm, its base-plate having longitudinal and cross slots and channels, the upper section formed with a pendent tongue and the bolt uniting the two.

5. The upper section of the tripping-arm formed with flaring sides, embracing or saddling the lower section or shank.

6. The combination of a tripping-arm made in sections, one of which is adjustable along the top of the other, with a sustaining-bar, to which the lower section is pivoted, and along which it is adjustable.



258,275. PUMP. GEORGE F. BERRY, Hornellsville, N. Y. Filed Apr. 7, 1882. (No model.)

Claim.—1. A pump provided with three working-barrels, the middle one being of greater diameter than the upper one, in combination with an adjustable piston-rod and two pistons, whereby the pistons can be adjusted up or down to change the pump from a force to a lift pump and from a lift to a force pump, substantially as set forth.

2. The combination of three working-barrels with the pipe Z, for connecting the two lower barrels to adapt the pump to walk of different depths, substantially as described and shown.

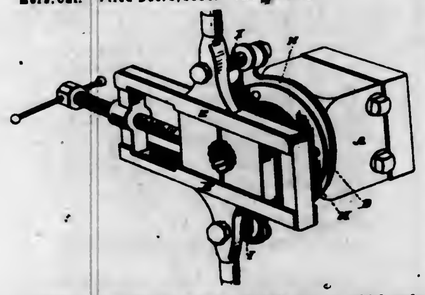
258,276. PICK. WILLIAM L. BLYTHE, Mokelumne Hill, Cal. Filed Feb. 16, 1882. (No model.)

Claim.—In a pick, the strip B, secured to the handle and forming a socket or eye, in combination with the blade C, having notches *a b*, wedge D, with its lugs *c*, and spring *e*, having a head, *e'*, and the wedge E, all arranged to secure the blade within the eye, substantially as described.

258,277. PROCESS OF PRODUCING WATER-PROOF GUM FROM FLAX. JONATHAN HOYT, Providence, R. I. Filed Apr. 24, 1882. (No specimens.)

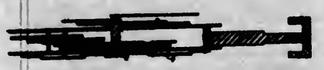
Claim.—1. The art of producing water-proof gum from the flax-plant by subjecting the plant to the process of softening, as described, removing the fatty matter by pressure, and concentrating the same by evaporation.

2. As a new article of manufacture, a gum having the consistency of india-rubber, made from the flax-plant, as described.



258,278. SEAL AND TAG. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Jan. 12, 1881. (No model.)

Claim.—1. A rigid, or substantially rigid, return-tag bearing a permanent number or distinguishing-mark, and having one or more threading-holes in the form of horizontal slots, as herein specified, in combination with a sheet-metal seal-shackle and an ordinary car-door hasp and staple, substantially as herein described, the combination being such that the tag is attached to the staple by the sealed shackle, and the hasp is secured on the shackle by the tag, so as to provide for leaving the door open, or for partly opening the door, and for freely separating the tag from the seal shackle for return as a check and for repeated use.



2. The combination, in a seal and tag, of a tag bearing a permanent number or distinguishing mark and a sheet-metal seal-shackle impressed with a corresponding number or mark, substantially as herein specified, for the purpose set forth.

258,279. DEVICE FOR FORMING SHOULDERS UPON VEHICLE-AXLES. GEORGE BRAINARD and JACOB E. SWARTS, Livermore, Cal. Filed Dec. 3, 1881. (No model.)

Claim.—A device for forming shoulders upon vehicle-axles, consisting of a case, A, having clamps by which it may be secured to the axle, a grooved periphery, as shown, and a tool-holder, E, in combination with the crescent-shaped arms H, fitting into the groove D, and the posts I, projecting in a line parallel with the spindle, and adapted to support the tool-holder so that it operates at a distance from the case, substantially as herein described.

258,280. TOY WATCH. ROBERT J. CLAY, Arlington, N. J. Filed Mar. 1, 1882. (No model.)

Claim.—1. The combination, with the standards cut out of the material of the base-plate and bent up as shown, of the shaft of the winding-pinion projecting through one of the said standards, substantially as shown and described.

2. In combination with the winding-wheel, the open ring or eyelet connected therewith by the two prongs or projections, and provided with a hook or catch for connecting the main-spring and winding-wheel, substantially in the manner and for the purpose set forth.

3. The combination, with the winding-wheel, of the open ring or eyelet attached thereto, and the shaft of the spring-wheel projecting through said eyelet and resting upon the winding-wheel, substantially as shown and described.

4. The combination of the base-plate, the winding-wheel struck up with a central bearing-surface for contact with said plate, and the open ring or eyelet having prongs projecting through the winding-wheel and located in the central recess formed in said wheel, substantially as shown and described.

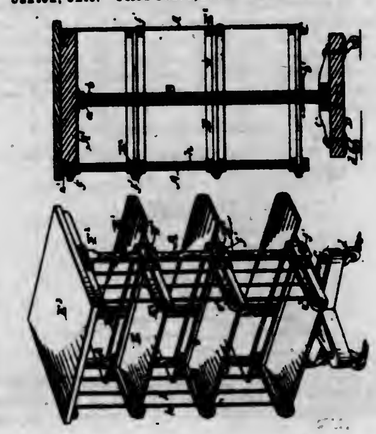
5. The combination, with the base-plate, of the winding-wheel having the annular recess formed therein to escape the projecting shafts of the wheels above said plate, and the central bearing-surface for contact with the base-plate, substantially as shown and described.

258,281. ARGAND LAMP-BURNER. ADOLPH E. CONRAD, Philadelphia, Pa., assignor of one-half to Andrew J. Weidner, same place. Filed Aug. 24, 1881. (No model.)

Claim.—1. The combination of the inner and outer tubes, A A', of the burner, the wick-carrier D, having a lug, *d*, and the coiled wire F, serving as an elevator for the wick-carrier, as set forth.

2. The combination of the inner and outer tubes, forming an oil-chamber, and the wick-tube having a stud, with the spiral coil and ring at the upper end of the tube for turning the coil in the said chamber, substantially as specified.

3. The combination of the inner and outer tubes, forming an oil-chamber, and the wick-tube having a stud, with the spiral in the said chamber, a ring at the top secured to the spiral, and a chimney-support attached to said ring, all substantially as described.

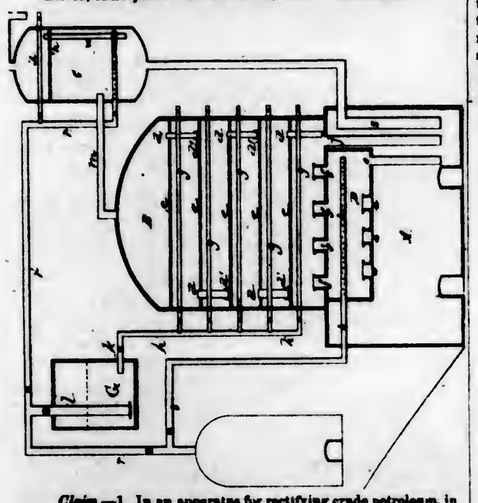


258,282. VENTILATOR FOR WINDOWS. HUGH H. CRAIG, Baltimore, Md. Filed Feb. 24, 1882. (No model.)

Claim.—1. A window-ventilator consisting of a bar adapted when placed in position, to separate the meeting bars of the sash and provided with a flange, *d*, as and for the purpose set forth.

2. The window-ventilator herein described, consisting of the bar *c*, made in two parts, hinged or pivoted together, and having the flange *d* and overlapping joint *f*, as set forth.

258,283. REVOLVING SHELF OR STAND. JOHN DANNER, Canton, Ohio. Filed Feb. 8, 1882. (No model.)

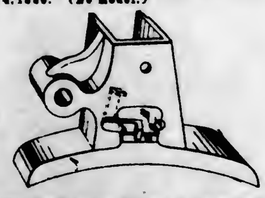


Claim.—1. The combination of a post having a hollow cap-bearing in its upper end, a yoke provided with a pendent pin, *a*, rods A, provided with a hooked end, *a'*, and a series of shelves provided with clamps secured thereto, and set-screws *f'*, adapted to operate upon or engage with the rods A, substantially as and for the purposes set forth.

2. The combination of a post, a yoke resting upon said post, vertical rods secured to said yoke, and a series of shelves provided with bars E^5, having vertical perforations c^5, with rods A, passing through the ends of the shelves, and clamps secured to the shelves and bars E^5, substantially as and for the purposes described.

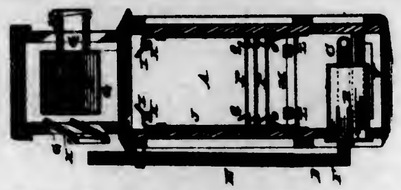
3. The combination of a post, a yoke adapted to rest thereon, and vertical rods secured to said yoke and provided with perforations a^5, with a series of shelves and screws, *f*, adapted to pass through the perforations a^5 and engage with the shelves, substantially as and for the purposes described.

258,284. APPARATUS FOR RECTIFYING PETROLEUM. LOUIS DAHL, Buffalo, N. Y., assignor of one-half to Charles F. Ritter, same place. Filed Jan. 20, 1882. (No model.)



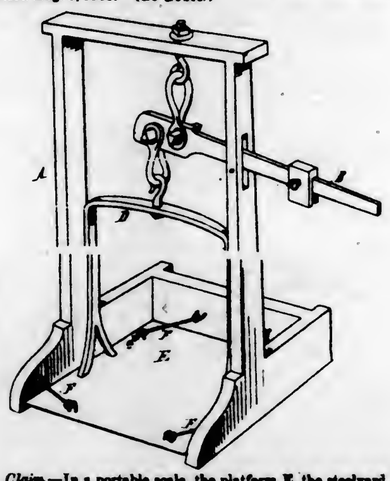
Claim.—1. In an apparatus for rectifying crude petroleum, in combination with still A and rectifier B, the separating-chamber D at the top of said still, provided with openings *a a a* and *f f f*, the steam-pipe *b*, and discharge-pipe *c*, all arranged and operating substantially as specified.

2. In an apparatus for rectifying petroleum, in combination with the main portion or walls, the perforated plates *e e e*, pipes *d*, and cap *d'*, the coils or worms *g g g*, situated just beneath plates *e*, and the hot-water tank G, and pipe connecting the worms with such tanks, all substantially as specified.



3. In an apparatus for rectifying petroleum, the purifier C, provided with pipes *p* and *n*, and perforated plate *n*, in combination with the steam-generator and connecting-pipe, as described, a distillation-chamber, and a pipe connecting the still and purifier, said connecting-pipe entering the purifier above the pipe *p* and below the perforated plate, all substantially as and for the purpose specified.

258,285. BRAKE-SHOE. JAMES DENVER, New Haven, Conn. Filed Aug. 4, 1880. (No model.)



Claim.—The combination of shoe A, shank B, receiving-box G, and pressure-lever J, its shank K, and nut L, constructed and operating together substantially as and for the purpose described.

258,286. FRUIT-DRIER. WILLIAM G. DORSETT, Albany, Oreg. Filed Jan. 16, 1882. (Model.)

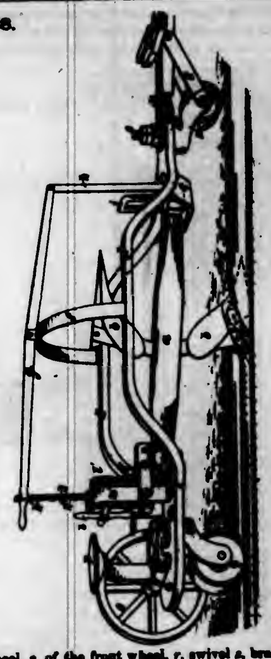
Claim.—In a fruit-drier, the herein-described combination and arrangement of the casing A, having ventilators H, openings U, provided with doors or dampers V and deflectors W, and mechanism, substantially as described, for manipulating the drying-trays, with the furnace B, having smoke-pipe C at its rear end, from which branches D, having dampers F, extend forwardly between the sides of the furnace and the walls of the casing and out through the front, where they are again united, by which arrangement, by manipulating the dampers F, the heat may be regulated and thrown to either side of the casing, as set forth.

258,287. BARREL-SCALES. JOHN DOLPH, Bay City, Mich. Filed Aug. 8, 1881. (No model.)

Claim.—In a portable scale, the platform E, the steelyard B, and the bifurcated yoke D, connecting the platform and steelyard, in combination with the frame A, supporting the steelyard and provided with a base surrounding three sides of the platform, and the four stay-rods F, connected to four sides of the upper surface of the platform and to the three sides of the base at points above the platform, substantially as and for the purpose specified.

258,288. SIDE-HILL PLOW. WILLIAM H. DUNFEE, Fall River, Mass. Filed Feb. 20, 1882. (No model.)

Brief.—Axle centrally pivoted to swing around and place the wheel always upon the land side. The front caster-wheel is turned to the front and braced to the tongue. When turning this operates to raise that side of the frame, taking the weight off the wheel and permitting it to be turned. The plow-beam is rotated by a hand-wheel and pinions and locked by a drop foot-pawl.

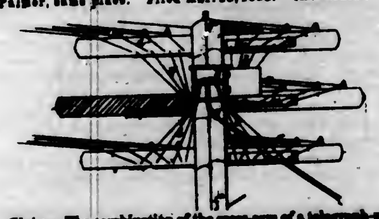


Claim.—1. In a side-hill plow, the combination, with the plow-beam *a*, of the frame *e*, forming the rear, and the frame *c*, forming the front, of the machine, the curved connecting-bars *d d*, and the arch *f*, constructed to allow the plows to be turned within the frame, as described.

2. The combination, with the plow-beam *a* and frame *c*, of the locking-lever *m*, the notched ring, the hand-wheel, and the pinions *l l*, adapted to turn the plow-beam, as described.

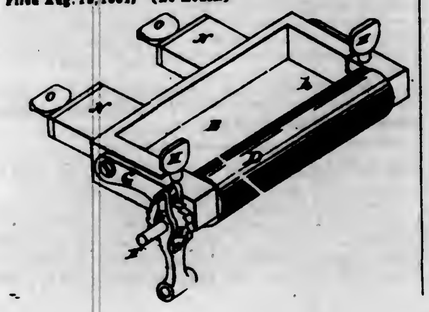
3. The combination, with the plow-frame, of the side wheel, *o*, secured to the pivoted axle *n*, and means for securing the axle in place and of turning it to change the side wheel from one side to the other, as described.

4. The combination, with the frame and the pivotally-secured



258,288.

side wheel, *o*, of the front wheel, *r*, swivel *s*, brace *t*, and tongue-plates *u*, all arranged and operating substantially as described.

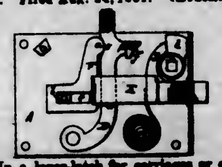


5. The combination, with the frame *c* and pivoted axle *n*, of the seat *p*, adapted to turn with the axle, as described.

258,289. PROTECTOR FOR LIGHTNING-ARRESTERS. CHAS. T. PITCH, Buffalo, N. Y., assignor of one-half to Marlow C. Palmer, same place. Filed Mar. 28, 1882. (No model.)

Claim.—The combination of the cross-arm of a telegraph-pole, provided with a recess in its under side and a removable or adjustable cover for such recess, with the line and cable wires leading to the interior of such recess and a lightning-arrester located in such recess, with the line and cable wires suitably connected thereto, substantially as shown and described.

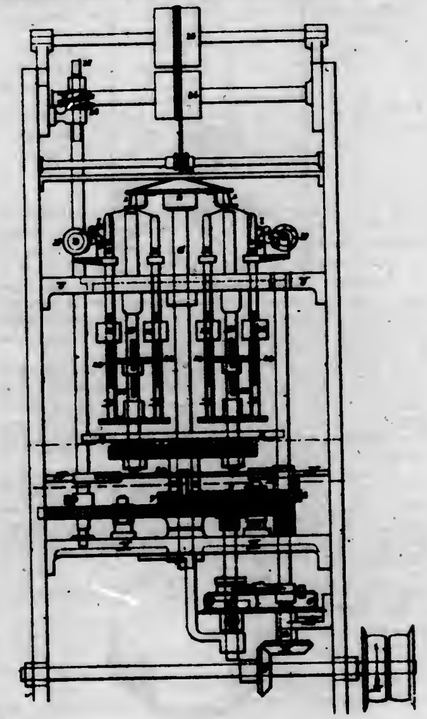
258,290. INK-FOUNTAIN. ALFRED GAGE, Philadelphia, Pa. Filed Aug. 16, 1881. (No model.)



Claim.—1. The combination, with the trough or receptacle B, of the dust-collar D, hinged arms G, and regulating-screws H, constructed and operating substantially as and for the purpose specified.

2. The combination, with the trough or receptacle B, of the lugs M, hollow plates N, and regulating-screws O, constructed and operating substantially as and for the purpose set forth.

3. The combination, with the trough or receptacle B, of the threaded standards P, brackets R, plates N, and threaded collars, substantially as and for the purpose set forth.

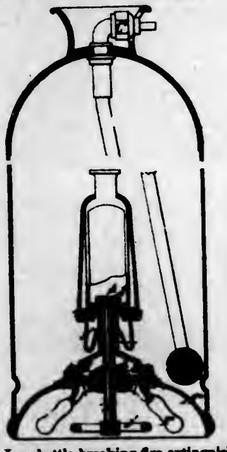


258,291. LATCH FOR CARRIAGE-DOORS. WILLIAM GAYNE, New Haven, Conn., assignor of one-half to Albert L. Babcock, same place. Filed Aug. 24, 1881. (Model.)

Claim.—In a lever-latch for carriages or other vehicles, the combination, with the latch-bolt B, having the upward extension *g*, and extension F, with curved bearing *a*, of the operating-lever D, curved at its lower end, as shown, and pivoted to the plate A, and having the curved recess *c*, constructed and arranged to operate substantially as and for the purpose set forth.

258,292. MACHINERY FOR TWISTING WIRE, &c. WALTER T. GLOVER and GEORGE F. JAMES, Manchester, County of Lancaster, England. Filed May 8, 1881. (No model.) Patented in Belgium Feb. 28, 1881, No. 53,063; in England Mar. 8, 1881, No. 913, and in France Sept. 3, 1881, No. 144,765.

Brief.—The delivery of wire from the bobbins is regulated by an escapement-lever upon each spindle adapted to engage with pins upon one of the heads of the bobbin carried thereby. The wire passes from the bobbin over a roller carried by the escapement-lever and under a pulley on the drop-rod within the spindle, and the drop-rod, when elevated by the tension of the wire, acts upon an arm of the lever to free its projection or catch from the



pins on the bobbin. When a wire breaks the drop-rod suspended therefrom descends and carries its weight into contact with a table upon a second drop-rod within one of the intermediate axes and causes the depression of the latter drop-rod. The projecting lower end of the second rod is carried by the revolution of the machine into contact with a projection on a tripping-ring, which is moved thereby and caused to release the shipper-rod.

Claim.—1. The combination of a hollow spindle having an internal drop-rod, a bobbin having pegs or projections on one of its ends, and an escapement having a lever-arm to engage with said drop-rod, a catch-projection to engage with said pegs, and a guide-roller, all mounted and operating substantially as hereinbefore specified, for the purpose set forth.

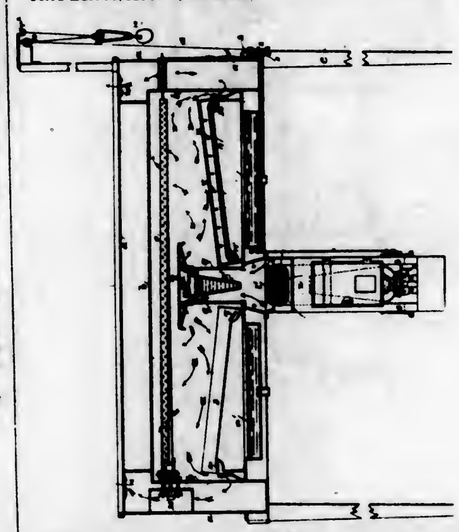
2. A weighted drop-rod, 24, arranged and operating substantially as hereinbefore specified, in combination with a bobbin-escapement, *e*, casting with the upper end of said drop-rod, a drop-rod, 25, having a table, 28, to engage with the weight of the former, clutching and unclutching mechanism, and mechanism connecting said drop-rod 25 with said clutching and unclutching mechanism, substantially as shown and described, for the purpose set forth.

258,293. BOTTLE-BREAKING FIRE-EXTINGUISHER. ALMON H. GRAGGS, Boston, Mass. Filed Sept. 15, 1881. (No model.)

Brief.—The bottle is adapted to be held at one end while it is rotated at the other end, thereby breaking it by torsional strain. When the rotative force is applied at the lower end the upper end is held stationary by two skeleton arms composing the neck of the polygonal or square bottle. When applied at the other end motion is communicated to the skeleton arms around the neck of the bottle, while a square or polygonal projection, fitting a corresponding recess in the bottle, holds the lower end stationary.

Claim.—1. In a bottle-breaking fire-extinguisher, the combination of a bottle-holder, which is adapted to fit one end of a bottle and hold it against turning, and a rotary device adapted to engage with the other end of the bottle, and by its turning to subject the bottle to torsional strain, substantially as specified.

2. In a bottle-breaking fire-extinguisher, the combination of a case, shell, or cup adapted to receive within it one end of a bottle and to fit the exterior thereof, and a projection adapted to enter a recess or depression in the bottom of the bottle, one of said parts being stationary and the other capable of being turned or rotated, substantially as specified.



3. In a bottle-breaking fire-extinguisher, the combination of a bottle-holder comprising a case or shell adapted to fit the exterior of a bottle and hold it against turning, and a rotary spindle carrying a square or polygonal projection, which is adapted to engage with a recess or depression of corresponding form in the bottom of the bottle, substantially as specified.

258,294. MUSTACHE-GUARD. GEORGE P. HALL, Baltimore, Md. Filed Mar. 30, 1882. (No model.)

Claim.—A mustache-guard consisting of the combination of a comb to enter the mustache, a guard-plate hinged to the comb, and a spring-plate attached to the comb to cause pressure on the guard-plate, as set forth.

258,295. INCUBATOR. AUGUSTUS M. HALSTED, Rye, N. Y. Filed Mar. 11, 1881. (No model.)

Claim.—1. In an incubating apparatus, the combination, with the chamber containing the egg-tray, of a lamp below the bottom of the chamber, the heating-drum and chimney, also below the egg-chamber, and connected so that the gases escape laterally at the ends of the drum, an air-chamber below the egg-chamber, around the chimney and drum, into which air is admitted and warmed before passing into the egg-chamber, and an opening for the escape of the heating-air from the egg-chamber, substantially as specified.

2. In combination with the incubating-chamber, the lamp, the heating-drum, and the air-trough, the deflector *l* partially covering the air-trough and directing the air horizontally toward the front and back portions of the incubator-chamber, as set forth.

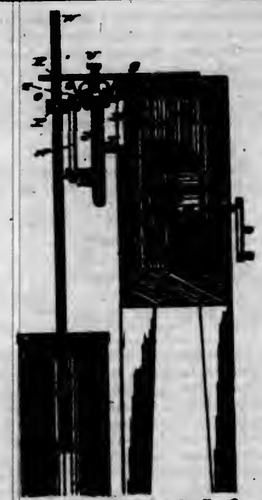
3. The combination, with the incubator-chamber and the lamp and heating-drum, of the partitions *q* and deflector *r* within the incubating-chamber, substantially as set forth.

4. The evaporating-trough *r'*, in combination with the partitions *q*, deflector *r*, and incubating-chamber, substantially as set forth.

5. In an incubator, the combination, with the lamp-chimney and heating-drum, of the diaphragm 7 and ring 6, as and for the purposes set forth.

6. In an egg-holding tray, the combination, with the wires or cross-bars, of a web of muslin or similar material on which the eggs rest, and which is movable, so as turn the eggs, substantially as set forth.

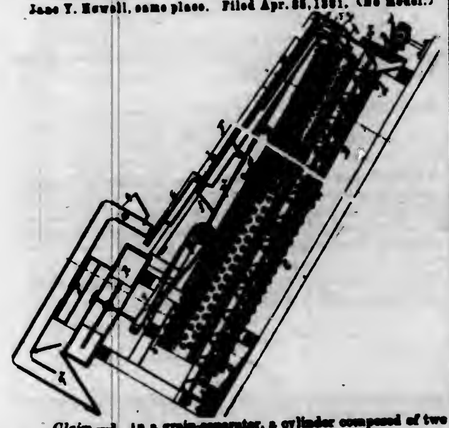
7. The combination, in an egg holding and turning tray, of cross wires or bars, a web, and a roller upon which the web may be wound, substantially as set forth.



8. The tray having cross wires or bars and a bottom of netting or open-work, a web of muslin or equivalent material, and two rollers with which the ends of the web are connected, as set forth.

9. In combination with the incubating-chamber, a lamp, heating-drum, and air-box, connected below the chamber and made removable, substantially as set forth.

258,296. CHURN-MOTOR. THOMAS J. HARRIS and CALEB P. OBERN, Sardis, Miss. Filed Mar. 16, 1882. (No model.)



Claim.—In a churn-motor, the combination, with the frame A, main shaft B, and spring C, operating through a train of wheels the shaft I, of the casing K, having slot L, through which said shaft projects, and bracket Q, having perforation R, hangers S, levers T and set-screw U, the balance-wheel J, having wrist-pin

258,296.

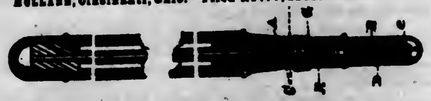
or crank M, the pitman N, having swiveled collar O, provided with set-screw P, and the churn-dasher W, all arranged and operating as set forth.

258,297. GRAIN AND COCKLE SEPARATOR. PAULINA M. L. RUSSE, Buffalo, N. Y., assignor, by mesne assignments, to Jane Y. Newell, same place. Filed Apr. 28, 1881. (No model.)

Claim.—1. In a grain-separator, a cylinder composed of two or more sections arranged end to end and provided with cavities, cells, or indentations of different sizes, and independent discharge mechanism for each section of the cylinder, substantially as set forth.

2. The combination, with the cylinder B, provided on its inner surface with indentations, cells, or pockets which admit the cockle and reject the wheat, and the cylinder C, forming a continuation of the cylinder B, and provided on its inner surface with indentations, cells, or pockets which admit the wheat and reject the oats, of pockets or cups *e*, which are interposed between the cylinders B and C and receive the wheat from the cylinder B and deliver it into the wheat-discharge trough of the cylinder C, substantially as set forth.

3. The combination, with the cylinder B, provided on its inner surface with indentations, cells, or pockets which admit the cockle and reject the wheat, and the cylinder C, provided on its inner surface with indentations, cells, or pockets which admit the wheat and reject the oats, of a preliminary grading apparatus, whereby the grain is divided into three different grades according to size, and mechanism whereby the smallest grains are delivered into the cylinder B, the largest grains into the cylinder C, and the medium-sized grains into the wheat-discharge trough of the cylinder C, substantially as set forth.



258,298. PENCIL-CASE. JOHN HOLLAND, Cincinnati, Ohio. Filed Feb. 27, 1882. (No model.)

Claim.—1. The combination, substantially as before set forth, of the outer tube, E, the lead-tube secured thereto, the tubes C C', interposed between the tube E and the lead-tube, and the caps F F'.

2. In a pencil-case, the combination, substantially as hereinbefore set forth, of the case composed of the tubes B C C' E and caps F F', with slide D, tube A, collars *a' a''*, and clamping-sleeve *a*.

258,299. WRITING-POINT FOR STYLOGRAPHIC PENS. JNO. HOLLAND, Cincinnati, Ohio. Filed Nov. 7, 1878.

Claim.—1. The tube D of a fountain-pen, tipped with a bored grain of iridosmine, applied substantially as specified.

2. In a fountain-pen, the combination of the pen-holder A, tube D, collar *c*, and point F, constructed substantially as and for the purpose specified.

3. In a fountain-pen, the combination, substantially as specified, of the gravitating valve C, the needle-point secured thereto, the tube H and its spring G, said valve C being centrally bored to receive the tube H and its spring G, for the purpose set forth.

4. The described method of constructing fountain-pens with non-wearing writing-points, which consists in inserting an easily-drilled core within the discharge-tube, leaving the end of the core projecting, placing the perforated writing-point over the projecting end of the core, and securing the parts together, after which the core is bored out and the writing-point dressed down to a cone shape.

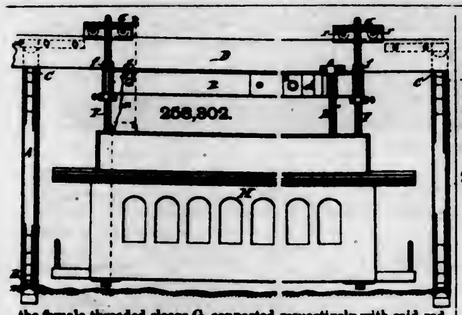
5. A writing-point for fountain-pens, formed of a single piece of iridium perforated and ground to a cone shape, as described, in combination with a tube, as D, as and for the purpose specified.

6. In a stylographic fountain-pen, the tube formed and reamed to the shortest section of the pen-holder, in combination with a perforated point or tip formed of a single piece of iridium, as set forth.

258,300. METHOD OF SECURING ROLLS OR PACKAGES OF FABRICS FROM UNROLLING. WILLIAM S. HOLLAND, Pence Dale, R. I. Filed July 28, 1880. (No model.)

Claim.—That improvement in the method of putting up piece-goods in rolls or packages consisting of applying at the end or ends of the roll or package an elastic or yielding fastening provided with end hooks, all substantially as shown and described.

258,301. MANUFACTURE OF FILES. MARTIN A. HOWELL, Jr., Chicago, Ill. Filed July 5, 1881. (No specimens.)



Claim.—1. In the manufacture of files, the process which combines the decarburization of cast-iron blanks for the purpose of softening and cutting, with the subsequent recarburization for the purpose of hardening and tempering, substantially as set forth.

2. In the manufacture of files, the combined process of carburizing, cutting, recarburizing, and hardening of decarburized cast-iron blanks, substantially as and for the purpose set forth.

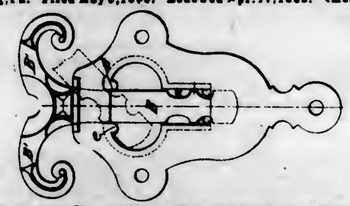
258,302. ELEVATED RAILWAY. ALBERT P. HOBBSON, Elizabridge, N. Y. Filed Aug. 18, 1881. (No model.)

Brief.—To a frame-work is secured an elevated rail, from which is centrally suspended a car by means of screw-threaded rods engaging with screw-threaded sleeves and adapted to be raised or lowered. The rods are connected by a bar, and are provided with rollers. The car is provided with a horizontal fins and carries a suitable motor, which operates a shaft having friction-wheels engaging opposite sides of the track-rail, and maintained yieldingly in contact therewith by spring-plates provided with an adjusting-screw. A brake adapted to engage with the rail is connected to the top of the car.

Claim.—1. In combination with the elevated rail D and rollers *r*, the suspension-rod F, screw-threaded at its lower end, and

the female-threaded sleeve G, connected respectively with said rod and with the car, as described and shown.

2. The combination of the car H, suspended centrally from the elevated track-rail D, and propelled by frictional contact of the wheels *c* directly with said track-rail, substantially as described and shown.



3. In combination with the elevated rail D and the car H, suspended therefrom, as shown, and carrying a suitable motor, the shafts *b b*, connected with the car and its motor, and having friction-wheels *c c*, engaging opposite sides of the track-rail and maintained yieldingly in contact therewith by spring-plates *d*, as described, for the purpose set forth.

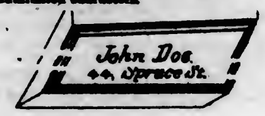
4. In combination with the elevated rail D, suspended car H, and the shafts *b b*, provided with friction-wheels *c*, the spring-plates *d*, arranged to hold the friction-wheels yieldingly against the track-rail, and provided with the adjusting-screw *e*, substantially as described and shown.

5. In combination with the elevated rail D and the car H, suspended therefrom, as shown, a brake connected to the top of the car and adapted to engage the rail D, as and for the purpose set forth.

6. The combination, with the car H, of the engine K, tank L, exhaust-pipe M, leading to said tank, and the horizontal flue I, all arranged upon the top of the car, substantially as described and shown.

258,803. WAGON-SEAT SUPPORT. HENRY H. JACOBS, Waynesburg, Pa. Filed May 8, 1882. Renewed Apr. 17, 1882. (Model.)

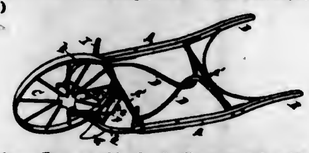
Claim.—1. The metal seat-bearer with the notches in its lower end for catching upon corresponding projections in the seat-bearing socket, for the purpose and substantially as set forth.



2. The inwardly-enlarged cavity in a metal seat-bearing socket, in combination with the interiorly-fitting notched end of the seat-bearer, for the purpose set forth.

3. The lug *g*, in combination with the notched metal seat-bearer B and inwardly-enlarged cavity *n*, for the purpose set forth.

4. The elliptical spring secured to the curved arms of the wagon-seat bearer B, with the notches *a a* and *c c*, in combination with the socket-plate having inwardly-enlarged cavity *n* and bearings *c c*, substantially as shown.

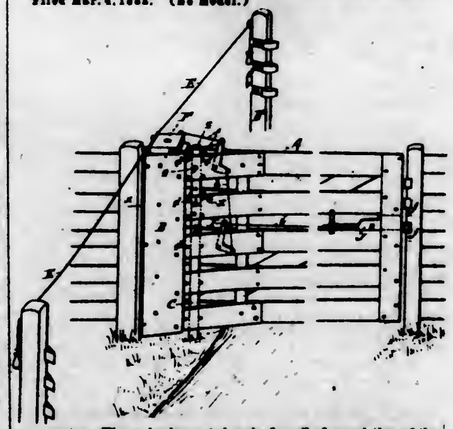


258,804. ILLUMINATED SIGN OR NAME-PLATE. AMOS B. KEITH, Boston, assignor to William W. Keith, Trustee, Newtonville, Mass. Filed Feb. 4, 1882. (No model.)

Brief.—The sign or name-plate has a layer of phosphorescent material laid thereon, a second plate having characters stenciled in it, and a glass facing which protects the phosphorescent material behind the stenciled openings, but allows it to be seen in the form of illuminated characters.

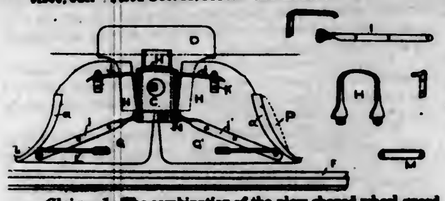
Claim.—In combination with a plate having a facing of luminous material applied thereto, a second opaque plate having characters cut through or stenciled in it and covering said luminous material, and a transparent plate, sheet, or facing which covers said stenciled characters as well as the remainder of the stenciled plate, but allows the light of the material behind to shine through in the form of illuminated characters, substantially as set forth.

258,805. COMBINED WHEELBARROW AND CULTIVATOR. WALTER W. KELLY, Hastings, Mich. Filed Dec. 28, 1881. (No model.)



Claim.—In a combined wheelbarrow and cultivator, the wooden side bars and handles A B, having metal extensions *b* to support the wheel *c*, and provided with bent metal cross-bars A' and with upturned stakes I, in combination with the legs D, each made of a single piece of bent metal, and hinged to and between the cross-bars A', the socket E, secured to the front cross-bar, the shovel G, having a shank adapted to be adjustably secured in the socket E, and the metal body H, bent to fit the frame and stakes, and provided with rigid eyes to slip over the stakes, all combined substantially as shown and described.

258,806. SWINGING GATE. GIDEON KING, Eminence, Ky. Filed Jan. 16, 1882. (No model.)



Claim.—Rod A, arm C, hinge D, crank F, key and washer *e*, swinging levers E E, levers K K, brackets *d d*, posts I I, slots H H, hand-holds J J, ropes *a a*, curved rod *p*, notch R, verticals *b b*, and elevations *f f*, combined, arranged, constructed, and operated substantially as and for the purposes specified.

258,807. SWINGING GATE. CHARLES H. LAMB, Delphos, Ohio. Filed Mar. 4, 1882. (No model.)

Claim.—The swinging gate herein described, consisting of the box B and rails A, secured to said box alternately, the pivotal post made in sections, the portion C having a pivotal pin and the portion *c* being secured to the gate, and having corresponding socket, the rope E, pivotal plate F, latch J, and connections, all combined and arranged to serve as set forth.

258,808. RAILWAY-CAR. HILTON H. LAMBURN, San Francisco, Cal. Filed Dec. 21, 1881. (No model.)

Claim.—1. The combination of the plow-shaped wheel-guard G, extending around the tread and in front of the wheel, with the hinge-supports H and I, connected to axle-box C, and spring-bracket J, as and for the purpose herein described.

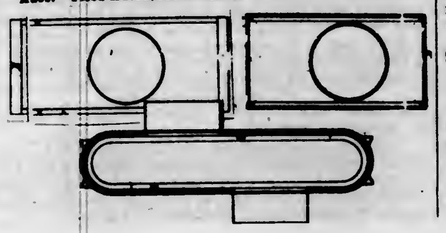
2. In combination with the guard G, the cushion P, as and for the purpose herein described.

258,809. MACHINE FOR BRONZING OR OTHERWISE ORNAMENTING PAPER, &c. THOMAS LUDWING, RICHARD RAY, and FRANCIS G. LYNDS, Manchester, County of Lancaster, England. Filed Mar. 6, 1882. (No model.) Patented in England Jan. 4, 1878, No. 56, and Oct. 27, 1874, No. 3,764, and in Germany Sept. 21, 1877, No. 480.

Claim.—1. In a bronzing-machine, the endless traveling table A, made of india-rubber or other suitable material, in combination with the cross sweeping bands *j* and *l*, as and for the purpose specified.

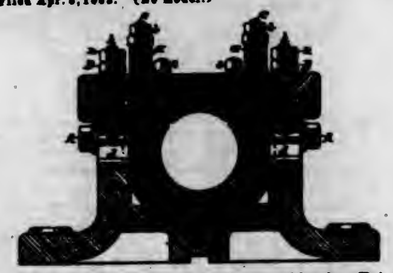
2. In a bronzing-machine, the cross sweeping bands *j* and *l*, operating as and for the purposes specified.

3. In a bronzing-machine, the combination, with a suspended hopper, of kickers whereby a jerking motion is imparted to the hopper for shedding the powder onto the paper, and of buffers for regulating the supply of the powder, all substantially as set forth.



4. The combination, in a bronzing-machine, of a suspended hopper, operated as described, buffers for regulating the supply of powder, an endless table, A, cross sweeping band *j* and *l*, and flap-valve *c*, these parts being arranged and operating in the manner and for the purposes described.

258,810. CORSET-BUSK. ADELAIDE B. HAHN, Lawrence, Mass. Filed Feb. 6, 1882. (No model.)

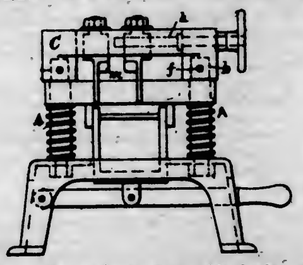


Claim.—In a corset, the busk C, having its front edge turned back against the main body thereof, providing a space between the turned-back portion and the main body of said busk, and having slots cut through into the said inner space, and the busk A, having the hooks B extended out from its edge and adapted to enter the slots in busk C, substantially as described.

258,811. STOVE ATTACHMENT. JOHN O. NEILSON, Hedford, Mass. Filed Mar. 6, 1882. (No model.)

Claim.—The combination of the endless belt provided with an indent and an object, the two flanged side pieces, and the exterior connection-bars, whereby the side pieces and the endless belt are secured together, all being adapted to operate as and for the purpose set forth.

258,812. PILLOW-BLOCK. GEORGE K. ORRELL, Oswego, N. Y. Filed Apr. 3, 1882. (No model.)



Claim.—1. In combination with the journal-box base P, jaws J, and cap C, the stud *h*, fixed to the jaws, the hollow bolt B, fitted loosely over the stud and working in a screw-threaded eye in the cap, and the nut *n* on the end of the stud, as set forth and shown.

2. In combination with the journal-box base P, jaws J, cap C, cheek-piece D, and wedge *w*, the studs *h* and *c*, fixed respectively to the jaws and to the wedge, the hollow bolts B and *a*, slipped loosely over the respective studs and working in threaded eyes in the cap, and the nuts *n* and *b*, applied respectively to the extremities of the studs, substantially as described and shown.

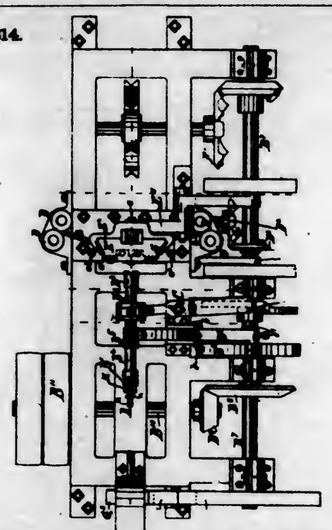
3. In combination with the journal-box base P, jaws J, cap C, cheek-piece D, and wedge *w*, the studs *h* and *c*, hollow bolts B and *a*, nuts *n* and *b*, and the set-screws A, all as shown and set forth.

4. In combination with the journal-box base P, jaws J, cap C, bottom bearing, *c*, and wedge *w*, the cheek-piece D, resting on the bottom bearing, *c*, and the set-screw *a*, working in the cap C and bearing on top of the cheek-piece, substantially as described and shown.

258,813. TRACE-TRIMMING MACHINE. HENRY P. OSBORN, Newark, N. J. Filed Nov. 21, 1881. (No model.)

Claim.—1. In a trace-trimming machine having a clamp and cross-head for carrying the guides, mounted upon pillars for the purpose described, the combination, with the cross-head C, formed with sockets *c* upon its lower side, for the purpose described, of the pillars A, removably secured therein, as by pins *f*, for securing access to the knives at pleasure, substantially as herein set forth.

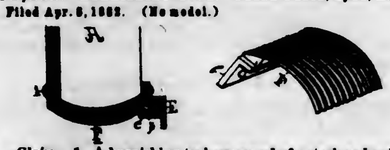
2. In combination with the cross-head formed with slot I, the studs H, provided with knives and double guides, arranged as described, and the screw *h*, inserted in the end of the cross-head and in one of the studs H, and operated to adjust the distance of the guides from one another, substantially as shown and described.



258,814. BARB-WIRE-FENCE MACHINE. FLOYD B. PATTERSON, Chicago, Ill., assignor to William L. Carpenter, Des Moines, Iowa. Filed Mar. 20, 1882. (No model.)

Claim.—1. In a barb-fence machine, the grooved spindle B, in combination with the adjustable holder M and the sleeve, substantially as specified.

2. The grooved spindle and its adjustable holder, in combination with the sleeve encircling the spindle and the coiling-head carried by the sleeve, substantially as specified.

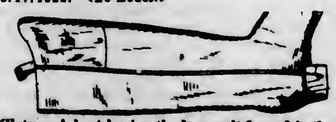


3. The combination, with the continuously-rotating mutilated

258,314.

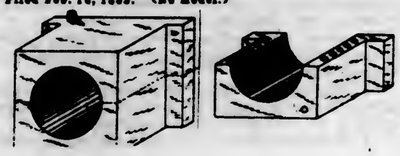
bevel-gear D^3, having broken rim d^3, of the intermittently-rotating bevel-gear D^2, provided with circular depressions in its periphery adapted to engage with the circular part of the rim d^3 for the purpose of intermittently locking the gear D^2, the feed-rolls, and mechanism for driving the same from the intermittently-rotating and locked gear D^2, substantially as specified.

258,315. BURNISHING-TOOL. FRANK FRASS, Lynn, Mass. Filed Apr. 6, 1882. (No model.)



Claim.—1. A burnishing-tool composed of a stock or head, *a*, and a burnishing-face composed of a series of springs placed side by side and adapted to yield independently to conform to the surface being operated upon.

2. As an improved article of manufacture, a face-plate composed of a series of independent springs placed contiguous to each other, and substantially in the same plane, and adapted to be attached to a burnishing-tool, all substantially as set forth.

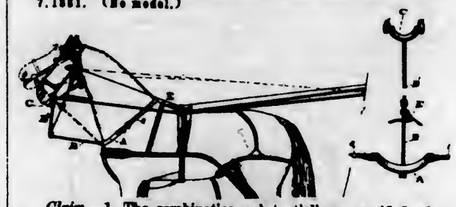


3. The guard-plate E, having groove *f* and lip *e*, combined with the detachable burnisher-plate F and blank A, substantially as described.

258,316. BOOT. EDWIN E. EDES, Williamstown, Mich., assignor of one-half to Leonard H. Simons, same place. Filed Feb. 17, 1882. (No model.)

Claim.—A boot having the loop-welt formed in the leg-seam, as described, combined with a wire spring operating in said loop-welt and the lower end thereof firmly embedded in the boot-heel, as set forth.

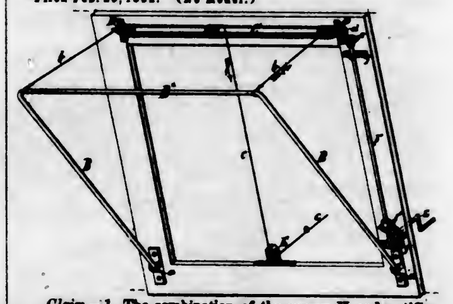
258,317. JOURNAL-BEARING. JACOB EDES, Pittsburg, Pa. Filed Feb. 16, 1882. (No model.)



Claim.—1. The method of manufacturing water-jacketed brasses or journal-bearings which consists in placing a spiral tube within a suitable mold, then casting the metal around the tube, then cutting the bearing so made into two sections, substantially as and for the purpose set forth.

2. As a step in the manufacture of water-jacketed brasses or journal-bearings, placing a spiral tube within a suitable mold, and then casting the metal around the tube, substantially as and for the purpose set forth.

3. The method herein described of securing a circular flow of water through a sectional water-jacketed brass or journal-bearing, which consists in forming the bearing in one piece and having an internal spiral tube, then cutting the bearing into two sections and placing the sections together, with an intervening gasket, substantially as and for the purpose set forth.



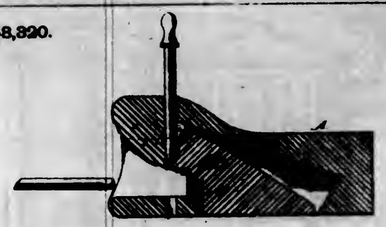
258,318. DEVICE FOR PREVENTING HORSES FROM RUNNING AWAY. MAX REYNOLDS, Cincinnati, Ohio. Filed Nov. 7, 1881. (No model.)

Claim.—1. The combination, substantially as specified, of a bit-piece and a breast-piece attached to a horse with toggle-jointed bars connecting said pieces and a line attached to the said jointed bars for the purpose of straightening them, as set forth.

2. As a new article of manufacture, the horse-controlling device hereinbefore described, consisting of breast-piece A, bit-piece C, jointed bars B B', and joint-piece D, constructed and combined to operate as specified.

258,319. AWNING. A. GUSTAV SAHLQUIST, Brooklyn, N. Y. Filed Feb. 20, 1882. (No model.)

Claim.—1. The combination of the canvas H and a stiffening-bar, B', attached to said canvas, with the supporting-cords *b*, operating-cords *c*, and roller C, said cords being secured by their ends to wind in opposite directions upon the roller C, so that the unwinding of the cord *c* will wind the cords *b*, and vice versa, substantially as set forth.



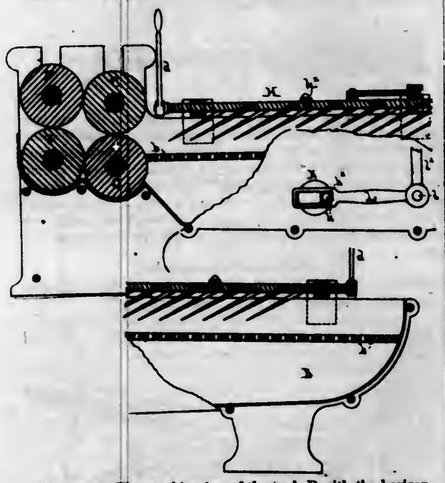
2. In an awning, the combination of the hinge-frame B B', the roller C, the canvas-supporting cords *b*, attached with their ends to the frame B, and roller C, and the operating-cord *c*, wound upon the roller C in opposite direction to that of the cords *b*, substantially as set forth.

3. In an awning, the combination, with the bar B', connecting the front ends of the canvas-supporting cords *b*, and with the roller C, and operating-cord *c*, the said cords *b* and *c* being wound on the roller in opposite directions, as described, of a canvas, H, having rings A, attached at intervals to slide on the cords *b*, for folding and unfolding the canvas by the winding and unwinding, respectively, of the cords *b*, substantially as specified.

258,320. CAR-COUPLING. REUBEN A. CAMPBELL, Salem, Ohio. Filed Feb. 9, 1882. (No model.)

Claim.—An automatic car-coupling consisting of the draw-head A, having within it the latch-block, constructed with a flat projecting lip for the support of the coupling-pin, and an angular slot to move upward and backward in parallel lines by the pressure of the connecting-link, substantially as described.

258,320.



258,321. OX-SHOE. ALBERT SANFORD, Oshkosh, Wis. Filed Mar. 25, 1882. (No model.)

Claim.—An ox-shoe having toe and heel calks and one or more intermediate calks extending transversely across the shoe, all said calks being broader or laterally wider at their outer portions than elsewhere, substantially as described, for the purpose specified.

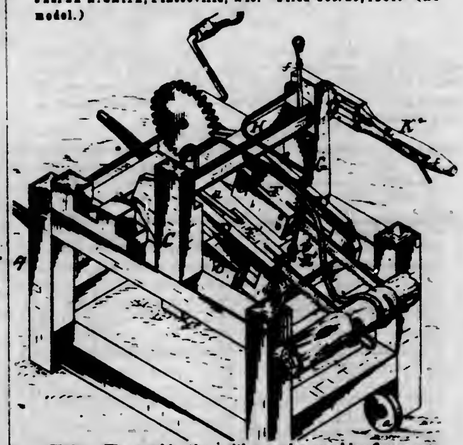
258,322. WOOL-WASHING MACHINE. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed June 13, 1881. (No model.)

Claim.—1. The combination of the tank B with the horizontally-reciprocating rake H, extending over substantially the entire portion of the bowl used to wash the wool in, provided with fixed teeth inclined forward in the line of their direction of forward movement, substantially as described.

2. The combination of the bowl B, provided with the swinging frame E, hinged to one side of it, with the sliding frame H, which extends over substantially the entire washing-space of the bowl, and is provided with forwardly-inclined teeth, substantially as described.

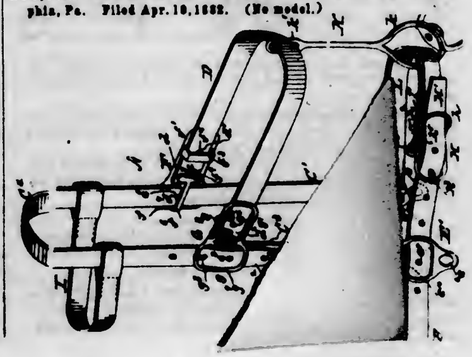
3. The combination of the bowl B with the rock-shaft D, supported by hinges at one side of the bowl, and provided with the hand-lever *d*, with the frame E, attached to each shaft, and the sliding frame H, provided with inclined teeth, substantially as described.

4. The combination of the tank B with a horizontally-reciprocating rake-frame provided with fixed inclined teeth, adapted to move backward and forward without being raised from the liquid in the tank, and feed the wool forward by their forward movement, and agitate it in the liquid by their backward movement, substantially as described.



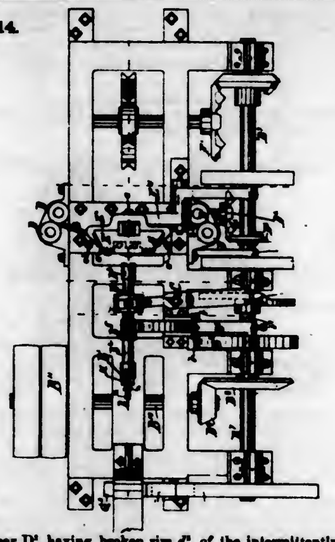
258,323. WHEELBARROW. GEORGE H. SHUMAKER, Pierceton, Ind. Filed Mar. 29, 1882. (No model.)

Claim.—1. In a wheelbarrow or truck, the combination, with the downwardly-curved longitudinal braces and supports F F, the lowermost portions of which rest on the ground, of the semicircular curved transverse brace and support I, formed of a single piece, and having its lower ends secured to the supports F F at a point in rear of where the latter touch the ground, and continued downwardly to form auxiliary supports or legs K K, touching the ground, as set forth.



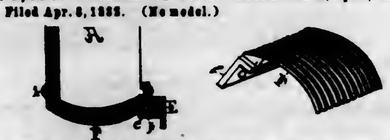
2. In a wheelbarrow or truck, the combination, with the braces or supports F F, of the semicircular curved forwardly-inclined transverse brace and support I, formed of a single piece, and having its central portion, I, secured to the body of the wheelbarrow or truck on its under side, and at or near the center thereof, and its lower ends to the braces F F, from whence they are continued downwardly to form legs or supports K K, resting on the ground, as set forth.

258,324. DEAD-SAWING MACHINE. ANDREW J. SMITH and JASPER N. SMITH, Plattsville, Wis. Filed Oct. 29, 1881. (No model.)



Claim.—The combination, with a sawing-machine frame constructed with the uprights G and bucks *i*, of a transverse shaft, H, having at one end a lever, K', with spring-pawl *k*, the fixed ratchet *l*, and clamping-bar K, substantially as and for the purpose set forth.

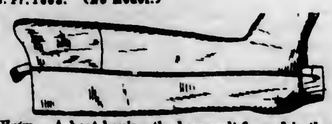
258,325. HALTER OR BRIDLE. HENRY F. SMITH, Philadelphia, Pa. Filed Apr. 10, 1882. (No model.)



258,314.

bevel-gear D^1, having broken rim d^3, of the intermittently-rotating bevel-gear D^2, provided with circular depressions in its periphery adapted to engage with the circular part of the rim d^3 for the purpose of intermittently locking the gear D^2, the feed-rolls, and mechanism for driving the same from the intermittently-rotating and locked gear D^2, substantially as specified.

258,315. BURNISHING-TOOL. FRANK FRASH, Lynn, Mass. Filed Apr. 6, 1882. (No model.)



Claim.—1. A burnishing-tool composed of a stock or head, *a*, and a burnishing-face composed of a series of springs placed side by side and adapted to yield independently to conform to the surface being operated upon.

2. As an improved article of manufacture, a face-plate composed of a series of independent springs placed contiguous to each other, and substantially in the same plane, and adapted to be attached to a burnishing-tool, all substantially as set forth.

3. The guard-plate E, having groove *f* and lip *e*, combined with the detachable burnisher-plate F and blank A, substantially as described.

258,316. BOOT. EDWIN H. REED, Williamstown, Mich., assignor of one-half to Leonard H. Simons, same place. Filed Feb. 17, 1882. (No model.)

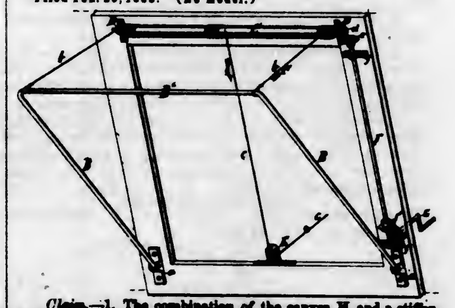
Claim.—A boot having the loop-welt formed in the leg-seam, as described, combined with a wire spring operating in said loop-welt and the lower end thereof firmly embedded in the boot-heel, as set forth.

258,317. JOURNAL-BEARING. JACOB REESE, Pittsburg, Pa. Filed Feb. 18, 1882. (No model.)

Claim.—1. The method of manufacturing water-jacketed brasses or journal-bearings which consists in placing a spiral tube within a suitable mold, then casting the metal around the tube, then cutting the bearing so made into two sections, substantially as and for the purpose set forth.

2. As a step in the manufacture of water-jacketed brasses or journal-bearings, placing a spiral tube within a suitable mold, and then casting the metal around the tube, substantially as and for the purpose set forth.

3. The method herein described of securing a circular flow of water through a sectional water-jacketed brass or journal-bearing, which consists in forming the bearing in one piece and having an internal spiral tube, then cutting the bearing into two sections and placing the sections together, with an intervening gasket, substantially as and for the purpose set forth.



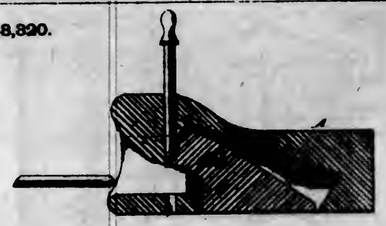
258,318. DEVICE FOR PREVENTING HORSES FROM RUNNING AWAY. MAX ROTHSCHILD, Cincinnati, Ohio. Filed Nov. 7, 1881. (No model.)

Claim.—1. The combination, substantially as specified, of a bit-piece and a breast-piece attached to a horse with toggle-jointed bars connecting said pieces and a line attached to the said jointed bars for the purpose of straightening them, as set forth.

2. As a new article of manufacture, the horse-controlling device hereinbefore described, consisting of breast-piece A, bit-piece C, jointed bars B B', and joint-piece D, constructed and combined to operate as specified.

258,319. AWNING. A. GUSTAF SAHLQVIST, Brooklyn, N. Y. Filed Feb. 20, 1882. (No model.)

Claim.—1. The combination of the canvas H and a stiffening-bar, B', attached to said canvas, with the supporting-cords *b*, operating-cords *c*, and roller C, said cords being secured by their ends to wind in opposite directions upon the roller C, so that the unwinding of the cord *c* will wind the cords *b*, and vice versa, substantially as set forth.



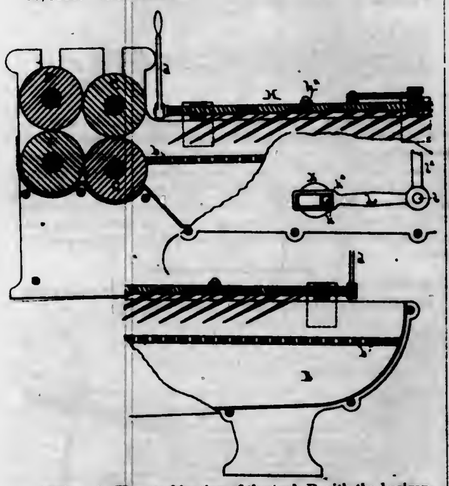
2. In an awning, the combination of the hinge-frame B B', the roller C, the canvas-supporting cords *b*, attached with their ends to the frame B, and roller C, and the operating-cord *c*, wound upon the roller C in opposite direction to that of the cords *b*, substantially as set forth.

3. In an awning, the combination, with the bar B', connecting the front ends of the canvas-supporting cords *b*, and with the roller C, and operating-cord *c*, the said cords *b* and *c* being wound on the roller in opposite directions, as described, of a canvas, H, having rings h, attached at intervals to slide on the cords *b*, for folding and unfolding the canvas by the winding and unwinding, respectively, of the cords *b*, substantially as specified.

258,320. CAR-COUPLING. HOMER A. SANFORD, Salem, Ohio. Filed Feb. 3, 1882. (No model.)

Claim.—An automatic car-coupling consisting of the draw-head A, having within it the latch-block, constructed with a flat projecting lip for the support of the coupling-pin, and an angular slot to move upward and backward in parallel lines by the pressure of the connecting-link, substantially as described.

258,320.



258,321. OX-SHOE. ALBERT SANFORD, Oshkosh, Wis. Filed Mar. 25, 1882. (No model.)

Claim.—An ox-shoe having toe and heel calks and one or more intermediate calks extending transversely across the shoe, all said calks being broader or laterally wider at their outer portions than elsewhere, substantially as described, for the purpose specified.

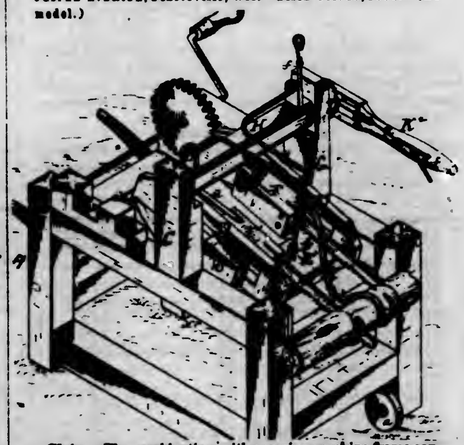
258,322. WOOL-WASHING MACHINE. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed June 13, 1881. (No model.)

Claim.—1. The combination of the tank B with the horizontally-reciprocating rake H, extending over substantially the entire portion of the bowl used to wash the wool in, provided with fixed teeth inclined forward in the line of their direction of forward movement, substantially as described.

2. The combination of the bowl B, provided with the swinging frame E, hinged to one side of it, with the sliding frame H, which extends over substantially the entire washing-space of the bowl, and is provided with forwardly-inclined teeth, substantially as described.

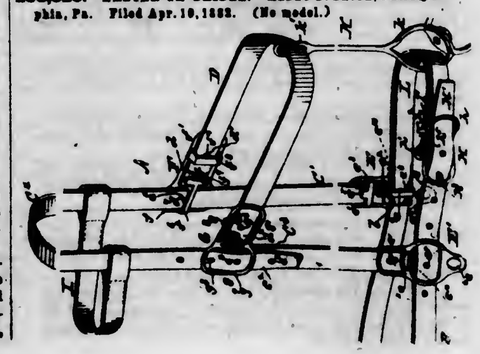
3. The combination of the bowl B with the rock-shaft D, supported by hinges at one side of the bowl, and provided with the hand-lever *d*, with the frame E, attached to such shaft, and the sliding frame H, provided with inclined teeth, substantially as described.

4. The combination of the tank B with a horizontally-reciprocating rake-frame provided with fixed inclined teeth, adapted to move backward and forward without being raised from the liquid in the tank, and feed the wool forward by their forward movement, and agitate it in the liquid by their backward movement, substantially as described.



258,323. WHEELBARROW. GEORGE M. SHUMAKER, Pierceton, Ind. Filed Mar. 30, 1882. (No model.)

Claim.—1. In a wheelbarrow or truck, the combination, with the downwardly-curved longitudinal braces and supports F F, the lowermost portions of which rest on the ground, of the semicircular curved transverse brace and support I, formed of a single piece, and having its lower ends secured to the supports F F at a point in rear of where the latter touch the ground, and continued downwardly to form auxiliary supports or legs K K, touching the ground, as set forth.

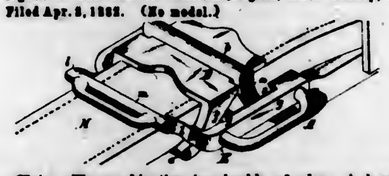


2. In a wheelbarrow or truck, the combination, with the braces or supports F F, of the semicircular curved forwardly-inclined transverse brace and support I, formed of a single piece, and having its central portion, L, secured to the body of the wheelbarrow or truck on its under side, and at or near the center thereof, and its lower ends to the braces F F, from whence they are continued downwardly to form legs or supports K K, resting on the ground, as set forth.

258,324. DRAG-SAWING MACHINE. ANDREW J. SMITH and JASPER M. SMITH, Plattsville, Wis. Filed Oct. 28, 1881. (No model.)

Claim.—The combination, with a mowing-machine frame constructed with the uprights G and bushes *i*, of a transverse shaft, H, having at one end a lever, K^1, with spring-pawl *k*, the fixed ratchet *l*, and clamping-bar K, substantially as and for the purpose set forth.

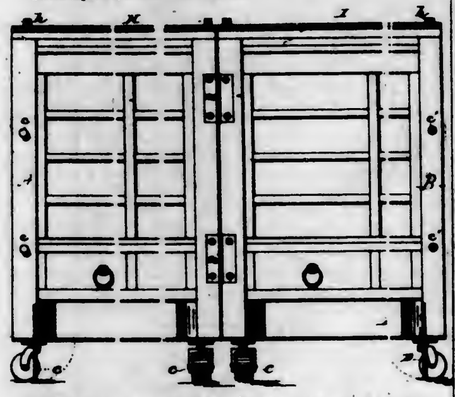
258,325. HALTER OR BRIDLE. HENRY F. SMITH, Philadelphia, Pa. Filed Apr. 10, 1882. (No model.)



Claim.—1. The improved halter or bridle, having continuous cheek-and-head strap C C' and a separate cheek-strap, C, united to strap C' by a tongued buckle, the two-part buckles E E', having grooves or recesses e^2, for the reception and protection of the lower ends of cheek-straps C C', and the continuous nose-and-chin strap B, secured to buckles E E', and provided with a tongued buckle, said parts being constructed substantially as shown and described.

2. A halter-buckle composed of two uniting frames or parts formed with a depressed cross-bar having a projecting lip adapted and designed to form a recess or groove for the reception and protection of the end of a strap, substantially as shown and described.

3. The combination, with cheek-straps C C' and chin-and-nose strap B, united by buckles E E', formed with grooves or recesses e^2, constructed substantially as shown and described, of the re-enforcing strap L, secured at one end to buckle E and at its opposite end to a buckle, H, on strap B, substantially as shown and described.



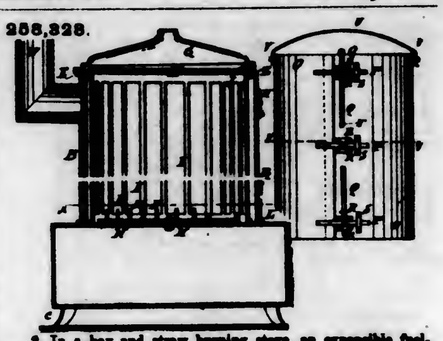
4. The buckle H, having depressed cross-bars h' h^3 and intermediate bar, h^2, elevated above frame h, the bar h' carrying tongue h^4 and the bar h^2 formed with or without stud h^5, substantially as shown and described.

258,326. BUCKLE. WILLIAM S. SPONHAUER, Fort Wayne, assignor of one-half to William Rogers, Allen County, Ind. Filed Apr. 8, 1881. (No model.)

Claim.—The combination, in a buckle, of a loop, A, having side arms and cross-bars, a lock-plate, D, provided with a pin, *d*, arms *f f*, and cross-bar *e*, and a union-plate, E, having recessed side pieces, *g g*, cross-pieces h h', notched arms *l l*, and a cross-bar, *m*, all substantially as set forth.

258,327. PROVISION-SAFE. ROBERT R. STEBS, Gallisburg, Fox., assignor of one-half to William S. Russell, same place. Filed Apr. 20, 1881. (No model.)

Claim.—1. In a provision-safe, the sections A B, provided with the spring-lock *e d* and jointed cover H I, substantially as set forth.



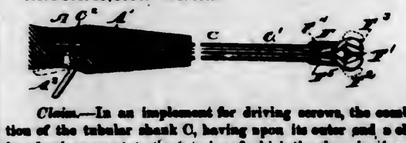
2. In a provision-safe, the sections A B, having jointed cover H I and metallic bottom L, the whole being mounted on the caster-rollers C C, as and for the purpose set forth.

3. The sections A B, having jointed cover H I, metallic bottom L, and caster-rollers C C, in combination with the folding leg E F, having clasp G, substantially as set forth.

258,328. HAY AND STRAW BURNING STOVE. WILLIAM TREPLE, Watertown, Dak., assignor to himself and H. C. Trout, same place. Filed Oct. 6, 1881. (No model.)

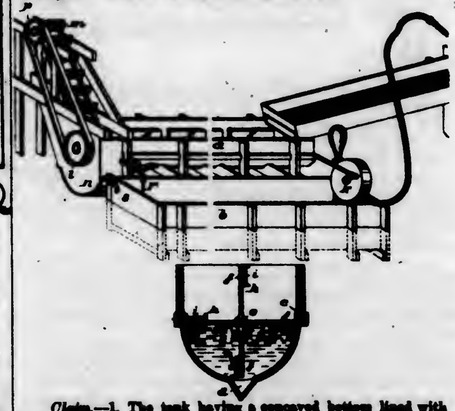
Claim.—1. The outer and inner cylinders, B I, the latter supported on cross-bars H of the former, in combination with the flanged cap E, having inner and outer covers, F G, pivoted thereto, as shown and described.

258,328.



2. In a hay and straw burning stove, an expansible fuel-bucket, O, made substantially as herein shown and described, and consisting of a cylinder which is capable of being expanded after its introduction within the fire-chamber, so as to discharge the fuel, as set forth.

3. In a hay and straw burning stove, the combination, with the expansible bucket O, of the notched straps P and the sliding look-rod Q, substantially as herein shown and described, whereby the bucket can be readily fastened and unfastened, as set forth.

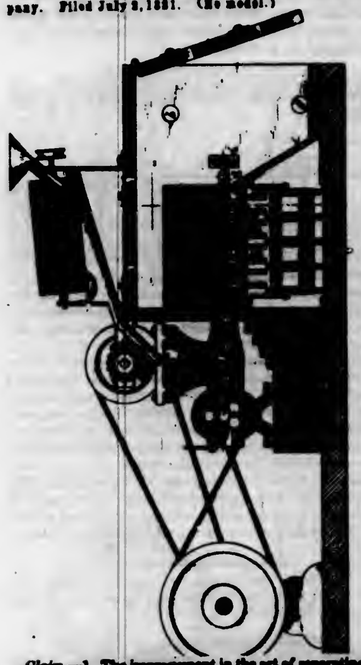


4. In a hay and straw burning stove, the combination, with the bucket-locking rod Q, of the projecting pin T, substantially as herein shown and described, to strike against the top of the stove, unlock the bucket automatically, and discharge the fuel when the filled bucket is inserted in the stove, as set forth.

258,329. SCREW-DRIVER. CAL THOMAS, Terre Haute, Ind. Filed Feb. 16, 1881. (Model.)

Claim.—In an implement for driving screws, the combination of the tubular shank C, having upon its outer end a chambered enlargement, to the interior of which the clamping-jaws are pivoted, a sliding rod, C', which passes through the shank and enters the handle A, clamping-jaws F F, a spring, A', for operating said jaws, located in the handle, and a lever, A^2, or equivalent device, for operating the clamping-jaws, the parts being constructed and arranged substantially as and for the purpose set forth.

258,330. AMALGAMATOR. HORATIO GREACH TRAIN, Kansas City, Mo. Filed June 13, 1881. (No model.)



Claim.—1. The tank having a concaved bottom lined with amalgam-plates, with a V-shaped gutter in the bottom and opening into a well, substantially as and for the purposes described.

2. In an amalgamator, a tank provided with a shaft having a series of separate conveyers, the wings or flanges of one conveyer being on a line between the flanges of the other conveyer, and having amalgamated surfaces, substantially as specified.

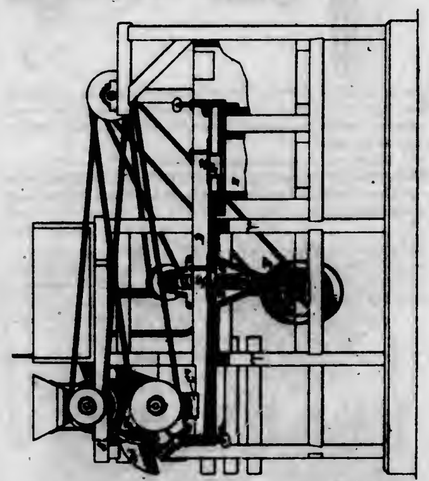
3. The combination of tanks a and b, well n at the end of tank a, pad communicating with tank b, and conveyers in the tank and well, the said conveyers being connected together and operated by power from the same shaft, substantially as set forth.

4. In combination with an amalgamator, the conveyers or paddles *f*, having amalgamated surfaces i, the tanks a and b, the concaved bottom covered with amalgam-plates o, the gutter d, for containing quicksilver, well n, buckets m, and discharge-cocks r and s, substantially as and for the purposes described.

258,331. SEPARATOR AND CONCENTRATOR FOR ORES, &c. ELIJAH WARNE, Easton, Pa., assignor, by direct and mesne assignments, to the Warne Concentrator and Separator Company. Filed July 2, 1881. (No model.)

Claim.—1. The improvement in the art of separating ores and other materials which consists in carrying and forcing the entire material in granular form, by means of an air-blast, through a nozzle, whereon it is blown over a series of separate openings or pockets, substantially as and for the purposes hereinbefore set forth.

2. In machinery for separating or concentrating ores and other materials, the combination of the blower or air-forcing apparatus, the air-duct leading therefrom, and the ore-feeding device communicating with and opening into said air-duct at a point intermediate between its nozzle or discharge end and the blower, substantially as and for the purposes hereinbefore set forth.



3. In machinery for separating or concentrating ores and other materials, the combination of a blower or air-forcing apparatus, an air-duct leading therefrom into an exhaust-chamber, an ore-feed device communicating with and opening into said air-duct at a point intermediate between its nozzle or discharge end and the blower, and a series of separate ore-receiving pockets arranged on or in the floor of the exhaust-chamber, substantially as and for the purposes hereinbefore set forth.

4. The feed-hopper and rotating feed-worm therein, in combination with the blower, the air-duct and its discharge nozzle, and the separate ore-receiving pockets or openings, under the arrangement and for operation as herein shown and set forth.

5. The combination, substantially as hereinbefore set forth, of the air and ore discharge nozzle with the exhaust-chamber, provided with openings for admission of air and means for closing the same more or less as required, and the ore-receiving pockets formed on or in the floor of said chamber and adjustable in width, substantially as and for purposes hereinbefore set forth.

6. The combination, substantially as hereinbefore set forth, of the blower, the air-duct and its discharge-nozzle, the ore-feed device, the exhaust-chamber, the ore-receiving pockets adjustable in width, and means, substantially as described, whereby the communication of said blower and exhaust-chamber with the surrounding air can be varied at pleasure, substantially as and for the purposes specified.

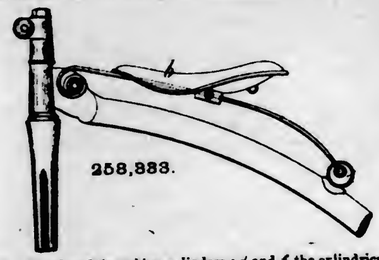
258,332. CONCENTRATOR AND SEPARATOR FOR ORES. ELIJAH WARNE, Easton, Pa., assignor, by direct and mesne assignments, to the Warne Concentrator and Separator Company. Filed July 2, 1881. (No model.)

Claim.—1. In machinery for concentrating and separating ores and other materials by the wet process, an inclined sluice provided at intervals in its bottom with openings or pockets adjustable in size in the direction of the length of the sluice and from their lower or downstream edges, substantially as and for the purposes set forth.

2. A sluice provided with openings or pockets, and having a bottom provided with sections adjustable, so that they may be tilted or inclined in order to regulate or modify the current of water passing through the sluice over said openings.

3. The combination of a sluice provided with openings or pockets adjustable in size, and with bottom sections adapted to be variably tilted or inclined in combination with one or more spouts or nozzles for supplying water under head or pressure to the sluice, and means for regulating the water-supply, substantially as hereinbefore set forth.

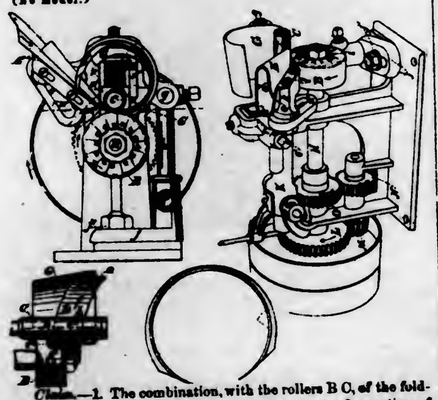
4. The inclined sluice provided with bottom openings or pockets adjustable in size, substantially as set forth, and one or more pipes or ducts for supplying water directly to said sluice, in combination with the receptacles containing still or non-flowing water, and communicating with said openings or pockets, said conveyers in said receptacles arranged and operating to raise and carry off from the receptacles the material deposited therein through the openings or pockets, substantially as hereinbefore set forth.



5. The inclined mixing and separating trough and conveyer arranged in the same, in combination with the sluice provided with bottom openings or pockets adjustable in size and arranged at the upper or higher end of said trough to receive from the same the heavier material which settles to the bottom of the trough, substantially as and for the purposes set forth.

6. The inclined mixing-trough and conveyer contained in the same, in combination with the two sluices D X, and their adjuncts, and means for furnishing independent water-supply to the said trough and sluices, these parts being arranged for joint operation, substantially as set forth.

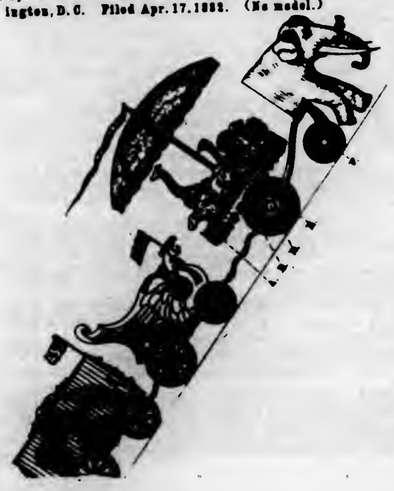
7. The inclined mixing and separating trough provided at its lower end with a vertically movable and adjustable gate, in combination with the conveyer contained in said trough, and the two sluices D X, substantially as hereinbefore set forth.



258,333. SEAT-SPRING FOR BICYCLES. JOSEPH WHITE, Coventry, County of Warwick, England. Patented in England Feb. 7, 1881, No. 512. (No model.)

Claim.—The combination, with the seat, seat-spring, and back-

bone in a bicycle, of the rubber cylinders *e e'* and *f*, the cylindrical cases for such springs, the joint pins or bolts passing through such rubber cylinders, and the jaw connected with the spine, substantially as set forth.

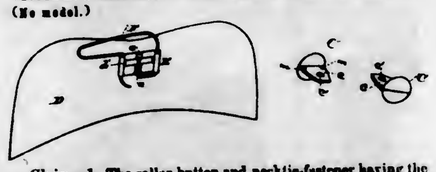


258,884. MACHINERY FOR FOLDING AND CURLING COLLARS. THOMAS S. WILES, Albany, N. Y. Filed Feb. 13, 1882. (No model.)

Claim.—1. The combination, with the rollers B C, of the folding-guide E and the curling-guide G in the form of a section of the inner surface of a hollow cone, and arranged in respect to said rollers and folding-guide substantially as described.

2. The combination, with the roller B, having a covering of cloth, hard roller C, and means, substantially as set forth, for heating said hard roller, of the folding-guide E and curling-guide G, both arranged in respect to said rollers and each other substantially as described.

258,885. MECHANICAL TOY. TURNEY E. WILKINS, Washington, D. C. Filed Apr. 17, 1882. (No model.)



Claim.—1. In a mechanical toy, the combination of the horizontal platform A, provided with holes *i*, carrying toy figures, the axle D, the drive-wheel B, having a beveled gear on its edge meshing into a beveled gear on the edge of the platform A, and the vertical axis *a*, fixed to the axle D, as described.

2. In a mechanical toy, the combination of the circular platform A, carrying toy figures, the beveled-gear wheel B, the fixed vertical axis *a* upon the axle D, supporting a canopy by a central staff, as described.

3. In a mechanical toy, the combination of a pair of wheels and an axle supporting a revolving platform carrying toy figures, said axle being firmly secured to a figure-head in the form of some animal, in whole or in part, said figure-head resting upon a caster-wheel forming part of the performing car, as described.

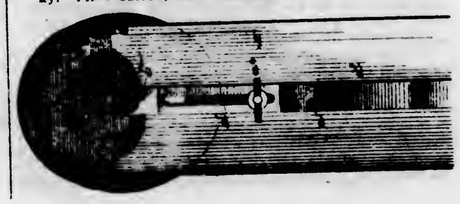
4. The combination of the platform A, carrying toy figures, the axle D, the drive-wheel B, provided with a hand-crank, E, and the supporting-jack C, as described.

258,886. COLLAR-BUTTON AND CRAVAT-FASTENER. SYLVESTER H. WILLIAMS, San Francisco, Cal. Filed Mar. 28, 1882. (No model.)

Claim.—1. The collar-button and necktie-fastener having the button C, provided with an apertured flat shank, *c*, combined with the spring F, having an L-shaped arm, and the plate E, having a central slot, and above and below said slot a guide-socket, *e*, substantially as and for the purpose set forth.

2. The collar-button and necktie attachment, consisting of the button C, with its flat shank *c*, having a hole, *c'*, and the plate *d*, with the slot or aperture *d'* in the stiffener of the cravat, the plate E upon the other side, with its socket-guide *e*, and the spring-wire F, a part of which passes above the stiffener, arranged and operating in the socket *e*, as shown, substantially as herein described.

3. The collar-button C, constructed of a piece or strip of metal having rounded ends and ears *m*, and notches *m'*, said strip being folded at the middle, its body forming the flat wide shank *c*, in which a hole, *c'*, is punched, and its rounded ends turned at right angles, forming the head of said button, substantially as herein described.

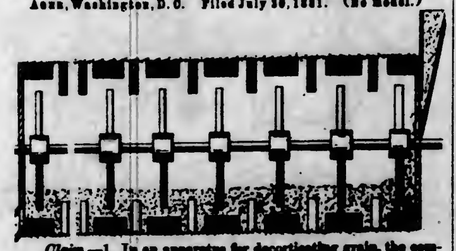


258,887. MITTEN. HERMON O. WITHERELL, Elkhart, Ind., assignor to the Eagle Knitting Company, same place. Filed Mar. 1, 1882. (No model.)

Claim.—1. A mitten composed of a hand portion provided with a thumb-opening cut therein, a double contracted wrist portion formed integral with said hand portion, and an attached lining provided with a thumb-stall, substantially as described.

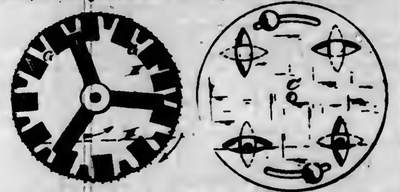
2. A knitted mitten formed from a continuous web and having a whipped or stitched end and a double contracted wrist portion, and provided with an attached lining and facing, substantially as described.

258,888. HEAD-REST. WILLIAM H. WOOLDRIDGE, Louisville, Ky. Filed Mar. 21, 1881. (No model.)



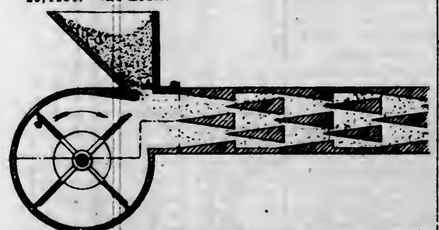
258,888.

Claim.—In a head-rest, the combination of standard A, having a central longitudinal slot and recessed at its upper end, the pivoted cushion B, and the bar *a*, having longitudinal slot *a'*, bend *a²* at one end, and outward inclination *b²* at the other, substantially as shown and described, and for the purpose specified.



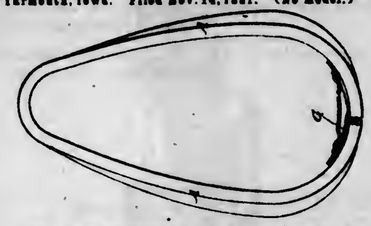
258,889. GRAIN-DECORTICATING APPARATUS. WILSON AGEE, Washington, D. C. Filed July 30, 1881. (No model.)

Claim.—1. In an apparatus for decorticating grain, the combination of the rotary screen having alternate long and short decorticators on the interior thereof with the central shaft provided with a series of radial decorticators, the whole arranged to operate substantially in the manner explained.



2. In an apparatus for decorticating grain or cereals, the rotary screen having alternate long and short decorticators on the interior thereof, the rotary shaft, and decorticators, the two being adapted to operate as described, in combination with air-exhaust mechanism to remove the dust and decorticated hulls, substantially as and for the purposes described.

258,890. GRAIN-DECORTICATING APPARATUS. WILSON AGEE, Washington, D. C. Filed Sept. 17, 1881. (No model.)



Claim.—The combination of the horizontal cylinder provided with a feed-opening at one end, the shaft C, having decorticators mounted on it, the adjustable discharging-passages at the opposite end, means for moving the shaft and screen and decorticators attached thereto in opposite directions with a relatively fast and slow speed, an inclosing-shell for said cylinder, and means for producing an air-blast, substantially as described.

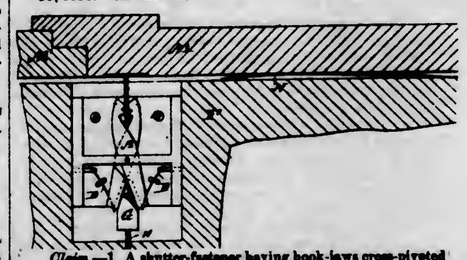
258,891. GRAIN-DECORTICATING APPARATUS. WILSON AGEE, Washington, D. C. Filed Jan. 31, 1881. Renewed Nov. 25, 1881. (No model.)

Claim.—In an apparatus for decorticating rice, coffee, and cereals, the horizontal box or grain passage having a series of stationary beveled surfaces on its interior walls composed of abrasive material, and a series of stationary alternating and tapering decorticators, composed of similar material, located within the box, and a blast or exhaust fan, the whole being combined and arranged substantially as and for the purpose specified.

258,892. HORSE-COLLAR FASTENING. JOHN W. ALBRIGHT, Yarmouth, Iowa. Filed Nov. 14, 1881. (No model.)

Claim.—1. The combination, with the part B, provided with the socket D, and the vertical slots F, opening into the said socket, of the part C, provided with the screw-threaded catch-bolt E, substantially as shown and described, whereby the collar is adapted to be widened, as set forth.

2. The combination, with the collar A, made open at the bottom, and provided with a flap overlapping the joint, of the keeper H, secured to the said flap, substantially as shown and described, whereby the pole-strap is prevented from dropping off when the collar is unfastened, as set forth.

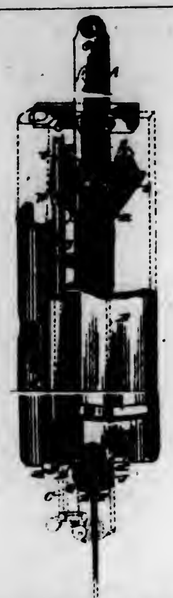


258,893. CARPET-SWEEPER. CHARLES O. ALLEN, Grand Rapids, Mich. Filed Apr. 7, 1881. (Model.)

Claim.—1. A rotary brush consisting of a central core having bristle-sockets bored therein transversely, with smaller holes or passage-ways connecting these sockets, in combination with the bristles and one or more wires laced through said holes and around the middle of the tufts of bristles, as described.

2. A rotary brush consisting of a central core having bristle-sockets bored therein transversely with holes *c*, connecting diametrical sockets and diagonal holes *d*, in combination with the bristles and a single wire laced through said holes and around the bristles, substantially as shown and described.

258,894. SHUTTER-FASTENER. CHARLES ALTSHILLER, New York, N. Y., assignor of one-half to Meyer A. Stein. Filed Apr. 11, 1882. (No model.)



Claim.—1. A shutter-fastener having hook-jaws cross-pivoted to a bed-plate, and springs D D, arranged to bear on the outer rear ends of said jaws, whereby both the front and rear of jaws are simultaneously pressed toward each other, as shown and described.

2. The combination, with the cross-pivoted hook-jaws having vertical flanges K, of the end-beveled block G, rhomboidal in shape and arranged on the end of a hand-rod, H, as and for the purpose specified.

258,895. NEEDLE-THREADING ATTACHMENT FOR SEWING-MACHINES. FRANK G. ALTMANS and FRED POHREN, Edina, Mo. Filed Mar. 4, 1882. (Model.)

258,345.

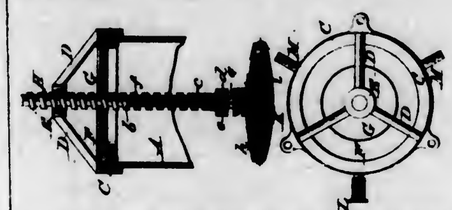
Claim.—1. In a needle-threading attachment for sewing-machines, the sliding rod C, carrying the hinged frame F, bevoled at H, and having the threading-tube G, in combination with the bracket J, having notch J, as and for the purpose set forth.

2. The threading-tube carrier C, having pin or stud T, in combination with the needle-bar A, having pin V, as and for the purpose set forth.

3. The needle-bar A, having pivoted cam-plate N, provided with the finger O, tooth P, and shallow notch Q, spring E, having hook S, and pin V, in combination with the threading-tube carrier C, having pin or stud T, as and for the purpose set forth.

258,346. SEWING-MACHINE SHUTTLE. MARSHALL D. ANDRUS, Middletown, Conn., assignor to the Victor Sewing Machine Company, same place. Filed Mar. 21, 1882. (No model.)

Claim.—1. A sewing-machine shuttle provided with a guard that is rigid with the shuttle-case, the said guard being formed with a curved wall located over and in close proximity to the flanged end of the bobbin, but not touching the same, whereby the thread will be prevented from slipping over the said end of the bobbin, substantially as described.

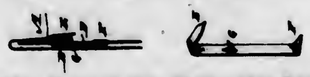


2. A sewing-machine shuttle provided with a concaved guard rigid with the shuttle-case and adapted to prevent the thread from slipping over the end of the bobbin, the said guard having a centrally-located step for the bobbin-journal, and the flanged end of the bobbin at the heel of the shuttle being received in the concavity of the guard, substantially as described.

3. The combination, in a sewing-machine shuttle, of the gate E, provided at its free end with a curved guard adapted to close over the flanged end of the bobbin at the point of the shuttle and to prevent the thread from slipping off the end of the bobbin, substantially as described.

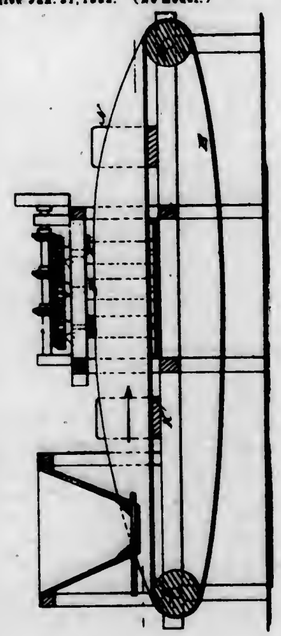
4. The combination, with the shuttle-case, of concaved guard C at the heel of the shuttle, and the curved guard F upon the pivoted shuttle-gate, substantially as described.

258,347. AIR-PUMP. ALFRED H. ARMEN, Chicago, Ill. Filed June 30, 1881. (No model.)



Brief.—The base of the frame is provided with nippers L M M, the former for the expulsion of air, the latter for drawing into the pump air from contiguous vessels. The interior base is of a conformation adapted to form an air-tight contact with the convex surface of the piston K, which is made of two plano-convex plates, *h i*, having concentric hubs *n n*, whose circumferences rest on a packing-ring, *s*. The interior hub, *n*, is screw-threaded to engage with a rod, *c*, which connects it to the hollow piston-rod H by means of the nuts *d f g*. The upper end of the pump contains on a packing, *a*, a cover, F, having a beveled central hole, whereby access is had to the interior of the cylinder. A cap, C, screw-threaded to engage with the threaded surface of the upper end of the frame, surmounts the whole, and radiating from it are two arms, D, which terminate in a central ring, E, in which the piston-rod works.

Claim.—1. The combination, with the piston K and tubular piston-rod H, having screw-thread *b* and nut *c*, of the rod *c*, provided with nuts *d g f*, substantially as shown and described.

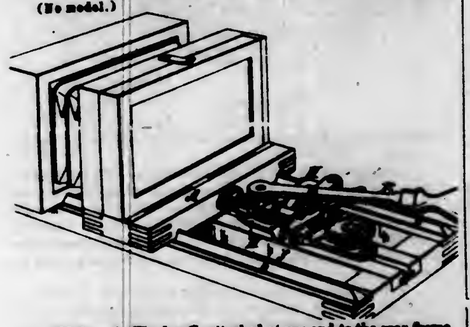


2. The combination, with the ribbed and flanged plates *h i*, having concentric hubs *n n*, of the tubular screw-threaded piston-rod H, nut *c*, and rod *c*, having nuts *d g f*, substantially as shown and described.

258,348. FASTENING FOR SAMPLE ENVELOPES. CHARLES W. BALLARD, New York, N. Y. Filed Aug. 8, 1881. (Model.)

Claim.—The combination, with an envelope, B, provided with a perforated flap, A, of a metal strip, D, provided with an open hook, E, a closed hook, F, and a tongue, G, substantially as herein shown and described, and for the purpose set forth.

258,349. CIDER-MILL. WILLIAM W. BARR, Elizabethtown, Ky. Filed Jan. 31, 1882. (No model.)



Claim.—1. In a cider-mill, the combination, with a series of rollers, of an endless apron and means, substantially as herein shown and described, for turning up the edges of the apron to cause it to pass between the said rollers in a fold, as set forth.

2. The series of vertically-arranged rollers placed successively nearer to each other, in combination with the folded apron E, flanged board K, and the means, substantially as described, for revolving the rollers as and for the purposes set forth.

3. The combination, with the crushing and compressing rollers and the folded apron E, of the saddle M, substantially as and for the purposes set forth.

258,350. FOCUSING ATTACHMENT FOR PHOTOGRAPHIC CAMERAS. ERASTUS B. BARKER, New York, N. Y., assignor to E. & H. T. Anthony & Co., same place. Filed Apr. 7, 1882. (No model.)

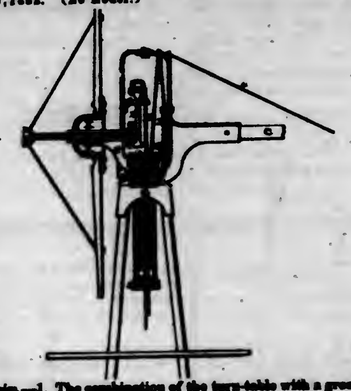
Claim.—1. The bar G, attached at one end to the rear frame, A, and having at its forward end a projection, *d*, in combination with the plate E, having long slot *e*, and the transversely-sliding plate H, having oblique slot *f*, forming the reverse wedges *g g*, as and for the purpose specified.

2. The combination, with the rear part of the body of the camera, the base-piece on or along which said body part slides, and the general adjusting or sliding plate E, provided with means for securing it, of the transverse slide or plate H, having an oblique slot, *f*, and the sliding bar G, connecting the obliquely-slotted portion of said plate H with the rear part of the body of the camera, essentially as and for the purposes herein set forth.

3. The combination, with the longitudinally-adjustable plate E and the transversely-sliding plate H, constructed to form reverse wedges *g g*, of the lever K, attached to said plates E H, the bar G, the rear body part, A, of the camera, and the base-piece D, substantially as shown and described.

258,351. STOVE-SUPPORT. H. CLAY BACCON, Troy, N. Y., assignor to H. S. Vedder Pattern Works, Bacon, Galbraith & Co., same place. Filed Sept. 30, 1881. (No model.)

Claim.—1. A stove-support composed of a horizontal frame of separable bars or plates and a corresponding number of legs which are adapted to and engaged by the ends of said bars, substantially as described, and the whole automatically locked together by gravity, substantially as and for the purpose specified.



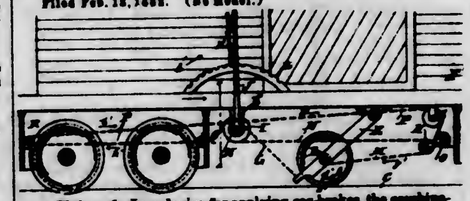
2. A stove-support composed of detachable legs having the central and lateral standing legs, *c d d*, with intervening spaces *e* and seats *f*, substantially as described, and the horizontal portion having the parts *g g* extending and fitting between and against said legs, and engaging with the lateral edges thereof, and resting upon said seats, and preventing lateral or sidewise movement of the legs on or along said horizontal portion, as set forth.

3. A stove-support composed of detachable legs having the standing top legs, *c* and *d d*, substantially as described, in combination with a horizontal portion consisting of separable bars or sections, each having its end portions, *g g*, extending and fitting between and against and engaging with said legs, and thereby securing said legs and bars or sections together in the form of a continuous or ring-like frame, as set forth.

4. The leg composed of the main portion L, having the standing top part, *c*, and the separable upper front portion, M, having the lateral legs *d d*, and fitting upon and against and engaging with said main portion, and adapted to be firmly secured thereto by engagement with the parts *g g* of the horizontal portion of a stove-support, substantially as described.

5. The combination, with the compound leg consisting of the separable parts L M, shaped and fitting together substantially as described, of the bars having end parts, *g g*, formed and engaging with the two parts of the leg, and thereby securing the same together, substantially as set forth.

258,352. WINDMILL. STEPHEN H. BOARD, Angola, Ind. Filed Jan. 27, 1882. (No model.)



Claim.—1. The combination of the turn-table with a grooved ring made in two parts, the guide for the pump-rod, which is placed inside of the divided ring, and a set-screw for holding the parts in place, substantially as set forth.

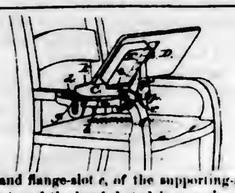
2. In a vertical wind-wheel, the casting E, in which the wheel is journaled, and which is curved laterally, so as to throw the wheel-shaft out of line with the vane, and thus enable it to swing around out of the wind, substantially as shown.

3. The combination of the guide-support 1, having an opening for the pitman to pass through, with the guides 6, which are placed upon its top and made adjustable, substantially as described.

4. The combination of the guide-support 1, having a flange formed upon the part 12, with the guides 6, having the grooves 18 formed in their under sides, substantially as set forth.

258,353. CAR-BRAKE. ARTHUR B. BUETTIS, Brooklyn, N. Y. Filed Feb. 18, 1882. (No model.)

Claim.—1. In a device for applying car-brakes, the combination, with the brakes, of the friction-wheels A, mounted on an axle, B, journaled in adjustable frames E, the lifting-chain G, attached to the frames E, and a shaft, H, and the chains M, attached to the axle B and to the drums or pulleys on the shaft H, substantially as herein shown and described, and for the purpose set forth.

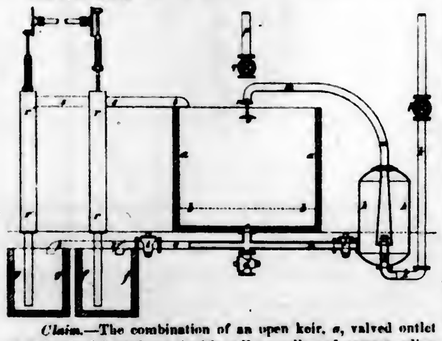


2. In a device for applying car-brakes, the combination, with the brakes, of the friction-wheels A, mounted rigidly on an axle, B, journaled in adjustable frames E, the chains M, attached to the axle B and a shaft, H, the pulley S on the bottom of the car, the coupled pulleys N O, and the brake-chains P, substantially as herein shown and described, and for the purpose set forth.

3. In a device for applying car-brakes, the combination, with the brakes, of the friction-wheels A, mounted rigidly on an axle, B, journaled in adjustable frames E, the lifting-chain G, attached to the frames E and to a shaft, H, the chain M, attached to the axle B and to pulleys or drums I on the shaft H, the lever J, for turning the shaft H, and devices for locking this lever J in the desired position, substantially as herein shown and described, and for the purpose set forth.

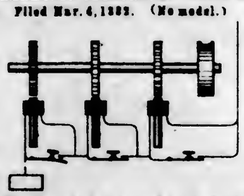
258,354. ATTACHMENT FOR CHAIRS. CHARLES S. BULL, Beaver Falls, Pa. Filed Nov. 5, 1881. (Model.)

Claim.—1. The combination, with the flanged arm-plate hav-



258,354.

ing the slot *d*, and flange-slot *e*, of the supporting-arm C, having the hinged tablet, and the headed stud *b*, engaging the slot of the arm-plate, substantially as specified.



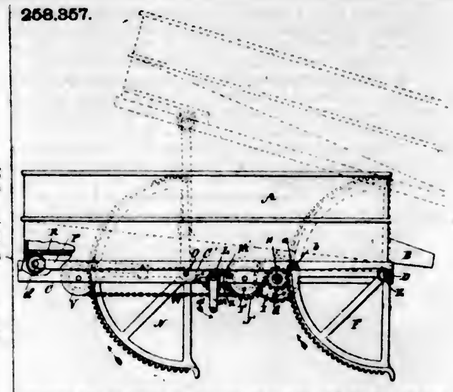
2. The supporting-arm C, having the inclined surface *k*, oblique shoulder *l*, and oblique forked extension-bearing *m*, and shouldered pawl *q*, in combination with the hinged tablet D and its ratchet *s*, substantially as specified.

258,355. APPARATUS FOR BLEACHING YARNS, &c. CHAS. E. BENNETT, Birch Vale, near Stockport, County of Derby, England. Filed Feb. 6, 1882. (No model.) Patented in England Jan. 7, 1880, No. 88.

Claim.—The combination of an open keir, *a*, valved outlet *a*, and valved branches *c d* with well or wells and corresponding pumps for receiving the discharged liquids through one branch, and a closed vessel, A, communicating with the other branch, steam-pipe *h*, and pipe *m*, all substantially as described.

258,356. HARMONIC TELEGRAPH. EMILE BERLINER, Boston, Mass. Filed Mar. 6, 1882. (No model.)

Claim.—In a harmonic telegraph, a shaft giving motion simultaneously to several iron or steel wheels placed in a magnetic field in proximity with wire coils, each wheel having teeth different in number in a given segment from the other wheels, and thereby producing electric undulations in each coil at a rate per minute different from the rest, substantially as described.



258,357. DUMPING-WAGON. HENRY S. BERNHART and ISAAC R. RITTER, Reading, Pa. Filed Jan. 12, 1882. (No model.)

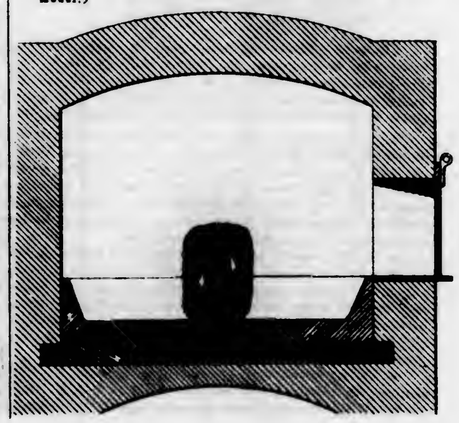
Claim.—1. In a dumping-wagon, the combination, with the supporting-frame C and the box A, of the quadrants or circular racks F at the rear end of the wagon and the quadrant or circular rack N at the front end of the wagon, and of gear-wheels for operating these racks, substantially as herein shown and described, and for the purpose set forth.

2. In a dumping-wagon, the combination, with the supporting-frame C and the box A, of the rear quadrants or circular racks, F, the front quadrant or circular rack, N, gear-wheels, sprocket-wheels U V, and the chain W, for operating the front and rear racks simultaneously, substantially as herein shown and described, and for the purpose set forth.

3. In a dumping-wagon, the combination, with the supporting-frame C and the box A, of the shaft D, the rear quadrants or circular racks, F, the shaft H, the pinions G, the front quadrant or circular rack, N, the shaft T, the pinion S, the sprocket-wheels U and V, the chain W, and of gear-wheels for operating the racks,

258,357.

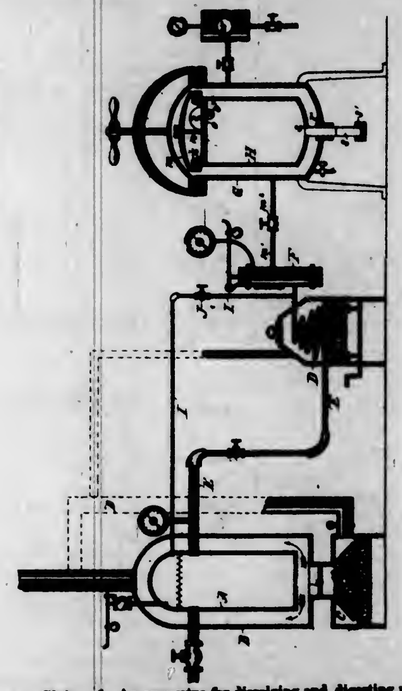
substantially as herein shown and described, and for the purpose set forth.



4. In a dumping-wagon, the combination, with the supporting-frame and the box, of circular or quadrant racks at the rear end of the wagon, a circular or quadrant rack at the front end of the wagon, the front rack being provided with an arm adjustably secured thereto, and of gear-wheels for operating the racks, substantially as herein shown and described, and for the purpose set forth.

5. In a dumping-wagon, the combination, with the supporting-frame C and the box A, of the rear circular or quadrant racks, F, the front rack, N, provided with sliding arms F', having a pulley, Q, at the outer ends, the groove R in the bottom of the box, at the front end of the same, and of gear-wheels for operating the racks, substantially as herein shown and described, and for the purpose set forth.

6. In a dumping-wagon, the shaft D, provided with the eccentric bushings E, in combination with the body A, the frame C, the quadrant-rack F, and mechanism for operating the same, substantially as shown and described, whereby the said rack is adapted to be disengaged from the operating mechanism, as and for the purpose set forth.



7. In a dumping-wagon, the combination, with the supporting-frame C and the box A, of the front circular or quadrant rack, N, the shaft D, provided with eccentric bushings E, the circular or quadrant racks F, loosely mounted on these eccentric bushings E, which racks are provided at the upper ends with slots *a*, the pintles *b*, passing through the slots *a* into the box A, and of gear-wheels for operating these racks, substantially as herein shown and described, and for the purpose of disengaging the rear racks, F, from their pinions, so that the box will be raised by the front rack only, as set forth.

258,358. PROCESS OF WELDING BESSEMER STEEL. WILLIARD T. BLOCK, Hannibal, Mo. Filed Sept. 13, 1881. (No model.)

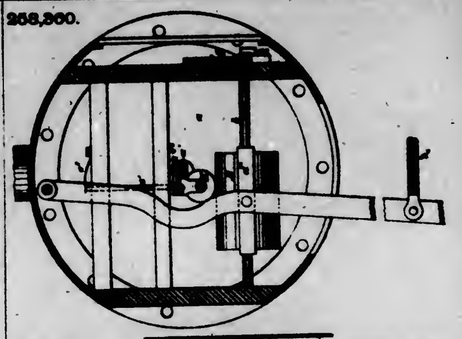
Claim.—The described process of welding together bars of Bessemer steel, wherein the said magnetic iron ore is used as a coating in place of the iron turnings heretofore used.

258,359. APPARATUS FOR DISSOLVING AND DIGESTING MEAT. SAMUEL W. BOWNE, New York, N. Y., assignor to Scott & Bowne, same place. Filed Jan. 24, 1881. (Model.)

Claim.—1. An apparatus for dissolving and digesting meat, consisting essentially of two vessels hermetically sealed, one suspended wholly within the other and carrying the charge of meat to be acted upon by superheated steam, and means whereby the steam is first introduced directly into the outer vessel at a defined pressure, and from thence, minus condensation, through a pressure-valve into the inner vessel, all substantially as and for the purposes as herein shown and set forth.

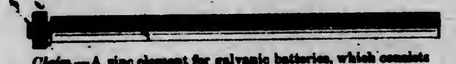
2. The dissolving and digesting apparatus consisting of vessel G and interior vessel, H, provided with compensating-valves *c* and *c'*, inlet steam-pipe *m'*, and discharge-pipe *c*, both vessels capable of being hermetically closed, all substantially as and for the purposes as herein shown and described.

3. The combination of vessels G and H, arranged to be hermetically closed and provided with inlet-pipe *m'*, discharge-pipe *c*, and automatic compensating-valves *c* and *c'*, and the vacuum-chamber M, all arranged, applied, and operating as and for the purposes substantially as herein shown and set forth.



4. The combination of the steam-drier A and heater B, superheater D, expansion-chamber F, and digesting apparatus G H, all arranged, applied, and operating substantially as and for the purpose as herein shown and set forth.

258,360. INTEGRATING APPARATUS. CHARLES V. BOYS, Wing, near Oakham, County of Rutland, England. Filed Dec. 8, 1881. (No model.) Patented in England June 8, 1881, No. 2,440, and in France Nov. 14, 1881, No. 146,772.

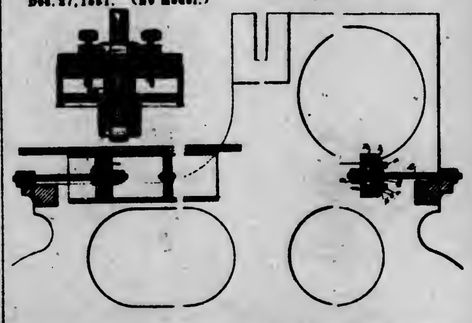


Claim.—1. An integrating apparatus consisting of a cylinder made to slide along its axis while its surface is in contact with a disk more or less inclined to the axis, and of a counter which registers the amount of revolution thus imparted to the cylinder, substantially as and for the purpose herein set forth.

2. In combination with the integrating-cylinder B, the disk E, mounted in frame *e*, and actuated alternately by the flexible diaphragms *a a*, subject to the pressure in the working-cylinder of the engine, substantially as and for the purposes set forth.

258,360.

258,361. RING FOR BATTERIES. HORATIO J. BENNER, New York, N. Y. Filed Apr. 4, 1882. (No model.)



Claim.—A zinc element for galvanic batteries, which consists of a zinc rod, A, provided with a screw-thread, B, cut upon it, and a nut, C, of different material screwing upon said screw-thread, and adapted to clamp the wire or strip beneath it, substantially as described.

258,362. DETACHABLE SAW-TOOTH. WILLIAM H. BROOKS, Trenton, N. J., assignor to the American Saw Company, same place. Filed Jan. 14, 1882. (No model.)

Claim.—The combination, with the saw-plate A, having recesses *a a'* and projection a^2, and the movable tooth B, provided with grooves *b b'* and concave surface b^2, of the spring locking-plate C, having groove *c*, tongue *c'*, projections c^2 c^3, and recess c^4, and the latch D, pivoted in the recess c^4, and having an arm, *d*, adapted to bear against the projection a^2, thereby securing the parts, substantially as described.

258,363. CUSHIONING DEVICE FOR PRINTING-PRESSES. JOHN RAGGE, Plainfield, N. J., assignor, by mesne assignments, to C. Potter, Jr., & Co., New York, N. Y., and himself. Filed Dec. 27, 1881. (No model.)

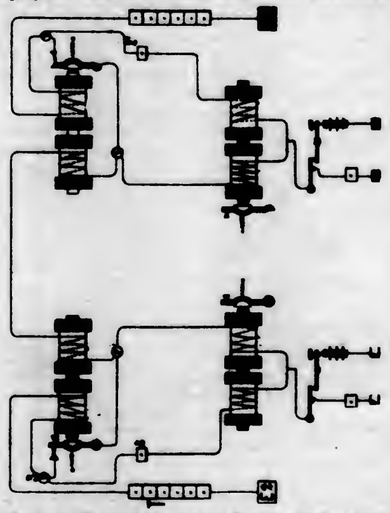
Claim.—1. The combination, in a cushioning apparatus, of a cylinder, a piston, a cup-leather, and a disk having an inclined edge and acting within the edge of the cup-leather to expand the same, substantially as set forth.

2. The combination, in a cushioning apparatus, of the piston,

the cup-leather, and an expander within the edge of the cup-leather, and actuated automatically by the pressure of the atmosphere for expanding such cup-leather or for allowing it to contract, substantially as specified.

3. In a cushioning apparatus for printing-presses, the combination, with the cylinder, of a cup-leather packing, a piston having openings through it, a tubular sleeve around the piston-rod, an expander having an inclined edge and sliding upon the sleeve, and adjusting-screws to limit the motion of the expander, substantially as set forth.

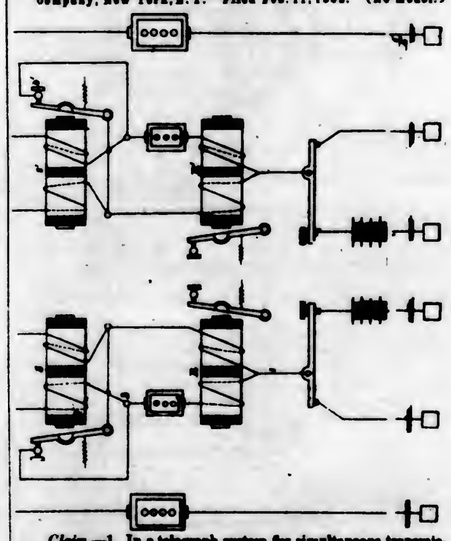
258,864. CLASP. WILLIAM G. BROWNE, Ansonia, Conn. Filed Mar. 17, 1882. (No model.)



Claim.—The herein-described clasp, consisting of the two parts A C, the one constructed with an eye, *a*, having an opening narrower than the eye itself, the other with a loop, *b*, at one end for attachment to one part of the strap, the other end T shape, the body of the T being broader than the opening in the eye, but narrower than the eye itself, the parts constructed and arranged for engagement substantially as described.

258,865. LAMP-BURNER. EDSON L. BRYANT, Ansonia, Conn., assignor of one-half to Wallace & Sons, same place. Filed Apr. 15, 1882. (No model.)

Claim.—As an article of manufacture, the herein-described burner, consisting of the chimney-rest, perforated air-distributer, and springs C, all made in one and the same piece, attached to the base, and having the deflector E, hinged to the rest at a point between the chimney-springs, substantially as described.



258,866. DUPLEX TELEGRAPH. CHARLES L. BUCHINGHAM, Elizabeth, N. J., assignor to the Western Union Telegraph Company, New York, N. Y. Filed June 16, 1881. (No model.)

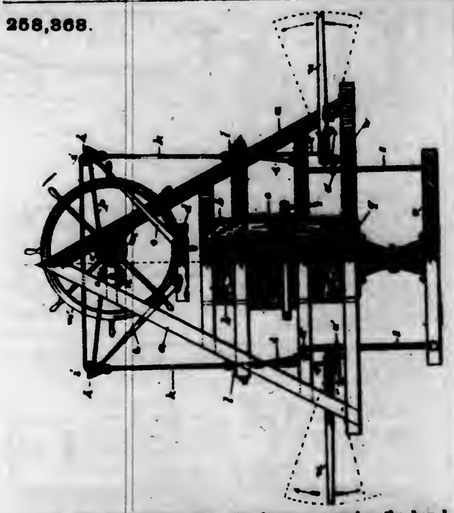
Claim.—1. The method, substantially as specified, of rendering the receiving-relay of a differential duplex system insensible to the effects of the inductive charge and discharge of the main line, which consists in causing both the inductive charge and discharge, respectively, to be divided or differentialized through the two oppositely-wound coils of the differential relay.

2. The method, substantially as specified, of rendering the receiving-relay at a transmitting-station in a telegraphic system for simultaneous transmission in opposite directions insensible to the effects of the inductive charge and discharge of the main line, which consists in causing both the inductive charge and discharge, respectively, through the receiving-instrument at the transmitting-station to be divided before passing through said receiving-relay, whereby the divided portion, will act oppositely thereon to produce neutral effects and avoid false signals.

258,867. DUPLEX TELEGRAPH. CHARLES L. BUCHINGHAM, Elizabeth, N. J., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Feb. 11, 1882. (No model.)

Claim.—1. In a telegraph system for simultaneous transmission in opposite directions, the combination, substantially as specified, at each station of the main line, an artificial line, a differential receiving-instrument, a differential electro-magnet whose oppositely-wound coils are in the main and artificial lines, respectively, and a bridge-conductor joining the main and artificial lines which is opened and closed by the agency of said differential electro-magnet.

2. In combination with a duplex-telegraph line, an artificial line, a differential receiving-relay, a normally-closed bridge or branch conductor, and a differential electro-magnetic circuit-breaker whose armature is adjusted to be insensible to the static discharge from the line, but which is actuated by a sufficiently-prolonged current from a distant station to make a signal, whereby the static discharge will pass to earth through both coils of the differential receiving relay or instrument, while a prolonged signal-current sent from a distant station will cause the bridge-conductor to be broken.



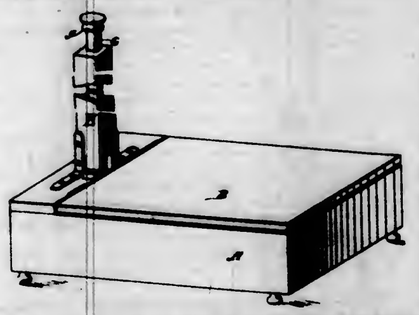
3. The combination, substantially as specified, of a main and artificial line, differential relay R, differential electro-magnetic circuit-breaker S, and a normally-closed bridge which is broken and closed by means of said circuit-breaker S.

4. In a telegraph system for simultaneous transmission in opposite directions, the combination at each station of a main line, an artificial or compensating circuit, a receiving-instrument, a bridge or branch conductor for connecting the main and artificial lines, and an automatic circuit-breaker for opening and closing said bridge, whereby said bridge may be closed both at the time of inductive charge and discharge of the main line, substantially as specified.

258,868. BAY AND COTTON PRESS. DAVID P. BURNETT, Elmo, Ark., assignor of one-third to Robt. R. Cass, same place; Keziah H. Burkett, Administratrix of David P. Burkett, deceased. Filed Jan. 26, 1882. (No model.)

Claim.—1. In a press, the combination, with a box open at its ends and provided with doors in its opposite sides, of an upper descending follower, *d*, a lower ascending follower, *g*, and auxiliary mechanism operating separately and independently of the frame, substantially as described.

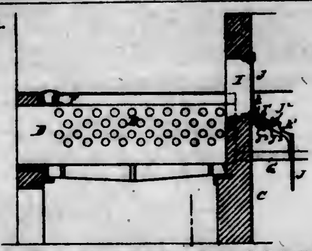
258,868.



2. The combination, with the frame *a*, carrying the box *b*, open at its ends and provided with doors in its opposite sides, of the follower *d*, provided with the hinged arms *e*, hooks *h*, having pulleys *i*, eyebolts *k*, links *l*, shafts *m n*, wire rope *p* and hand-wheel *m'*, and slit *r*, provided with rods *s*, and follower *g*, fulcrumed irons *t t*, suspended from the links *l*, levers *o o*, and rings *o'*, substantially as described, and for the purpose set forth.

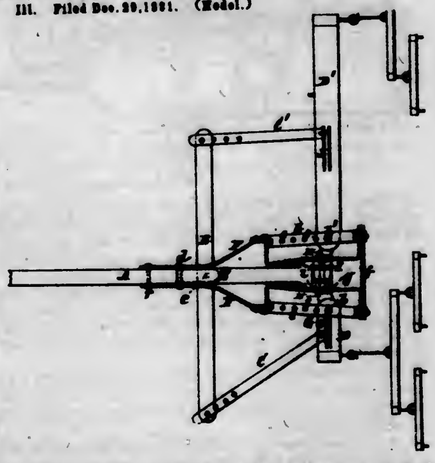
258,869. FIRE-KINDLER HOLD. JAMES W. BURNS, Springfield, Ohio. Filed Dec. 2, 1881. (No model.)

Claim.—The combination, with a mold partitioned to form chambers *c*, of followers B, connected by flexible strip F, and having between them spaces, into which the partitions pass as the followers are pressed down, whereby a number of kindlers are formed at the same time, as described.



258,870. SPITTOON-HOLDER. JAMES CAMPOS, Saguache, Colo. Filed Feb. 14, 1882. (No model.)

Claim.—In a spittoon-holder, the combination, with the box or case A, the hinged cover B, provided with the rigid arm D, and the vertical hollow standard E, of the sliding rod G, provided with the knob *g* at its upper end, and at its lower end with a lateral fork, consisting of the arms A A', adapted to engage alternately with the arm of the cover for raising and lowering the same, substantially as herein shown and described.



258,871. STEAM-GENERATOR FURNACE. CLAUDE H. CANDLEE and JAMES WHITEHEAD, Detroit, Mich. Filed Nov. 1, 1881. (No model.)

258,871.

Claim.—The combination of the bridge-wall C, having openings I, with the combined division-wall and feed-water heater D, having connections F G H, and provided with transverse tubes E, the dampers J, the parallel shafts J' J², the pinions J³, and the arms *b b'*, substantially as described.

258,872. DRAFT-EQUALIZER. DALLAS CARR, Chandlerville, Ill. Filed Dec. 29, 1881. (Model.)

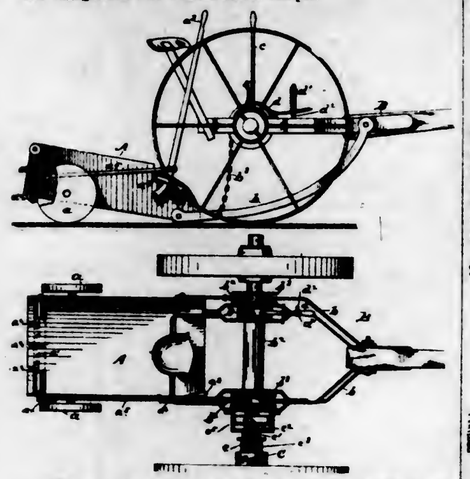
Claim.—1. The combination, with the plow-beam A, draft cross-bar B, connecting-bars C C', and draft-equalizing levers D D', of the adjustable side arms, F F, substantially as specified.

2. The pivoted loop E, in combination with the draft cross-bar B, the adjustable side arms, F F, and the plow-beam A, essentially as shown and described.

3. The pivoted loop E and draft cross-bar B, made adjustable up or down by a pin, *d*, and holes *e e* in the side arms, F F, in combination with the plow-beam A, to which said side arms are adjustably attached, substantially as specified.

4. The plow-beam A, provided with a series of adjusting-apertures, *h*, in its jaw or forward end, in combination with the pivoted side arms, F F, the pin *g*, the looped straps G G, and the levers D D', of different lengths, essentially as described.

5. The looped straps G G, provided with a series of adjusting-apertures, *e e*, in combination with the levers D D', pivots *b b'*, fitting said apertures, the adjustable side arms, F F, and the plow-beam A, substantially as and for the purpose specified.



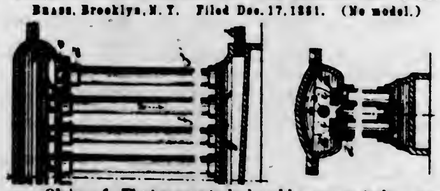
6. The adjustable stirrup I, in combination with the adjustable braces H H and the draft-equalizing levers D D', essentially as herein set forth.

7. The combination of the draft-equalizing levers D D', the looped straps G G, having adjusting-apertures for the fulcrums of said levers, the adjustable side bars, F F, the draft cross-bar B, adjustably attached to said levers, the connecting-bars C C', the adjustable stirrup I, the adjustable braces H H, and the plow-beam A, substantially as specified.

258,873. EARTH-SCRAPER. ROBERT W. CHAMBERS, Sidney, Ohio, assignor of one-half to P. Smith, Brother & Co., same place. Filed Dec. 19, 1881. (No model.)

Brief.—The scraper has rollers on its rear and curved bars on its front connecting with the tongue of a sulky. The curved bars are connected with sheaves on the sulky-axle by means of hoisting-chains. The sheaves are rotated by a clutch mechanism on

the axle engaging one of the sulky-wheels. The end-gate of the scraper is hinged at the top and secured at its lower edge by pins on a shaft actuated by lever-arms connected to a lever-handle adjacent to the sulky-seat and held by a spring forcing a pin thereon into engagement with a notch on the scraper.



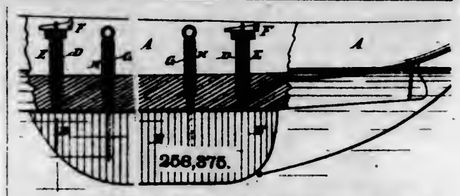
Claim.—1. In an earth-scraper, the end-gate hinged at the upper edge, in combination with a shaft having stops for holding the end-gate and means for operating the said shaft, the scraper being mounted on rollers at the rear end and supported by a sulky at the forward end, substantially as shown and described.

2. The combination, in the scraper A, mounted on the rollers *a a*, of the end-gate *a'*, hinged at its upper edge, the pins *a²* and their shaft, arranged underneath the scraper, the lever *a³*, arm *a⁴*, rod *a⁵*, having a lug on its inner side, and spring *a⁶*, substantially as shown and described.

3. The combination of the scraper A, the curved bars *b b*, the sulky B, the axle *b²*, sheaves *b³ b³*, chains *b⁴ b⁴*, and means for regulating the winding and unwinding of the said chains, substantially as shown and described.

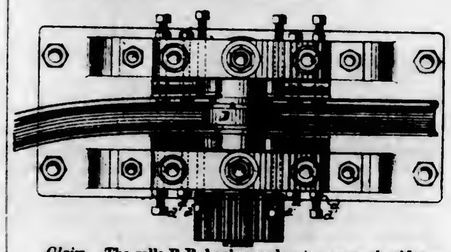
4. The combination of the sulky B, having its tongue secured to its axle to one side of the center thereof, the scraper A, secured to said tongue and adapted to run close to one of the wheels of the sulky, and having suitable means for being operated, substantially as shown and described.

258,374. STEAM-RADIATOR. JOHN CHAPMAN and ROBERT BRASS, Brooklyn, N. Y. Filed Dec. 17, 1881. (No model.)



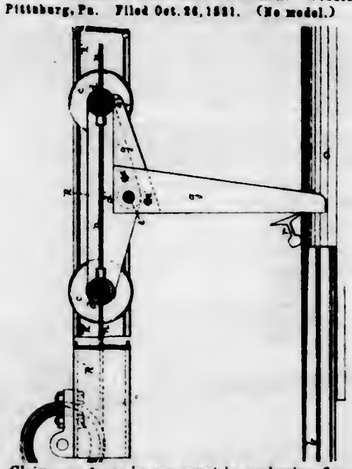
Claim.—1. The top receptacle, *b*, and lower receptacle, *g*, connected by circulating-pipes *f*, secured within the bottom plate of the upper receptacle by nipples *d*, attached to the ends of the pipes by screw-threads, said nipples passing loosely through the bottom plate of the receptacle and secured in place by nuts *d'*, whereby the joint may be packed, substantially as described.

2. The top and bottom receptacles connected by circulating-pipes *f*, secured by nipples *d* and nuts *d'*, projecting above the bottom plate of the receptacle *b*, in combination with the horizontal conduit-pipe *e*, arranged between the rows of pipes *f*, and provided with exits in the bottom thereof, as hereinbefore set forth.



3. The top receptacle, *b*, formed with a transverse trough, *c*, below the bottom of the receptacle to receive the products of condensation, in combination with the end pipes, *f'*, and nipples, arranged, as described, to receive the water and conduct it to the receptacle below, as set forth.

258,375. CENTER-BOARD BOAT. THOMAS CHAPMAN, Roslyn, N. Y. Filed Feb. 28, 1882. (No model.)



Claim.—In a center-board boat, the combination, with the boat A, provided with holes in its keel, and with the tubes E H, of the rods D, passing up through the holes of the keel and the tubes E, and secured by the washers and keys F, the center-board B, hinged to the lower ends of the said rods, and the pins G, passing down through the tubes H and holes in the keel into holes in the center-board, substantially as herein shown and described, and for the purpose set forth.

258,376. CAMBERING-MACHINE. WILLIAM CLARK, Pittsburg, Pa. Filed Oct. 26, 1881. (No model.)

Claim.—The rolls B B, having each a tongue or shoulder, *s*, adapted to engage the under side of the head of a rail while passing through, in combination with side guides on both the feeding and delivery sides of the rolls, arranged and adjusted to engage the top of the rail-head and bend the rail out of the direct line of feed to a uniform curvature, substantially as set forth.

258,377. ROLLING-MILL RAIL-CARRIER. WILLIAM CLARK, Pittsburg, Pa. Filed Oct. 26, 1881. (No model.)

Claim.—1. As an improvement in mechanism for removing rails from the rolling-mill, the arrangement of the moving mechanism above and distinct from the cooling-bed, in the manner substantially as described.

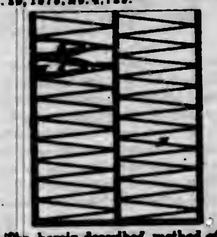
2. The truck R, composed of wheels *c*, frame *d*, pivoted swinging pusher-leg *g*, and a stop to limit the swinging of the pusher in one direction and support it against the force brought to bear to move the rail, substantially as set forth.

3. In combination with a cooling bed or frame and raised or elevated channeled guide-rails R', a truck, R, carrying a pusher-leg, *g*, and connected to a power drawing mechanism at one end and to a counter-weight at the other, substantially as set forth.

258,378. DARNING-LAST. GEORGE A. COCHRANE, New York, N. Y. Filed Feb. 28, 1882. (No model.)

Claim.—1. A darning-last having a groove formed around its body, in combination with an elastic band or equivalent means for securing the fabric to said last, for the purpose set forth.

2. A darning-last provided with two or more peripheral grooves, in combination with an elastic band or bands, for the purpose specified.



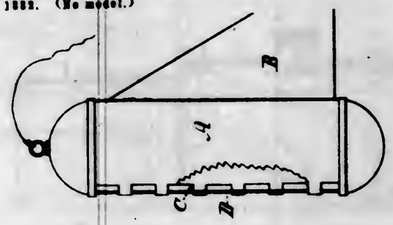
3. A darning-last having a groove formed around its body at or near its greatest diameter, in combination with an elastic band cylindrical in cross-section, as and for the purpose specified.

4. A darning-last of conoidal form, having a peripheral groove at or near its greatest diameter and a like groove near its vertex, in combination with elastic bands, as and for the purpose specified.

5. A darning-last having the configuration herein described and shown—that is, of substantially conoidal form, with broad flattened base and sides or periphery, carving from base to point or vertex—substantially as and for the purpose specified.

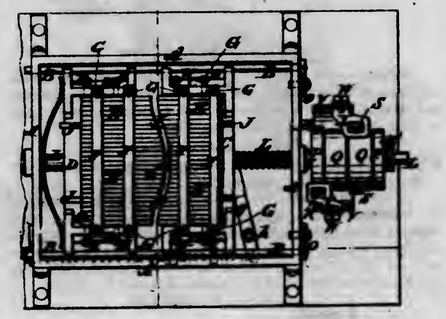
6. In combination with a darning-last, a band or equivalent means for holding the fabric rigidly thereon, as described.

258,379. METHOD OF PACKING BOTTLES AND OTHER ARTICLES. THOMAS COCKSHOTT, Birkenhead, County of Chester, England. Filed Apr. 14, 1882. (No model.) Patented in England Nov. 29, 1879, No. 4,729.



Claim.—1. The herein-described method of packing bottles and other articles larger at one end than at the other, consisting in forcing said articles between flexible partitions with the large and small ends alternated, substantially as set forth, whereby a double flexure is formed in the partition, as explained.

2. The herein-described method of packing bottles and other articles larger at one end than at the other, consisting in forcing a series of two or more of said articles between flat flexible partitions against opposite sides of each partition at points on the said partitions not opposite to each other, thus producing a flexure and a retention of said partitions in an abnormal form, whereby a double flexure is formed in the partitions, as explained.

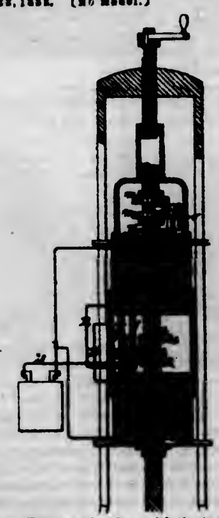


258,380. WATER-PROOF CLOTH. ERASMUS B. COLLINS and LYMAN P. CONVERSE, Chicago, Ill. Filed Apr. 24, 1882. (No specimens.)

Claim.—The compound for rendering fabrics water-proof, composed of the raw linseed-oil, copal varnish, gutta-percha bark, burnt umber, red oxide of iron or white lead, pulverized pumice-stone, and japan, in the proportions set forth, and prepared, applied, and finished substantially as described.

258,381. TOY. LYMAN P. CONVERSE, Chicago, Ill., assignor of one-half to Erasmus B. Collins, same place. Filed Mar. 27, 1882. (No model.)

258,382. SPRING-SETTER. JOHN CORRIGAN and CHARLES D. TYLER, Jr., Cleveland, Ohio. Filed Aug. 20, 1881. (No model.)



Claim.—1. The combination of the rods B, the grooved end flanged plates, C D, having notched end lugs, the adjustable bars E, held down by bars F, the bolts G, the screws H, and the bars J, as and for the purpose specified.

2. The combination, with the slide-bar Y, of the slotted lever *g*, the pivoted slide-rod *i*, provided with collars *l m*, and the hangers *j k*, one of which is attached to movable plate C, as and for the purpose specified.

3. The combination, with the frame C, of the nut K, the screw L, the two flat pulleys Q, the straight belt R, the crossed belts S, the long pulley T on drive-shaft U, the slotted curved plate V, the slotted arms X, the pivoted slide-bar Y, and the bar *b*, pivoted to standard *c* and having arms *d e*, as and for the purpose specified.

4. In a spring-setter, the combination, with the sliding bar Y of the belt-shifter, of the double angle-lever *b d e*, substantially as herein shown and described.

258,383. ELECTRIC MOTOR. LEE DAFT, Greenville, N. J. Filed Jan. 23, 1882. (No model.)

Claim.—1. The combination, with the two axial magnets and soft-iron core common to both, of the metal rod *f*, sectional rod *g h*, circuit-changer *e*, sliding on both rods, and tappets *a b*, arranged to strike and slide the circuit-changer, substantially as set forth.

2. The combination, with the reciprocating core common to the two magnets, carrying a tool, and sliding in but turning with a ratchet, S, of a crank-lever, *n o*, annular tappets *m m* on the core,

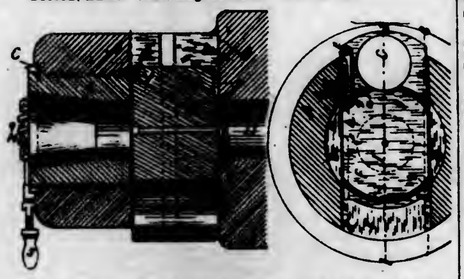
arranged to strike one arm, *n*, of the lever, ring *v*, turning on the core and vibrated by the arm *o* of the crank-lever, and a pawl, *r*, carried by the ring and engaging with the ratchet, as and for the purpose specified.

258,884. OVEN. ERSKINE DAVIS, Canton, Ohio. Filed Feb. 18, 1882. (No model.)

Claim.—As a new article of manufacture, a lining for ovens, consisting of a tile or slab made of some suitable porous material, and having a metallic surface made non-oxidizable by a coating or glaze thereon, substantially as set forth.

258,885. VAPOR-BURNER. ERSKINE DAVIS, Canton, Ohio. Filed Feb. 18, 1882. (No model.)

Brief.—When the cover of the burner is made to swing off the induction-tube is constructed with a deflecting-side of such size that when moved sufficiently far a portion of the jet of vapor will pass through the burner and burn at the top, while the remainder will be deflected against the bottom thereof. When the top is not removable all of the vapor is deflected to one side.



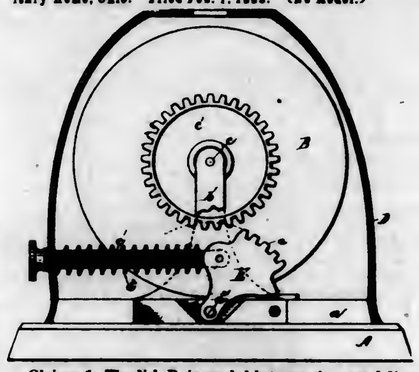
Claim.—1. A vapor-burner having an induction-tube pivoted to its under side, in combination with a connecting-rod and movable cap, the tube and cap being connected directly and rigidly together, substantially as shown.

2. In a vapor-burner, the combination of a pivoted induction-tube, a movable cap or top, and a connecting-rod which passes up through the burner, whereby the cap and induction-tube are made to move together, substantially as described.

3. The combination of a vapor-burner with a pivoted induction-tube, the induction-tube having a deflecting-surface, F, formed upon its side, substantially as set forth.

4. The combination of the vapor-burner with an induction-tube having a deflector formed upon its side, and a movable cap, whereby an auxiliary heating-flame may be maintained at the top of the burner, substantially as specified.

258,886. BREECH-LOADING ORDNANCE. SAMUEL B. DEAN, Boston, Mass. Filed Aug. 15, 1881. (No model.)



Claim.—1. The combination, with a gun having a breech-screw, L, provided with a central opening and a transverse guide-slot, E, of a breech-block, F, composed of a loading-opening, G, and a solid part, J, said breech-screw and said breech-block being interlocked, substantially as described, so that the turning of the breech-screw will cause the breech-block to slide in said guide-slot, as and for the purpose specified.

2. A breech-block, F, with its loading-opening G, a solid part, J, circular running groove *g*, and draw-bar H, and a transverse slot, E, at open breech end of gun, in combination with a breech-screw, L, with its central opening, and pin *u*, said screw being arranged to turn in a screw-socket of the gun, all substantially as described, for the purpose specified.

3. A breech-block, F, provided with a loading-opening, G, solid part J, two circular running grooves, *f g*, and draw-bar H, and arranged in a transverse guide-slot, E, at the open breech end of the gun, in combination with a breech-screw, L, provided with an opening, and two pins, *t u*, arranged to turn in a screw-socket, C, of the gun, all substantially as and for the purpose described.

4. The combination, with a transverse guide-slot, E, having a rib or tenon at the breech end of the gun, of a breech-block, F, composed of a loading-opening, G, and a solid part, J, and having a groove to fit said rib, said rib and said groove serving in the movement of the breech-block in said guide-slot by the narrowing of the rib, substantially as described, to move the breech-block to and away from the inner face, *h*, of the said guide-slot, substantially as and for the purpose specified.

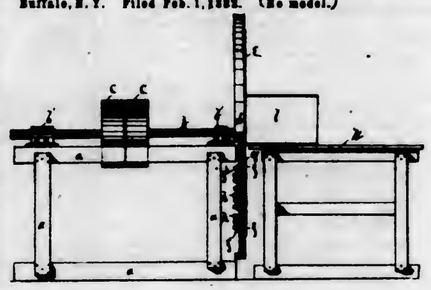
258,887. GAME-WHEEL. WILLIAM DOBBINGS, National Military Home, Ohio. Filed Feb. 1, 1882. (No model.)

Claim.—1. The disk B, journaled between the posts *b b'*, and provided with a cog-wheel, *c'*, adapted to impart motion to the disk, substantially as and for the purposes specified.

2. The disk B, journaled between the posts *b b'*, having its periphery bent at right angles, with figures marked on its face and carved projections *b³* on its inner side, the solid cylinder *b⁴*, ranging on said projection, and the plate *c²*, placed on the shaft *c* and adapted to fit inside the periphery of the disk, substantially as shown and described.

3. The pawl E, provided with teeth *e*, pivoted in the recess *a'* by the pin *e²*, and adapted to revolve the disk B, substantially as shown and described.

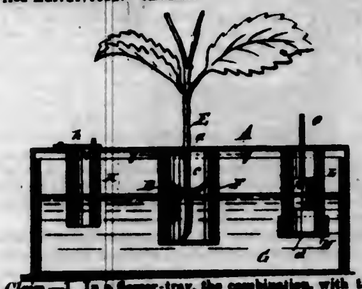
4. The casing D, having a recess in its top, and adapted to cover the disk B and to be secured to the sides of the projection *a'*, substantially as shown.



5. The lever *c'*, pivoted to the pawl E, passing through the side of the casing D, and provided with a spiral spring, *c³*, substantially as and for the purposes shown and described.

6. The combination of the disk B and its cog-wheel *c'* with the pawl E and its actuating-lever *c'*, all arranged to operate as set forth.

7. The combination of the pawl E, actuating-lever *c'*, and spring *c³* with the stand A and casing D, all arranged as shown and described.



8. The spring *c³*, arranged around the lever *c'*, in combination with the pawl E and casing D, substantially as and for the purposes set forth.

258,888. BOX-TRIMMING CUTTER. JULIAN F. DE WITT, Buffalo, N. Y. Filed Feb. 1, 1882. (No model.)

Claim.—A box-trimmer consisting of the disk *d*, adapted to operate by suitable power, and provided with the recesses *g* and slots *g'*, the knives *e*, provided with the slots *e'*, having beveled sides *e²*, such knives being adapted by means of adjusting-screws *f* and *h* to be adjusted both in the plane of the disk and to and from such plane in the manner shown, the whole being combined and operating substantially as shown and described.

258,889. FLOWER-TRAY. JOHN DREW, Old Mission, Mich. Filed Mar. 21, 1882. (Model.)

Claim.—1. In a flower-tray, the combination, with the box provided with an aperture in its top, of a closed vessel secured to the under side of the top of the said box, and provided with means, substantially herein shown and described, for holding the lower ends of the flowers, as set forth.

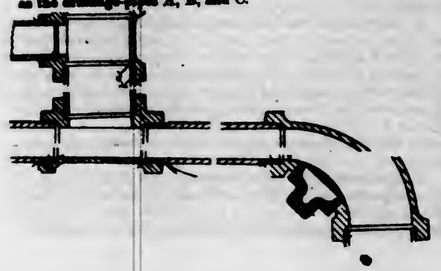
2. In a flower-tray, the combination, with the box A, provided with an aperture, *a*, in its top, and having a closed vessel or cup, B, with a side aperture, F, attached to the under side of its top, of the reservoir G, substantially as herein shown and described, and for the purpose set forth.

3. In a flower-tray, the combination, with the box A, having an aperture, *a*, in its top, and with the reservoir G, of the closed vessel or cup B, attached to the under side of the top of the box A, and provided with a side aperture, F, and with an apertured transverse strip, C, substantially as herein shown and described, and for the purpose set forth.

4. In a flower-tray, the combination, with the box A, having apertures *a* and H in its top, and having a vessel or cup, B, attached to the under side of its top, of the reservoir G, substantially as herein shown and described, and for the purpose set forth.

5. In a flower-tray, the combination, with the box A, having a cup, B, attached to the under side of its top, of the reservoir G, the tube L, the float M, and the indicator-rod O, substantially as herein shown and described, and for the purpose set forth.

6. In a flower-tray, the combination, with the box A, having apertures *a* and H in its top, and having a vessel or cup, B, attached to the under side of its top, of the reservoir G and gate h, for closing the aperture H, substantially as herein shown and described, and for the purpose set forth.



258,890. REAMER. GEORGE W. DUDLEY, Waynesborough, assignor to himself and J. Marshall McCue, Afton, Va. Filed Aug. 16, 1881. (No model.)

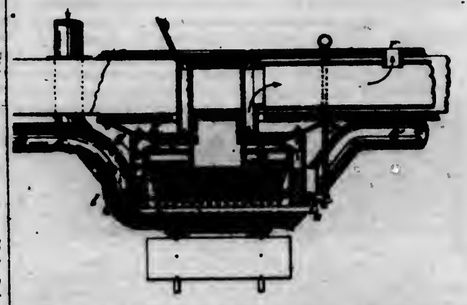
Claim.—A reamer made with flat tapered sides, grooved at the corners, and twisted, substantially as shown and described.

258,891. ELBOW-FITTING FOR DRAINAGE-PIPES. CALEB W. DURHAM, Chicago, Ill. Filed Nov. 26, 1881. (No model.)

Brief.—The fittings H G K have the same internal diameter as the drainage-pipes A, B, and C.

Claim.—The elbow-fitting for drainage-pipes, provided with a hand-hole at its inner angle, substantially as specified.

258,892. WHIFFLETREE-HOOK. FERDINAND ECCERS, Rock County, Wis. Filed Oct. 5, 1881. (No model.)



Claim.—A whiffletree-thimble having hook C and lugs *b b*, in combination with a pivoted recessed block adapted to receive and lock the eyebolts, as set forth.

258,893. FLY-HOOK. FRANCIS ENRIGHT, Clifton, assignor to Charles F. Imbrie, New York, N. Y. Filed July 6, 1881. (No model.)

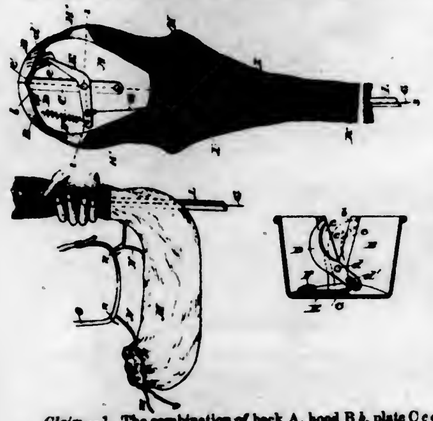
Claim.—In fly-hooks, the threads *d*, in combination with eyelets *b*, as and for the purposes described.

258,894. CAR-HEATER. PHILO S. EWING, West Berkshire Vt., and FREDERICK A. WISWELL, Beebe Plain, Quebec, Canada. Filed Nov. 9, 1881. (No model.)

Claim.—1. The combination, with the fire-pot of a car-heating apparatus, of a fuel-magazine provided with doors for closing the mouth thereof, the hinged falling doors arranged in the interior of the fuel-magazine, and the door-operating mechanism located outside the said fuel-magazine, all substantially as shown and described, and for the purpose set forth.

2. In a car-heater, the combination, with a fire-pot, of a fuel-magazine having means for closing its mouth and provided with the flanges upon its interior surface, and the pair of hinged doors with means for raising or lowering said doors and holding them against the under surface of said flanges, substantially as and for the purpose set forth.

3. In a car-heater the combination, with the fire-pot, of a fuel-magazine having means for closing its mouth and provided with the interior flanges, the pair of hinged doors, the sectors, and the chain and lifting-rod provided with a spring-catch, as set forth, and for the purpose described.



4. The combination, with the fire-chamber D, of the auxiliary chambers *l l'*, communicating with the space below the grates, the intermediate perforated partitions P, and the draft-flues L L', opening into the auxiliary chambers and provided each with means for regulating the draft, substantially as shown and described, and for the purpose set forth.

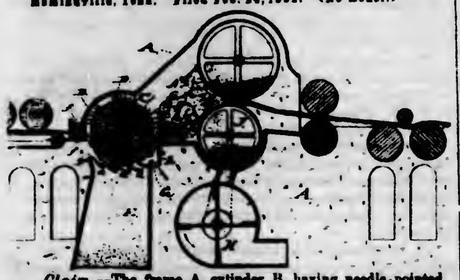
5. The fire-chamber having the auxiliary chambers provided each with a door, as shown, and the perforated partitions separating the auxiliary chambers from the fire-chamber, in combination, substantially as set forth.

6. The combination, with the air-chamber, of the supplemental chamber extending along one side and partially around the ends of

the air-chamber, as shown, the intermediate perforated partition dividing the supplemental chamber from the air-chamber, and the air-supply pipes Q Q', connected to the supplemental chamber at opposite ends thereof, and provided each with dampers, as shown, and for the purpose set forth.

258,395. FRUIT-GATHERER. PHILLIP A. FABLER, St. Louis, Mo. Filed June 24, 1881. (No model.)

Claim.—1. The combination of hook A, hood B *b*, plate C *c c'*, curved knife D, having pivot *d*, lever E, slot-and-stud connection *d' e*, spring F, and cord G, as set forth.



2. The combination of gatherer A B *b* C *c c'*, wire rings H H', netting I, hose K, knife D, lever E, spring F, cord G, and pole L.

258,396. METALLIC WASH-BOARD PLATE. MARSHALL H. FARNSWORTH, Brooklyn, assignor to the Ohio Wooden Ware Manufacturing Company, Cleveland, Ohio. Filed Oct. 8, 1881. (Model.)

Claim.—A metallic wash-board plate having a series of transverse angular corrugations, A, the faces of which are traversed by a series of oblique or downward-diverging depressions, *a*, with confluent upper ends, in the angle of which are projections or swells *c*, sloping down to the channels between the transverse corrugations, and having between the said series of oblique depressions or grooves swells or projections *c*, causing alternating swells and depressions along in the face of said corrugations A, substantially as described.

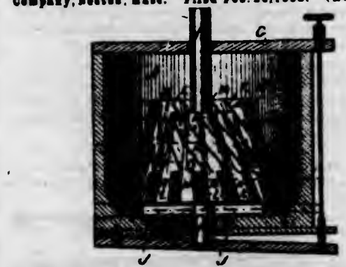
258,397. COTTON OPENER OR LAPPER. WM. P. FARLEVER, McMinnville, Tenn. Filed Feb. 24, 1881. (No model.)

Claim.—The frame A, cylinder B, having needle-pointed wires D, and concave knife-edged grate-bars *a a*, in combination with the trunk A', provided with the opening G, the hinged plate *b*, chamber E, and fan H, all constructed to operate substantially as set forth.

258,398. CHECK-VALVE INDICATOR. EDWARD G. FELTHOUSEN, Buffalo, N. Y. Filed Dec. 12, 1881. (No model.)

Brief.—As the valve rises and falls the short end, *h*, of the indicator H takes part in the movement of the valve as it is held against the under side of the valve-stem *g* by the overhanging weight of the long arm of the indicator.

Claim.—1. The combination, with a check-valve, of an indicator, means whereby an increased motion is imparted to the indicator, and a transparent case which incloses the indicator and renders its movements visible, substantially as set forth.



2. The combination, with a check-valve provided with a stem, *g*, of the pivoted indicator H, composed of a short arm and a long arm, a chamber, G, inclosing the stem *g* of the valve and the short arm of the indicator, and a transparent chamber, I, inclosing the long arm of the indicator, substantially as set forth.

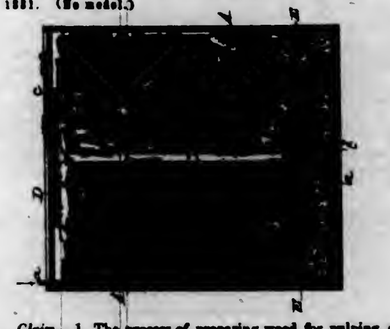
3. The combination, with the pivoted indicator H, of the chamber G, pivot-plate L, glass tube *i*, inclosing-tube *j*, washer *m*, and packing-disk *n*, substantially as set forth.

4. The combination, with the pivoted indicator H and transparent casing I, of the chamber G, provided with projection *p*, and pivot-plate L, having a notch, *o*, substantially as set forth.

5. The combination, with a check-valve, B, of an indicator set in motion by the check-valve and a transparent case which incloses the indicator, and which communicates with the chamber in which the check-valve is arranged by a passage located above the transparent case, whereby the latter can be kept filled with a transparent liquid of heavier specific gravity than the non-transparent liquid which passes through the check-valve chamber, and thus render the movements of the indicator visible, substantially as set forth.

258,399. PAPER-PULP ENGINE. HOSEA B. FLETCHER, Bristol, N. H., assignor to the New Hampshire Chemical Pulp Company, Boston, Mass. Filed Feb. 20, 1882. (No model.)

Claim.—1. In a tank, A, the rotating vertical drum D and fixed vertical shell B, each of conical shape and each provided with ribs that are arranged in one or more rows and severally run in a vertical and inclined direction, and are disposed, the ribs of the drum to intersect and cross the ribs of the shell, in combination with the chamber between the shell and drum, and open at both ends to the tank, all substantially as described, for the purpose specified.



2. In a tank, the rotating vertical drum D and fixed vertical shell B, each of conical shape and each provided with ribs that are arranged in one or more rows and severally run in a vertical and inclined direction, and are disposed, the ribs of the drum to intersect and cross the ribs of the shell and the ribs of each to be separated by a vertical channel or groove, in combination with the chamber E, between the shell and the drum, and open at both ends to the tank, all substantially as described, for the purpose set forth.

3. In a tank, A, the rotating vertical drum D, the fixed vertical shell, each of conical shape and each provided with ribs that are arranged in one or more rows and severally run in a vertical and inclined direction, and are disposed, the ribs of the drum to intersect and cross the ribs of the shell, and the chamber E, between the drum and shell, open at both ends to the tank, in combination with mechanism adapted to raise and lower the drum within the shell, all substantially as described, for the purpose specified.

4. In a tank, A, the rotating vertical drum D, the fixed vertical shell B, each of conical shape and each provided with ribs that are arranged in one or more rows and severally run in a vertical and inclined direction, and are disposed, the ribs of the drum to intersect and cross the ribs of the shell, and the chamber between the drum and shell, open at both ends to the tank, in combination with the rotating fan located at the bottom of the drum and shell and within the chamber of the tank, all substantially as and for the purpose described.

5. The tank A, the rotating vertical drum D, the fixed vertical shell B, each of conical shape and each provided with vertical inclined ribs—such as the crushing and severing ribs, or either of them—in one or more rows, and running, the ribs of the one in a direction across the ribs of the other, and with grooves or channels M N between the ribs, the annular chamber between the shell and drum, open at both ends to the tank, and the rotating fan J, all substantially as described, for the purpose specified.

258,400. APPARATUS FOR AND PROCESS OF PULPING WOOD. HENRY A. FRANKSON, Kaukauna, Wis. Filed May 17, 1881. (No model.)

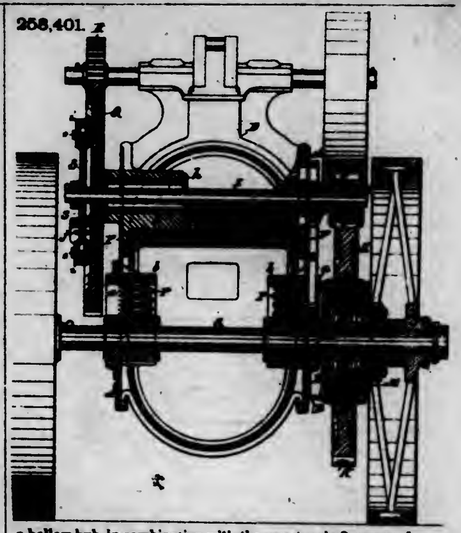
Claim.—1. The process of preparing wood for pulping, consisting in subjecting it to the simultaneous action of intermittent jets of mingled spray and steam, as set forth.

2. The process of preparing wood for pulping, consisting in subjecting it, in a closed vessel, to the combined and simultaneous action of steam and spray introduced within the vessel from above the wood, as set forth.

3. In the preparation of wood pulp, the process of purifying the wood, consisting in cooking out the resinous matters wholly by steam, combined with only sufficient water to carry off the impurities and preserve the tenacity of the fibre of the wood without deadening them and without lowering the temperature of the steam.

4. In a wood-pulping apparatus, the combination of the closed vessel A, perforated false bottom E, steam-injecting pipe *a*, open tube C, deflector D, and annular flange *b*, substantially as shown and described.

5. In the preparation of wood pulp, the process of subdividing the wood while in a natural condition, with the bark on, and subjecting it to the described combined and simultaneous action of steam and spray, whereby the natural gum uniting the bark and wood is dissolved out, enabling their subsequent easy separation and avoiding any preliminary stripping off of bark, as set forth.



258,401. TRACTION-ENGINE. ABRAHAM C. PRICE, Waynesborough, Pa. Filed Mar. 7, 1882. (No model.)

Claim.—1. The engine-cylinder, crank-shaft, and slotted side plates, all connected together for transmitting the strain to the axle independently of the boiler, in combination with the axle, springs supporting the weight of the engine, a radially-movable counter-shaft having one end extended through and made vertically movable in a slot in the side plate, and a link connecting the counter-shaft at this end to the axle, substantially as and for the purpose described.

2. The combination of the axle, the counter-shaft, and the driving-gear, the axle being connected at one end to the counter-shaft by a link, and the counter-shaft having at its other end a loose-jointed or flexible connection with its driving-gear, substantially as shown and described.

3. The gear-wheel Q, mounted in fixed bearings and having

258,401.

a hollow hub, in combination with the counter-shaft arranged concentrically therein, and connected to said gear-wheel for a loose or flexible movement, substantially as described.

4. The deflectible counter-shaft I, with its gear-wheels, arranged above the main axle, and combined with the crank-shaft and its driving-gear, the axle and its driving-gear, the supporting-springs for the engine, and a link for connecting the axle and counter-shaft at one end only, as and for the purpose described.

5. The combination, with the axle of a traction-engine having a gear-wheel thereon, of the longitudinally-adjustable counter-shaft I, having a gear-wheel, substantially as described, arranged to mesh with the wheel on the axle, and to follow the same in its lateral variations.

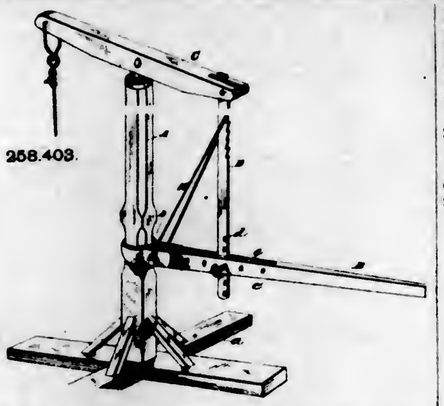
6. The combination, with the axle having compensating-gear K L M *e*, arranged, as described, to transmit rotary strain to either or both of the traction-wheels, of springs for sustaining the weight of the engine, a horizontal counter-shaft having one end only made vertically movable for a radial adjustment, and a link connecting the bearing of the axle at one end to the bearing of the counter-shaft, from which motion is imparted to the compensating-gear, as described.

7. The deflectible and longitudinally-movable counter-shaft I, arranged above and combined with the axle and supporting-springs by wheels and a link at one end only, and connected to the driving mechanism, substantially as described.

8. The side plates, F, slotted at one side and combined with its brace N, having marginal guide *d* at that side and a bearing at the other, and the counter-shaft having a movable bar, *v*, playing in said guide, as set forth.

9. The tag-spring T, composed of a single spring, *k*, and loops or stirrups *l m*, with feet *l' m'*, in combination with the draft-bolt *a* and *e*, and the hollow abutment-lugs *i* and *j*, whereby the same spring is made to furnish a rotary elastic strain in either forward or backward movement, as described.

258,402. MANUFACTURING GLASS FOR USE IN ILLUMINATED WINDOWS. ALPHONSE FRIEDRICH, Brooklyn, N. Y. Filed Oct. 19, 1881. (No specimens.)

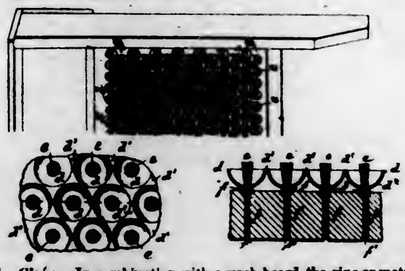


Claim.—The hereinbefore-described process of molding glass sections for illuminated windows, which consists in first forming a sectional pattern-matrix of the complete design, and then pressing or rolling the melted glass into the matrix, thereby forming the design in sections as required for use.

258,403. CRANE. MARK FRISBIE, Orland, Ind. Filed Apr. 13, 1882. (No model.)

Claim.—1. The upright or post A, the hand-lever B, capable of turning upon the post, the lever C, also adapted to turn upon the post, the rack D and bail E, in combination, substantially as and for the purpose set forth.

2. The post A, having the levers B and C adapted to turn thereon, and one provided with adjusting slots and apertures, in combination with the rack D, provided with adjusting-apertures and the bail E, substantially as and for the purpose set forth.



258,403.

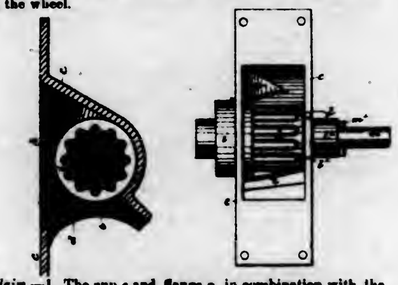
258,404. EDGE-BLACKING POWDER FOR LEATHER. JAMES H. GARRETT, Terre Haute, Ind. Filed Feb. 7, 1882. (No specimens.)

Claim.—The edge-blacking powder for leather, consisting of the extract of logwood, bichromate of potash, prussiate of potash, and copperas, and blue vitriol, compounded in the proportions specified.

258,405. WASH-BOARD. ADELBERT W. GRIESEL, St. Louis, Mo. Filed Mar. 13, 1882. (No model.)

Claim.—In combination with a wash-board, the zinc or metal face D, having the series of concavities *d* arranged in "staggering" rows, the bristles or brushes *e*, and fastening-wire *f*, to operate as and for the purposes set forth.

258,406. WALL-PAPER-HANGING DEVICE. WILLIAM GRIST, Pittsburg, Pa. Filed Mar. 13, 1882. (No model.)



Claim.—1. In a device for holding wall-paper, the holder herein described, consisting of the hinged parts *a b*, one of which has an edge rubber strip and the other an upset biting edge or lip, in combination with a swiveling curved clamping-arm, and a spring carried by said arm between the hinged parts, substantially as herein set forth.

2. In a device for hanging wall-paper, the part *a*, formed with an edge groove, and having the rubber strip seated therein, and the part *b*, hinged to the part *a*, and formed with an angle biting edge or lip, in combination with a curved clamping-arm having a swiveling connection with one part and passing through a hole in the other part, and a spring arranged upon said clamping-arm between said hinged parts, substantially as described.

3. The particular device herein described and shown for use in matching and hanging wall-paper, consisting of the hinged parts *a b*, one part having an edge rubber strip seated in a groove and the other an upset edge lip, a curved clamping-arm having a swiveling connection with one part and passing through a hole in the other part, a spring arranged upon said clamping-arm between the hinged parts, and the stops to limit the opening of the part *b* to hold it open and to support the device in level position.

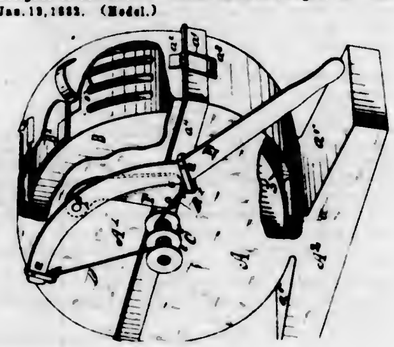
258,407. GRAIN AND GRASS-SEED DISTRIBUTER. ADOLPHUS F. GIBBONEY, Belleville, Pa. Filed Jan. 7, 1882. (Model.)

Brief.—Within the cup, and forming a part thereof, is an inclined triangular flange for guiding the grain to be fed and for freeing the wheel.

Claim.—1. The cup *c* and flange *n*, in combination with the sliding cut-off *i*, whereby the flange performs the double purpose of guiding the grain and scraping the cut-off, substantially as described.

2. The combination with the hopper *b*, seed-cup *c*, provided with the guide-flange *n* and opening *d*, having a slanting lip, *e*, sliding shaft *m*, cylindrical corrugated cut-off *i*, fast thereon, and feed-wheel *k*, substantially as described, and for the purpose set forth.

258,408. GLOVE-FASTENING. WM. GIFFORD, Schenectady, N. Y. Filed Oct. 11, 1881. (No model.)



Claim.—1. In a glove-fastening, the metallic strips A H, having the parts A' H' folded or bent over the edge of the glove material, and provided with prongs E L to enter said material, as shown and described.

2. The combination, with a glove, of the strip A, the strip H, the strip N, the rivet R, and devices for holding the strips A and H together, substantially as herein shown and described, and for the purpose set forth.

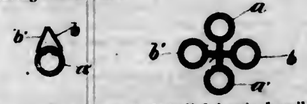
3. The combination, with a glove, of the strip A, provided with an apertured tongue, F, the strip H, provided with a stud, M, and the rivet R, substantially as herein shown and described, and for the purpose set forth.

258,409. WASHING-MACHINE. GEORGE W. GLICK, Paris, assignor of one-third to Charles A. Miner, Edgar, Ill. Filed Jan. 19, 1882. (Model.)

Claim.—1. The case A A', cylindrical in form, attached to the apex of the slanting top *a' a'* of the bottom portion, A', and separated therefrom by a slotted partition, substantially as shown and described.

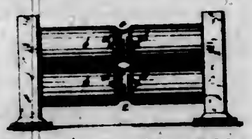
2. The combination of a slotted internal case, B, adapted to be rotated, an outer cylindrical case, A A', adapted to support the rotative inner case, B, and secured to the apex of the slanting top *a' a'* of the bottom portion, A', and separated therefrom by a slotted partition, with means for rotating said inner case, all substantially as shown and described.

258,410. WINDOW-SHADE. BENJAMIN L. GOLDSMITH, Baltimore, Md. Filed Feb. 13, 1882. (No model.)



Brief.—The shade is folded around the roller, lapped upon itself, and fastened by a tough elastic cement.

Claim.—A window-shade folded round its bar or roller and lapped upon itself, and having a tough elastic and flexible cement between the shade and bar or roller and the lapped portions of the shade, the said cement subserving the double functions of attaching the shade to the bar or roller and of affording an elastic stiffened portion of the shade, preventing it from bending sharply upon itself and breaking when rolled, as set forth.



258,411. CHAIN-LINK. HENRY GORHAM, Providence, R. I., assignor of three-fourths to Sylvester G. Martin, William A. Copeland, and Edgar W. Martin, all of same place. Filed Sept. 16, 1881. (No model.)

Brief.—The links are formed from a punched cross-shaped blank having circular ends.

Claim.—The improved chain-link herein described, consisting of the cross-shaped blank, with its annular ends *a a'* bent upward and together and ends *b b'* bent downward and together, substantially as and for the purpose specified.

258,412. MANUFACTURE OF BARBED STRIPS FOR FENCES. SAML. H. GROSS, Crawfordsville, Ind. Filed Feb. 8, 1882. (No model.)

Claim.—1. The combination of the rolls *b b*, provided with oval grooves *c c*, having angular recesses *d d* cut in their sides and lying directly opposite each other, substantially as described, and for the purpose set forth.

2. The process herein described of manufacturing metallic corrugated barbed fencing-strips, consisting in first passing a round bar or rod through a pair of rolls having oval grooves formed therein, then passing said bar or rod through a second pair of rolls provided with oval grooves having angular recesses cut in their sides, and lying directly opposite each other, then passing the oval bar provided with spurs between rolls provided with flat square grooves to flatten and reduce the thickness of the rod, then trimming the strip and its barbs, and finally passing it through a pair of rolls grooved longitudinally, whereby the strip and its barbs are crimped or corrugated transversely, as set forth.

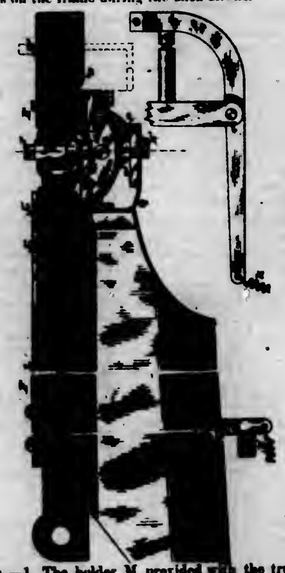
3. As an improved article of manufacture, the metallic fencing-strip A, corrugated transversely, and provided with opposite barbs in the plane of the strip and integral therewith, and projecting upwardly and downwardly from its upper and lower edges, as and for the purposes specified.

258,413. JOURNAL-BEARING. NATHANIEL A. GRIFFITH, Austin, Nev. Filed Mar. 27, 1882. (No model.)

Claim.—1. In a journal-bearing, the combination, with the journal box and shaft, of an outer and an inner series of anti-friction rollers secured together and to the box and shaft by rib-and-groove engagement, substantially as set forth.

2. In a journal-bearing, the combination, with a journal-box

258,413.



provided with an interior annular flange and a shaft provided with an annular groove, of a series of anti-friction rollers provided with annular grooves adapted to the rib of the box, and a second series of anti-friction rollers provided with annular flanges adapted to the groove of the shaft and those of the outer series of rollers, substantially as set forth.

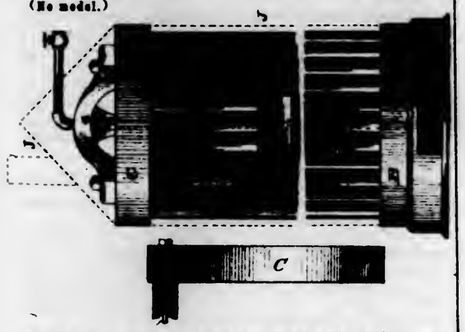
3. In a journal-bearing, the combination, with the box and shaft, of two series of anti-friction rollers, all of said parts being connected by tongue-and-groove connections, and one of said rollers being formed in two sections connected by a male and female screw connection, substantially as set forth.

258,414. MACHINE FOR CUTTING MATCH-SPLINTS. HERBERT L. HARMON, Athol, Mass., assignor to Hapgood & Smith, same place. Filed Sept. 19, 1881. (No model.)

Brief.—A reciprocating knife-carriage moves below a hopper, with suitable feed-rolls for feeding the block, said carriage carrying a slicing-knife and a pivoted head supporting small upright knives. This head bears against abutments during the forward stroke of the carriage and is thrown over, so as to depress the knives by projections on the frame during the back stroke.

Claim.—1. The holder M, provided with the trunnions *j j* and means of holding a gang of spar-cutters, *i i*, and the planing-cutters *r* and *r'*, in combination with one or more removable washers, *s s*, fitted to each trunnion, substantially as and for the purposes described.

2. The combination of the slide F, provided with the abutments V and V', the holder M, mounted by its trunnions *j* and *j'* in bearings on said slide, and provided with means of holding a gang of spar-cutters, *i i*, and mechanism for imparting to said holder an intermittent oscillating motion.



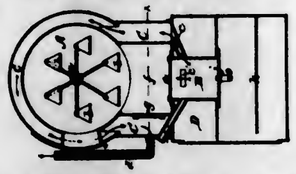
3. The combination of the reciprocating slide F, the holder M, the forked and slotted lever N, the stops O and P', and means of locking the lever N in a vertical and an inclined position.

4. The combination of the slide F, the holder M, the forked lever N, provided with the curved slot *s*, the pin *l*, the stops O and P', the spring Q, provided with the detent-notches *p* and *p'*, and the roll *q*, all arranged and adapted to operate substantially as and for the purposes described.

5. The combination of the slide F, cutter-holder M, mounted by its trunnions in half-boxes formed on said slide, the removable half-boxes *t t*, the pivoted caps T T, the lips *u u*, the section F′ of slide F, pivoted as set forth, and the screw *w*, all arranged and adapted to operate substantially as and for the purposes described.

6. The combination of the slide F, the holder M, the lever N, the stop-levers O and P, springs *b* and *b′*, and the stops or abutments *a* and *a′*, all arranged and adapted to operate substantially as described.

258,415. TUBULAR SECTIONAL BOILER. THOMAS HARDING, Lafayette, Ind., assignor of two-thirds to William T. Barbee and Chas. B. Simpson, both of same place. Filed Oct. 1, 1881. (No model.)

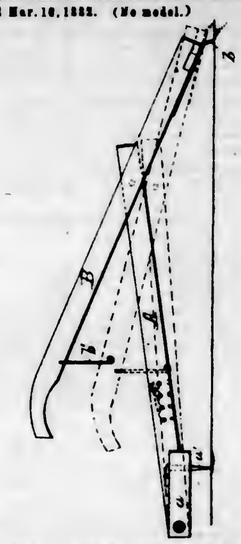


Claim.—1. A tubular boiler constructed with a hollow annulus-ring at bottom and a similar ring at top, joined together by a consecutive series of vertical tubes set in a circular line, whereby said annuli and tubes constitute both the shell and frame of water-jacket, fire-chamber, and steam-generator, and the products of combustion pass freely out at the top, as set forth.

2. The hollow annuli B and C and their connecting-tubes set close together to inclose the grate, combined with the pieces E, fashioned to fit and be retained in place between and by the tubes, as set forth, whereby the lower part of the boiler is caused to constitute a close fire-box, and the jacket J, surrounding and inclosing the whole, as set forth.

3. The hollow annuli and their connecting-tubes arranged in a circular line close together to form the shell and frame of a boiler, combined with a hollow arched bridge-piece, G, substantially as described.

258,416. BAKER'S OVEN. TIMOTHY HARRINGTON, Boston, Mass. Filed Dec. 8, 1881. (No model.)

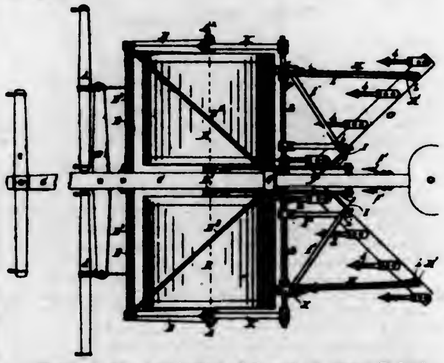


Claim.—1. In a baker's oven, the combination of the oven A, the fire-pot B under the oven, the flue C, surrounding the oven and arranged to conduct the products of combustion around the oven, as described, and the end flues, *d* C′, connected with the fire-pot and conducting the products of combustion upwardly along the ends of the oven into the flue C, as set forth.

2. In a baker's oven, the combination of the oven A, containing the shelves, and having the lower extension, *f*, with the flue C, surrounding the oven, the fire-pot, and the slides or dampers *e g*, whereby the products of combustion may be caused to pass from the fire-pot directly through the extension *f* and into the flue C, without passing into the part of the oven containing the trays, substantially as described.

3. In a baker's oven, the combination of the oven A, the fire-pot B under the oven, the flue C, surrounding the oven and arranged to conduct the products of combustion around the oven, as described, the end flues, *d* C′, connected with the fire-pot and conducting said products of combustion upwardly along the ends of the oven into the flue, and the slides or dampers *e g*, whereby direct communication can be had from the fire-pot to the flue C through the lower extension, *f*, of the oven, substantially as described.

258,417. CARPET-STRETCHER. JAMES H. HAWLEY, Odin, Ill. Filed Mar. 16, 1882. (No model.)



Claim.—1. A carpet-stretcher consisting of the brace A, provided with an arm, *a*, in which is secured a brace-pin, *a′*, and of a stretcher, B, pivoted to the forward portion of the brace, and arranged to operate substantially as shown and described.

2. In a carpet-stretcher, the combination of the brace A, arm *a*, and its pin *a′* with the T-shaped stretcher B, pivoted to the forward portion of the brace A, all arranged to operate substantially as shown and described.

3. In a carpet-stretcher, the combination of the brace A, provided with pin-arm *a* and its pin *a′*, with the T-shaped stretcher B, pivoted in to the former portion of the brace A, and provided with a hook-rod, *b′*, adapted to be secured to one of the pins *a′*, substantially as shown and described.

258,418. COMBINED ROLLER, HARROW, AND CULTIVATOR. GEORGE M. EAIM, Brownsville, Ind. Filed June 26, 1880. (No model.)

Claim.—1. The combination of the axle A, rollers B, horizontal bars or frame B, vertical bars B′, attached to the axle between the rollers B, and securing the tongue C, braces B″, and diagonal braces B‴, for holding the tongue rigidly in position, rods K, pivoted to the axle at their front ends, and being connected in pairs by the rods L, substantially as shown and described.

2. The combination of the rollers B, axle A, rods K, pivoted upon the axle at their front ends and to the rods L at their rear ends, the rods or braces *l l′ F*, and the cultivator-frame, to which the cultivating devices are secured, substantially as set forth.

3. The combination of the rollers, mechanism for attaching the frame to which the cultivating or harrowing devices are secured, the rollers, and brace-rods, which bear against the rollers so as to force the cultivating devices into the ground, all substantially as specified.

4. The combination of the rollers, frames to which the cultivating devices are attached, and mechanism for attaching the frames to the rollers, with the brace-rods M, provided with the rollers N, substantially as shown.

5. The combination of the rollers, frames to which the cultivating devices are attached, mechanism for attaching the frames to the rollers, with the brace-rods M, provided with the rollers N, and suitable adjusting mechanism, whereby the cultivator or harrow teeth can be caused to run shallow or deep, all combined and arranged substantially in the manner and for the purpose set forth.

258,419. ICE-CREEPER. JOSEPH P. HENNESSY and PATRICK WELSH, Woonsocket, R.I. Filed Apr. 1, 1882. (No model.)

Claim.—1. The combination, with the rabbeted heel *a b*, of the bowed metallic protector-band having its serrated lower edge, *l*, level, or nearly so, with the heel-base and the points *b* on its upper edge, the end pivots, *g*, and holding-screws *h* in rear, substantially as specified.

2. The combination, with the rabbeted heel *a b*, of the bowed and reversible metallic protector-band and creeper *d* and the elastic support *e*, having end hooks, *n*, substantially as specified.

258,420. CORKSCREW. RICHARD HESSEL, Berlin, Germany. Filed Apr. 7, 1882. (No model.)

Claim.—A corkscrew provided with a splitting-cone between the shank and screw portion proper, substantially as and for the purpose set forth.

258,421. CLOCK. ARTHUR B. HOTCHKISS, Cheshire, Conn. Filed Dec. 24, 1881. (Model.)

Claim.—1. In a clock, the combination, with the center shaft and pinion-shafts of the train arranged horizontally and supported in vertical plates, of the mainspring-arbor arranged vertically in the clock, and a mainspring attached to one end thereof, and suitable gearing connecting the mainspring-arbor and center shaft, substantially as set forth.

2. In a clock, the combination, with the center shaft and pinion-shafts of the train arranged horizontally and supported in vertical plates, of the mainspring-arbor arranged vertically in the clock, a winding device attached to one end of the mainspring-arbor, and a mainspring contacted with its opposite end, substantially as set forth.

3. The combination, with the center shaft and pinion-shafts of the train arranged horizontally and supported in vertical plates, of a mainspring-arbor arranged vertically in the clock and connected by gearing with the center shaft, and devices located on the outside of the movement for setting the hands or pointers, substantially as set forth.

4. The combination, with the center shaft of a clock, of a mainspring-arbor arranged vertically in the clock and connected by gearing with the center arbor, and winding devices attached to the opposite ends of the mainspring-arbor, substantially as set forth.

5. The combination, with the center shaft and pinion-shafts of the train arranged horizontally and supported in vertical plates, of the mainspring-arbor arranged vertically in the clock, a sleeve encircling the mainspring-arbor and provided with gearing for imparting motion to the clock-train, and ratchet and pawl for connecting the sleeve with the mainspring, substantially as set forth.

6. The combination, with a pinion attached to the center shaft of a clock, of a sleeve encircling the mainspring-arbor and provided with a pinion adapted to mesh with the pinion on the center shaft, and a disk attached to the sleeve for turning the latter and setting the hands, substantially as set forth.

7. A clock having a rotary top constructed and adapted for setting the hands of the clock, substantially as set forth.

8. The combination, with the center shaft and pinion-shafts of the train arranged horizontally and supported in vertical plates, of the mainspring-arbor arranged vertically in the clock, a mainspring attached to the lower end of said arbor, and a winding device to its upper end, substantially as set forth.

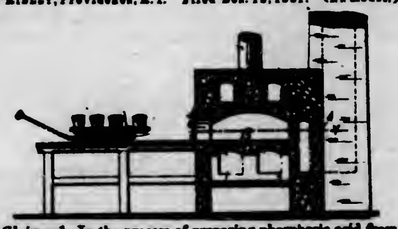
9. The combination, with the center shaft and pinion-shafts of the train arranged horizontally and supported in vertical plates, of the mainspring-arbor arranged vertically, and having winding and setting devices connected with its upper end and located at the top of the clock, substantially as set forth.

10. A clock wherein is employed a train of wheels located between the front and middle plates, and a mainspring-arbor arranged vertically between the middle and back of the frame, substantially as set forth.

11. A clock consisting of the center shaft and pinion-shafts of the train supported in vertical plates, a mainspring located in a separate casing supporting said vertical plates, and a mainspring-arbor arranged vertically, and gearing for transmitting motion to the clock-train, substantially as set forth.

12. A clock having the mainspring-arbor arranged at right angles to the pinion-shafts of the remainder of the train of the movement.

258,422. LOCK-NUT. HENRY HOWSON, Philadelphia, Pa., assignor to Allen Middleton, same place. Filed Mar. 20, 1882. (No model.)



Claim.—1. A nut-locking device in which a nut, A, notched in its under face so as to form segments *b*, is combined with a ring, D, which is interposed between the object to be confined by the nut and the said segments *b* of the same, all substantially as and for the purpose set forth.

2. As a new manufacture, the ring D, having an outer flange, *d*, substantially as shown and described.

3. The combination of the notched nut A with the ring D and its flange *d*, as specified.

258,423. PROCESS OF PREPARING PHOSPHORIC ACID FROM BONES. WILLIAM H. HUGHES, Johnston, and PHILIP O'REILLY, Providence, R.I. Filed Dec. 15, 1881. (No model.)

Claim.—1. In the process of preparing phosphoric acid from bones, the treating calcined bones by mixing them with sulphuric acid, leaching the result, then heating the resulting products by the application of heat equally in all directions to substantial dryness and fusion, and dissolving the last result, while hot, in water with successive filtrations at different stages of the process, substantially as herein described.

2. Treating liquid acid phosphates with chlorate of potassa or its equivalents, and subjecting the compound to a high degree of heat, as described, and for the purpose set forth.

3. In the process of preparing phosphoric acid from bones, the treating calcined bones by mixing them with sulphuric acid, leaching the result, treating the leached products with steam, then heating the resulting products by the application of heat equally

in all directions to dryness or until fusion takes place, and dissolving the last result, while hot, in water with successive filtrations at different stages of the process, substantially as herein described.

4. The within-described process of obtaining phosphoric acid and acid phosphates from bones, consisting substantially of, first, washing the bones before calcination with water acidulated with hydrochloric acid, as described; second, calcining the bones; third, mixing the calcined bones, as described, with sulphuric acid and water; fourth, filtering the mixture, as described; fifth, the treating of the filtered result with hot air or steam; sixth, treating the result with chlorate of potassa and subjecting the same to heat, as described, in an evenly-heated furnace; seventh, the mixing the result with water and filtering the same.

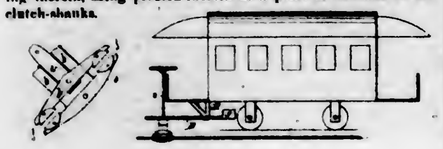
258,424. DENTAL PLUGGER. ANDREW JACKSON, San Francisco, Cal. Filed Mar. 21, 1881. (No model.)

Brief.—The lower part of the plugger-case is made up of curved tubes that turn in couplings. The power is conveyed from the hammer through these curved tubes to the plugging-point by a series of balls.

Claim.—1. In a dental plugger having a main or casing tube, A, two or more curved tubes, one of which carries the plugging point or tool, said curved tube or tubes being coupled to the main tube and to each other, so as to turn thereon either jointly or separately to change the direction of the plugging point or tool, and a means for transmitting power from its source through said curved tube or tubes to the plugging point or tool to cause it to deliver a blow, substantially as herein described.

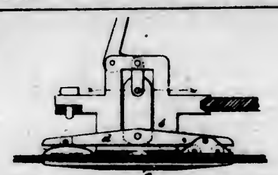
2. In a dental plugger, the main tube A, with a curved forward end, A', the curved tube B, carrying the plugging point or tool, said tube B being coupled to the curved end A' and turning thereon to change the direction of the plugging point or tool and the line of balls or spheres E within the curved end A', and the curved tube B, for transmitting power from its source through said curved portions to the plugging point or tool to cause it to deliver a blow, substantially as herein described.

3. In a dental plugger, the main tube having curved jointed tubes, the line of transmitting-balls E, the plunger P and its stem, the spring *f*, pawl *h*, and cam *e*, substantially as and for the purpose set forth.



4. In a dental plugger, the combination and arrangement of the main tube A, adjustable curved tubes A' and B, reducing-tube C, tool or point holder D, with its spring *d*, and the power-transmitting balls E, substantially as herein described.

5. In a dental plugger, the combination of curved tube, line of balls, a plugger-point, a hammer, and means for transmitting power to the hammer, substantially as and for the purpose set forth.



6. An automatic universal dental plugger consisting of the main tube A, adjustable curved tubes A' and B, reducing-tube C, tool or point holder D, with its spring *d*, power-transmitting balls E, plunger P, with its operating-spring *f*, and a means for drawing back said plunger and letting it slip to deliver its blow, substantially as herein described.

258,425. CABLE-TRACTION FOR STREET-CARS. ORLANDO H. JARVIS, Brooklyn, N.Y. Filed Dec. 19, 1881. (No model.)

Brief.—The clutch consists of two main jaws, one or both being adapted to rock in the plane of the cable, and provided with supplemental bearing-surfaces having friction-rollers, also pivoted to rock in the plane of the cable. The clutch has flexible connection with the car by means of a counterbalanced pull-bar fulcrumed thereto, and the clutch is enabled to oscillate laterally in an opening therein, being pivoted thereto at a point in advance of the clutch-shanks.

258,425.

Claim.—1. In a clutch or grip for seizing a traction-rope, the combination of the two main jaws *a* and *d*, one or both of which are made to rock in the plane of the cable and one or both of which are provided with supplemental bearing-surfaces, also pivoted to rock in the plane of the cable, substantially as shown and described.

2. In a clutch or grip for seizing a traction-rope, the combination of the two main jaws *a* and *d*, one or both of which are arranged to rock in the plane of the cable and one or both of which are provided with supplemental shoes, also pivoted to rock in the plane of the cable, and bearing friction-rollers, substantially as and for the purpose described.

3. The combination, with the cable, the car, and a clutch having flexible connection with the car, of a counterbalance pull-bar for sustaining the clutch in equilibrium and relieving the cable of its weight.

4. The combination, with a car, of a pull-bar extending the full length of the car and fulcrumed thereto in the middle, and provided at each end with a clutch or grip for connection with the cable, substantially as and for the purpose described.

5. The combination of the clutch and the pull-bar connecting the same with the car, the two being jointed together at a point in advance of the center of the clutch, as described.

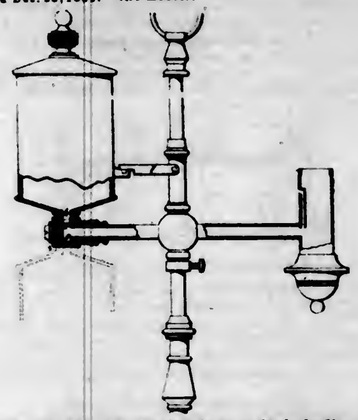
6. The combination, with the pull-bar having an opening in its forward end, of the clutch-frame pivoted to the bar at its forward end, and arranged to swing in said opening horizontally, as described.

258,426. BOILER-FLUE CLEANER. OMAR H. JEWELL, Chicago, Ill. Filed Sept. 13, 1881. (No model.)

Claim.—1. An apparatus constructed substantially as shown, that is flexibly connected with a boiler and detachably connected with the flues of a boiler, in combination with a flue-scraper, and adapted to force the scraper through the flues by the pressure of steam, in the manner set forth.

2. An apparatus substantially as shown that is flexibly connected with a boiler and detachably connected with the flues in the boiler, and arranged to force the scraper through the flue by the pressure of steam, and then to retract it by spring-power, all in the manner substantially as set forth.

3. The casing A, having pipe-neck *b*, with valve G, and a pipe-neck, *c*, with rubber cone *h*, and inclosing sheave B, for winding chain *r*, that holds scraper C, all constructed and arranged substantially in the manner and for the purpose described and shown.

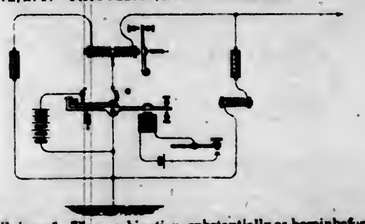


4. In combination with the casing A, having pipe-neck *b*, the valve G and pipe-neck *c*, the rubber cone *h*, the sheave B, bolt *o*, and spring *p*, adapted to wind up the chain *r*, that holds the flue-scraper C, all substantially as and for the purpose set forth.

5. The casing A, having pipe-neck *b*, with valve G, that is provided with hose-coupling *f*, pipe-neck *c*, with rubber cone *h*, handles *i* and *j*, and bell-crank *k*, all substantially as and for the purpose set forth.

6. The casing A, having pipe-neck *b*, with valve G, pipe-neck *c*, with rubber cone *h*, and shells *n*, holding springs *m*, in combination with sheave B, spindle *l*, chain *r*, and flue-scraper C, all constructed and arranged substantially in the manner and for the purpose set forth.

7. The combination, with the flue-cleaning apparatus described, of the flue-scraper C, composed of cone *c*, wire or blade carrying shank *t*, and rubber disk *n*, all constructed and arranged substantially as and for the purpose specified.



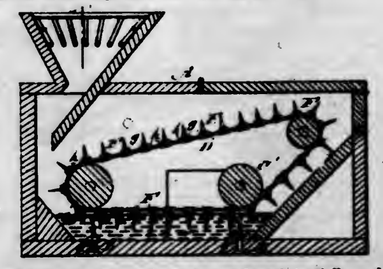
258,427. STUDY-LAMP. AUGUSTUS H. JONES, Meriden, Conn. Filed Dec. 20, 1881. (No model.)

Claim.—1. The wick-chamber, fount, and tube leading from the fount to the wick-chamber, the said fount being attached to the said tube by a swiveled joint, whereby the fount may be inverted on said joint, with an opening from said tube into the fount in both the upright and inverted position, whereby when in the inverted position the fount may be filled through the wick-chamber, substantially as described.

2. The wick-chamber, fount, and tube leading from the fount to the wick-chamber, the said fount being attached to the said tube by a swiveled joint, whereby the fount may be inverted on said joint, with an opening from said tube into the fount in both the upright and inverted position, whereby when in the inverted position the fount may be filled through the wick-chamber, with mechanism, substantially such as described, to secure the fount in its upright position, and substantially as specified.

258,428. DUPLEX TELEGRAPH. FRANCIS W. JONES, New York, N.Y. Filed Jan. 14, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a main line, an artificial line, a main battery, a key or transmitter which connects said battery simultaneously to said main and artificial lines, a receiving-instrument upon which the outgoing currents upon the main and artificial lines produce equal and opposite effects, a branch line extending from a point between the main line and the receiving-instrument to the earth, and an electro-magnetic inductor included in said branch line.

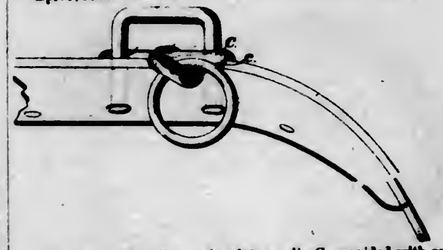


2. The combination, substantially as hereinbefore set forth, of a main line, an artificial line, a main battery, a key or transmitter which connects said battery simultaneously to said main and artificial lines, a receiving-instrument upon which the outgoing currents upon the main and artificial lines produce equal and opposite effects, a branch line extending from a point between the main line and the receiving-instrument to the earth, an electro-magnetic inductor included in said branch line, and means for varying the normal electrical resistance of said branch line.

3. The combination, substantially as hereinbefore set forth, of a main line, an artificial line, a main battery, a key or transmitter which connects said battery simultaneously to said main and artificial lines, a receiving-instrument upon which the outgoing currents upon the main and artificial lines produce equal and opposite effects, a branch line extending from a point between the main line and the receiving-instrument to the earth, an electro-magnet included in said branch line, and means for varying the intensity of force of the electric discharge from said inductor.

4. The combination, substantially as hereinbefore set forth, of a main line, an artificial line, a main battery, a key or transmitter which connects said battery simultaneously to said main and artificial lines, a receiving-instrument upon which the outgoing currents upon the main and artificial lines produce equal and opposite effects, a branch line extending from a point between the main line and the receiving-instrument to the earth, an electro-magnetic inductor included in the branch line, and means for varying the length or duration of the electric discharge from said inductor.

5. In a duplex telegraph, the combination, substantially as hereinbefore set forth, of a main line extending to the distant station, an artificial equating-line returning directly to the earth at the home station, having a resistance less than that of the main line, and a branch line extending from a point between the main line and the receiving-instrument to the earth, having a resistance greater than that of the main line.

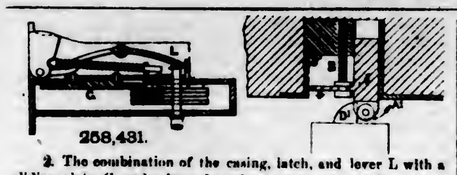


258,429. AMALGAMATOR. HENRY M. JONES, Santa Fe, N. Mex. Filed Sept. 15, 1881. (No model.)

Claim.—1. An amalgamator made substantially as herein shown and described, consisting of an endless belt of teeth adapted to travel over rollers within a suitable receptacle which has fixed teeth rising from its bottom, the belt-teeth passing between the fixed teeth, whereby the ore and the mercury will be thoroughly mixed, as set forth.

2. In an amalgamator, the combination, with the box A, having fixed teeth rising from its bottom, of the revolving endless belt D, provided with teeth F, substantially as herein shown and described, whereby the ore and mercury are mixed, as set forth.

258,430. HAME. RICHARD W. JONES, Syracuse, N.Y. Filed Apr. 5, 1882. (Model.)

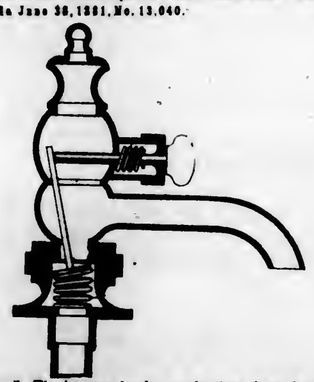


Claim.—1. In a hame, the plate or clip C, provided with recesses or bearings on opposite sides of the hame-staple and rigidly secured to the hame-iron, substantially as set forth.

2. The hame clip or plate C, provided with recesses at each end and at opposite sides, and adapted to rest against each leg of the hame-staple, and having a suitable eye for the breast-ring, substantially as set forth.

3. The hame clip or plate C, provided with flanges at each side and at opposite ends, which are adapted to bear against the back or hame iron, substantially as specified.

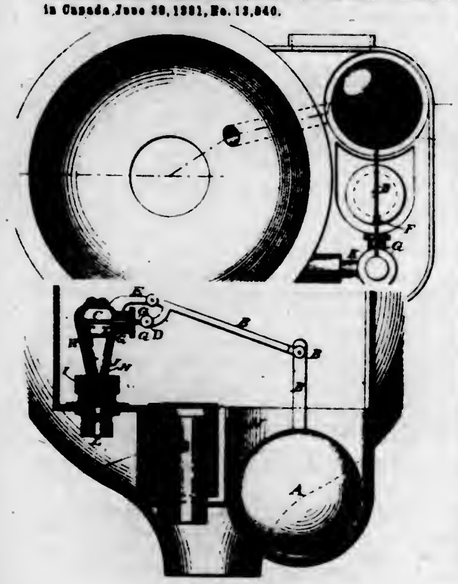
258,431. LATCH. JOSEPH KAYE, Kirkstall, near Leeds, County of York, England. Filed Jan. 13, 1881. (Model.) Patented in England Apr. 21, 1880. No. 1,643.



Claim.—1. A striking-plate having a movable striking-face, and a screw, B, having a swivel-connection with said movable striker, whereby the turning of the screw will adjust the striker toward or from the door, all substantially as set forth.

258,431.

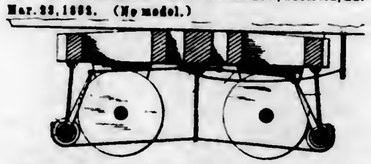
2. The combination of the casing, latch, and lever L with a sliding plate, G, and a key adapted to operate the sliding plate, and also the said lever, when the plate is thrown back, substantially as described.



258,432. VALVE MECHANISM. DAVID S. KEITH, Toronto, Ontario, Canada. Filed Apr. 12, 1882. (No model.) Patented in Canada June 26, 1881, No. 13,040.

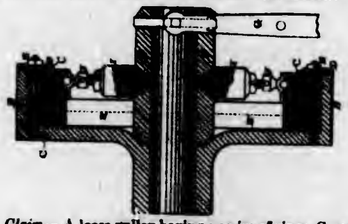
Claim.—1. The improved valve mechanism above described, consisting of the combination of the canting spindle-valve, the guides, the valve-spring, the push-rod and its spring and hand-knob, the stuffing-box, and the jacket or valve-body with the outlet and inlet pipes or passages, substantially as and for the purposes set forth.

2. The combination of the inverted canting spindle-valve, the guides, the push-rod and its spring and hand-knob, the stuffing-box, the jacket or valve-body, and the outlet and inlet pipes or passages, substantially as and for the purposes set forth.



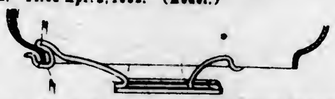
258,433. WATER-CLOSET. DAVID SMITH KEITH, Toronto, Ontario, Canada. Filed Oct. 28, 1881. (No model.) Patented in Canada June 26, 1881, No. 13,040.

Claim.—1. The valve mechanism above described, consisting of the combination of the canting spindle-valve H H, the guides T T, the spring I, the spindle C, the stuffing-box G G G, and the jacket J J, with the outlet K, substantially as and for the purpose above set forth.



2. The valve mechanism above described, consisting of the combination of the canting spindle-valve H H, the guides T T, the spring I, the spindle C, the stuffing-box G G, the jacket J J, with the outlet K, and the floating ball A and hinged lever B B B, substantially as and for the purpose set forth.

258,434. CAR-BRAKE. JOHN W. KENADY, Garfield, La. Filed Mar. 23, 1882. (No model.)



Claim.—In a car-brake, the suspended brake-shafts having brakes capable of a partial rotary movement and movement toward and from the wheels, combined with the chains or cords fastened to said brakes and passed through eye or looped bolts depending from the car and having their lower ends arranged slightly above the lower surfaces of the brakes, and mechanism to rotate the brake-shafts in their bearings, substantially as and for the purpose set forth.

258,435. FRICTION-CLUTCH AND LOOSE PULLEY. JOHN KING, Oswego, N. Y., assignor to the Vulcan Iron Works Company, same place. Filed Feb. 8, 1882. (No model.)

Claim.—A loose pulley having a series of rings, C, secured inside of it, the friction-blocks D', the screws J, the sockets I, sleeve F, and lever G, substantially as shown and described.

258,436. GLOBE-HOLDER. CHARLES A. KINNEY, Meriden, Conn. Filed Apr. 3, 1882. (Model.)

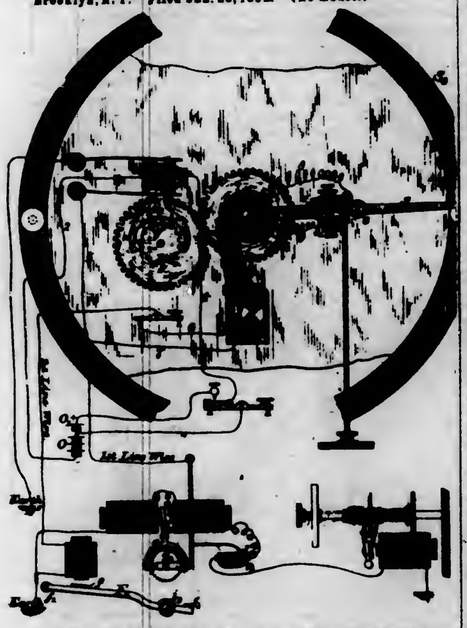
Claim.—1. In combination with the lamp-ring provided with struck-up fluted horizontal seats at equidistant points, the arms provided with horizontal boat ends, adapted to set into the seats from the inside, extending horizontally to the periphery of the ring and secured in the seats, substantially as specified.

2. In combination with the burner-ring, the arms provided with U-shaped seats at their ends, and the arm provided with a series of beads, forming a lip, E, to engage the inside of the shade, and a seat, F, for the lower edge thereof, substantially as and for the purpose specified.

258,437. WAGON-SPRING. WILLIAM V. KISH, Buffalo, N. Y. Filed Mar. 11, 1882. (No model.)

Claim.—1. The combination, with the boards A B and spiral springs C, interposed between said boards, of sockets D and plates E, fitting in said sockets, so as to slide therein, said sockets and plates being connected by elongated openings and bolts b, and secured respectively to said boards A B, near their ends, the whole forming a removable spring-support in which both boards are rigidly held against lateral displacement, but permitted to move freely toward and from each other, substantially as set forth.

2. The combination, with the boards A and B and interposed springs C, of telescopic fastening devices D E, arranged transversely between the boards, and a similar fastening device arranged lengthwise between the boards, substantially as set forth.



3. The combination, with the boards A and B and interposed spiral springs C, of the sockets D and plates E, provided respectively with flanges *d* and *e*, which overlap the edges of the boards, and horizontal fastening-bolts *f*, substantially as set forth.

258,438. PILLOW-SHAM FRAME. JOHN A. KNIGHT, Auburn, Me. Filed Mar. 15, 1882. (No model.)

Claim.—The combination of the roll *a*, spiral spring *b*, catch *c*, ears *d*, wire rods *e e e*, and cord *f*, the same being made as herein set forth, and attached to a bedstead, as described.

258,439. PRINTING-TELEGRAPH. ADOLPHUS A. KNUDSON, Brooklyn, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of a type-wheel, a platen for effecting the impression of a character upon said type-wheel, a clock or time-piece, a corrector for adjusting the minute-hand of said time-piece, and mechanism, substantially such as described, for actuating said platen and corrector.

2. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of a type-wheel, a platen for effecting the impression of a character upon said type-wheel, a time-piece, a corrector for adjusting the minute-hand of said time-piece, and an electro-magnet for actuating said platen and corrector.

3. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of a platen for effecting the impression of a character upon the type-wheel, a corrector for adjusting the minute-hand of a time-piece, an electro-magnet for actuating said platen and corrector, a line-wire, and two independent transmitters connected therewith, one for actuating the printing-platen and the other for actuating the time-corrector.

4. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of a clock or time-piece, mechanism, substantially such as described, for correcting the position of the hands of said time-piece by the action of the printing mechanism, and means for disconnecting the printing from the correcting mechanism, except at stated times or when the correction is to be effected.

5. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of an intermittently-rotating shaft, a radial arm mounted thereupon, a circular range of finger-keys, each of which, when depressed, arrests the rotation of the arm at a predetermined point, a line-wire, a transmitter actuated by said shaft for sending electrical pulsations over said line-wire, a second line-wire, and a yielding contact-lever mounted upon said radial arm, which closes a circuit with said second line-wire when brought into contact with a depressed key.

6. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of an intermittently-rotating shaft, a battery, a line-wire, a series of finger-keys for controlling the movement of said shaft, a pole-changer for sending electric pulsation of alternate polarity from said battery through said line-wire, a second line-wire, and a key or circuit-closer which transmits a pulsation of either polarity over the second line-wire, and is actuated whenever said shaft is arrested by the depression of a finger-key.

7. The combination, substantially as hereinbefore set forth, in a printing-telegraph, of a type-wheel, an electro-magnet for controlling said type-wheel, a unison-stop, a device for releasing the type-wheel from the control of said electro-magnet while being brought to unison, a constantly-moving time-train, and a circuit-changer operated by said time-train to close a circuit through an independent electro-magnet for actuating said releasing device whenever an intermission occurs in the movement of the type-wheel.

8. The combination, substantially as hereinbefore set forth, of a main line, an electro-magnet included in said main line, a type-wheel controlled by said electro-magnet, a unison device, an independent electro-magnet for controlling the action of said unison device, a circuit-changer for diverting the main-line current from the type-wheel magnet to the unison-magnet during a pause in the movement of the type-wheel, and a time-train and connections, substantially such as described, for actuating said circuit-changer.

9. The combination, substantially as hereinbefore set forth, of a main line, an electro-magnet included in said main line, a type-wheel controlled by said electro-magnet, a unison device, an independent electro-magnet for controlling the action of said unison device, a circuit-changer for diverting the main-line current from the type-wheel magnet to the unison-magnet during a pause in the movement of the type-wheel, and a device moving with the type-wheel for operating said circuit-changer to close the circuit through said type-wheel magnet when the type-wheel is at the zero or unison point.

10. In a printing-telegraph, the combination, substantially as hereinbefore set forth, of the type-wheel, the electro-magnet for controlling said type-wheel, the type-wheel shaft, the escape-wheel, the clutch-wheel longitudinally movable along said shaft, the locking-pin, the spring for normally locking the clutch-wheel and pin together, the fork for disconnecting said clutch-wheel from the pin, the independent electro-magnet for actuating the fork, the circuit-changer, and the device moving with the type-wheel for operating said circuit-changer to close a circuit through the type-wheel magnet when the type-wheel is at its zero or unison point.

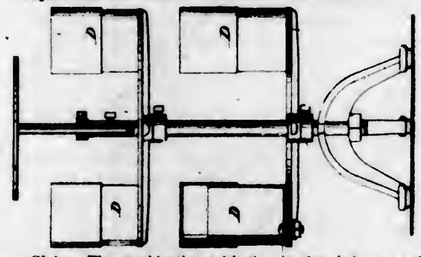
258,440. WITHDRAWN.

258,441. FIRE-ESCAPE. JOHN R. KOONS, Shickshinny, Pa. Filed Feb. 16, 1882. (No model.)

Brief.—The ladder rests on rods extending lengthwise through the case when not in use. The rounds are metal, having filling-pieces of wood clamped or riveted in. Lengthening-ropes can be attached to the ladder at its upper end, so that the full length of ladder can hang outside the case.

Claim.—1. In fire-escapes, the rope ladder B, combined with the case A, provided with rods *a*, substantially as shown and described.

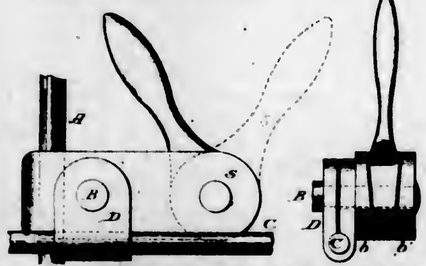
2. In a fire-escape, the combination, with the ropes *c* of the ladder, of the rounds *d*, composed of looped metal strips surround-



ing the said ropes, the filling-pieces *c*, of wood, and the straps *f*, for securing the filling-piece between the looped strips and clamping the ends of the said strips to the ropes, substantially as herein shown and described.

3. The combination of the case A, rods *a*, ladder B, and rope *k*, substantially as shown and described.

4. The split loops *a*, combined with ladder B, case A, and rope *k*, substantially as and for the purposes set forth.



5. The lengthening-ropes *p*, combined with the case A and ladder B, substantially in the manner and for the purposes set forth.

258,442. REVOLVING BOOK-STAND. DAVID T. KOSER, Ringgsville, Pa. Filed Feb. 11, 1882. (No model.)

Claim.—The combination, with the circular shelves *c*, each provided with a circular slot near its periphery, of the book-receptacle D and the bolts O, whereby the receptacle may be adjusted on the shelves, as shown, and for the purpose described.

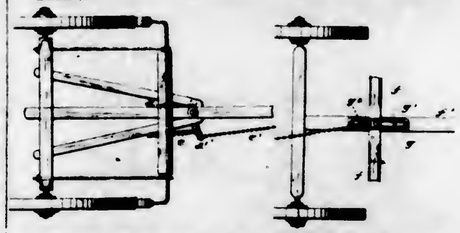
258,443. HEAD AND BACK REST FOR PHOTOGRAPHIC PURPOSES. WILLIAM S. LAIGHTON, Norwich, Conn., assignor to E. & H. T. Anthony, New York, N. Y. Filed Oct. 19, 1881. (No model.)

Claim.—The combination of the rod A, clamp *b b'*, bolt B, and cam S with the clamp D and rod C, substantially as described, and for the purpose set forth.

258,444. HAME. EMMIT S. LATTA, Friendship, N. Y., assignor of two-thirds to Adrian C. Latta, same place, and Harvey D. Blakeslee, Buffalo, N. Y. Filed Mar. 2, 1882. (No model.)

Claim.—1. The combination, with a hame, of a plate, C, provided on its inner sides with ribs or projections *c*, forming openings *c'*, through which the hame-strap may be drawn, and provided in its face with openings *d*, adapted to receive a plate or projection formed on the hame-strap loop, substantially as set forth.

2. The combination, with the plate C, provided with one or more upright slots, *d*, having enlargements *d'*, of a hame-strap loop, B, provided with an inwardly-projecting plate, *e*, having lateral projections *e'*, substantially as set forth.



3. The combination, with the plate C, provided with a socket, *f*, of the terret F, having an arm or stud, *f'*, engaging in said socket, substantially as set forth.

4. The combination, with the hame A, back-strap A', and draft-staple H, of the loop or ring I, provided with a plate, J, interposed between the body of the hame and the back-strap, substantially as set forth.

5. The combination of the loop or ring I, provided with plates J and L, and the draft-staple H, passing through said plates, substantially as set forth.

6. The combination, with the loop or ring I, of the plate J and loop K, all cast together in one piece, substantially as set forth.

258,445. WAGON-BRAKE. CHARLES J. LE ROY, Palestine, and JOHN W. HENSON, Dallas, assignors to themselves and Samuel J. Adams, Jack Leonard, J. T. Odell, Sidney Smith, and N. W. Godbold, all of Dallas, Tex. Filed Jan. 26, 1882. (No model.)

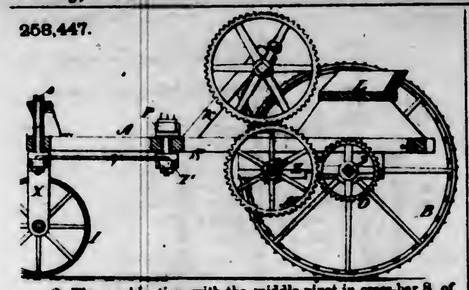
Claim.—1. In a wagon-brake, the combination, with a running-gear, of a brake-arm supported across the reach and connected by rods to the rear bolster, a lever pivoted underneath the reach and connected rigidly at one end to the said arm and at the other end having a spring connected to the adjacent bound, and a back-and-forth-sliding double-tree connected to said lever by a chain, substantially as shown and described.

2. In a wagon-brake, the combination, with a wagon, of the brake-arm *b'*, supported upon the bar *a'*, the rods *c'*, connecting the arm to the rear bolster, the lever *d'*, pivoted to the reach and connected to the arm by the rod *d*, the spring *e*, connecting the long end of the lever to the adjacent bound, and a suitable device for operating the said lever, substantially as shown and described.

3. In a wagon-brake, the combination, with a wagon, of the double-tree *f*, having an upward-projecting bolt provided with a link, *g'*, the guide consisting of the slotted bar *g* and upward-projecting bolts at each end, and the link *g'* in the rear bolt, and a suitable brake connected to the double-tree, substantially as shown and described.

258,446. CHILD'S BLOUSE. CHRISTIAN C. LIBE, New York, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—1. The combination, with a boy's blouse or coat having front plaits and a single line of front buttons between the same, of a detachable front portion having two rows of buttons and fastening devices covered by the plaits when attached, whereby the blouse may be changed from a single to a double breasted coat, substantially as set forth.



2. The combination, in a boy's blouse or coat having a single line of front buttons and front plaits, of a detachable front portion, detachable collar, and detachable pocket, sleeve, and back pieces, which are applied by fastening devices to covering-plaits, substantially as specified.

3. In a boy's blouse or coat, the combination, with the sleeve having detachable buttons, of a lining which is slotted below the buttons and provided with closing devices, substantially as set forth.

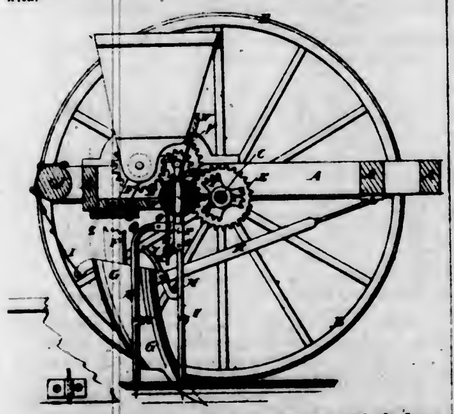
258,447. VELOCIPEDE. JOHN H. LOWERY, La Grange, Ga. Filed Mar. 28, 1882. (No model.)

Claim.—1. The combination, with an axle, D, having fast wheel B, thimble G, and loose wheel C, of the frame A, having the bearing-boxes E F, and the hand mechanism O M J, as and for the purpose described.

258,447.

2. The combination, with the middle pivot in cross-bar S, of the levers P T on opposite sides of said cross-bar, the rods V, the arms W, the standard X, and the wheel I, as and for the purpose specified.

3. The driving-axle positively secured in the hub of one of the driving-wheels and working loosely in the other, and being fitted in the frame-box F by a thimble, G, substantially as specified.

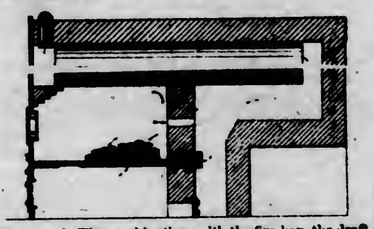


258,448. COMBINED BUNG AND BUSHING FOR BEER-BARRELS. PHILIPP HADLENER, Milwaukee, Wis. Filed Mar. 22, 1882. (No model.)

Claim.—The combination of the bushing A, having locking-lugs *a'*, with the bung B, provided with handle *b*, and the locking-plug D, provided with grooves and inclined ways for the lugs, and cut away centrally on its under side, so as to leave space for the handle of the bung, and also a downward depending circular flange adapted to be interposed between the said bung and the locking-lugs on the bushing, as set forth.

258,449. GRAIN-DRILL. SLAUGHTER G. MAJOR, Haynesville, Me. Filed Feb. 10, 1882. (No model.)

Brief.—Depending from a transverse shaft on either side of the drill-boot are teeth, provided with rule-joints and break-pins, for cleaning accumulated trash from the boots. The shaft is provided with a segment, whereby an intermittent oscillatory movement is imparted to it by a gear-wheel on the axle engaging therewith.

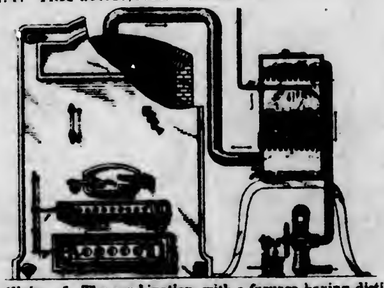


Claim.—1. In a grain-drill, the combination, with the frame A and the axle C, of the shaft K, the jointed teeth M, the gear-segments T U, and the spring V, substantially as herein shown and described, whereby the said shaft and teeth will receive a reciprocating movement from the revolution of the said axle, as set forth.

2. The combination, with the hoes, arranged in two rows, and a single shaft, K, of teeth M, having the bend or offset Q in their upper parts, whereby both rows of hoes can be cleared by a single shaft, as described.

3. The combination, with the teeth M, rule-jointed at N, the shaft K, having spring V and arm Y, and the axle C, of the gear-wheel T, formed of three segments, each provided with four teeth, the four-toothed segment U on shaft K, and the leather plate Z on frame, as and for the purpose specified.

258,450. BOILER OR OTHER FURNACE. EDWD. J. HALLETT, Jr., New York, N. Y. Filed Jan. 31, 1882. (No model.)



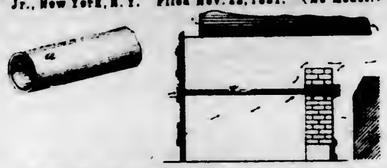
Claim.—1. The combination, with the fire-box, the draft-flue, and the suction-fan or air-exhauster, of the perforated septum or division-wall, and separate, distinct, and controllable air channels or ducts, admitting air in regulated quantities, the one to the ash-pit, the other to the furnace, at a point where the air will meet and mingle with the fuel-gases passing through or issuing from the said division-wall, substantially as hereinbefore set forth.

2. The fire-box, the draft-flue, and the suction-fan or air-exhauster, in combination with the perforated septum or division-wall, the separate and distinct air channels or ducts, admitting air, the one to the ash-pit, the other to the furnace, at a point where the air will meet and mingle with the fuel-gases passing through or issuing from the said division-wall, and registers or gates for said air-channels, substantially as hereinbefore set forth.

3. The combination, with the air-exhauster and the condenser or cooler, of the furnace provided with perforated septum or division-wall, and with separate and distinct sets of valve or register controlled air channels or ducts, substantially as and for the purpose hereinbefore set forth.

258,451. APPARATUS FOR PROMOTING THE COMBUSTION OF FUEL IN FURNACES. EDWD. J. HALLETT, Jr., New York, N. Y. Filed Nov. 28, 1881. (No model.)

Claim.—1. The combination, with a furnace having distinct separate and controllable air-inlets which introduce air in regulated quantities to the furnace both through the ash-pit and also at a point where it will meet the fuel-gases, of a draft-flue and a suction-fan by which air is sucked or drawn into and through the furnace, substantially as and for the purposes hereinbefore set forth.



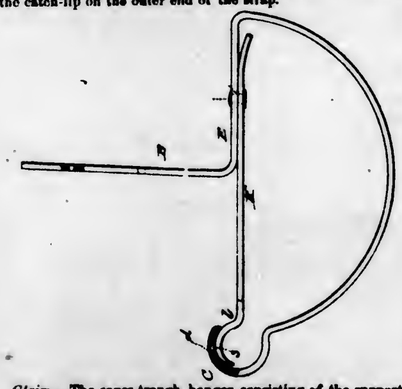
2. The combination, substantially as hereinbefore set forth, of the furnace provided with inlets which introduce air into the furnace both through the ash-pit and at a point where it will meet the fuel-gases, the draft-flue, the suction-fan, and the condenser.

3. The combination, substantially as hereinbefore set forth, of the furnace provided with two sets of air-inlets, the one admitting air to the fire through the ash-pit, the other conducting air into the furnace at a point where it will meet the fuel-gases, the registers or gates for said sets of inlets, and the suction-fan.

4. The combination, substantially as hereinbefore set forth, of the tubular grate-bars open from end to end and discharging air into the furnace at a point beyond the bridge-wall, the ash-pit and air-inlets therein, registers or gates controlling admission of air through said inlets and through the grate-bars, the suction-fan, and the condenser.

5. The combination, substantially as hereinbefore set forth, of hollow grate-bars, suction-fan or air-exhauster, and intermediate water-contact condenser.

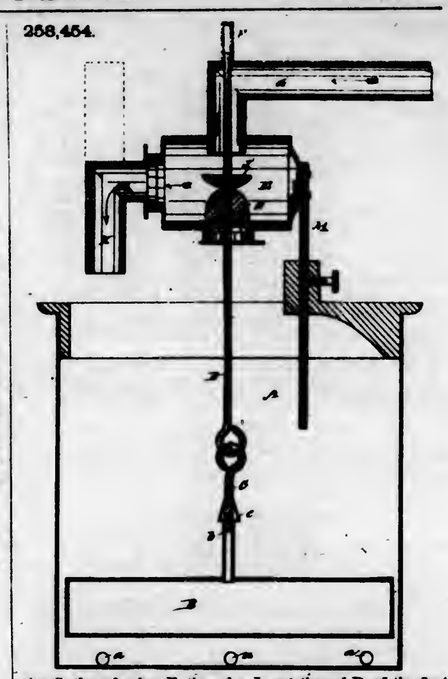
258,452. BOILER OR OTHER FURNACE. EDWD. J. HALLETT, Jr., New York, N. Y. Filed Nov. 23, 1881. (No model.)



Claim.—1. In a furnace, the combination, substantially as hereinbefore set forth, of tubular grate-bars open from end to end and conducting air from the outside into or beyond the bridge-wall, air-inlet passages in the ash-pit which admit air beneath the grate-bars, and registers applied to and controlling both the open inlet ends of the grate-bars and the air-inlet passages of the ash-pit, substantially as hereinbefore set forth.

2. The combination, with the tubular grate-bars and the air-inlet passages of the ash-pit, of registers applied to the outer ends of the bars and the air-inlets of the ash-pit, respectively, and the lever-handle connected to and adapted to operate simultaneously both sets of registers, so that in proportion as the one is closed the other will open, substantially as hereinbefore set forth.

3. The combination of the tubular grate-bar, adapted both to slide lengthwise and rotate, and the removable key, provided, the one with bayonet-slots and the other with pin to engage said slots, substantially as and for the purposes hereinbefore set forth.



258,453. EAVES-TROUGH HANGER. RICHMOND E. HALLEY, West Salem, Ohio. Filed Mar. 25, 1882. (No model.)

Brief.—A stud on the pivoted latch-bar engages a perforation in the catch-lip on the outer end of the strap.

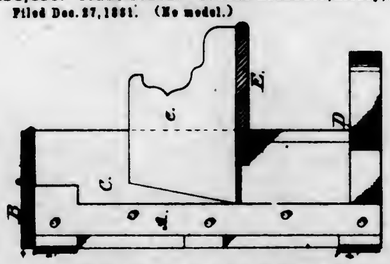
Claim.—The eaves-trough hanger consisting of the supporting-strap B, its perforated arm E and perforated catch-lip C, and the pivoted latch-bar K, its curved end *l* fitting under the catch-lip and its stud *s* engaging the perforation *d* of said catch-lip, substantially as specified.

258,454. SELF-REGULATING FEEDER FOR SACCHARINE LIQUIDS. CHARLES F. HANSEN, Weston, Vt. Filed Feb. 13, 1882. (No model.)

Claim.—1. In a self-regulating feeder, the combination, with the feed-pipe G and the valve-box E, of the valve J, loosely mounted on the rod D, the supporting-block H on the rod D, and the float-supporting rod D, substantially as herein shown and described, and for the purpose set forth.

2. In a self-regulating feeder, the combination, with the feed-pipe G and the valve-box E, of the valve J, the block H, the rod D, and the float B, substantially as herein shown and described, and for the purpose set forth.

3. In a self-regulating feeder, the combination, with the feed-pipe G and the valve-box E, of the valve J, the block H, the rod D, the float B, and the vessel A, containing the float and provided with apertures *a* for the entrance of the sap or saccharine liquid, substantially as herein shown and described, and for the purpose set forth.



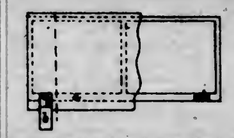
4. In a self-regulating feeder, the combination, with the feed-pipe G, of the valve-box E, the adjustable supporting-rod M, the valve J, the rod D, the float B, and the vessel A, substantially as herein shown and described, and for the purpose set forth.

5. In a self-regulating feeder, the combination, with the feed-pipe G, the valve-box E, the valve J, and the rod D, of the float B and the hollow suspending-hook C, provided with an air-vent, *b*, substantially as herein shown and described, and for the purpose set forth.

6. In a self-regulating feeder, the combination, with the feed-pipe G and the float-rod D, of the rounded block H, rigidly mounted on the rod D, and the valve J, loosely mounted on the rod D and resting on the block H, which valve has a layer of rubber on its upper surface, substantially as herein shown and described, and for the purpose set forth.

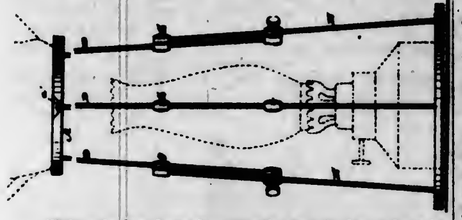
7. In a self-regulating feeder, the combination, with the feed-pipe G and the valve-box E, of the valve-supporting and float-carrying rod D and of the guide-socket F on the pipe G, substantially as herein shown and described, and for the purpose set forth.

258,455. PIANO-FORTE. EDWARD MCCAMMON, Albany, N. Y. Filed Dec. 27, 1881. (No model.)



Claim.—1. In an upright piano, the combination, with a body-frame, A, containing the usual iron plate, strings, and sounding-board, of an outer ornamental casing separable from the frame A, substantially as described, and for the purpose set forth.

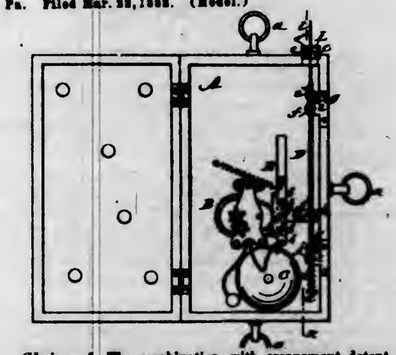
2. The combination, with the body-frame A, for containing the plate, strings, and sounding-board of an upright piano, of an ornamental casing consisting of the end pieces, C, pedal-rail D, and key-board bottom E, separable from the frame A, essentially as and for the purpose specified.



258,456. DASH-BOARD FOR VEHICLES. LACHLAN E. MCKINNON, St. Catharines, Ontario, Canada. Filed Nov. 18, 1881. (No model.) Patented in Canada Dec. 16, 1881, No. 13,849.

Claim.—The combination of a dash, with its lower rail, *a*, provided with the groove *g*, having slots *d*, with the bolts C, having oblong heads adapted to be inserted through said slots and turned across said channels, and secured to the foot by nuts, substantially as described, and for the purpose set forth.

258,456.



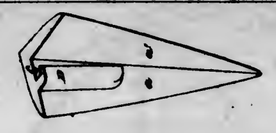
258,457. HEATING-FRAME FOR LAMPS. JOSIAH W. HELVIN, Houston, Tex. Filed Apr. 8, 1882. (Model.)

Claim.—1. In a frame for supporting vessels above a lamp in position to be heated, the thin cast-metal top plate, A, formed with an annular marginal flange, and having upon its upper surface a series of horizontal radial ribs, C, upon which the vessel to be heated rests, the flange being recessed at intervals, and the plate being supported upon rods secured in its ribbed portions, substantially as described.

2. The combination, with the flanged cast-metal top plate, A, formed with a central opening and a series of radial ribs, C, of the two sets of supporting-rods D and E, and the metal base-ring provided with feet or lugs *f* upon its under side, the upper set of rods being secured in the ribbed portions of the top plate, the lower set of rods being inserted in the base-rings where the feet or lugs occur, and both sets of rods being connected together by slidable connections, substantially as described.

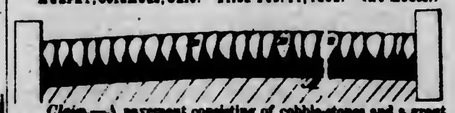
258,458. BURGLAR-ALARM. PETER HOGAN, Philadelphia, Pa. Filed Mar. 22, 1882. (Model.)

Claim.—1. The combination, with escapement-detent and alarm mechanism, of the spring-pressed sliding rods D, and the plate F, connecting the rods with the detent, substantially as and for the purpose set forth.



2. The combination, with the escapement-detent E, provided with the pins *h*, of the sliding rods D, provided with the pins *h*, and the T-shaped plate F, provided with the inclines *i* and the slot, substantially as and for the purpose set forth.

3. The combination, with the box A, provided with the perforated posts *f f'*, and the detent E, provided with pins *h*, of the rods D, the springs *d*, and the T-shaped plate F, provided with the inclines *i*, substantially as and for the purpose set forth.



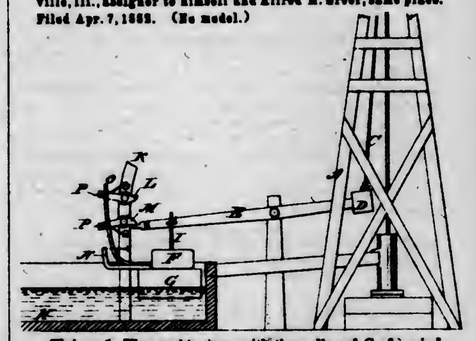
258,459. FENCE-POST. JOSEPH F. HOUGHTON, Fort Atkinson, Wis. Filed Apr. 4, 1881. (No model.)

Claim.—In fence-posts, the socket A, consisting of two blades, *a* and *a'*, at substantially right angles to each other, and the hooked flange D, as set forth.

258,459.

258,460. COBBLE-STONE AND GROUT PAVEMENT. JOHN MURPHY, Columbus, Ohio. Filed Feb. 11, 1882. (No model.)

Claim.—A pavement consisting of cobble-stones and a grout composed of pulverized slag, sand, lime, silica, Portland cement, and ore-dust, substantially as described, whereby the use of pitch or asphaltum may be dispensed with, as set forth.



258,461. BUFFER FOR LOOMS. MICHAEL MURRAY, South Manchester, Conn. Filed Feb. 21, 1881. (No model.)

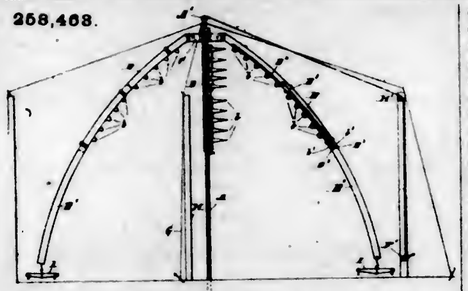
Brief.—The blow of the shuttle upon the picker is checked by means of a small crank pivoted upon the under side of the lathe-beam and bearing against the side of the picker-stick. The strap connecting the crank with the spring that draws it forward is formed with several holes, whereby such connection may be adjusted. The crank admits of being turned back away from the picker-stick and thrown out of operation.

Claim.—The combination of a lathe-beam, *a*, and a picker-stick, *c*, with the retractible crank *e* and spring *f*, and means for adjustably connecting said spring and crank, all substantially as described.

258,462. WINDMILL-REGULATOR. JOHN H. NEWELL, Scottsville, Ill., assignor to himself and Alfred H. Greer, same place. Filed Apr. 7, 1882. (No model.)

Claim.—1. The combination, with the pull-cord C of a windmill, and weight D, suspended thereon, of setting and tripping lever E, float G, weight F, catch-dogs L M, and tripping-arms N O, substantially as specified.

2. The combination of weight F, yoke I, and float G with the tripping-lever E, substantially as specified.



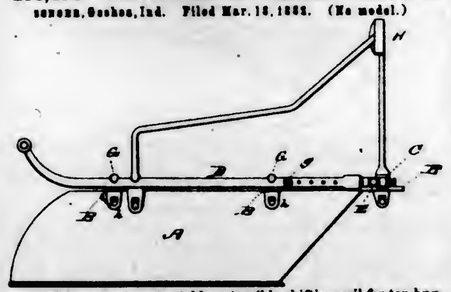
3. The catch-dogs L M, combined with the lever E, weight F, float G, and the trippers N O, substantially as specified.

4. The catch and trip dogs L M, arranged on the vertical standard K, in combination with the vertically-swinging shifting-lever E and the float G, said float having trippers N O, substantially as specified.

258,463. MACHINE FOR STACKING HAY AND STRAW. JOHN G. A. NEWSOM, Columbus, Ind. Filed Aug. 26, 1881. (No model.)

Claim.—1. The combination, in a hay or straw stacker, of the central pole and the revolving arms, said pole being substantially

258,468.

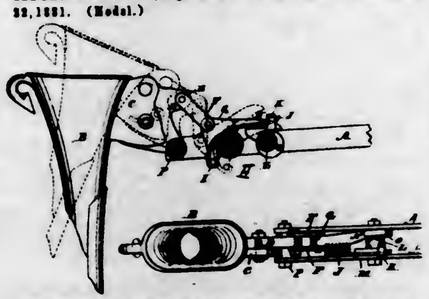


vertical, and said arms being adapted to continuously bear upon and move over the surface of the stack while the same is in process of being built, all substantially as described, and for the purposes specified.

2. The combination, in a hay or straw stacker, of the central shaft, the revolving arms, and the guiding arms or fingers *b*, substantially as shown and described, and for the purposes specified.

3. The combination, with the arms B of a straw or hay stacker, of fingers *b*, rod B', and thumb-screws B', passing through bearings secured to said arms, all substantially as and for the purposes set forth.

4. The combination of the pole A, cross-head C, arms B, and extensions B', substantially as and for the purposes set forth.

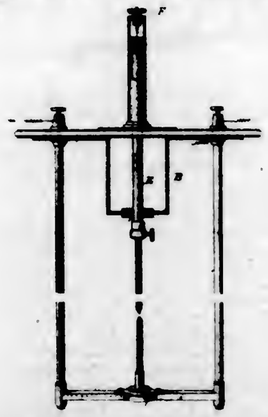


258,464. SHIFTING-RAIL FOR VEHICLES. JAMES A. MCKENZIE, Goshen, Ind. Filed Mar. 16, 1881. (No model.)

Claim.—1. An adjustable extensible shifting-rail for top-buggies, consisting of the angle-irons E, the slotted rail-section C, and the slotted adjustable rail-sections D D in sliding engagement therewith, said sections being adapted to be secured to the seat by fastening-bolts and bearings, substantially as specified.

2. In a shifting-rail for vehicle-seats, the combination, with the seat A, having perforated bearing-plates B secured thereto, of the perforated slotted rails C D, having apertures *c*, the angle-irons E, screws *g*, and the T-headed bolts G and nuts *h*, substantially as specified.

258,466. SPRING-HOE FOR GRAIN-DRILLS. JAMES NIXON and THOMAS H. NIXON, Ingersoll, Ontario, Canada. Filed Dec. 22, 1881. (Model.)



Claim.—1. In a grain-drill, the combination, with the hoe B and drag-bars A A', of a rocking cylinder, H, axially journaled between the drag-bars, spring J, wound spirally around said cylinder, the free end secured to a lug, I, of the cylinder, the other end attached to a fixture, links F F, pivoted to a lug, G, of the cylinder, and to a plate, D, or fin C of the hoe above the pivot-point of its connection with the drag-bars, and eccentric O, forming a stop for an arm, N, of cylinder H, whereby the primary resistance of the hoe to an obstruction can be weakened and strengthened by throwing the pivotal end of links F F more or less out of line with the axis of cylinder H by the adjustment of the eccentric O, raising and lowering the arm N, the spring J reacting to retract the hoe to a normal position after yielding to and passing over an obstruction, as set forth.

2. In combination with a cylinder, H, journaled between the drag-bars of a grain-drill, and spring J, wound spirally around said cylinder, the cylinder I, axially secured between the drag-bars by a clamping-bolt, and provided with interlocking faces, for the purpose set forth.

3. In combination with spring J, wound around a cylinder, H, journaled between drag-bars A A, pivoted to the hoes B or plate D, and connected to the hoes by links F F, the cylinder I, axially secured between the bars A A, and having a flange, M, and projection K, to secure the end of spring J fixedly, as set forth.

258,466. ELECTRIC-ARC LAMP. MICHAEL J. O'SULLIVAN, Baltimore, Md., assignor to the American Electrophore Company, Washington, D. C. Filed Dec. 19, 1881. (No model.)

Claim.—1. In an arc lamp, the combination, with the movable upper-carbon holder, of a horn insulated from electrical connection with said holder, and other parts which may be embraced in the lamp-circuit, substantially as hereinbefore set forth.
